---

In the Matter of: )

U.S. Department of Energy )

(License Application for Geologic Repository )  
at Yucca Mountain) )

---

January 16, 2009

Docket No. 63-001

---

**ANSWER OF THE U.S. DEPARTMENT OF ENERGY TO  
THE STATE OF NEVADA'S PETITION TO INTERVENE**

---

Donald J. Silverman, Esq.  
Thomas A. Schmutz, Esq.  
Paul J. Zaffuts, Esq.  
Alex S. Polonsky, Esq.  
Lewis M. Csedrik, Esq.

Mary B. Neumayr, Esq.  
James Bennett McRae, Esq.

COUNSEL FOR THE  
U.S. DEPARTMENT OF ENERGY

## TABLE OF CONTENTS

	Page
I. INTRODUCTION .....	1
II. BACKGROUND .....	6
A. Submittal of the License Application .....	6
B. The Yucca Mountain Site .....	7
C. Proposed Repository Operations.....	7
D. NRC Regulatory Framework for Repository Construction Authorization.....	9
1. The NRC’s Safety Review .....	9
2. The NRC’s National Environmental Policy Act Responsibilities .....	11
E. Commencement of the NRC Staff’s Technical Review and the Hearing Process .....	13
III. COMPLIANCE WITH LSN REQUIREMENTS.....	14
IV. LEGAL STANDING.....	28
V. ADMISSIBILITY OF CONTENTIONS.....	28
A. Applicable Legal Standards and Relevant NRC Precedent.....	28
1. Petitioner Must Submit at Least One Admissible Contention to be Admitted as a Party .....	28
2. Petitioner in this Proceeding Has a Heightened Obligation to Proffer Well Pled and Adequately Supported Contentions Given the Availability of the LSN.....	29
3. Proffered Contentions Must Meet All of the Contention Admissibility Requirements of 10 C.F.R. § 2.309(f)(1) as Well as the Requirements of the Applicable June 20, 2008 and September 29, 2008 Case Management Orders .....	34
4. Environmental Contentions Addressing DOE’s Final Environmental Impact Statement and its Supplements Must Also Meet the Requirements of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326.....	57
5. Contention Subjects That Are Outside the Scope of, or Immaterial to the NRC’s Required Findings in, the Yucca Mountain Licensing Proceeding.....	64
B. DOE’s Answer Regarding the Admissibility of Petitioner’s Proposed Contentions .....	74
1. NEV-SAFETY-01 - Doe Integrity .....	74
2. NEV-SAFETY-02 - Doe Management.....	96

**TABLE OF CONTENTS**

**UNITED STATES OF AMERICA  
NUCLEAR REGULATORY COMMISSION  
ATOMIC SAFETY AND LICENSING BOARD**

In the Matter of:	)	January 16, 2009
	)	
U.S. Department of Energy	)	
	)	Docket No. 63-001
(License Application for Geologic Repository at Yucca Mountain)	)	
	)	

**ANSWER OF THE U.S. DEPARTMENT OF ENERGY TO  
THE STATE OF NEVADA’S PETITION TO INTERVENE**

**I. INTRODUCTION**

In accordance with 10 C.F.R. § 2.309 and 10 C.F.R. Part 63, and the Advisory Pre-Application Presiding Officer (PAPO) Board Order of June 17, 2008, the U.S. Department of Energy (DOE or the Department) hereby files its Answer to the State of Nevada’s (Nevada) Petition to Intervene (Petition), filed on December 19, 2008.<sup>1</sup> The Petition responds to the U.S. Nuclear Regulatory Commission’s (NRC or Commission) Notice of Hearing and Opportunity to Petition for Leave to Intervene on an Application for Authority to Construct a Geologic Repository at a Geologic Repository Operations Area at Yucca Mountain, published in the *Federal Register* on October 22, 2008 (73 Fed. Reg. 63,029) (Hearing Notice). The Hearing

---

<sup>1</sup> DOE is filing this Answer in advance of the deadline set by the Commission in its Hearing Notice. DOE recognizes, however, that Petitioners have the full time allotted by the Hearing Notice to file their replies. DOE's early filing does not affect the deadlines set by the Commission.

Notice concerns DOE's License Application (Application or LA) for authorization to construct a geologic repository at Yucca Mountain, Nevada for the disposal of spent nuclear fuel (SNF) and high-level radioactive waste (HLW).

To be admitted as a party to this proceeding, under 10 C.F.R. § 2.309, Nevada must: (1) be in substantial and timely compliance with the Licensing Support Network (LSN) requirements imposed by 10 C.F.R. § 2.1003 at the time of its request for participation in the proceeding as provided in 10 C.F.R. § 2.1012(b)(1), and be in compliance with all orders of the Pre-License Application Presiding Officer (PAPO) regarding electronic availability of documents; (2) have legal standing to intervene in the proceeding pursuant to 10 C.F.R. § 2.309; and (3) submit at least one admissible contention in accordance with 10 C.F.R. § 2.309(f)(1). In addition to the NRC's contention admissibility requirements in 10 C.F.R. § 2.309(f), environmental contentions must also meet the requirements of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326. As discussed in detail below, Nevada has failed to demonstrate that it is in substantial and timely compliance with its LSN obligations.

Nevada, which is represented by experienced nuclear counsel and has had the benefit of considerable time, access to the LSN, and experts, has submitted a lengthy Petition with 229 contentions. While Nevada has legal standing as the host state for the geologic repository operations area pursuant to 10 C.F.R. § 2.309(d)(2)(iii), DOE respectfully submits that Nevada has failed to file any admissible contentions.

DOE has reviewed all of Nevada's contentions and addresses each one in considerable detail in Section V. below. During DOE's careful review of Nevada's contentions, it became apparent that, apart from unique deficiencies identified in particular contentions, there are common and repetitive failures to meet the mandatory requirements for admissibility under 10

C.F.R. § 2.309 (and for National Environmental Policy Act of 1969 (NEPA)-based contentions) 10 C.F.R. §§ 51.109 and 2.326 as well. To assist the Atomic Safety and Licensing Board in reviewing the large volume of documentation presented by both Nevada and DOE, summarized below are some of the consistent and repetitive deficiencies in Nevada’s contentions that render such contentions inadmissible. Each of these deficiencies is discussed in more detail later in this Answer.

- Nevada frequently alleges errors, omissions, inadequate data, faulty assumptions, or improper modeling by DOE but rarely, if ever, describes the *implications* quantitatively or even qualitatively of those alleged deficiencies, if proven true, in terms of the applicable regulatory requirements. As such, in these instances, Nevada has failed to demonstrate that there is any genuine dispute of material fact or law, contrary to 10 C.F.R. § 2.309(f)(1)(vi).
- Many of Nevada’s criticisms are not based on an adequate factual basis or expert opinion. In numerous instances, criticisms and assertions are not supported by a technical reference. In some cases, there is no reference at all. In others, the reference, upon review, does not support the criticism or assertion. Furthermore, when Nevada purports to rely on an expert affidavit, the affidavit does no more than broadly state that the affiant “adopts” certain portions of the contention prepared by counsel. This practice falls far short of the requirement to provide a reasoned basis, and explanation of the rationale, for the expert’s opinion. Furthermore, in many instances, the alleged expert clearly lacks the qualifications to render an opinion on the subject of the contention. All of this is contrary to 10 C.F.R. § 2.309(f)(1)(v).

- Many of Nevada’s contentions allege deficiencies in DOE’s postclosure modeling but fail to demonstrate how the contention either independently or cumulatively in combination with other contentions could result in an increase in the mean dose above regulatory limits and thus be material to this proceeding. While, as DOE shows, Nevada has the ability to quantify the impacts of its contentions on dose and at a minimum to provide a qualitative analysis of how the contention would affect the model, including the likely range of impacts on dose, it has failed to provide any such analysis.
- Nevada frequently alleges that “uncertainties” exist in DOE’s postclosure analyses. Part 63 explicitly recognizes that such uncertainties will exist in predictions of long-term, postclosure performance (*see, e.g.*, 10 C.F.R. §§ 63.101 and 63.102) and incorporates the reasonable expectation standard to reflect this recognition. Mere allegations of such uncertainties are, in effect, improper challenges to the regulations and are, therefore, outside the scope of the proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iii).
- In the case of its NEPA contentions, Nevada fails to address any of the mandatory requirements of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326. Specifically, Nevada did not submit the affidavit of a qualified expert in support of any of its NEPA contentions that separately addresses each of the factors under § 2.326, including a demonstration that its contention, if proven to be true, would or would likely result in a materially different outcome in the proceeding.
- Many of Nevada’s NEPA contentions challenge DOE’s transportation decisions and the environmental analyses on which they are based, notwithstanding the fact

that DOE's transportation decisions and the environmental analyses upon which these decisions are based are beyond the scope of this proceeding. Any such challenges may be pursued only through a petition for review to a federal court of appeals.

Nevada has an opportunity to file a Reply to this Answer and may attempt to “cure” these and other deficiencies in its Petition. DOE notes, however, that it is well recognized that “[r]eplies must focus narrowly on the legal or factual arguments first presented in the original petition or raised in the answers to it.” *Nuclear Mgmt Co., L.L.C.* (Palisades Nuclear Plant), CLI-06-17, 63 NRC 727, 732 (2006) (citing cases); see *La. Energy Servs., L.P.* (National Enrichment Facility), CLI-04-25, 60 NRC 223, 225 (2004)(citing Final Rule, Changes to Adjudicatory Process, 69 Fed. Reg. 2182, 2203 (Jan. 14, 2004)). Replies should not be used to “*expand the scope of the arguments set forth in the original hearing request,*” nor should they be used to *introduce new bases* for contentions submitted with the original petition. See *Nuclear Mgmt Co., L.L.C.*, CLI-06-17, 63 NRC at 732 (emphasis added). Additionally, the Advisory PAPO Board explicitly stated that “[r]eplies shall be limited to addressing points that have been raised in answers.” *U.S. Dep’t of Energy* (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board), LBP-08-10, 67 NRC \_\_ (slip op. at 9) (June 20, 2008). DOE reserves the right to file motions to strike or to seek other appropriate relief if Nevada expands the factual or legal bases for its contentions in its Reply.

## II. BACKGROUND

Provided below is a brief background section that addresses, among other things, an overview of repository operations, the NRC regulatory framework governing the Construction Authorization, and the NRC technical review and hearing processes.<sup>2</sup>

### A. Submittal of the License Application

On June 3, 2008, pursuant to section 114 of the Nuclear Waste Policy Act, as amended (NWPA), 42 U.S.C. § 10134, 10 C.F.R. Part 63 and 10 C.F.R. § 2.101, DOE submitted an application to the NRC seeking authorization to construct a HLW repository at a geologic repository operations area (GROA) at Yucca Mountain, in Nye County, Nevada. On September 8, 2008, the NRC Staff docketed the Application. The NRC published the Notice of Hearing in the *Federal Register* on October 22, 2008.

The NWPA establishes a comprehensive policy and program for the safe, permanent disposal of commercial SNF and other HLW in one or more geologic repositories. Specifically, the NWPA charges DOE with: (1) establishing criteria for recommending sites for repositories; (2) “characterizing” (investigating) the Yucca Mountain site to determine its suitability for a repository; (3) if the site is found suitable, recommending it to the President, who would submit a recommendation to the Congress if he agreed that the site was qualified; and (4) seeking permission from the NRC to construct and operate a repository at the approved site. This proceeding only concerns DOE’s request that the NRC issue a construction authorization pursuant to 10 C.F.R. § 63.31. A license to receive and possess radioactive material at a GROA

---

<sup>2</sup> In addition, DOE has also attached a 28-page document prepared for the public by DOE entitled “The Safety of a Repository at Yucca Mountain.” Attachment 1; LSN Participant Acc. No. ALA.20090115.0636. DOE believes review of that document may enhance the Licensing Board’s ability to efficiently disposition the Petitions before it. A color copy of this document is available at [www.ocrwm.doe.gov/ym\\_repository/license/docs/safety\\_of\\_a\\_repository.pdf](http://www.ocrwm.doe.gov/ym_repository/license/docs/safety_of_a_repository.pdf).

at the Yucca Mountain site will require separate NRC approval, which DOE will seek at a later date pursuant to 10 C.F.R. § 63.41.

**B. The Yucca Mountain Site**

In February 2002, the Secretary of Energy recommended that the President approve the Yucca Mountain site following more than two decades of scientific investigations. As required by the NWPA, the Secretary submitted the *Final Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada* (FEIS) with his recommendation. On July 23, 2002, the President signed into law a joint congressional resolution, Pub. Law 107-200, designating the Yucca Mountain site for development as a geologic repository for the disposal of SNF and HLW. That action concluded the site selection process required by the NWPA, thereby enabling DOE to proceed with a construction authorization application.

The Yucca Mountain site is in a remote area of the Mojave Desert in Nye County in southern Nevada, about 145 kilometers (90 miles) northwest of Las Vegas, Nevada. The site is isolated from concentrations of human population and human activity and is likely to remain so. It is on land controlled by the Federal Government. Further information regarding the site is provided in the Application.

**C. Proposed Repository Operations**

The following is a brief summary of the proposed repository operations that are detailed in the Application. If authorized by the NRC, DOE would build a geologic repository at Yucca Mountain to receive, possess, handle and dispose of SNF and HLW.

Waste handling surface operations and repository subsurface operations are the two major repository operations. The handling and disposal of SNF and HLW at the repository

would take place in the GROA. The surface portion of the GROA would include the facilities necessary to receive, package, and support emplacement of SNF and HLW in the repository. Some commercial SNF would be aged to reduce its thermal output, in order to manage temperatures within and between emplacement drifts. This would be accomplished by placing NRC-approved transportation, aging, and disposal (TAD) canisters and other designated canisters into aging overpacks and placing the overpacks on aging pads at the Aging Facility. When heat output declines to an appropriate level, the canisters would be placed in waste packages for disposal. Those TADs not placed on the aging pads would be placed directly in waste packages for disposal, as would canisters containing DOE-origin SNF and HLW. The surface facilities would also have the capability to load uncanistered commercial SNF into TADs in the Wet Handling Facility.

The subsurface portion of the GROA would include the facilities necessary for waste emplacement and disposal. These facilities would consist primarily of an underground network of horizontal tunnels, or “emplacement drifts” as referred to above. The drifts would total about 42 miles in length and would be able to accommodate about 11,000 waste packages containing a total of 70,000 metric tons of heavy metal (MTHM) of SNF and HLW. DOE would emplace waste packages containing SNF and HLW at least 700 feet below the ground surface and approximately 1,000 feet above the water table. The natural features of the site and engineered barriers would provide a total system to help ensure the long-term isolation of the materials from the accessible environment after the repository has been closed.

## **D. NRC Regulatory Framework for Repository Construction Authorization**

### **1. The NRC's Safety Review**

10 C.F.R. Part 63, applicable only to a DOE application for a geologic repository at Yucca Mountain, Nevada, contains risk-informed, performance-based licensing criteria for disposal of SNF and HLW.<sup>3</sup> Part 63 specifies those performance objectives that must be met through permanent closure and those performance objectives that must be met after permanent closure. Part 63 requires the use of both a preclosure safety analysis (PCSA) and a postclosure performance assessment to evaluate the effect of events and other factors on the performance objectives. The performance objectives in Part 63 must be consistent with the standards established by the U.S. Environmental Protection Agency (EPA) for a Yucca Mountain repository.<sup>4</sup>

Part 63 requires DOE to perform a systematic examination of the potential hazards during the operations period to ensure that all relevant hazards that could result in unacceptable radiological consequences are adequately evaluated, and that protective measures are identified so that the repository will comply with the preclosure performance objectives. The PCSA systematically examines the site, the design, potential hazards, initiating events and their consequences, and the potential dose consequences to workers and the public (so as to limit such doses to acceptable risk levels). The PCSA considers the probabilities and uncertainties

---

<sup>3</sup> In finalizing its Part 63 regulations, the NRC emphasized that risk-informed, performance-based regulation is an approach in which risk insights, engineering analysis and judgment, and performance history are used to: (1) focus attention on those activities most important to performance; (2) establish objective criteria based upon risk insights for evaluating performance; (3) develop measurable or calculable parameters for monitoring system and licensee performance; and (4) focus on the results as the primary basis for regulatory decision making. Final Rule, Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, NV, 66 Fed. Reg. 55,732 (Nov. 2, 2001).

<sup>4</sup> A portion of the EPA and NRC regulations were vacated in *Nuclear Energy Inst., Inc. v. Env'tl. Protection Agency*, 373 F.3d 1251 (D.C. Cir. 2004) (*NEI*), and proposed rules were subsequently issued by EPA and NRC. EPA published its final rule on October 15, 2008 and the NRC is in the process of issuing conforming regulations.

associated with potential hazards. DOE understands that the NRC's preclosure review seeks to confirm that repository design, construction, and operation will meet the performance objectives (exposure limits), including a review of risk-significant systems, structures, and components important to safety. Final Report, Yucca Mountain Review Plan, NUREG-1804, Rev. 2 at xvi (July 2003) (YMRP).

Part 63 also requires DOE to conduct a performance assessment to demonstrate compliance with the postclosure performance objectives (the Total System Performance Assessment, or TSPA). It is DOE's understanding that the NRC's postclosure performance objectives will focus on items most important to waste isolation, including a review of the natural and engineered barriers identified by DOE as important to waste isolation. *Id.* DOE has identified those features, events, and processes (FEPs) that are most risk-significant to repository safety, and has considered whether the repository design will assure that, when considering these risks-significant FEPs, radiological exposures to the reasonably maximally exposed individual (RMEI) will remain within the applicable limits specified in Part 63. The postclosure performance objectives also protect ground water by limiting the radioactivity in a representative volume of ground water and require an assessment of performance under conditions of human intrusion.

To facilitate its technical review of the Application, the NRC Staff has issued the Yucca Mountain Review Plan (YMRP), NUREG 1804. The YMRP includes the areas of review, review methods, acceptance criteria, evaluation findings, and references the NRC Staff will use for its review. It also includes sections for reviews of general information, repository safety before permanent closure, repository safety after permanent closure, the research and development program to resolve safety questions, the performance confirmation program, and

administrative and programmatic requirements. Like Part 63, the YMRP guidance also is risk-informed and performance-based.

## **2. The NRC's National Environmental Policy Act Responsibilities**

The National Environmental Policy Act of 1969 (NEPA), 42 U.S.C. § 4321 *et seq.*, requires Federal agencies, as part of their decision-making process, to consider the environmental impacts of major Federal actions. For the licensing of a geologic repository for the disposal of SNF and HLW, the NRC's responsibilities under NEPA are expressly prescribed and limited by the NWPA.

In particular, section 114(f)(4) of the NWPA addresses the obligations of the NRC with respect to an environmental impact statement (EIS) prepared by DOE in connection with a proposed repository. As reflected in the legislative history of the NWPA, section 114(f)(4) was “intended to avoid the duplication caused as a result of the applicability of NEPA to the actions of both the Secretary [of Energy] and the Commission regarding the preparation of an environmental impact statement.” H.R. REP. No. 97-785, pt. 1 at 69 (1982). The statute provides that:

Any environmental impact statement prepared in connection with a repository proposed to be constructed by the Secretary under this part shall, *to the extent practicable, be adopted by the Commission* in connection with the issuance by the Commission of a construction authorization and license for such repository.

42 U.S.C. § 10134(f)(4) (emphasis added). Section 114(f)(4) further provides that to the extent NRC adopts any such DOE EIS, that adoption satisfies NRC's NEPA responsibilities and “no further consideration shall be required” under NEPA.

On September 8, 2008, the NRC Staff concluded, pursuant to section 114(f)(4) of the NWPA that it is practicable to adopt, with some further supplementation, the 2002 Repository

FEIS, as well as the *Final Supplemental Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Waste at Yucca Mountain, Nye County, Nevada* June 2008 (Repository SEIS) and the *Final Supplemental Environmental Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada-Nevada Rail Transportation Corridor* June 2008 (Rail Corridor SEIS).<sup>5</sup>

In particular, in its Adoption Report, the NRC Staff determined that the proposed action described in the FEIS, Repository SEIS, and the Rail Corridor SEIS, with the exception described below, met NRC completeness and adequacy requirements in 10 C.F.R. § 51.91 and in 10 C.F.R. Part 51, Subpart A, Appendix A and was generally consistent with NRC's NEPA guidance in NUREG 1748. U.S. Nuclear Regulatory Commission Staff's Adoption Determination Report for the U.S. Department of Energy's Environmental Impact Statements for the Proposed Geologic Repository at Yucca Mountain, September 5, 2008, *available at* ADAMS Accession No. ML082420342 (Adoption Report). The NRC Staff determined that supplementation was warranted to address certain additional repository-related impacts on

---

<sup>5</sup> On April 8, 2004, DOE issued a Record of Decision (ROD) announcing its selection, both nationally and in the State of Nevada, of the mostly rail scenario as the primary means of transporting spent nuclear fuel and high-level radioactive waste to the repository. *See Record of Decision on Mode of Transportation and Nevada Rail Corridor for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye, County, NV*; 69 Fed. Reg. 18,557, April 8, 2004. In the same ROD, DOE also selected the Caliente rail corridor as the corridor in which to study possible alignments for a rail line to connect the repository site at Yucca Mountain to an existing rail line in the State of Nevada. Subsequently, in July 2008, DOE issued the Repository SEIS, the Nevada Rail Corridor SEIS, and the *Final Environmental Impact Statement for a Rail Alignment for the Construction and Operation of a Railroad in Nevada to a Geologic Repository at Yucca Mountain, Nye County, Nevada* (Rail Alignment EIS). On October 10, 2008, DOE issued a ROD announcing its decisions to construct and operate a railroad along a rail alignment within the Caliente corridor and to allow shipments of general freight on the rail line. *See Record of Decision and Floodplain Statement of Findings-Nevada Rail Alignment for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, NV*, 73 Fed. Reg. 60,247 (Oct. 10, 2008).

groundwater, or from surface discharges of groundwater, and requested that DOE prepare a plan for the preparation of a supplement. Adoption Report at ES-1, 3-15.

On October 3, 2008, DOE provided its Notification of Plan for Supplementing the FEIS, and on October 24, 2008, DOE issued a Notice of Intent to prepare the requested supplement. Notice of Intent to Supplement to the Environmental Impact Statements for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-Level Radioactive Waste at Yucca Mountain, Nye County, Nevada, 73 Fed. Reg. 63,463 (Oct. 24, 2008).

**E. Commencement of the NRC Staff's Technical Review and the Hearing Process**

The NRC formally accepted the Application as sufficiently complete to perform its detailed technical review, and docketed the Application under 10 C.F.R. Part 63 on September 8, 2008. On October 22, 2008, the NRC published in the *Federal Register* a notice that the NRC will hold a hearing on the Application and that interested persons must file a petition for leave to intervene pursuant to 10 C.F.R. § 2.309, including contentions that satisfy the admissibility standards in § 2.309, no later than 60 days after the date of publication of the notice. *See* Hearing Notice, 73 Fed. Reg. at 63,029. The matters of fact and law to be considered are whether DOE's Application satisfies the applicable safety, security, and technical standards of the Atomic Energy Act of 1954, as amended (AEA), the NWPA, the NRC's standards in 10 C.F.R. Part 63 for a construction authorization for a high-level waste geologic repository, and also whether the applicable requirements of NEPA and the NRC's NEPA regulations, 10 C.F.R. Part 51, have been met. Specifically, under 10 C.F.R. § 63.31, after review and consideration of DOE's application, the NRC may authorize construction of a geologic repository operations area (GROA) at Yucca Mountain if it determines: (1) there is reasonable assurance that the types and amounts of radioactive materials described in the application can be received and processed

in the GROA without unreasonable risk to the health and safety of the public; and (2) there is reasonable expectation that the material can be disposed of without such unreasonable risk.

As noted above, on December 19, 2008, Nevada submitted its Petition, to which DOE herein responds. As discussed in Section I above, the three prerequisites to participation as a party to this proceeding are: (1) a showing that Nevada is in “substantial and timely compliance” (see 10 C.F.R. § 2.1012) with the LSN requirements imposed by 10 C.F.R. § 2.1003(d); (2) a demonstration of legal standing; and (3) the submission of at least one admissible contention. Section III below addresses Nevada’s LSN compliance. Section IV addresses Nevada’s legal standing. Finally, Section V addresses the admissibility of Nevada’s proffered contentions.

### III. COMPLIANCE WITH LSN REQUIREMENTS

As a threshold matter, a petitioner seeking to participate in the licensing proceeding must demonstrate that it is in compliance with the NRC’s LSN requirements.<sup>6</sup> Specifically, 10 C.F.R. § 2.1012(b)(1) states that:

---

<sup>6</sup> 10 C.F.R. § 2.1003 (a) requires that “each other potential party, interested governmental participant or party shall make available [on the LSN] no later than ninety days after the DOE certification of compliance under 2.1009(b) – an electronic file including bibliographic header for all documentary material . . . generated by, or at the direction of, or acquired by, a potential party, interested governmental participant or party.”

Each potential party, interested governmental participant or party is required thereafter to “continue to supplement its documentary material made available to the other participants via the LSN with any additional material created after the time of initial certification in accordance with [§ 2.1003(a)] until the discovery period in the proceeding has concluded.” 10 C.F.R. § 2.1003(e).

10 C.F.R. § 2.1009 prescribes the following additional LSN requirements:

- (a) Each potential party, interested government participant, or party shall –
  - (1) Designate an official who will be responsible for the administration of its responsibility to provide electronic files of documentary material;
  - (2) Establish procedures to implement the requirements of § 2.1003;
  - (3) Provide training to its staff on the procedures for implementation of the responsibility to provide electronic files of documentary material;
  - (4) Ensure that all documents carry the submitter’s unique identification number;
  - (5) Cooperate with the advisory review process established by the NRC under § 2.1011(d).
- (b) The responsible official designated under paragraph (a)(1) of this section shall certify to the [PAPO] that the procedures [specified above] have been implemented and that . . .the documentary material specified

A person, including a potential party given access to the [LSN] under this subpart, may not be granted party status under [10 C.F.R.] § 2.309 or status as an interested governmental participant under [10 C.F.R.] § 2.315, if it cannot *demonstrate substantial and timely compliance* with the requirements of [10 C.F.R.] § 2.1003 at the time it requests participation in the HLW licensing proceeding under § 2.309 or § 2.315.

Emphasis added.

Section 2.1012(c) additionally provides that the “Presiding Officer *shall not* make a finding of substantial and timely compliance pursuant to paragraph (b) of this section for any person who is not in compliance with all applicable orders of the [PAPO Board].” 10 C.F.R. § 2.1012(c) (emphasis added).<sup>7</sup>

Further, 10 C.F.R. § 2.309(a) states that, in ruling on a petition to intervene in this proceeding, the presiding officer shall consider “any failure of the petitioner to participate as a potential party in the pre-license application phase” governed by 10 C.F.R. Part 2, Subpart J.<sup>8</sup>

---

in § 2.1003 has been identified and made electronically available. The initial certification must be made [within 90 days of the DOE certification of compliance].

Each potential party also is “responsible for obtaining the computer system necessary to comply with the requirements for electronic document production and service.” 10 C.F.R. § 2.1011(b)(1).

<sup>7</sup> The PAPO Board has issued a series of Case Management Orders that impose certain requirements regarding privilege claims for documentary material on the LSN. One of those orders also requires each participant to supplement its LSN production each month with newly created or discovered documentary material, and to file a certification with the PAPO Board when the monthly supplement is made. Revised Second Case Management Order § VI(A) (July 6, 2007).

<sup>8</sup> Compliance with LSN requirements is crucial to the efficient conduct of this proceeding, insofar as the LSN is designed to enable “the comprehensive and early review of the millions of pages of relevant licensing material by the potential parties to the proceeding, so as to permit the earlier submission of better focused contentions resulting in a substantial saving of time during the proceeding.” Final Rule, Submission and Management of Records and Documents Related to the Licensing of a Geologic Repository for the Disposal of High-Level Radioactive Waste, 54 Fed. Reg. 14,925, 14,926 (Apr. 14, 1989) (amending hearing rules for adjudication on application for a license to receive and possess HLW and establishing basic LSN procedures) (Final Rule, Documents Related to the Licensing of Geologic Repository). It also is intended to facilitate the sharing of information between DOE, the NRC Staff, and the admitted parties throughout the licensing process. *See* Final Rule, Licensing Proceeding for a High-Level Radioactive Waste Geologic Repository: Licensing Support Network, Submissions to the Electronic Docket, 69 Fed. Reg. 32,836, 32,840 (June 14, 2004) (“[A]n LSN participant does have an obligation to maintain its existing LSN collection intact and available for the balance of the construction authorization proceeding.”) (Final Rule, LSN, Submissions to the Electronic Docket).

The Board should deny Nevada's Petition because Nevada has not demonstrated that it is in substantial and timely compliance with the foregoing requirements. Nevada asserts that it has substantially and timely complied (Petition at 3-4), but its assertion is wholly conclusory. Nevada provides no factual support, by affidavit or otherwise, to substantiate its assertion and demonstrate that it has complied with Subpart J and the PAPO Board's orders.

Nevada's conclusory assertion is inadequate. Although a "potential party" in the pre-license application phase was required only to "certify" its good-faith compliance with LSN requirements, a "petitioner" is to be denied party status if it fails to "demonstrate" its substantial and timely compliance. The burden thus is on Nevada at this stage of the proceeding to demonstrate that it is in compliance. As the PAPO Board held, 10 C.F.R. § 2.1012(b)(1) "operates to deny a person party status *unless it shows* substantial and timely compliance with the requirements of § 2.1003." *U.S. Dep't of Energy* (High-Level Waste Repository: Pre-Application Matters), LBP-04-20, 60 NRC 300, 315 n.28 (2004) (emphasis added).

Nevada's conclusory assertion that it has complied fails to carry that burden. The record of Nevada's LSN production raises genuine and material doubt that Nevada has made a substantial, good-faith effort to identify and make available all three classes of documentary material, and prevents reliance on Nevada's unsubstantiated assertion of compliance as the basis to find that Nevada has complied, for the following reasons.

**1. Supporting Documentary Material.** Nevada's proposed contentions are replete with references to allegedly supporting information for which Nevada has neither provided a LSN accession number nor attached copies to its Petition, as required by the Advisory PAPO Board's Case Management Order. These instances are identified in DOE's individual responses to specific contentions, but the following examples are illustrative:

- NEV-SAFETY-85 relies on alleged results of “numerous tests made by laboratories engaged in testing of titanium for corrosion applications.” Petition at 461. Nevada does not cite or attach the referenced data.
- NEV-SAFETY-91 states that “it is known that the [nitrate/chloride] ratio does not exert the control DOE claims under the conditions of low pH that commonly occur during unsaturated zone dripping and evaporation.” Petition at 496. Nevada does not cite or attach data to support this assertion.
- NEV-SAFETY 114 alleges that “the general concentration of sorbing minerals in the Calico Hills formation is far greater than what might be found in welded tuff fracture networks.” Petition at 607. Nevada does not cite or attach the referenced data.

Such information referenced in Nevada’s contentions clearly qualifies as documentary material, and Nevada’s failure to provide a citation or otherwise attach it raises a serious question whether Nevada has made available all supporting information in its possession (including the possession of its experts and consultants). Nevada’s conclusory assertion of compliance fails to address these omissions and thus fails to demonstrate that Nevada has made available all its supporting documentary material.

**2. Non-Supporting Documentary Material.** The record likewise raises genuine and material doubt whether Nevada has identified and made available all non-supporting information in its possession. In particular, it appears that Nevada either did not review its documents to identify non-supporting information following submittal of the LA or used an unduly restrictive standard for identifying non-supporting information, or both. The PAPO Board’s order denying DOE’s motion to strike Nevada’s initial LSN certification in January, 2008 provides the context for this issue.

In denying DOE's motion, the PAPO Board accepted Nevada's argument that it was not required to identify and make available its non-supporting documentary material at the time of its initial LSN certification. Nevada was not required to make its non-supporting information available at that time, the PAPO Board reasoned, because Nevada did not yet have access to the LA. According to the PAPO Board, the existence of non-supporting information is dependent on the potential party's intended positions in the licensing proceeding, and since Nevada was not required to have positions until after the LA was submitted, Nevada had no obligation to identify non-supporting information when it made its initial LSN certification. *U.S. Dep't of Energy* (High Level Waste Repository: Pre-Application Matters), LBP-08-05, 67 NRC 205, 212-16 (2008), *aff'd*, CLI-08-22 (2008).

Indeed, Nevada maintained before the PAPO Board that it had been unable to form intended positions because of its alleged lack of access to DOE's information. Nevada stated that DOE's actions had made "framing focused or meaningful contentions impossible." State of Nevada's Response to DOE's Motion to Strike Nevada's LSN Certification (February 8, 2008) [Nevada Response] at 21. Nevada claimed that, as a result, the formulation of its contentions at the time of its initial LSN certification was "embryonic" (*id.* at 20) and that it did not have "a *single* final contention" at that time. *Id.* at 19 (emphasis in original).

In accepting Nevada's position, however, the PAPO Board made clear that Nevada would have the ability--and the concomitant obligation--to identify and make available all its non-supporting information after the LA was filed. That would require Nevada to review the documents in its possession following submittal of the LA and make available all of those documents with non-supporting information in light of its intended contentions. As the PAPO Board held:

Such material [*i.e.*, Nevada’s non-supporting information] will first exist only after the application is filed and then docketed. At that point, Nevada’s obligation to file contentions addressed to the application will surface. With it will arise the need to make publicly available any documentary material in its possession that either supports or counters such contentions as, upon review of the license application, Nevada deems warranted in light of its position in the proceeding reflected by its filed contentions.

*Dep’t of Energy*, 67 NRC at 213.

The need for this subsequent review and production was especially urgent because Nevada’s procedures and training prior to initial certification were facially inadequate to capture all of its non-supporting information. Nevada’s document production was anchored by two “Call Memos”--a short one in 2004 and a more extensive and substantive one in June 2007 that was “the centerpiece of Nevada’s document collection and production effort.” *Id.* at 217 (Karlin, dissenting). The June 2007 Call Memo, however, is “riddled with errors in its interpretation of Non-supporting [documentary material]” that “serve to omit and categorically exclude Non-supporting [documentary material].” *Id.* at 217. Those errors include:

- Use of an overly narrow “relevance standard” that improperly limits the scope of the information that qualifies as non-supporting documentary material.
- Use of a definition of non-supporting documentary material that omits an alternative formulation provided in the regulatory definition and thus further limits improperly the scope of information that qualifies as non-supporting documentary material.
- Use of a “decision tree” with examples that erroneously conclude that documents do not contain non-supporting information and that allow documents to be excluded from the LSN without proper consideration.

*Id.* at 217.<sup>9</sup>

The training that Nevada provided prior to its initial certification exacerbated those deficiencies. Nevada maintained before the PAPO Board that it supplemented the Call Memos with oral instruction about Nevada's LSN obligations, but by Nevada's own concession in its response and accompanying affidavits, that instruction focused on the identification of supporting information only. It did not address the identification and production of non-supporting information. As Judge Karlin recounts:

Nevada declares that its expert consultants were repeatedly cautioned that "anything they might possibly eventually *rely on* in forming opinions or writing reports or testifying in connection with the licensing proceeding must be on the LSN." Response, Charles J. Fitzpatrick Decl. ¶ 12 [Fitpatrick Decl.] (emphasis added). Likewise, Ms. Lynch speaks only of [documentary material] that Nevada's experts might "*rely on*." Lynch Decl. ¶ 6 (emphasis added). Nevada's Response alleges that it repeatedly instructed its experts to gather and produce "anything which they might possibly eventually *rely upon*." Response at 6.

Conspicuously absent from Nevada's Response and declarations is any suggestion that it gathered and produced Non-supporting [documentary material]. Nevada's counsel acknowledged that his declaration did not address non-supporting [documentary material].

*Id.* at 217.

Therefore, in order to comply with Subpart J and the PAPO Board order denying DOE's Motion to Strike, Nevada was required to review the documents in its possession (including those in the possession of its experts and consultants) following submittal of the LA. Nevada was required to review those documents using the proper standard for non-supporting

---

<sup>9</sup> Although these deficiencies were detailed in a dissenting opinion, the other members of the PAPO Board did not disagree with these criticisms of the June 2007 Call Memo. Further, these deficiencies are apparent on the face of the June 2007 Call Memo.

documentary material, and it was required to make available on the LSN all such documents that meet that standard. It is apparent for three reasons, however, that Nevada did not do that.

First, Nevada's Call Memos do not provide for any such review. The Call Memos do not direct Nevada's experts, consultants and staff to conduct a review of their documents following submittal of the LA and to identify all documents that qualify as non-supporting documentary material. Rather, the Call Memos instructed their recipients to make productions in 2004 and 2007 and are silent about any additional review of existing documents after the LA is submitted and as Nevada develops its contentions.<sup>10</sup>

Second, Nevada did not state in its Petition that it performed such a review following submittal of the LA. Nor did Nevada state that it had corrected the deficiencies in the June 2007 Call Memo to ensure that its production was compliant.

Third, Nevada's production of documents on the LSN since its initial certification belies any reasonable possibility that Nevada undertook a substantial, good-faith effort to identify and make available all non-supporting information after submittal of the LA. A review of the documents Nevada has added to the LSN since its initial certification demonstrates this in several respects:

- Nevada has added approximately 573 documents to its LSN collection since its initial certification (less than 500 of which were added after the LA was submitted).<sup>11</sup> That is

---

<sup>10</sup> Copies of the two Call Memos are Exhibits G and H to The Department of Energy's Motion to Strike the January 17, 2008 Licensing Support Network Certification by the State of Nevada (January 28, 2008). Also instructive is a 2008 memorandum to Nevada's experts regarding preparation of contentions. The memorandum is silent about the obligation to review documents to identify non-supporting information as they prepare contentions. LSN participant accession # NEV0004601, April 18, 2008 External Memorandum from M.C. Thorne to Technical Experts.

<sup>11</sup> Nevada's LSN collection contains two series of participant accession numbers. As of January, 2008, when Nevada made its initial certification, one series went up to at least NEV0004544 and the other went up to at least NEV5000244. As of December, 2008, those series ended with NEV0005028 and NEV5000335. There are gaps in the series of participant accession numbers assigned to Nevada's post-certification production, and

an extraordinarily small number of documents considering that Nevada has been acquiring information regarding the Yucca Mountain repository since 1985 and has had for several years a team of more than 40 experts and consultants on a wide array of scientific and technical disciplines who have been preparing for the licensing proceeding. *Dep't of Energy*, 67 NRC at 217 (Karlin, dissenting). Even assuming that all 573 documents are non-supporting documentary material--a proposition that is not credible as discussed below--it strains credulity that a substantial, good-faith effort to identify non-supporting information would have identified so few documents from among two decades of information.<sup>12</sup>

- It appears that Nevada added few, if any, of the 573 documents in its post-certification production because they contain non-supporting information. Rather, Nevada's supplemental production consists largely of documents with information that Nevada believes supports its contentions, such as (1) articles that Nevada cites in its Petition;<sup>13</sup> (2) reports that Nevada cites in its Petition;<sup>14</sup> (3) charts, graphs and other data files from corrosion tests and soil and rock samples that Nevada relies on in its Petition;<sup>15</sup> (4)

---

when those gaps are taken into account, the number of documents Nevada with new participant accession numbers that Nevada added to the LSN since January, 2008 does not exceed 573. Some of these documents appear to be duplicates of documents that other participants have made available on the LSN. The number of unique documents that Nevada added to the LSN since its initial certification, therefore, is less than 573.

<sup>12</sup> Nevada has maintained that its experts' work regarding Yucca Mountain before 2001 was performed for a purpose other than for use in the licensing proceeding. Nevada Response at 2. That distinction is irrelevant. The definition of documentary material in 10 C.F.R. § 2.1001 does not depend on the purpose for which the information was generated or acquired. If information in the possession of Nevada and its experts and consultants does not support Nevada's contentions, Nevada is required to make it available on the LSN regardless of why Nevada and its experts and consultants obtained it.

<sup>13</sup> Nevada's supplemental production contains at least 83 documents that are published articles.

<sup>14</sup> Nevada's supplemental production contains at least 193 documents that Nevada characterizes as reports in their bibliographic headers.

<sup>15</sup> At least 130 of the documents in Nevada's supplemental production are charts, graphs and photographs generated in connection with the corrosion experiments that Nevada commissioned at the Institute of Metals

documents by Nevada's transportation expert, Robert Halstead, that repeat his views about transportation issues discussed in Nevada's Petition;<sup>16</sup> and (5) Nevada's public comments on various regulatory documents prepared by DOE.<sup>17</sup> That Nevada's supplemental production largely consists of these kinds of documents further suggests that Nevada did not undertake to review the documents in its possession following LA submittal to identify non-supporting documentary material.

- Nevada's supplemental production is largely devoid of documents such as emails and internal memoranda by its experts and consultants that are likely sources of non-supporting documentary material. In fact, Nevada's supplemental production appears to contain only 19 internal memoranda from its experts, most of which Nevada cites in its Petition and therefore presumably are not non-supporting information. Moreover, Nevada's entire supplemental production contains a single email. It is a 2008 email from a Nevada contractor regarding the Caliente rail line. LSN participant accession # NEV0004981, email from R. Moore to R. Halstead (January 2, 2008).<sup>18</sup>

The production of only 1 additional email raises a significant concern that Nevada has failed to review emailed documentation or documentary material. As the PAPO Board held in ordering DOE to complete the review of 10 million of its emails, emails "might very well be of the most importance to persons who may want to question or to challenge" an adversary's

---

Research in China, and on which Nevada relies in its proposed contentions. Another 18 documents are graphic files generated in connection with other tests or experiments commissioned by Nevada.

<sup>16</sup> At least 19 of the documents in Nevada's supplemental production are presentations or reports by Halstead regarding transportation issues.

<sup>17</sup> *E.g.*, LSN participant accession # NEV0005005, State of Nevada Agency for Nuclear Projects Comments on the 2/23/2007 Outline for OCRWM's National Transportation Plan.

<sup>18</sup> One of Nevada's documents, LSN participant accession # NEV5000293, includes a January 6, 2003 email from Chuck Marks to Aaron Barkatt. That email is a duplicate of an email that was in Nevada's original production at LSN participant accession # NEV5000105.

position. *U.S. Dep't of Energy* (High Level Waste Repository: Pre-Application Matters), LBP-04-20, 60 NRC 300, 323 (August 31, 2004). Yet, Nevada's original LSN production included "fewer than 114 emails from its multi-year, multi-disciplinary, multi-million dollar effort." *Dep't of Energy*, 67 NRC at 217 (Karlin, dissenting). Those emails basically were provided by only one of Nevada's many experts, consultants, and staff who have worked on Yucca Mountain over the past two decades. *Id.*

A substantial, good-faith effort to identify non-supporting documentary material, therefore, would have included a review of the emails authored by Nevada's experts, consultants and staff in light of Nevada's now developed positions to augment the paucity Nevada originally produced. It is obvious from Nevada's production of only 1 additional email since its initial certification, however, that Nevada did not conduct such a review following its receipt of the LA and as it formulated its positions.<sup>19</sup>

- Nevada's supplemental production is largely devoid of documents authored by its experts who vouch for the State's proposed contentions.<sup>20</sup> In fact, four of those experts are not

---

<sup>19</sup> The emails that Nevada had to review date back to at least 2004. Nevada's 2004 Call Memo states that Nevada instructed its experts and consultants starting in December, 2003 to retain all their Yucca Mountain related emails. DOE Motion to Strike, Exhibit G, at 2. Moreover, the Yucca Mountain-related activities of the Nevada Agency for Nuclear Projects and many of Nevada's experts date back to the 1980s. Nevada was obligated by at least 2004 to preserve any earlier emails related to those efforts, as by Nevada's own admission it reasonably anticipated litigation by that date. Nevada should thus have preserved a body of emails that pre-date 2004 that it was required to review as well following submittal of the LA. If Nevada did not in preserve these documents, it would not be in substantial and timely compliance for this reason as well.

<sup>20</sup> The following Nevada experts who provided affidavits as part of Nevada's petition have no documents of any kind in Nevada's supplemental production: Adrian H. Bath; Allen Messenger; Brenda J. Little; Doug F. Hambley; Hugh Horstman; Howard S. Wheeler; Jonathan Overpeck; Robert A. Cottis; Richard E. Chandler; and James McMaster. The following Nevada experts have only 1 or 2 documents in Nevada's supplemental production: Adrian P. Butler; Lawrence Phillips; Stephan Matthäi; Maurice E. Morgenstein; and, Steven A. Frishman.

shown as recipients of the Call Memos, raising the question whether they even were asked to review and produce their documents.<sup>21</sup>

In sum, it appears that Nevada did not make a substantial, good-faith effort to identify all non-supporting information in the possession of its experts, consultants and staff. Nevada's production after its initial certification augmented (in a limited way) its supporting information, but that was all. It appears that Nevada did not perform the review required by the PAPO Board's order to identify all its non-supporting information.

A petitioner party cannot demonstrate that it is in substantial and timely compliance if it has not properly looked for all its documentary material. That principle was made clear when Nevada successfully struck DOE's LSN certification in 2004.

Nevada argued, and the PAPO Board agreed, that DOE was not compliant at that time because it had not completed its review of emails and other documents. The PAPO Board did not require Nevada to identify specific emails and other documents that DOE should have made available but did not. Rather, the PAPO Board held that DOE's production effort could not be considered reasonable if it had not performed a proper collection and review effort. *Dep't of Energy*, 60 NRC at 321-26.

That is the situation here. Nevada has not made a proper effort to collect and review its documents. Accordingly, the Board cannot find for that reason alone that Nevada has substantially and timely complied with its LSN obligations.

**3. Reports and Studies.** Nevada's conclusory assertion of compliance also cannot be accepted with respect to Nevada's obligation to make available reports and studies. This is demonstrated by Nevada's prior assertions of compliance which were demonstrably unreliable.

---

<sup>21</sup> Those four experts are: Doug F. Hambley; James A. McMaster; Robert A. Cottis; and, Richard E. Chander.

Nevada previously certified as part of its initial LSN certification in January, 2008 that it had made available all extant reports and studies on the LSN. However, Nevada's subsequent production includes at least 75 documents that pre-date 2008 and that Nevada itself characterizes in their bibliographic headers as reports by its experts and consultants. Most of these documents are several years old, many dating back into the 1980s. *E.g.*, LSN participant accession # NEV0004822, July Report of Yucca Mountain Paleoenvironments Project (August 1, 1988).

A potential party's obligation to make reports and studies available on the LSN is not dependent on a reliance criterion. *U.S. Dep't of Energy* (High Level Waste Repository: Pre-Application Matters), CLI-06-5, 63 NRC 143, 152-53 (2006). Thus, Nevada could not have withheld these reports from the LSN at the time of its initial LSN certification on the ground that it had not yet formed its intended positions. Nevada's Petition does not explain why Nevada produced these reports after its certifications.

Indeed, it appears that Nevada's production of reports and studies is still incomplete. For example, Professor Eugene Smith of the University of Nevada, Las Vegas, is one of Nevada's principal experts, adopting nine of Nevada's proposed contentions in the area of geology and volcanism. As reflected in his curriculum vitae that is attached to Nevada's Petition, Professor Smith has conducted research for the Nevada Agency for Nuclear Projects since 1985. Smith C.V. at 4 (identifying various grants from the Nevada Agency for Nuclear Projects) and 5 (identifying as current research volcanic hazard studies related to placing a nuclear waste repository at Yucca Mountain). Reflecting his extensive research in this area, Professor Smith's curriculum vitae states that he has prepared "over 300 reports" to the Nevada Nuclear Project Office, U.S. Navy's Geothermal Project Office and the Bureau of Land Management. *Id.* at 27. That is in addition to the numerous published reports identified in his curriculum vitae.

Nevada's LSN collection does not contain reports from Professor Smith covering the years that he performed work for Nevada from 2005. The last report from Professor Smith to the Nevada Agency for Nuclear Projects that Nevada has made available is from 2005. Yet, both Nevada and Professor Smith have stated that his work for Nevada continued into at least 2007.<sup>22</sup>

The documents concerning Professor Terry Plank provide another example. Professor Plank began to work on Yucca Mountain-related projects for Nevada in 2005. *See* LSN participant accession # NEV0002916, Geoscience Consultants Progress Report (April 30, 2005) at 1. Nevada's LSN collection contains only three documents from Professor Plank--progress reports for January, February, and March, 2008--which Nevada cites in its Petition.<sup>23</sup> It is clear from the context of those reports that they are interim reports, and that other reports precede and follow the three Nevada has provided. Nevada, however, appears to have selectively made available only three of Professor Plank's reports because Nevada cites those in its Petition.

It thus appears that Nevada's production reflects a fundamental misunderstanding of a potential party's obligation to make available reports and studies. Nevada appears to have limited its production of recent reports to those it intends to cite or rely on in the licensing proceeding. That is unduly restrictive, as Nevada was required to make available all reports and studies by its experts, regardless of whether those reports and studies have supporting or non-supporting information.

---

<sup>22</sup> Nevada did make available a report from Dr. Smith, dated November, 2008, that was prepared pursuant to a contract with Clark County. LSN participant accession # NEV0004948. Nevada has not made available, however, any reports from Dr. Smith for work he performed for Nevada since 2005.

<sup>23</sup> Yucca Mountain Project Terry Plank Lamont-Doherty Earth Observatory, Report on Activities from December 26, 2007 - January 26, 2008 (LSN participant accession # NEV5000331); Yucca Mountain Project Terry Plank Lamont-Doherty Earth Observatory, Report on Activities from January 26, 2008 - February 26, 2008 (LSN participant accession # NEV5000332); Yucca Mountain Project Terry Plank Lamont-Doherty Earth Observatory, Report on Activities from February 26, 2008 - March 27, 2008 (LSN participant accession # NEV5000333).

For all these reasons, the Board cannot find that Nevada has demonstrated timely and substantial compliance with its LSN obligations. Nevada’s conclusory assertion in its Petition cannot satisfy Nevada’s burden in light of the record concerning Nevada’s LSN collection.<sup>24</sup>

#### **IV. LEGAL STANDING**

Because the Commission has stated that it will “permit intervention by the State of [Nevada]” as long as “the contention requirements in 10 CFR 2.309(f) are satisfied with respect to at least one contention” Hearing Notice, 73 Fed. Reg. at 63,031, DOE has no objection to Nevada’s legal standing.

#### **V. ADMISSIBILITY OF CONTENTIONS**

##### **A. Applicable Legal Standards and Relevant NRC Precedent**

##### **1. Petitioner Must Submit at Least One Admissible Contention to be Admitted as a Party**

To be admitted as a party in the Yucca Mountain licensing proceeding, a petitioner must proffer at least one admissible contention. *See* 10 C.F.R. §§ 2.309(a), 2.309 (d)(2)(iii). The NRC will deny a petition to intervene from a petitioner who has complied with the LSN requirements and has demonstrated standing to intervene, but who has not proffered at least one admissible contention. *See generally Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), CLI-01-17, 54 NRC 3, 5 (2001). As the Commission has observed, “[i]t is the responsibility of the Petitioner to provide the necessary information to satisfy the basis

---

<sup>24</sup> 10 C.F.R. § 2.1012(b)(1) is clear that a potential party “may not be granted” party status or participate under 10 C.F.R. § 2.315(c) if it cannot demonstrate substantial and timely compliance “at the time it requests participation.” 10 C.F.R. § 2.1012(b)(2) makes clear that the time to cure any such failure to meet LSN requirements is *after* party status or the right to participate has been “denied,” and not in any such Reply.

As discussed in Section I. above, Nevada may not “cure” this or any other defect in its Petition in its Reply pursuant to 10 C.F.R. § 2.309(h)(2).

requirement for the admission of its contentions and demonstrate that a genuine dispute exists within the scope of this proceeding.” *Baltimore Gas & Elec. Co.* (Calvert Cliffs Nuclear Power Plant, Units 1 and 2), CLI-98-14, 48 NRC 39, 41 (1998). “A contention’s proponent, not the licensing board, is responsible for formulating the contention and providing the necessary information to satisfy the basis requirement for the admission of contentions.” *Statement of Policy on Conduct of Adjudicatory Proceedings*, CLI-98-12, 48 NRC 18, 22 (1998). Finally, “government entities seeking to litigate their own contentions are held to the same pleading rules as everyone else.” *Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-05-24, 62 NRC 551, 568 (2005).

**2. Petitioner in this Proceeding Has a Heightened Obligation to Proffer Well Pled and Adequately Supported Contentions Given the Availability of the LSN**

As the Commission has noted, this proceeding involves a number of “unique facts and circumstances” – one of those being the development of the LSN as a substitute for traditional document discovery. In developing this system, the NRC sought both to streamline the discovery process *and* to facilitate submittal of well-pled contentions:

Another efficiency the [LSN] provides is reducing the effort consumed in carrying out document discovery and allowing more effort to be spent in case preparation. Because access to these documents is provided *before* the application is docketed, each party can focus on formulating meaningful contentions before the licensing hearing begins. *There should be no excuse for poorly crafted contentions, and the licensing board can reduce hearing delays by readily rejecting or otherwise disposing of unfocused or unsupported contentions.* Likewise, the [LSN] rule places tighter restrictions on amending or adding contentions late in the hearing processes because the [LSN] affords the parties an opportunity to raise and resolve issues earlier than what traditionally has been possible.

SECY-95-153, Memorandum from James M. Taylor, Executive Director of Operations, to the Commissioners, “Licensing Support System Senior Management Team Recommendations on Direction of the Licensing Support System,” June 14, 1995, *available at* LEGACY ADAMS Accession No. 9506280652 (emphasis added).

In issuing the final LSN rule nearly a decade later, the Commission noted that “the history of the LSN and its predecessor . . . makes it apparent it was the Commission’s expectation that the LSN, among other things, would provide potential participants with the opportunity to frame focused and meaningful contentions” and avoid potential discovery-related delays. Final Rule, LSN, Submissions to the Electronic Docket, 69 Fed. Reg. at 32,843. The Commission added that “[t]hese objectives are still operational.” *Id.* In fact, in a recent adjudicatory order related to this proceeding, the Commission reaffirmed these objectives:

The use of the LSN was intended, among other things, to “enabl[e] the comprehensive and early review of the millions of pages of relevant licensing material by the potential parties to the proceeding, so as to permit the earlier submission of better focused contentions resulting in a substantial saving of time during the proceeding.”

*U.S. Dep’t of Energy* (High-Level Waste Repository: Pre-Application Matters), CLI-08-12, 67 NRC \_\_ (slip op. at 8) (June 17, 2008).

And in fact, DOE’s production of documentary material on the LSN fulfilled those objectives. DOE first made documentary material available on the LSN in 2004, when it publicly released approximately 1.3 million documents. Transcript of Record at 540, *U.S. Dep’t of Energy* (High-Level Waste Repository: Pre-Application Matters), ASLBP No. 04-8239-01-PAPO (July 12, 2005). DOE made another 2.1 million documents publicly available on the LSN in April, 2007—more than a year before it submitted the LA. Policy Issue Information Memorandum, SECY-07-0130, August 7, 2007, *available at* ADAMS No. ML071930440 at 5.

DOE regularly added documents to the LSN each month thereafter, and in October, 2007, DOE certified that all its extant documentary material was available on the LSN. The Department of Energy submitted its Certification of Compliance on October 19, 2007. DOE has since then updated its LSN production each month with new documentary material that it has generated, received, or identified. *See, e.g.*, The Department of Energy’s Certification of Licensing Support Network Supplementation (November 1, 2007); *see also* Revised Second Case Management Order, ASLBP No. 04-829-01-PAPO (July 6, 2007) at 21 (requiring monthly supplemental production on LSN of documentary material created or discovered after party’s initial LSN certification).

Altogether, DOE has made more than 3.5 million documents available on the LSN. *U.S. Dep’t of Energy* (High-Level Waste Repository: Pre-Application Matters), LBP-08-01, 67 NRC \_\_ (slip op. at 11) (January 4, 2008) (stating that “it is not disputed that DOE has made available a massive amount of documentary material—3.5 million documents, amounting to over 30 million pages, including redacted versions of some privileged documents and privilege logs for hundreds of others”). That production includes documents that DOE cites and relies upon in the LA. It includes extensive underlying calculations, data, and other material on which those documents are based. Further, as required by regulation, it also includes documents with information that does not support the information DOE intends to cite or rely upon in the licensing proceeding. 10 C.F.R. § 2.1001 (definition of “documentary material”).

DOE’s extensive production substantially heightens Nevada’s ability—and *its corresponding obligation*—to proffer focused and adequately supported contentions in this proceeding. As the Commission observed in rejecting a challenge to DOE’s initial LSN certification, “potential parties had access to millions of DOE documents upon which to begin

formulating meaningful contentions” during the period following that certification, as contemplated by the Commission’s regulations. *U.S. Dep’t of Energy*, CLI-08-12, 67 NRC \_\_\_ (slip op. at 9). Indeed, because of DOE’s early production of documentary material on the LSN starting four years before LA submittal, every potential party has had a greater opportunity than the regulations contemplate to use those materials to develop contentions.

Nevada, in particular, has been in a position to avail itself of that documentary material to develop contentions. By its own description, “the State of Nevada, specifically the Nevada Agency for Nuclear Projects, has been engaged in a comprehensive program for monitoring, overseeing, and intervening in the federal Yucca Mountain project” for over two decades. Report and Recommendations of the Nevada Commission on Nuclear Projects (December 2006) [2006 Nev. Comm. Report] at 25 [Exhibit A to the Department of Energy’s Motion to Strike the January 17, 2008 Licensing Support Network Certification by the State of Nevada [DOE Motion to Strike] (January 28, 2008)]. The Agency has conducted “[m]ajor technical research” as part of “a sustained and concerted research effort to address key technical and scientific issues that are expected to be important to the State’s licensing intervention.” *Id.* at 25, 32. As it has acknowledged, Nevada has received \$78 million from DOE for those efforts as of 2004 (to say nothing of the State funds expended). Affidavit of Robert R. Loux (March 19, 2004) at ¶ 11 [DOE Motion to Strike, Exhibit B].

To further that effort, Nevada hired outside counsel for the licensing proceeding in 2001 and thereafter identified a group of at least 25 experts for the proceeding. Statement of Joseph R. Egan, before the House Subcommittee on the Federal Workforce and Agency Organization (April 5, 2005) [Egan Statement] at 1 [DOE Motion to Strike, Exhibit C]; Petition by the State of Nevada under Atomic Energy Act Section 274 and 10 C.F.R. § 63.63 for Financial Assistance in

the Licensing Review of the Yucca Mountain Nuclear Waste Repository (May 10, 2004) [Petition for Funds] at 6 [DOE Motion to Strike, Exhibit D]; “Nevada’s Scientific Experts,” Petition for Funds, Attachment 1 [DOE Motion to Strike, Exhibit E]. These attorneys and experts are said to have been “diligently” preparing over the past several years a “rigorous, substantive and effective” opposition to the LA. 2006 Nev. Comm. Report at 31. They have been “performing a thorough evaluation of the scientific and legal integrity of the work done by DOE and its contractors at Yucca.” Egan Statement at 1 & 3.

Nevada’s team of experts and counsel “intensified” their preparation in 2004 when DOE first made documents available on the LSN. 2006 Nev. Comm. Report at 25. That intensified effort included “assembling data and information on key technical issues that will form the basis of Nevada’s prospective challenge to any license application DOE may submit to the NRC for Yucca Mountain and undertaking new research that may be required to support the State’s licensing contentions . . . .” *Id.*

To do that, Nevada’s experts have been “combing” DOE’s LSN collection since 2004. Egan Statement at 3. In May, 2007, they reportedly divided among themselves for review the additional documents DOE made available on the LSN at that time. DOE Motion to Strike, Exhibit F at 1. One of Nevada’s experts has described a “routine,” which was suggested to Nevada’s experts by the Agency’s director of technical projects, of regularly reviewing DOE’s Analysis Model Reports as they became available. *E.g.*, DOE Motion to Strike, Exhibit O at O-54, O-56, O-58. The Analysis Model Reports are, by Nevada’s own description, “the basic building blocks” of the LA. Declaration of Mike Thorne, ¶ 3 [attached to State of Nevada’s Motion to Strike DOE’s October 19, 2007 LSN Recertification and to Suspend Certification Obligation of Others Until DOE Validly Recertifies (October 29, 2007)].

Nevada's access to this material on LSN enabled it to begin early the preparation of contentions. Indeed, Nevada advised the PAPO Board in 2005 that it was already drafting contentions. Declaration of Mike Thorne, ¶ 3 [attached to State of Nevada's Motion to Strike DOE's October 19, 2007, LSN Recertification and to Suspend Certification Obligation of Others Until DOE Validly Recertifies (October 29, 2007)].

Based on the above circumstances, Nevada must be held to a particularly heightened burden to proffer well-pled and adequately supported contentions. Nevada is a well-funded participant that has had the legal and technical resources to review DOE's documentary material to develop contentions.

**3. Proffered Contentions Must Meet All of the Contention Admissibility Requirements of 10 C.F.R. § 2.309(f)(1) as Well as the Requirements of the Applicable June 20, 2008 and September 29, 2008 Case Management Orders**

Section 2.309(f)(1) requires a petitioner to "set forth with particularity the contentions sought to be raised," and to satisfy the following six criteria: (1) provide a specific statement of the legal or factual issue sought to be raised; (2) provide a brief explanation of the basis for the contention; (3) demonstrate that the issue raised is within the scope of the proceeding; (4) demonstrate that the issue raised is material to the findings the NRC must make to support the licensing action that is the subject of the proceeding; (5) provide a concise statement of the alleged facts or expert opinions, including references to specific sources and documents that support the petitioner's position and upon which the petitioner intends to rely; and (6) provide sufficient information to show that a genuine dispute exists with regard to a material issue of law or fact. *See* 10 C.F.R. § 2.309(f)(1)(i)-(vi). *A failure to comply with any one of the six admissibility criteria is grounds for rejecting a proffered contention. See* Final Rule, Changes to

Adjudicatory Process, 69 Fed. Reg. 2182, 2221 (Jan. 14, 2004); *see also Private Fuel Storage L.L.C.*, (Independent Spent Fuel Storage Installation) CLI-99-10, 49 NRC 318, 325 (1999).

The purpose of these six criteria is to “focus litigation on concrete issues and result in a clearer and more focused record for decision.” Final Rule, Changes to Adjudicatory Process, 69 Fed. Reg. at 2202. The current contention admissibility standards are “strict by design,” *Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC 349, 358 (2001), *recons. denied*, CLI-02-1, 55 NRC 1 (2002), and were intended to “raise the threshold for the admission of contentions.” Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. 33,168 (Aug. 11, 1989); *see also Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 334 (1999). As explained above, the availability of the LSN further raises this threshold for the admission of a contention in this proceeding. In revising its Part 2 rules in 2004, the Commission reiterated that the standards are “necessary to ensure that hearings cover only genuine and pertinent issues of concern and that the issues are framed and supported concisely enough at the outset to ensure that the proceedings are effective and focused on real, concrete issues.” Final Rule, Changes to Adjudicatory Process, 69 Fed. Reg. at 2189-90 (stating that the NRC “should not have to expend resources to support the hearing process unless there is an issue that is appropriate for, and susceptible to, resolution in an NRC hearing”); *id.* at 2202.

Strict application of these contention admissibility criteria in this proceeding is critically important. The vast number of contentions submitted and the “rigorous schedule” imposed by the Appendix D to Part 2 present unprecedented challenges to the conduct of a timely, effective, and focused adjudication. Recognizing these challenges, the Advisory PAPO Board, with the Commission’s express approval, issued its Case Management Order “to help both potential

parties and licensing boards address the admissibility of contentions in any HLW proceeding effectively and efficiently.” *U.S. Dep’t of Energy* (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board), LBP-08-10, 67 NRC \_\_ (slip op. at 3) (June 20, 2008) (Case Management Order).<sup>25</sup> That Order imposes numerous format requirements for proffered contentions. Failure to adhere to these format requirements may provide an additional basis for rejection of proffered contentions should a potential party significantly and in bad faith ignore these requirements. *Id.* at 3, 5-9.

The six contention admissibility criteria set forth in 10 C.F.R. § 2.309(f)(1), and the related pleading requirements contained in the Case Management Order, are discussed further below.

**a. Petitioner Must Specifically State the Issue of Law or Fact to Be Raised**

Section 2.309(f)(1)(i), the first admissibility criterion, requires that a petitioner “provide a specific statement of the issue of law or fact to be raised or controverted,” by “articulat[ing] at the outset the specific issues [it] wish[es] to litigate as a prerequisite to gaining formal admission as [a party].” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 338. To be admissible, a contention “must explain, with specificity, particular safety or legal reasons requiring rejection of the contested [application].” *Dominion Nuclear Conn., Inc.*, CLI-01-24, 54 NRC at 359-60. Section 2.309(f)(1)(i) “bar[s] contentions where petitioners have only ‘what amounts to generalized suspicions, hoping to substantiate them later.’” *Duke Energy Corp.* (McGuire Nuclear Station, Units 1 and 2; Catawba Nuclear Station, Units 1 and 2), CLI-03-17, 58 NRC 419, 424 (2003) (quoting *Duke Energy Corp.*, CLI-99-11, 49 NRC at 337-39). Elaborating further on this

---

<sup>25</sup> A second case management order was issued. *See* Order (Regarding Contention Formatting and Tables of Contents) (unpublished) (September 29, 2008).

requirement, the June 20, 2008, Case Management Order for this proceeding requires “narrow, *single-issue* contentions” that are “sufficiently specific as to define the relevant issues for eventual rulings on the merits, and not require” extensive narrowing or clarification by the parties or boards. *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 6) (emphasis added).

In this regard, Nevada’s individual contentions typically cite and rely on certain specific portions of the LA, but then repeatedly add the phrase “and similar subsections,” without specifically identifying any of those subsections. This lack of specificity is insufficient to constitute a valid statement of the “issue of law or fact to be raised or controverted” contrary to 10 C.F.R § 2.309(f)(1). Accordingly, Nevada may not rely, in its Reply (or otherwise), on these unspecified subsections to support admission or litigation of its contentions.

**b. Petitioner Must Briefly Explain the Basis for the Contention**

Section 2.309(f)(1)(ii) requires that a petitioner provide “a brief explanation of the basis for the contention.” *See also* Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. at 33,170. This includes “sufficient foundation” to “warrant further exploration.” *Public Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-942, 32 NRC 395, 428 (1990) (footnote omitted). A petitioner’s explanation serves to define the scope of a contention, as “[t]he reach of a contention necessarily hinges upon its terms coupled with its stated bases.” *Public Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-899, 28 NRC 93, 97 (1988), *petitions denied in part, granted in part, Massachusetts. v. U.S. Nuclear Regulatory Comm’n*, 924 F.2d 311 (D.C. Cir. 1991), *cert. denied*, 502 U.S. 899 (1991). The Board, however, must determine the admissibility of the contention itself, not the admissibility of individual “bases.” *Duke Energy Corp.* (McGuire Nuclear Station, Units 1 and 2; Catawba Nuclear Station, Units 1 and 2), CLI-02-28, 56 NRC 373, 379 n.45 (2002).

**c. Petitioner Must Demonstrate that the Issue Raised in the Contention is Within the Scope of the Proceeding**

Section 2.309(f)(1)(iii) requires that a petitioner demonstrate “that the issue raised in the contention is within the scope of the proceeding.” The scope of the proceeding is defined by the Commission’s Notice of Hearing and the NRC regulations governing review and approval of the Application. *See, e.g., Duke Power Co.* (Catawba Nuclear Station, Units 1 and 2), ALAB-825, 22 NRC 785, 790-91 (1985). Contentions are necessarily limited to issues that are germane to the specific application pending before the Board. *Yankee Atomic Elec. Co.* (Yankee Nuclear Power Station), CLI-98-21, 48 NRC 185, 204 n.7 (1998). Any contention that falls outside the specified scope of this proceeding – as discussed further below – must be rejected. *See, e.g., Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-04-36, 60 NRC 631, 639 (2004).

A contention that challenges an NRC rule is outside the scope of this proceeding because, absent a waiver, “no rule or regulation of the Commission . . . is subject to attack . . . in any adjudicatory proceeding....” 10 C.F.R. § 2.335(a). This includes contentions that advocate stricter requirements than agency rules impose or that otherwise seek to litigate a generic determination established by a Commission rulemaking. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159 (2001), *aff’d on other grounds*, CLI-01-17, 54 NRC 3.

Similarly, any direct or indirect challenge to the current EPA standard or NRC implementing rule is a collateral attack and is outside the scope of the proceeding. Moreover, Nevada challenged the EPA rule in federal court and thus this proceeding is the wrong forum to raise such a challenge.

In addition, any contention that collaterally attacks applicable statutory requirements or the basic structure of the NRC regulatory process must also be rejected by the Board as outside the scope of the proceeding. *Carolina Power & Light* (Shearon Harris Nuclear Power Plant Units 1), LBP-07-11, 65 NRC 41, 57-58 (citing *Philadelphia Elec. Co.* (Peach Bottom Atomic Power Station, Units 2 and 3), ALAB-216, 8 AEC 13, 20 (1974)). Accordingly, a contention that simply states the petitioner's views about what the regulatory policy should be does not present a litigable issue. See *Philadelphia Elec. Co.*, ALAB-216, 8 AEC at 20-21, 21 n.33. Similarly, challenges to the adequacy of the NRC Staff's safety review process, including the contents of its SER, are outside the scope of this proceeding. "The NRC has not, and will not, litigate claims about the adequacy of the Staff's safety review in licensing adjudications." *AmerGen Energy Co., LLC* (License Renewal for Oyster Creek Nuclear Generating Station), CLI-08-28, 68 NRC \_\_ (slip op. at 13-14) (Nov. 6, 2008).

Nevada has proffered numerous contentions expressing that generalized "uncertainties" exist in postclosure models or data, without showing in any way, how or why those uncertainties call into question the conclusions reached by DOE, or findings NRC must make in its review of the LA. To merely assert the existence of such uncertainties, without specifying their impact on a finding NRC must make in its issuance of the construction authorization, amounts to an improper challenge to Part 63, which explicitly recognizes that such uncertainties exist and cannot be eliminated. The Commission, in the Statements of Consideration accompanying Part 63, expressly rejected requests made by several commenters to define an acceptable level of uncertainty in Part 63, finding it "neither practical nor appropriate." Final Rule, Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, NV, 66 Fed. Reg. 55,732, 55,747-748 (Nov. 2, 2001). The Commission "decided to adopt EPA's

preferred criterion of ‘reasonable expectation’ for purposes of judging compliance with the postclosure performance objectives [since] ... a standard of ‘reasonable expectation’ allows it the necessary flexibility to account for the inherently greater uncertainties in making long-term projections of a repository's performance.” *Id.* at 55,740. This flexibility encompasses consideration of the use, as appropriate, of cautious but reasonable approaches consistent with present knowledge in lieu of bounding or more conservative approaches. *See, e.g.*, 10 C.F.R. § 63.305(c).

In this regard, Nevada has made no effort to demonstrate and has not even asserted that DOE has failed to satisfy the reasonable expectation standard identified by 10 C.F.R. § 63.101 as the general standard for postclosure matters. The following examples from 10 C.F.R. § 63.101 are illustrative of the reasonable expectation standard:

- “Proof that the geologic repository will conform with the objectives for postclosure performance is not to be had in the ordinary sense of the word because of the uncertainties inherent in the understanding of the evolution ....”
- “[W]hat is required is reasonable expectation, making allowance for the ... uncertainties involved, that the outcome will conform with the objectives for postclosure....”
- “[D]emonstration of compliance must take uncertainties and gaps in knowledge into account so that the Commission can make the specified finding....”

10 C.F.R. § 63.304 describes the characteristics of reasonable expectation by stating that reasonable expectation:

- Requires less than absolute proof because absolute proof is impossible to attain for disposal due to the uncertainty of projecting long-term performance;

- Accounts for the inherently greater uncertainties in making long-term projections of the performance of the Yucca Mountain disposal system;
- Does not exclude important parameters from assessments and analyses simply because they are difficult to precisely quantify to a high degree of confidence; and
- Focuses performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

In addition, 10 C.F.R. § 63.305(c) makes clear that, in the context of reasonable expectation, conservative means the use of cautious but reasonable assumptions consistent with present knowledge.

Given the obligation of the Commission under section 801(b) of the Energy Policy Act of 1992 (EPACT) to modify its technical requirements and criteria under section 121(b) of the NWPA to be consistent with the radiological protection standards promulgated by the Environmental Protection Agency (EPA) under section 801(a) of EPACT, the proper application of the reasonable expectation standard must take into account the statements by EPA in promulgating the standards required by EPACT.<sup>26</sup> These statements make clear that, while reasonable assurance and reasonable expectation are similar concepts, the evaluation of the Yucca Mountain repository requires a different level and type of technical proof than required

---

<sup>26</sup> See Final Rule, Public Health and Environmental Radiation Protection Standards for Yucca Mountain, NV, 66 Fed. Reg. 32,074, 32,101-03 (June 13, 2001) (section III.B.2.c titled “What Level of Expectation Will Meet Our Standards?”); see also Proposed Rule, Public Health and Environmental Radiation Protection Standards for Yucca Mountain, NV, 70 Fed. Reg. 49,014, 49,020-21 (August 22, 2005) (section I.A.1.c titled “What is “Reasonable Expectation?”); Final Rule, Public Health and Environmental Radiation Protection Standards for Yucca Mountain, NV, 73 Fed. Reg. 61,256, 61,271-73 (October 15, 2008) (section III.A.4 titled “How Did We Consider Uncertainty and Reasonable Expectation?”).

for reactors and other situations licensed by NRC in the past.<sup>27</sup> Reasonable expectation recognizes that, in the context of the Yucca Mountain repository, “unequivocal numerical proof of compliance is neither necessary nor likely to be obtained,”<sup>28</sup> and while some “sources of uncertainty can be addressed, or at least accounted for while in other [data or model] areas our knowledge may be too limited to even characterize the uncertainty, much less explicitly account for it.”<sup>29</sup> Identifying postclosure uncertainties, without specifying their impact on whether the reasonable expectation standard is met, does not provide an adequate basis to admit a contention.

Therefore, in formulating its contentions, the initial burden is on Nevada to explain the implications of alleged uncertainties and show why, if true, they exceed the range of acceptable (and unavoidable) uncertainties clearly reflected in the regulations, particularly the reasonable expectation standard set forth in 10 C.F.R. § 63.101. Nevada has frequently not addressed this pleading requirement, and when Nevada has so attempted to address this it has failed. Any contention attempting to shift that burden to the applicant is an improper challenge to 10 C.F.R. § 2.309. *See Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Power Station), LBP-06-23, 64 NRC 257, 358-59 (2006). DOE’s responses to specific contentions identify where Nevada has violated these pleading requirements.

**d. Petitioner Must Demonstrate That Each Contention Raises a Material Issue**

Section 2.309(f)(1)(iv) requires that a petitioner “[d]emonstrate that the issue raised in the contention is *material* to the *findings the NRC must make to support the action* that is involved in

---

<sup>27</sup> See Final Rule, Public Health and Environmental Radiation Protection Standards for Yucca Mountain, NV, 66 Fed. Reg. at 32,101.

<sup>28</sup> Proposed Rule, Public Health and Environmental Radiation Protection Standards for Yucca Mountain, NV, 70 Fed. Reg. at 49,021.

<sup>29</sup> Final Rule, Public Health and Environmental Radiation Protection Standards for Yucca Mountain, NV, 73 Fed. Reg. at 61,256, 61,271 (Oct. 15, 2008).

the proceeding.” Emphasis added. As the Commission has observed, “[t]he dispute at issue is ‘material’ if its resolution would ‘make a difference in the outcome of the licensing proceeding.’” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34; *see also* Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. at 33,172. Thus, each contention must be one that, if proven, would entitle the petitioner to relief. *Yankee Atomic Elec. Co.* (Yankee Power Station), CLI-96-7, 43 NRC 235, 244 (1996). The Case Management Order states that this criterion “requires citation to a statute or regulation that, explicitly or implicitly, has not been satisfied by reason of the issue raised in the contention.” *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 7).

The “findings the NRC must make to support” the issuance of a construction authorization for a geologic repository are set forth in 10 C.F.R. § 63.31. To authorize construction of the repository, the NRC must determine that:

- there is reasonable assurance that the types and amounts of radioactive materials described in the application can be received and possessed in a geologic repository operations area of the design proposed without unreasonable risk to the health and safety of the public;
- there is reasonable expectation that the materials can be disposed of without unreasonable risk to the health and safety of the public; and
- there is reasonable assurance that the activities proposed in the application will not be inimical to the common defense and security.

In short, the NRC must determine the validity of DOE’s conclusions concerning the ability of the repository design to limit exposure to radioactivity, both during the construction and operation phase of the repository (*i.e.*, preclosure phase) and during the phase after the repository has been filled, closed, and sealed (*i.e.*, postclosure phase).

In making these determinations, the NRC must evaluate DOE’s compliance with the applicable provisions of Part 63, including, among other things, whether DOE has described the

proposed geologic repository as specified in § 63.21, and whether the site and design comply with the Part 63 performance objectives and requirements. Proposed safety contentions that fail to raise issues that are material to these findings are inadmissible. For example, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as *mean* doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively fail to demonstrate an increase in the mean dose *above regulatory limits* are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

**e. Petitioner Must Demonstrate that Each Contention is Supported by Adequate Factual Information and/or Expert Opinion**

Section 2.309(f)(1)(v) requires a petitioner to present the factual information or expert opinions necessary to support its contention adequately, and failure to do so requires the Board to reject the contention. *See also Yankee Atomic Elec. Co.*, CLI-96-7, 43 NRC at 262 (in referencing 10 C.F.R. § 2.714, the predecessor to 10 C.F.R. § 2.309, the Commission stated that petitioners must present “claims rooted in fact, documents, or expert opinions”). A petitioner is “obligated to put forward and support contentions when seeking intervention, based on the application and information available” by examining the application and publicly available information. *Consumers Energy Co. (Palisades Nuclear Power Plant)* CLI-07-18, 65 NRC 399, 414 n.46 (2007).

As explained above, the LSN heightens a petitioner’s already “ironclad” obligation to furnish adequate support because “early access to . . . documents in an electronically searchable form [has] allow[ed] for a thorough and comprehensive technical review of the license application by all parties and potential parties to the HLW licensing proceeding.” Final Rule,

LSN, Submissions to the Electronic Docket, 69 Fed. Reg. at 32,837. Thus, where a petitioner neglects to provide the requisite support for its contentions, the Board may not—and in this case absolutely should not—make assumptions of fact that favor the petitioner or supply information that is lacking. *See Ariz. Pub. Serv. Co.* (Palo Verde Nuclear Generating Station, Unit Nos. 1, 2, and 3), CLI-91-12, 34 NRC 149, 155 (1991).

Vague references to documents are not permissible. A petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). Moreover, the mere incorporation of massive documents by reference is unacceptable. *See Tenn. Valley Auth.* (Browns Ferry Nuclear Plant, Units 1 and 2), LBP-76-10, 3 NRC 209, 216 (1976). Consistent with these requirements, the Case Management Order directs petitioners to ensure that documentary references “be as specific as reasonably possible.” *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 7). Additionally, it requires that supporting documents (with the exception of readily available legal authorities, copyright-restricted material, and LSN documentary material), be electronically attached to the petition. In citing LSN documents, petitioners must include the LSN accession number as well as the title, date, and relevant pages of the document.

A petitioner also must explain the significance of any factual information upon which it relies. *See Fansteel, Inc.* (Muskogee, Oklahoma Site), CLI-03-13, 58 NRC 195, 204-05 (2003). With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage* (Independent Spent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998), *aff’d on other grounds*, CLI-98-13, 48 NRC 26. Any supporting material provided by a petitioner, including those portions

thereof not relied upon, is subject to Board scrutiny, “both for what it does and does not show.” See *Yankee Atomic Elec. Co.*, LBP-96-2, 43 NRC 61, 90 (1996), *rev’d in part on other grounds and remanded*, CLI-96-7, 43 NRC 235 (1996). The Board should examine documents to confirm that they support the proposed contention(s). See *Vt. Yankee Nuclear Power Corp.* (Vermont Yankee Nuclear Power Station), ALAB-919, 30 NRC 29, 48 (1989), *vacated in part on other grounds and remanded*, CLI-90-04, 31 NRC 333 (1990). The petition must provide analysis, references, calculations, or some other support for its contention. *Dominion Nuclear Conn., Inc.* (Millstone Power Station, Unit 3), CLI-08-17, 68 NRC \_\_ (slip op. at 11) (August 31, 2008). Mere reference to articles or documents without “explanation or analysis” does not supply an adequate basis for admitting a contention. See *USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006). Nor can a petitioner’s imprecise reading of a document be the basis for a litigable contention. See *Ga. Inst. of Tech.* (Georgia Tech Research Reactor), LBP-95-6, 41 NRC 281, 300 (1995).

Furthermore, “an expert opinion that merely states a conclusion (*e.g.*, the application is ‘deficient,’ ‘inadequate,’ or ‘wrong’) without providing a *reasoned basis or explanation* for that conclusion is inadequate because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion” alleged to provide a basis for the contention. See *USEC*, CLI-06-10, 63 NRC at 472 (emphasis added) (quoting *Private Fuel Storage*, LBP-98-7, 47 NRC at 181). A contention cannot stand merely on an expert’s unsupported assertion the expert rejects the applicant’s representations and calculations as inadequate, without any specific challenge to the relevant analysis in the application. See *Dominion Nuclear Conn., Inc.*, CLI-08-17, 68 NRC \_\_ (slip op. at 11). Conclusory statements cannot provide “sufficient” support for a contention, even if they are proffered by an alleged expert. See *USEC*, CLI-06-10, 63 NRC at

472. In summary, a contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000) (*GPU*)).

Nevada’s Petition falls well short of these standards. As will be demonstrated in response to individual contentions, Nevada’s bases for numerous contentions are unsubstantiated arguments of counsel that lack an adequate factual basis or rely upon alleged expert opinions that, in fact, do not exist in the affidavits submitted for that very purpose.<sup>30</sup>

Speculation does not provide adequate factual and/or expert opinion to support admitting a contention. *Dominion Nuclear Conn., Inc.*, CLI-08-17, 68 NRC \_\_ (slip op. at 11). Furthermore, for all but two of its experts, Nevada merely proffers an empty affidavit in which the expert adopts the entirety of statements and arguments contained in paragraph 5 of designated contentions. The affidavits of these experts consistently provide no additional factual information or analysis to support the legal argument reflected in the referenced paragraph 5 of the contention.<sup>31</sup>

The Atomic Safety and Licensing Board has criticized this very approach – the wholesale endorsement of contentions – and the Board has cautioned that a petitioner should distinguish its

---

<sup>30</sup> For example, Nevada’s contention NEV-Safety-34 challenges DOE’s calculation of storm durations for modeling of net infiltration of rainfall. Nevada contends that DOE’s hydrological calculations are “flawed” and “inappropriate” because they allegedly ignore the “possibility” of short duration, high intensity rainfalls. Petition at 208-9. With respect to the requirement to provide adequate factual support, Nevada identifies no contrary data, studies, or scholarly references in support of that statement. On that basis alone, the contention does not satisfy section 2.309(f)(1)(v). Without any factual support – and without even pretense of explanation or analysis – Nevada simply concludes that this may lead to “potentially significant changes” to corrosion, radionuclide release and transport, and radiological impacts. *Id.* at 209.

<sup>31</sup> As just one example of many, Nevada relies on the affidavit of Adrian Butler (Attachment 6 to the Petition) to provide the requisite support for its contention NEV-Safety-34, but Mr. Butler’s affidavit adds no further information or analysis to buoy this contention. Instead, he merely adopts wholesale the statements contained in paragraph 5 of the contention.

legal pleadings from the substantive facts and opinions expressed by its expert. *See Entergy Nuclear Vermont Yankee LLC and Entergy Nuclear Operations, Inc.* (Vermont Yankee Nuclear Power Station), LBP-04-28, 60 NRC 548, 560 n.16 (2004). Having provided no “reasoned basis or explanation” for the experts’ conclusions, Nevada’s expert affidavits “deprive[] the Board of the ability to make the necessary, reflective assessment of the opinion” alleged to provide a basis for the contention. *See USEC, CLI-06-10, 63 NRC at 472.* Nevada takes this approach even further by indicating multiple experts that have adopted the same paragraph 5 for a single contention, leaving it unclear as to which expert is being proffered to support various portions of the contention.

An expert’s nominal imprimatur, however, cannot cure a contention’s failure to provide factual or other support for the claims therein. *USEC, CLI-06-10, 63 NRC at 472.* An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *Id.* Absent any tangible information or substance – let alone a “reasoned basis or explanation” – an affidavit is completely insufficient, rendering the contention inadmissible. *Fansteel, CLI-03-13, 58 NRC at 203.* DOE’s responses to the individual contentions point out those contentions that suffer from this deficiency. Those contentions, therefore, should be rejected.

**f. Petitioner Must Demonstrate that the Contention Raises a Genuine Dispute With Respect to a Material Issue of Law or Fact**

With regard to the final requirement, that a petitioner “provide sufficient information to show . . . a genuine dispute . . . with the applicant . . . on a material issue of law or fact, 10 C.F.R. § 2.309(f)(1)(vi), the Commission has stated that the petitioner must “read the pertinent portions of the license application, . . . state the applicant’s position and the petitioner’s opposing view,” and explain why it disagrees with the applicant. Rules of Practice for Domestic Licensing

Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. at 33,170; *Dominion Nuclear Conn., Inc.*, CLI-01-24, 54 NRC at 358.

In claiming that the Application fails to address adequately a material issue, a petitioner must “explain why the application is deficient.” Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. at 33,170; *Ariz. Pub. Serv. Co.*, CLI-91-12, 34 NRC at 156. An allegation that some aspect of a license application is “inadequate” or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. See *Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990). Put another way, a contention that does not *directly controvert a position taken by the applicant in the application* is subject to dismissal. See *Tex. Utils. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992) (emphasis added). For example, if a petitioner submits a contention of omission, but the allegedly missing information is, in fact, contained in the license application, then the contention does not raise a genuine dispute.

Another repeated and critical flaw in Nevada’s contentions, particularly those relating to the TSPA and postclosure analysis, is the failure of Nevada to explain the significance of the errors, omissions, and uncertainties it alleges to the repository’s ability to meet regulatory standards, Nevada repeatedly states, in the context of its postclosure contentions, that:

Because the TSPA is a complex non-linear model, and changes in the approach adopted are likely to result in changes in the results obtained that vary both as a function of time postclosure and from realization to realization within a modeling case, a determination whether acceptance of this contention would necessarily lead to calculated doses in excess of EPA’s dose standards would require DOE to perform a substantial number of additional modeling cases

that are not included in the LA and that are beyond the practical ability of anyone else to perform.

While Nevada proclaims its inability to ascertain the significance of its allegations of errors and omissions, Dr. Thorne—an expert Nevada has retained for the past several years—is clearly on record as stating that Nevada acquired the tools to produce just such results.

In his own words, Dr. Thorne is “qualified and experienced in performing risk assessments for nuclear waste disposal facilities.” Declaration of Mike Thorne ¶ 1 (available on the LSN at participant accession # NEV5000160). He has undertaken an “extensive review of documents relating to the Yucca Mountain project” and is “familiar with DOE’s approach to developing its Total Systems Performance Assessment or ‘TSPA,’ which is [DOE’s] effort to assess quantitatively the combined performance of the natural and engineered systems at Yucca Mountain and compare the results with dose standards established or to be established by the EPA.” *Id.* ¶¶ 1 and 2.

In that regard, Dr. Thorne acquired GoldSim by 2004. GoldSim “is a software tool that serves as the architecture for integrating the TSPA data and models and performing the necessary multiple Monte Carlo simulations or calculations of dose (or runs).” *Id.* ¶ 6. Nevada, through Dr. Thorne, has expended “significant resources” in the ensuing years “acquiring relevant GoldSim expertise and in scrutinizing previous versions of the TSPA ....” August 13, 2007 Memorandum from Mike Thorne to A. Messenger et al. at 3 (available on the LSN under participant accession # NEV5000136).<sup>32</sup>

---

<sup>32</sup> The previous versions of the TSPA that Dr. Thorne analyzed were prepared in connection with DOE’s Site Recommendation in 2002 and the draft Yucca Mountain Supplemental Environmental Impact Statement (Draft SEIS) that DOE issued in 2007. Notably, DOE provided Nevada with an external hard drive in connection with the Draft SEIS. That hard drive contained approximately 150 Gigabytes of TSPA data files that Dr. Thorne admitted would be “fundamental to scrutinizing the adequacy of the TSPA-LA.” Declaration of Mike Thorne ¶ 5. *See also* Affidavit of Peter Swift, ¶¶ 3-6 (Attachment 2).

Nevada apparently undertook this effort to enable it to quantify the impact of its contentions on the TSPA-LA, the version of the TSPA that supports the LA. *See* January 1, 2004 Memorandum from Mike Thorne at 2 (“Indeed, the State has acquired and *implemented* the DOE Total System Performance Assessment model *for the purpose of carrying out variant calculations* to investigate the issues that it has identified as requiring further consideration.”) (available on the LSN under participant accession # NEV5000140) (emphasis added). As Dr. Thorne states: “my own review of the GoldSim documentation indicates that GoldSim will be a convenient system within which to *modify* the DOE model and *examine implications* of such modifications.” January 1, 2002 Memorandum from Mike Thorne at 4 (available on the LSN at participant accession # NEV5000152) (emphasis added). Dr. Thorne has further opined: “If the TSPA-LA can be scrutinized and run on a single PC, the State should have *no difficulty* in understanding the model scrutiny and diagnostic calculations required to inform its evaluation of the DOE model.” October 15, 2007 Memorandum from Mike Thorne to R. Loux at 4 (available on the LSN at participant accession # NEV5000176) (emphasis added).

Nevada has since confirmed that the TSPA-LA can be scrutinized and run on its PCs. DOE gave Nevada hard drives in June 2008 that contained the data files for the TSPA-LA. *See* attached Affidavit of Peter Swift ¶ 8,<sup>33</sup> *see also* Petition at 851 (“The TSPA model was made available to the State of Nevada on an external hard drive.”) DOE additionally held a “tutorial” for Nevada regarding the TSPA-LA, and assisted Dr. Thorne in making the TSPA-LA operational on his computers and in troubleshooting problems he encountered. *See* August 13 and 18, 2008 emails from C. Fitzpatrick to M. Shebelskie (informing DOE of problem Dr.

---

<sup>33</sup> Dr. Peter Swift’s curriculum vitae is Attachment 3 to this Answer.

Thorne encountered in running the TSPA-LA on his PCs and subsequently informing DOE that the “fix” it proposed worked) (LSN# DEN001607193 and LSN# DEN001607200, respectively).

Indeed, Nevada also obtained from the NRC Staff a copy of its independently derived Total Performance Assessment (TPA) model, which the Staff intends to use to review the TSPA-LA. October 8, 2007 Memorandum from Mike Thorne to R. Loux at 3 (available on the LSN at participant accession # NEV5000172). Dr. Thorne also installed that model on his computers and, according to Nevada’s records, has used it to perform test calculations to assist in analysis of the TSPA. *Id.*

The fact that Nevada had the ability to provide qualitative and quantitative assessments of the effects of its alleged errors and deficiencies in DOE's modeling as a result of this information is clearly demonstrated in the attached affidavit of Dr. Peter Swift. As Dr. Swift explains, DOE has provided Nevada with the calculation files for the TSPA model version that supports the LA and that allows execution of the TSPA model. Swift Aff. ¶¶ 7 and 8. Those files would permit Nevada to run full and partial realizations of the TSPA (assuming Nevada has a license for the GoldSim software, which Dr. Thorne has said Nevada does). Swift Aff. ¶ 10. Even without running TSPA executions, those calculation files, along with the Analysis Model Reports and associated files on the LSN, enable Nevada to provide at least a qualitative assessment, and in many cases a quantitative assessment, of the effect of its alleged errors and deficiencies on the repository's ability to meet regulatory standards. Swift Aff. ¶ 14. Nevertheless, despite its ability to do so, Nevada has failed to produce any such qualitative or quantitative results to show that its contentions might raise genuine disputes with respect to material issues of law or fact.

As this record demonstrates, Nevada had the ability to provide at a minimum, qualitative assessments from its experts describing the effect of its alleged errors and deficiencies on the

repository's performance. As discussed below, Nevada, by failing to present such information, fails to meet its burden at the contention admissibility stage.

That Nevada is required to explain the *implications* of the deficiencies it alleges, and to describe alternative results that differ materially from DOE's conclusions is made clear in the applicable NRC case law. In *Duke Energy*, the Board rejected as inadmissible a subpart of a petitioner's contention that the applicant relied upon "unreasonable and unsupported" assumptions in calculating accident consequences and that the applicant "understates" the "consequences" of accidents. *Duke Energy Corp.* (McGuire Nuclear Station, Units 1 and 2; Catawba Nuclear Station, Units 1 and 2), LBP-03-17, 58 NRC 221, 238 (2003), *aff'd on other grounds*, CLI-03-17, 58 NRC 419 (2003). In rejecting the subpart of this contention, the Board stated:

[T]he Intervenor[s] have made no showing either that the models used by [the applicant] are defective or incorrect for the purpose used or that those models were used incorrectly by Duke. Nor have the Intervenor[s] demonstrated that the models they are recommending are superior in any way to those employed by [the applicant]. The Intervenor[s] merely point out that, by using their models in the manner they are recommending, a different result would be achieved. This is an insufficient basis to formulate a valid contention.

*Id.*

With respect to a separate subpart of the contention at issue in *Duke Energy*, the Commission affirmed the licensing board's decision against the petitioner, where petitioner alleged that the applicant's severe accident mitigation analysis (SAMA) was "not supported" by a complete probabilistic risk assessment (PRA) model and, as a result, petitioner was unable to challenge the results of the applicant's analysis. LBP-03-17, 58 NRC at 229, *aff'd*, CLI-03-17, 58 NRC 419. The Commission found "generous support" for the Board's decisions, relying, for

instance, on testimony that with the PRAs provided by the applicant, the petitioner “could very easily ... do a SAMA evaluation for virtually anything.” *Duke Energy Corp.*, CLI-03-17, 58 NRC at 425. Despite the ability to perform “any kind of ‘independent calculations’ or analysis to point out anything lacking or wrong in the available PRA information” petitioner did not attempt to do so. *Id.* at 426. Nevada’s similar assertions are equally specious, considering its expert’s admitted capability to understand and modify the model’s diagnostic calculations.

Nevada frequently alleges that DOE omitted particular data or factors in its postclosure analysis without providing any insight into the *ramifications* of the omissions if Nevada's assumptions were correct and DOE’s were wrong. Such bare assertions, “without any specific source of evidence concerning the importance of the alleged omission,” do not raise a valid basis for attacking the model. *Fla. Power and Light Co.*, (Turkey Point Plant Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 515 (1990).<sup>34</sup> The Petitioner in *Fla. Power and Light* alleged that a proposed editorial change to the facility’s technical specifications “increases the probability of operator error which could *result* in missed surveillances and unsafe plant operation.” *Id.* at 521 (emphasis added). The Board ruled on the admissibility of this contention and found that petitioner failed to “offer any facts,” “expert sources,” or a “reasoned statement” in support of its position. *Id.* The petitioner did not meet its burden to raise a genuine issue of fact and the contention was dismissed. *Id.* Likewise, quite recently in *Entergy Nuclear*, the Board, in

---

<sup>34</sup> A petitioner must allege not only that “more accurate input data could be used,” but that the use of the data “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339-340 (2006). In *Entergy*, the petitioner alleged errors in Pilgrim’s SAMA analysis but also established that the use of “probabilistic modeling and incorrect parameters in [Entergy’s] SAMA analysis’ *results* in the downplaying of the likely consequences” of a severe accident. *Id.* at 324. The Board held that, when balanced alongside the “limited amount of detail” provided in the Application, petitioner met its burden. *Id.* at 339. Unlike the petitioner in *Entergy*, Nevada has failed to demonstrate that the alleged errors in DOE’s model could alter the results. What’s more, DOE’s over 8,000 page Application and several million documents filed on the LSN do not suffer from a lack of “detail.”

dismissing a contention as inadmissible on the ground that it failed to demonstrate a genuine dispute, said: “Riverkeeper [petitioner] has failed to make the minimal demonstration, as required by contention admissibility rules, that Entergy’s ER [Environmental Report] analysis fails to meet a statutory or regulatory requirement. *Presentation of an alternative analysis is, without more, insufficient* to support a contention alleging that the original analysis failed to meet applicable requirements.” *Entergy Nuclear Ops., Inc.* (Indian Point Nuclear Generating Units 2 and 3), LBP-08-13, 67 NRC \_\_ (slip op. at 183-84) (July 31, 2008) (emphasis added), *reconsideration denied*, LBP-08-13, 68 NRC \_\_ (slip op. at 7) (Dec. 18, 2008).

Nevada must also demonstrate how the use of a model different from the TSPA would change the results, and then tie those changes to a regulatory requirement that was not met. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Unit 2), LBP-03-12, 58 NRC 75, 92-93 (2003), *aff’d*, CLI-03-14, 58 NRC 207 (2003). In *Dominion Nuclear Conn.*, the petitioner alleged that Dominion’s proposed changes to the facility’s technical specifications regarding fuel-handling could modify containment closure and spent fuel pool ventilation requirements.” LBP-03-12, 58 NRC at 83. Accordingly, “*if ... containment penetrations are left open ... there is a greater likelihood of a release of radioactivity that might have an impact on those who live nearby.*” *Id.* (emphasis added). Although the Board found the above circumstances sufficient to show standing, they indicated that contention admissibility standards are “considerably more stringent.” *Id.* at 93. In dismissing the contention, the Board held that “mere allegation[s]” that increased levels of radiological effluents “will be ‘significant’” did not exhibit a genuine issue when: (1) “Petitioner has not specifically or directly challenged whether the Applicant meets the requirements of section 50.67(b)(2) or section 50.36...”; (2) “stated

with any specificity *how* any increases would occur”; (3) or “raised any challenge to the specific dose calculations.” *Id.* at 93-94 (emphasis in original).

On appeal to the Commission, the petitioner in *Dominion Nuclear Conn.* presented the same “general and speculative statements” absent “alleged facts” and “expert opinion” that it made before the Board. CLI-03-14, 58 NRC at 213. The Commission affirmed the Board’s decision and made the following pertinent findings:

- “it was [petitioner’s] burden to point out how the application is deficient. [Petitioner’s] contention, however, never challenges any of [Dominion’s] accident analyses, dose calculations, or its conclusion that postulated radiological releases from a fuel handling accident would not exceed applicable limits....” *Id.* at 215.
- “A contention alleging that an application is deficient must identify each failure and the supporting reasons for the petitioner’s belief.” *Id.* at 216
- “[Petitioner] never directly challenges [Dominion’s] accident analyses or dose calculations, *never provides any accident or dose analysis of its own, and therefore never indicates how a ‘significant’ radiological release may occur as a result of the proposed changes.*” *Id.* at 217 (emphasis added).

As will be demonstrated in response to individual contentions, on numerous occasions Nevada alleged that DOE’s model contained “uncertainties,” but it did not include any additional factual information or analysis regarding their impact on postclosure. The Commission recognizes that “uncertainties” may exist in DOE’s postclosure model. *See* Final Rule, Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, NV, 66 Fed. Reg. at 55,747-748. The Commission, however, has not found that the existence of “uncertainties,” by itself, is grounds for accepting a contention. For instance, in *Duke Energy Corp.*, LBP-03-17, 58 NRC at 236-38, *aff’d*, CLI-03-17, 58 NRC 419, the Board rejected as inadmissible the contention that Duke failed to take adequate account of uncertainties and their effect on the results of its analysis. LBP-03-17, 60 NRC at 234. The underlying question is not whether uncertainties exist, but, more importantly, whether the applicant “has satisfied

applicable NRC guidance with respect to such uncertainty analyses” or, in the alternative, “performed a qualitative analysis.” *Id.* at 236; *see also Fla. Power and Light Co.* (Turkey Point Nuclear Generating Plant), LBP-89-15, 29 NRC 493 (1989) (denying contention based upon allegations of errors and uncertainties in analysis). As noted previously, the applicable requirements for this proceeding have been codified in Part 63 and, in particular, 10 C.F.R. § 63.101(a)(2) that adopts the reasonable expectation standard established by EPA and § 63.304 that sets forth the characteristics of reasonable expectation.

DOE’s responses to the individual contentions, particularly those related to alleged errors, omissions or uncertainties in the TSPA modeling identify where Nevada’s contentions suffer from these critical flaws.

**4. Environmental Contentions Addressing DOE’s Final Environmental Impact Statement and its Supplements Must Also Meet the Requirements of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326**

In its Hearing Notice, the Commission reaffirmed that proposed environmental contentions are subject to substantially heightened admissibility standards. In addition to the NRC’s contention admissibility requirements in 10 C.F.R. § 2.309(f), environmental contentions must also meet the requirements of 10 C.F.R. § 51.109 and the requirements of 10 C.F.R. § 2.326. These two sections impose the following admissibility standards on environmental contentions:

1. Contentions must allege that it is not practicable to adopt the DOE EIS for one of two reasons:

“(1)(i) The action proposed to be taken by the Commission differs from the action proposed in the license application submitted by [DOE]; and (ii) the difference may significantly affect the quality of the human environment;<sup>35</sup> or

---

<sup>35</sup> Because the action proposed to be taken by the NRC does not differ from the action proposed in DOE’s application, this first factor has no relevance to this proceeding and will not be discussed further.

(2) Significant and substantial new information or new considerations render such [EIS] inadequate.” 10 C.F.R. § 51.109(c).

2. The contention must address a “significant” environmental issue. 10 C.F.R. § 2.326(a)(2).
3. The contention must demonstrate that, if true, “a materially different result would be or would have been likely . . . .” 10 C.F.R. § 2.326(a)(3).
4. The contention must be supported by affidavits that set forth the factual and/or technical basis for the movant’s claims and must be given by competent individuals with knowledge of the facts or by experts in the appropriate disciplines. 10 C.F.R. § 2.326(b).<sup>36</sup>

These additional admissibility standards are discussed in greater detail below.

**a. The 10 C.F.R. § 51.109 Criteria**

Given the *sui generis* nature of this proceeding, neither the Commission nor its boards have applied § 51.109 in the context of an adjudication. Nevertheless, existing Commission decisions and federal case law under NEPA provide guidance with respect to how the criteria under § 51.109 should be applied in this proceeding.

First, the Commission has made clear that its adjudicatory boards should not “automatically assume” that a proffered environmental contention—though cognizable as a “new consideration” under the D.C. Circuit’s decision in *Nuclear Energy Inst. v. Env’tl. Protection Agency*—contains “significant and substantial information” that, if true, would render the DOE EIS and its supplements “inadequate” under NEPA. 373 F.3d 1251 (D.C. Cir. 2004) (*NEI*). Letter from Bradley W. Jones, Esq., Assistant Gen. Counsel, U.S. Nuclear Regulatory Comm’n, to Martin G. Malsch, Esq., “Request By Nevada For Reconsideration and Clarification of Notice of Denial,” March 20, 2008, *available at* ADAMS Accession No. ML080810175 (Jones Letter). This approach is consistent with well-established NEPA principles, as applied by the federal

---

<sup>36</sup> In addition, evidence in the affidavits must meet NRC admissibility standards and each criteria in 10 C.F.R. § 2.326 must be addressed separately.

courts, under which reviewing courts have held that the identification of a deficiency in an EIS does not necessarily render that EIS “inadequate.” For example, the D.C. Circuit so held in denying Nevada’s challenge to the transportation-related portions of DOE’s 2002 FEIS. *Nevada v. Dep’t of Energy*, 457 F.3d 78, 93 (D.C. Cir. 2006) (rejecting alleged inadequacies in the FEIS relating to environmental impacts on cultural resources, floodplains and archaeological and historic impacts and stating “we do not think that the inadequacies to which Nevada points make the FEIS inadequate” or render DOE’s selection of the Caliente Corridor “arbitrary and capricious.”). The D.C. Circuit in this prior proceeding emphasized that courts “will not ‘flyspeak’ an agency’s environmental analysis, looking for any deficiency no matter how minor.” *Id.* (citing *Fuel Safe Wash. v. Fed. Energy Regulatory Comm’n*, 389 F.3d 1313, 1323 (10th Cir. 2004); *Half Moon Bay Fishermans’ Mktg. Ass’n v. Carlucci*, 857 F.2d 505, 508 (9th Cir. 1988)).

The Commission, for its part, has indicated that this same standard applies in its licensing proceedings. As the Commission explained:

NEPA’s twin goals are to inform the agency and the public about the environmental effects of a project. At NRC licensing hearings, petitioners may raise contentions seeking correction of *significant inaccuracies and omissions* in the [applicant’s environmental report (“ER”) or agency’s EIS]. Our boards do not sit to ‘flyspeak’ environmental documents or to add details or nuances. If the ER (or EIS) on its face “comes to grips with all important considerations” nothing more need be done.<sup>37</sup>

*Sys. Energy Res., Inc.* (Early Site Permit for Grand Gulf Site), CLI-05-4, 61 NRC 10, 13 (2005) (quoting *Hydro Res., Inc.* (P.O. Box 15910, Rio Rancho, NM 87174), CLI-01-4, 53 NRC 31,

---

<sup>37</sup> See also *Duke Energy Corp.*, CLI-03-17, 58 NRC at 431 (“NRC adjudicatory hearings are not EIS editing sessions. Our busy boards do not sit to parse and fine-tune EISs.”). The Commission’s admonition against the “flyspecking” and “fine-tuning” of EISs is particularly apt here, given that DOE has “primary responsibility” for consideration of environmental matters under the NWPA. Final Rule, NEPA Review Procedures for Geologic Repositories for High-Level Waste, 54 Fed. Reg. 27,864, 27,865 (July 3, 1999) (codified at 10 C.F.R. § 51.109). In contrast, under the NWPA, the NRC’s NEPA-related responsibility in this proceeding is limited to determining whether adoption of DOE’s EIS, as supplemented, is “practicable.” *Id.*

71)) (emphasis added). A petitioner's claim must "suggest *significant environmental oversights* that warrant further inquiry at an evidentiary hearing." *Exelon Generation Co., LLC* (Early Site Permit for Clinton ESP Site), CLI-05-29, 62 NRC 801, 811 (2005) (emphasis added). Thus, as the D.C. Circuit recognized in *NEI*, there must be significant "substantive defects" in the FEIS. *Id.* at 1314.

Under NEPA, an EIS is not inadequate merely because a reviewing court or other adjudicatory tribunal might have reached a different conclusion. As the U.S. Supreme Court has explained, "[n]either the statute nor its legislative history contemplates that a court should substitute its judgment for that of the agency as to the environmental consequences of its actions." *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976). The NRC has indicated that it would adhere to this same tenet in deciding whether to adopt DOE's EIS. Specifically, in promulgating 10 C.F.R. § 51.109, the NRC stated that "the adoption of the [DOE] statement does not necessarily mean that NRC would independently have arrived at the same conclusions on matters of fact or policy." Proposed Rule, NEPA Review Procedures for Geologic Repositories for High-Level Waste, 53 Fed. Reg. 16,131, 16,142 (May 5, 1988). Thus, in accordance with 10 C.F.R. § 51.109(d), insofar as the presiding officer determines that NRC adoption of DOE's EIS is "practicable" under § 51.109(c), "such adoption shall be deemed to satisfy all responsibilities of the Commission under NEPA and no further consideration under NEPA or this subpart shall be required."

In this proceeding, DOE submits that boards should apply § 51.109 consistent with the above referenced well established NEPA case law and decisions of the Commission.

**b. The 10 C.F.R. § 2.326 Criteria and Procedures**

Section 51.109(a)(2) directs the presiding officer, “to the extent possible,” to use the “criteria and procedures that are followed in ruling on motions to reopen under § 2.326.” In its Hearing Notice, the Commission reiterated that a presiding officer should, to the extent possible, apply the reopening procedures and standards set forth in § 2.326. *See* Hearing Notice, 73 Fed. Reg. at 63,031.

By explicitly directing presiding officers to use the criteria and procedures contained in § 2.326, the Commission reaffirmed its longstanding intent to avoid, in accordance with the NWPA, “the wide-ranging independent examination of environmental concerns that is customary in NRC licensing proceedings.” Proposed Rule, NEPA Review Procedures for Geologic Repositories for High-Level Waste, 53 Fed. Reg. at 16,136; *see also* Final Rule, 54 Fed. Reg. 27,864, 27,865 (July 3, 1999) (codified at 10 C.F.R. § 51.109) (“[W]e believe it to be a fair reading of Congressional intent that NRC can adequately exercise its NEPA responsibility with respect to a repository by relying upon DOE’s environmental impact statement.”). Specifically, the Commission has noted that the test for reopening a closed record—the same test to be applied by the Board in ruling on the admissibility of environmental contentions in this proceeding—is a “stiff test” that imposes a “strict” burden. *Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), CLI-06-3, 63 NRC 19, 22, 25 (2006); *see also Fla. Power & Light Co.* (Turkey Point, Units 3 and 4), LBP-87-21, 25 NRC 958, 963-64 (stating that “a party seeking to reopen the record has a ‘heavy burden’ to bear”) (quoting *Kan. Gas and Elec. Co.* (Wolf Creek Station, Unit No. 1), 7 NRC 320, 338 (1978)). Parties seeking to reopen a closed record must raise a “significant” safety or environmental issue and demonstrate that “a materially different result [is] ‘likely’ as a result of the new evidence.” *Private Fuel Storage,*

CLI-06-3, 63 NRC at 25. In applying this test, the Commission has further noted that “[n]ew information is not enough, *ipso facto*, to reopen a closed hearing record,” and that “the information must be significant and plausible enough to require reasonable minds to inquire further.” *Private Fuel Storage* (Independent Spent Fuel Storage Installation), CLI-05-12, 61 NRC 345, 350 (2005).

The Commission has further noted that the supporting material required by § 2.326(b) “must be set forth with a degree of particularity *in excess of* the basis and specificity requirements contained in 10 C.F.R. [§ 2.309] for admissible contentions. Such supporting information must be more than mere allegations; it must be tantamount to evidence.” *Long Island Lighting Co.* (Shoreham Nuclear Power Station, Unit 1), CLI-89-1, 29 NRC 89, 93 (1989) (emphasis added) (quoting *Pacific Gas and Elec. Co.* (Diablo Canyon Nuclear Power Plant, Units 1 and 2), ALAB-775, 19 NRC 1361, 1366 (1984), *aff’d sub nom. San Luis Obispo Mothers for Peace v. U.S. Nuclear Regulatory Comm’n*, 751 F.2d 1287 (D.C. Cir. 1984), *aff’d on reh’g en banc*, 789 F.2d 26 (1986), *cert. denied*, 479 U.S. 923 (1986)). An intervenor’s mere “belief” is insufficient to satisfy § 2.326(b). *Fla. Power & Light Co.*, LBP-87-21, 25 NRC at 963.

In short, “the Commission expects its adjudicatory boards to enforce the [§ 2.326] requirements rigorously—*i.e.*, to reject out-of-hand [] motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989) (citing *La. Power & Light Co.* (Waterford Steam Electric, Unit 3), CLI-86-1, 23 NRC 1 (1986); *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), CLI-86-7, 23 NRC 233 (1986), *aff’d sub nom. Ohio v. U.S. Nuclear Regulatory Comm’n*, 814 F.2d 258 (6th Cir. 1987)).

In the *Private Fuel Storage* decision (CLI-06-3) discussed above, the Commission applied the § 2.326 standard in ruling on a motion to reopen the record (after the Commission had rendered its final adjudicatory decision and authorized license issuance) to litigate a proposed environmental contention. The Commission’s ruling is illustrative and underscores the heavy burden imposed by § 2.326.<sup>38</sup> For example, the Commission emphasized “the high threshold” for reopening a record as established by “longstanding regulations and precedent.” *Private Fuel Storage*, CLI-06-3, 63 NRC at 22; *see id.* at 25 (stating that the NRC does “not lightly reopen [its] adjudicatory proceedings”). The Commission found that the intervenor had failed to meet substantive and evidentiary requirements of § 2.326, stating that “we cannot say on the current record that a materially different result in our licensing proceeding is so ‘likely’ that we must reopen the adjudicatory proceeding for additional hearings and findings.” *Id.* at 26-27. Consequently, the Commission rejected the intervenor’s request that the entire project be placed on hold.

In the context of the Yucca Mountain proceeding, the requirement that the petitioner must demonstrate that a materially different outcome would likely result means that the contention, if true, would severely impact the EIS such that it could not be adopted unless formally supplemented by NRC or DOE.

In summary, given the considerably heightened admissibility standards applicable here, DOE submits that in this proceeding a presiding officer should admit *environmental* contentions in this proceeding only under very limited circumstances. Under 10 C.F.R. §§ 51.109(c) and

---

<sup>38</sup> In recently denying a motion to reopen the record, the Commission emphasized the “deliberately heavy” burden associated with § 2.326. *See AmerGen Energy Co., LLC* (License Renewal for Oyster Creek Nuclear Generating Station), CLI-08-28, 68 NRC \_\_ (slip op. at 13-14) (Nov. 6, 2008) (“The burden of satisfying the reopening requirements is a heavy one, and proponents of a reopening motion bear the burden of meeting all of [these] requirements.”) (internal quotation marks and citations omitted).

2.326, an environmental contention must present *evidence* concerning a “significant” environmental issue. Under those same provisions, that information must be so “substantial” as to demonstrate that the alleged inadequacy in the DOE EISs is “likely” to dictate a “materially different result.” As the Commission explained in *Private Fuel Storage*, this means that any “new information” proffered by a petitioner must present a “seriously different picture of the environmental landscape,” such that it would “be likely to change the outcome of the proceeding or affect the licensing decision in a material way.” CLI-06-3, 63 NRC at 19, 23.

**5. Contention Subjects That Are Outside the Scope of, or Immaterial to the NRC’s Required Findings in, the Yucca Mountain Licensing Proceeding**

As discussed above, a petitioner seeking admission of a proposed contention must, among meeting other requirements, demonstrate that the issue raised in the contention is within the scope of the proceeding and material to the findings that the NRC must make to support issuance of a repository construction authorization to DOE. A non-exclusive discussion of certain categories of contentions that clearly fall outside the proper scope of this proceeding and/or lack a material nexus to the Staff’s required findings is provided below.

**a. Contentions Relating to Transportation of Spent Nuclear Fuel (SNF) and High Level Radioactive Waste (HLW) Are Beyond The Scope of This Proceeding**

**(1) The NRC has no regulatory authority over transportation of SNF or HLW.**

Under the AEA and the Energy Reorganization Act (ERA), NRC does not have regulatory authority over DOE’s facilities and activities except as specifically provided by statute. 42 U.S.C. § 5851. Section 202 of the ERA provides the NRC with licensing and related regulatory authority over certain specific facilities of the DOE, including facilities for the disposal of SNF and HLW. 42 U.S.C. § 5842. However, neither section 202 of the ERA, nor the

NWPA, nor any other statute provides NRC with authority over the transportation by DOE of SNF and HLW.

DOE's transportation of SNF or HLW therefore is not subject to NRC regulation and the NRC has recognized the limited scope of its regulatory authority. For example, in its discussion of proposed amendments to its regulations regarding GROA Security and Material Control and Accounting Requirements, the NRC explained that the rulemaking did not cover transportation of HLW to the GROA because "the NRC's regulatory authority is limited to the operations at a GROA." GROA Security and Material Control and Accounting Requirements, 72 Fed. Reg. 72,522, 72,527 (Dec. 20, 2007). DOE is required by the NWPA to use NRC certified casks for shipment of SNF or HLW to the repository.<sup>39</sup> 42 U.S.C. § 10175. That certification, however, is separate and distinct from the repository licensing action being undertaken by the NRC under Part 63. The requirements for such a certification are set forth not in Part 63, but instead in 10 C.F.R. Part 71.

---

<sup>39</sup> Similarly, in a May 10, 2002, response to a March 22, 2002, letter from Senator Richard Durbin, asking what role the NRC would play regarding transportation of spent fuel to Yucca Mountain, NRC Chairman Richard Meserve stated:

If DOE takes custody of the spent fuel at the licensee's site, *DOE regulations would control the actual spent fuel shipment*. Under such circumstances, the NRC's primary role in transportation of spent fuel to a repository would be certification of the packages used for transport.

\*       \*       \*

As stated previously, if DOE takes custody of the spent fuel at the reactor site the only involvement NRC will have in the transport will be the certification of the transport cask.

Letter from Richard Meserve, Former Chairman of the NRC, to Sen. Richard J. Durbin at 2 (May 10, 2002) available at ADAMS Accession No. ML21060662 (emphasis added). DOE's plan is to take custody of the spent fuel at the reactor site.

**(2) Contentions challenging DOE’s Records of Decision concerning transportation of materials to Yucca Mountain are outside the scope of this proceeding and are within the original and exclusive jurisdiction of the Courts of Appeals.**

In addition to the NRC’s lack of regulatory authority over transportation of SNF and HLW, under the NWPA, any challenges to DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. In particular, section 119 of the NWPA expressly provides that the United States Courts of Appeals shall have original and exclusive jurisdiction over any civil action for review of any final decision or action of the Secretary of Energy as well as of any civil action alleging the failure of the Secretary “to make any decision, or take any action, required under this subtitle.” 42 U.S.C. § 10139(a)(1)(C). Any such action must be initiated through a petition for review filed with a court of appeals within 180 days of the decision or action or failure to act involved. 42 U.S.C. § 10139(c).

Relevant to this proceeding, on October 10, 2008, DOE issued a Record of Decision (ROD) documenting DOE’s decision to construct a railroad in the State of Nevada in an alignment within the Caliente corridor along various segments together with various support facilities as detailed in the ROD. As discussed below, any challenge to the ROD accordingly must be initiated through a petition for review to a court of appeals – not through the NRC contention process.

In *Nevada v. Dep’t of Energy and Nuclear Energy Inst. v. Env’tl. Protection Agency*, the D.C. Circuit anticipated that DOE would in the future be issuing transportation related decisions. For example, in *NEI*, 373 F.3d at 1312, the Court stated:

Section 114(f)(4) of the NWPA provides, in relevant part, that the DOE’s FEIS “shall, to the extent practicable, be adopted by [NRC] in connection with the issuance by [NRC] of a construction

authorization and license for such repository.” 42 U.S.C. § 10134(f)(4). To the extent NRC adopts the FEIS, NRC’s responsibilities under the National Environmental Policy Act shall be deemed satisfied and “no further consideration shall be required.” *Id.* In addition, DOE is expected to use the FEIS to support one or more future decisions related to Yucca Mountain, including the selection of an alternative for transporting waste to the site.

Emphasis added.

On April 8, 2004, DOE issued a ROD addressing transportation matters. Subsequently, following issuance of DOE’s April 8, 2004 ROD, Nevada filed a petition for review with the D.C. Circuit pursuant to section 119 of the NWPA seeking review of the ROD and the transportation-related portions of the 2002 FEIS on which it was based. The ROD announced DOE’s selection, both nationally and in Nevada, of the mostly rail scenario analyzed in the 2002 FEIS as the primary means of transporting SNF and HLW to the repository. The ROD also selected the Caliente rail corridor from several corridors considered in the 2002 FEIS as the corridor in which to study possible alignments for a rail line connecting the Yucca Mountain site to an existing rail line in Nevada. *See* ROD on Mode of Transportation and Nevada Fuel and High-Level Radiation Waste at Yucca Mountain, Nye County, NV, 69 Fed. Reg. 18,557 (Apr. 8, 2004). Nevada claimed that “in selecting a national transportation mode and Nevada rail corridor for the movement of waste to Yucca, DOE violated NEPA and NEPA implementing regulations” and acted in an arbitrary and capricious manner and contrary to law. Petitioner’s Final Opening Brief at 2-4.

The D.C. Circuit took jurisdiction of the State’s petition for review and rejected the State’s claims on their merits (with the exception of certain contingency plans which the court

held were not ripe for review).<sup>40</sup> The Court held, among other things, that DOE had taken the “requisite hard look” at the potential rail corridor environmental impacts and that “DOE’s analysis of the environmental impacts of rail corridor selection in its FEIS is adequate.” *Nevada*, 457 F.3d at 89-93. The D.C. Circuit also held that “[w]e summarily deny any claims not specifically addressed in this opinion,” which included all the issues raised in the State’s briefs. *Id.* at 94 n.10.

This decision is res judicata as to Nevada and the preclusive effect of this decision applies not only to those NEPA claims decided by the court of appeals but also to those which could have been raised. *W. Radio Servs. Co. v. Glickman*, 123 F. 3d 1189 (9th Cir. 1997) (concluding that “any cognizable claims should have been raised in *Western Radio I*, and are thus barred by res judicata”). Of course, any person who failed to file a challenge within 180 days would be time barred pursuant to NWSA section 119(c) among other defenses. Further, as the Commission has recognized, a party does not have the option of postponing judicial review under section 119 of the NWSA, by instead trying to raise transportation-related environmental issues before the NRC. In particular, the NRC rejected this approach when it was raised in comments to the proposed 10 C.F.R. § 51.109 in 1989. In their comments to the Commission, certain environmental organizations stated that “affected parties may decide for reasons of litigative strategy” to raise environmental issues “in NRC licensing proceedings rather than by going to court.” Final Rule, NEPA Review Procedures for Geologic Repositories for High-Level Radioactive Waste, 54 Fed. Reg. at 27,866. The Commission responded by stating that such a “unilateral decision” would “circumvent the clear policy of the NWSA....” *Id.*

---

<sup>40</sup> The Court of Appeals noted that “[a]lthough much of the FEIS concentrated on the Yucca site, it also analyzed alternatives for, and the ‘potential environmental consequences’ of, transporting nuclear waste from the many production sources throughout the country to the repository at Yucca.” *Nevada*, 457 F.3d at 82.

The same path of review followed in 2004 is appropriate with respect to challenges to DOE's transportation decisions set forth in the Department's October 10, 2008 ROD. The fact that the NRC construction authorization proceeding, which is limited to activities at the GROA, now has commenced does not alter the requirement under section 119 of the NWPA that final DOE decisions must be appealed to the courts of appeals whose jurisdiction is "original and exclusive" over such matters. 42 U.S.C. § 10139(a)(1).

In summary, challenges to the April 2004 ROD, and the transportation related portions of the 2002 FEIS on which it was based, are no longer subject to review in any forum, both as a result of the expiration of the 180 day period to challenge that ROD set forth in section 119 of the NWPA and as a result of the D.C. Circuit's 2006 decision. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD also are not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

**(3) Consideration by NRC of transportation impacts under NEPA is limited.**

Under section 114 of the NWPA, the Commission must adopt DOE's FEIS to the extent practicable. In considering the environmental impacts of transportation decisions made by DOE, the role of the NRC here is similar to that adopted by the Commission in *Pub. Serv. Co. of N.H.*, (Seabrook Station, Units 1 and 2), CLI-78-1, 7 NRC 1, 25 (1978), and affirmed by the court of appeals in *New England Coalition on Nuclear Pollution v. U.S. Nuclear Regulatory Comm'n*, 582 F.2d 87 (1st Cir. 1978). In that case, the petitioners argued that NEPA did not permit the NRC to adopt EPA findings made under the Federal Water Pollution Control Act (FWPCA) without an independent inquiry of the effects a proposed nuclear power plant would have on the aquatic environment. As the Commission noted, Congress had amended the FWPCA to avoid

duplicative reviews, and left to the EPA the decision as to the water pollution control criteria to which a nuclear power plant's cooling system would be held. The NRC was not free to ignore considerations of aquatic impact; "it would have to consider them, but only as part of its overall 'balancing judgment' on whether it is in the public interest to grant the requested permit." *Pub. Serv. Co. of N.H.*, CLI-78-1, 7 NRC at 25. The NRC, further, could not "go behind" the EPA's determination. *Id.* at 26.

Similarly, in this proceeding, the NRC should decide whether to issue construction authorization for the repository given the transportation impacts as determined by DOE (and potentially as reviewed by the court of appeals). Accordingly, contentions challenging the accuracy or adequacy of DOE's NEPA analysis of the impacts of transporting SNF or HLW are not proper subjects for contentions in this proceeding.

**b. Contentions Relating to the Proposal by DOE to Accept SNF in TADs Are Beyond The Scope of This Proceeding**

Certain Nevada contentions relate to DOE's proposal to accept a substantial amount of commercial SNF for transportation and disposal in Transportation Aging and Disposal canisters (TADs) rather than dual purpose canisters (DPCs). These contentions would have NRC second-guess DOE's management decision to accept up to as much as 90% of commercial SNF in TADs and, in effect, would require DOE to accept a smaller percentage of commercial SNF in TADs. DOE will make its decisions concerning how to accept commercial SNF pursuant to contracts mandated by the NWPA, and NRC has no statutory or regulatory authority over those contractual decisions. While NRC can consider the effects of DOE's proposal to accept up to 90% of commercial SNF in TADs, it cannot go behind that proposal and, in effect, specify how much commercial SNF DOE can accept in TADs. Thus, any contention premised on such a change is beyond the scope of this proceeding.

**(1) The NRC has no regulatory authority over DOE SNF or HLW management outside the GROA.**

Under the AEA and the ERA, NRC does not have regulatory authority over DOE's facilities and activities except as specifically provided by statute. 42 U.S.C. § 5851. Section 202 of the ERA provides the NRC with licensing and related regulatory authority over certain specific facilities of the DOE, including facilities for the disposal of SNF and HLW. 42 U.S.C. § 5842. However, neither section 202 of the ERA, nor the NWPA, nor any other statute provides the NRC with authority over DOE's management of SNF and HLW outside the specified facilities, including the acceptance of SNF and HLW for disposal at the Yucca Mountain site. As noted previously, the NRC has recognized its "regulatory authority is limited to the operations at a GROA." GROA Security and Material Control and Accounting Requirements, 72 Fed. Reg. 72,522, 72,527 (Dec. 20, 2007). While DOE is required by the NWPA to use NRC certified casks for shipment of SNF or HLW to the repository, that requirement is separate and distinct from any contractual decisions that DOE may make in the future as to how much, if any, commercial SNF to accept in TADs.

**(2) DOE's decisions in the future on what percentage of commercial SNF to accept in TADs are contract decisions outside the scope of this proceeding.**

DOE's decisions on how much commercial SNF to accept in TADs are not subject to review by NRC. Section 302 of the NWPA is explicit that the acceptance by DOE of commercial SNF and HLW for disposal at the Yucca Mountain site is governed by the contract between DOE and the generator of the SNF and HLW and that DOE is responsible for establishing the terms and conditions of the contract. While section 302 makes such a contract a condition for the issuance or renewal by NRC of a license for a commercial power plant, neither section 302 nor any other statutory provision grants the NRC the authority to approve the terms

and conditions of the contract or regulate how the contract is implemented. Any questions concerning the implementation of a contract under section 302 must be resolved by DOE and the contractholder or by an appropriate court.

In addition, DOE's 2002 FEIS analyzed the impacts of the proposed action – the construction and operation of a geologic repository at Yucca Mountain for the disposal of SNF and HLW, including the transportation of commercial SNF to the repository. As part of the transportation analysis, DOE assessed the impacts of fuel packaging and loading activities at the commercial utility sites. DOE subsequently issued a ROD addressing transportation matters, including the selection of mostly rail as the national mode of transportation. In the Repository SEIS, DOE updated the FEIS to reflect changes in the design and operational details, including the use of TADs to accept, transport and dispose of up to 90 % of the commercial SNF. The SEIS also reflected DOE's transportation-related decisions made following the completion of the FEIS. DOE concluded in the final Repository SEIS that the potential impacts associated with the updated repository design and operational plans are similar in scale to the impacts analyzed in the 2002 FEIS. DOE did not modify the April 2004 ROD decision on the transportation mode.

**(3) Consideration by NRC of environmental impacts of DOE's decision to accept up to as much as 90 percent of commercial SNF in TADs is limited.**

For the same reasons discussed in sections 5.a.(2) and (3), challenges to DOE's proposal to accept up to as much as 90 % of commercial SNF in TADs and DOE's analysis of the environmental impacts of that proposal are not appropriately a part of this proceeding. Put simply, NRC must take DOE's proposal to accept up to as much as 90 percent of commercial SNF in TADs and DOE's analysis of the environmental impacts of that proposal as a given in

deciding whether to issue a construction authorization for the repository. *See* Pub Serv. Co. of N.H., CLI-78-1, 7 NRC at 25-26.

**B. DOE’s Answer Regarding the Admissibility of Petitioner’s Proposed Contentions**

**1. NEV-SAFETY-01 - Doe Integrity**

The LA cannot be granted because DOE lacks the requisite integrity to be an NRC licensee.

**RESPONSE**

In this contention Nevada alleges that DOE lacks the integrity to be issued a license by the NRC based upon alleged “material false statements and omissions and an elevation of schedule considerations over safety and compliance” over the last 20 years. Petition at 16. Nevada raises a very serious allegation about the general character and integrity of a federal agency, based on a small number of hand-selected quotations taken out of context. In doing so, Nevada does not accurately characterize the record or accomplishments of the United States Department of Energy, the OCRWM, or the Yucca Mountain Project.

Ultimately, this contention represents an attempt to redirect this proceeding away from an adjudication of the technical adequacy of the Application, as mandated by statute and regulation, towards an unauthorized inquiry into the general qualifications of the applicant. Even if such an inquiry were authorized—which it is not—Nevada has failed to present credible evidence of a legitimate integrity issue within DOE, OCRWM, or the Yucca Mountain Project. Instead, Nevada uses information taken out of context from a handful of documents in a failed effort to impugn the general character and integrity of DOE.

Nevada’s contention raises an issue which is outside the scope of this proceeding, is immaterial to any findings NRC must make in this proceeding, is without any adequate factual

premise and fails to raise a genuine dispute of law or fact; and for the reasons more fully discussed below, it should be denied.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is outside the scope of this proceeding because the “character” requirements of Section 182a of the Atomic Energy Act of 1954 (AEA), 42 U.S.C. § 2011 *et. seq.*, do not apply to DOE, and because under the Nuclear Waste Policy Act (NWPA), 42 U.S.C. § 10101 *et. seq.*, Congress has already designated DOE as the appropriate applicant. By challenging the character and integrity of the U.S. Department of Energy and its fitness to receive construction authorization, Nevada has attempted to redirect this proceeding away from an adjudication of the technical adequacy of the *application*,<sup>41</sup> towards an impermissible and wide-ranging inquiry into the general character and integrity of a department of the United States government, which is the statutory *applicant*.

---

<sup>41</sup> The Commission’s Notice of Hearing, which defines the scope of this proceeding states, in pertinent part, that [t]he matters of fact and law to be considered are whether the *application* satisfies the applicable safety, security, and technical standards of the AEA and NWPA and the NRC’s standards in 10 CFR Part 63 for a construction authorization for a high-level waste repository . . . .” Hearing Notice, 73 Fed. Reg. 63,029 (Oct. 22, 2008) (emphasis added).

**(1) The “Character” Requirement in Section 182a of the AEA Does Not Apply to DOE or to this Proceeding**

This contention is outside the scope of this proceeding because Nevada mistakenly relies upon Section 182a of the AEA (42 U.S.C. § 2232a), in arguing that “an applicant’s integrity is a proper consideration in a licensing hearing.” *See* Petition at 16 (*citing Georgia Power Co.* (Vogtle Electric Generating Plant, Units 1 & 2), CLI-93-16, 38 NRC 25 (1993) (citing, in turn, to 42 U.S.C. § 2232a)).<sup>42</sup> Section 182a of the AEA requires an NRC license application to provide, among other things, sufficient information for the NRC to determine the “character of the applicant” for a license. 42 U.S.C. § 2232a. This aspect of Section 182a, however, does not apply to DOE, nor does the character inquiry apply to this proceeding.

First, Nevada misconstrues the purpose of NRC’s statutory authority to consider the “character of the applicant.” The legislative history makes clear that Congress intended this provision to provide the Atomic Energy Commission with the authority to ensure that *private* applicants possessed the requisite character to be licensed under the AEA. The Joint Committee on Atomic Energy’s Report on Amending the Atomic Energy Act of 1946 states that the AEA would permit “the Commission to license private industry to possess and use special nuclear materials. . . . [It] also permits private persons . . . to own reactors intended to produce and utilize such materials.” S. Rep. No. 1699-83, at 9 (1954). For security reasons, the Joint Committee was concerned, among other things, about retaining strict controls on access to information about nuclear power. *See id.* at 7 (“Clearance for access to restricted data has been contingent upon an investigation as to the *character*, associations, and loyalty of the individual.”) (emphasis added).

---

<sup>42</sup> DOE also objects to Nevada’s routine practice of omitting page citations to Commission case law. This is contrary to the Advisory PAPO Board’s Case Management Order, which states that “references shall be as specific as possible.” LBP-08-10, slip op. at 7. DOE understands this directive to cover “legal authorities” as well. *See id.*

The same concerns motivated the previous “stringent prohibitions . . . against private participation in atomic energy.” *Id.* at 9. Thus, Section 182a specified that Commission licensees should possess the requisite “character.” 42 U.S.C. § 2232a.

Based on this provision, intended to safeguard the public from the unfettered *private* access to restricted information concerning nuclear power, Petitioner—the State of Nevada—now asks one agency of the federal government—NRC—to adjudicate sweeping allegations against the *general* character and “integrity” of another federal agency—DOE; an agency that Congress, through the AEA, the Energy Reorganization Act, the DOE Organization Act and other statutes, has assigned substantial national security responsibilities in this country and around the world. This is not what Congress had in mind when it determined that DOE “shall” apply for this license. 42 U.S.C. § 10134(b). This Board should decline Nevada’s invitation to redirect this proceeding away from the technical validity of the application towards this type of wide-ranging and unauthorized inquiry.

Moreover, in addition to the general provisions of AEA Section 182a, Section 121(b) of the NWPA provides more specific requirements for this license application proceeding. Specifically, NWPA Section 121(b) authorizes the Commission to “promulgate technical requirements and criteria that it will apply . . . in approving or disapproving *applications* for authorization to construct repositories . . . .” 42 U.S.C. § 10141(b) (emphasis added). This provision, unlike AEA Section 182a, omits any reference to an evaluation of character qualifications of the *applicant*, confirming that this proceeding is limited to an inquiry into the technical adequacy of the application, not the *general* character or integrity of the applicant.

## (2) Nevada Impermissibly Challenges the NWPA

In enacting the NWPA, Congress determined that DOE is the appropriate applicant for the license at issue in this proceeding and to exclude from this proceeding any wide-ranging inquiry into the technical qualifications of the applicant. Congress designated DOE as the applicant and it is not for the NRC to reconsider that designation. It is well established that a petitioner may not challenge applicable statutes as part of an adjudicatory proceeding. *Carolina Power & Light* (Shearon Harris Nuclear Power Plant), LBP-07-11, 65 NRC at 57-58 (2007) (citing *Phila. Elec. Co.* (Peach Bottom Atomic Power Station, Units 2 and 3), ALAB-216, 8 AEC 13, 20 (1974)) (stating that any contention that collaterally attacks applicable statutory requirements must be rejected by the Board as outside the scope of the proceeding).

As explained in Section (1), above, NWPA Section 121(b) specifies an inquiry into the technical adequacy of the application, but not into the general qualifications of the applicant. *See* 42 U.S.C. § 10141(b). Further, NWPA Section 114(b) directs DOE to construct and operate a geologic repository for the disposal of HLW. 42 U.S.C. § 10134(b) (“If the President recommends to Congress the Yucca Mountain Site . . . the Secretary [of Energy] shall submit to the Commission an application for a construction authorization for a repository . . .”). In so doing, Congress concluded that DOE, as an agency of the federal government, not only possesses the requisite attributes of an applicant, but is the *only* appropriate applicant for this license. Nevada’s contention is an impermissible challenge to Congress’ specifications for this proceeding and choice of applicant and, as such, constitutes a collateral attack on the NWPA.

If Nevada’s contention were admitted, it would place the NRC in the untenable position of potentially denying the application, not because of any identified technical inadequacy, but because of a dispute over the alleged integrity of the applicant. In that case, the NRC would be

overruling Congress's choice of DOE as the applicant. *Cf. U.S. Dep't of Energy (Plutonium Export License)*, CLI-04-14, 59 NRC 357, 375 (2004). In *Plutonium Export*, the Commission held that, in the nuclear export arena, "the Executive Branch's noninimicality determinations involve 'strategic judgments' and foreign policy and national security expertise regarding the common defense and security of the United States, and the NRC may properly rely on those conclusions." *Id.* at 374. In this proceeding, the situation is even more compelling in that the determination that Nevada seeks to challenge—Congress' choice of DOE as the appropriate applicant for this license—has been made by the Legislative Branch and this decision carries with it the force of law.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

As discussed above, Nevada's challenge to DOE's integrity and therefore its fitness to hold the construction authorization is not material to the findings the NRC must make in this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Even assuming that Nevada's "integrity" allegations are cognizable in this proceeding, they are still unsupported by adequate facts or expert opinion. The allegations rest primarily upon quotations from documents selectively taken out of context and then mischaracterized. As explained in the Legal Standards section above, Boards must carefully scrutinize factual allegations and the documents cited in support of contentions. This includes a review of the cited documents to confirm that they support the proposed contention. Section f(3), below, discusses each document cited by Nevada in support of its contention in more detail and explains why they fail, individually and collectively, to provide the requisite factual support for a

contention challenging DOE or OCRWM's integrity or character. Thus, this contention is not supported by references to sufficient facts.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Even if this contention were within the scope of this proceeding, it still fails to raise a genuine dispute on a material issue of fact or law.

**(1) General Legal Standards Governing Integrity-Related Allegations**

Historical actions by an applicant or licensee are not relevant to its current fitness as an applicant unless “there [is] some direct and obvious relationship between the [alleged] character issues and the licensing action in dispute.” *Dominion Nuclear Conn.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC 349, 365 (2001) (citation omitted); *see also Ga. Inst. of Tech.* (Georgia Tech Research Reactor), CLI-95-12, 42 NRC 111, 120 (1995) (stating that “[a]llegations of management improprieties or poor ‘integrity,’ of course, must be of more than historical interest: they must relate directly to the proposed licensing action”). As the Commission has noted,

To accept the Petitioners' reasoning [regarding alleged historical management deficiencies] would potentially insert management integrity issues into virtually all [licensing] proceedings at facilities with prior violations . . . . We cannot allow admission of contentions premised on a general fear that a licensee cannot be trusted to follow regulations of any kind . . . . [W]hen ‘character’ or ‘integrity’ issues are raised, we expect them to be directly germane to the challenged licensing action.

*Dominion Nuclear Conn.*, CLI-024, 54 NRC at 366-67.

Since the *Dominion Nuclear Conn.* case, the Commission has consistently followed this principle. For example, in *La. Energy Servs., L.P.* (National Enrichment Facility), the Commission upheld the Board's rejection of a contention alleging historical management

improprieties because the intervenors “nowhere linked these individuals [who were involved in past deficiencies] to [the applicant’s] *current* management personnel or practices, and thus they have not shown how these long-ago alleged historical events pertain to the proposed . . . facility.” CLI-05-28, 62 NRC 721, 724 (2005) (emphasis in original). Thus, the Board “correctly found that [the intervenors] did not demonstrate a direct and obvious relationship between the alleged management character issues and the licensing action at issue. *Id.* at 725 (citations and quotations omitted); *see also USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 464-65 (2006) (upholding the Board’s rejection of a similar contention alleging management incompetence and improprieties).

Accordingly, a petitioner may not use allegations of historical DOE deficiencies or alleged management improprieties as a basis for a contention. This is because “this proceeding cannot be a forum to litigate whether [the applicant] made mistakes in the past, but must focus on whether [the applicant] as presently organized and staffed can provide reasonable assurance of candor and willingness to follow NRC regulations.” *Ga. Inst. of Tech* (Georgia Tech Research Reactor), CLI-95-12, 42 NRC at 120-21; *see also Metro. Edison Co.* (Three Mile Island Nuclear Station, Unit No. 1), CLI-85-9, 21 NRC 1118, 1139 (1985) (“It is the qualifications of this management, not the management of 6 years ago, that the Commission is now evaluating.”).

Moreover, alleged errors—or even multiple violations of NRC requirements—are insufficient by themselves to raise a valid “management” contention. *Cf. USEC, Inc.*, CLI-06-10, 63 NRC at 465 (upholding the Board rejection of a management competence contention because intervenor’s claims did not “present any *ongoing* pattern of violations or disregard for regulations that might be expected to occur in the future”) (emphasis in original); *Union Elec. Co.* (Callaway Plant, Unit 1), ALAB-740, 18 NRC 343, 346 (1983) (a contention alleging a

systemic quality assurance breakdown must be “of sufficient dimensions to raise legitimate doubt as to the overall integrity of the facility and its safety-related structures”). The NRC also recognizes that applicants may make errors, so evaluations of character and integrity must include an evaluation of corrective actions. *Houston Lighting & Power Co.* (South Texas Project, Units 1 & 2), ALAB-799, 21 NRC 360, 373-74 (1985). In fact, an applicant’s corrective actions alone are evidence of good character, even without evidence that those corrective actions were effective. *Houston Lighting & Power Co.* (South Texas Project, Units 1 & 2), LBP-84-13, 19 NRC 659, 688 (1984), *aff’d* ALAB-799, 21 NRC 360 (1985) (“An applicant’s sincere attempts to correct deficiencies may be viewed as favorable from a character standpoint irrespective of success.”).

As explained in Section (2), below, all of Nevada’s integrity-related allegations relate to historical deficiencies, technical matters that have been corrected, or otherwise fail to raise any recognizable integrity issue.

**(2) Petitioners Face An Elevated Burden to Raise Integrity-Related Allegations In This Proceeding**

Even if this Board were to find that an integrity claim could conceivably be made in this proceeding, the petitioner would face an elevated burden of demonstrating its allegations through “clear evidence” that must be sufficient to rebut the presumption that DOE and its officials act with integrity.

DOE (and the specific organization responsible for this Application, OCRWM) is an agency of the United States government, and so therefore can be presumed to possess the requisite integrity to hold a license from another agency of the United States government. It is well-established that a “presumption of regularity attaches to the actions of Government agencies . . . .” *U.S. Postal Serv. v. Gregory*, 534 U.S. 1, 10 (2001) (citation omitted); *see also U.S. Dep’t*

*of Energy* (High-Level Waste Repository: Pre-Application Matters), CLI-08-11, 68 NRC \_\_ (slip op. at 8) (June 5, 2008). As the Commission has recognized in these proceedings, “[a]bsent clear evidence to the contrary, we presume that public officers will properly discharge their official duties.” *U.S. Dept. of Energy*, CLI-08-11, 68 NRC \_\_\_\_\_ (slip op. at 8) (internal quotations, brackets and citation omitted). Thus, Petitioners in this proceeding face an elevated burden, beyond that in the case law described in Section (1), above, of demonstrating their integrity-related allegations through clear evidence.

In attempting to rebut this presumption, Nevada fails to recognize that DOE is already an NRC licensee, and raises no specific integrity-related issues with respect to DOE’s conduct under its existing NRC licenses. For example, since 1999 DOE has held an independent spent fuel storage facility (“ISFSI”) license for the Three Mile Island-2 ISFSI (Materials License SNM-2508). *See also U.S. Dep’t of Energy*, CLI-04-17, 59 NRC at 375 (rejecting an intervention petition and authorizing issuance of a license to DOE to export 140 kg of plutonium oxide to France). Nevada fails to identify any inspection report documenting any integrity concerns from an NRC inspector, much less provide evidence of such integrity concerns that are sufficiently linked, in time and subject matter, to the instant proceeding.

Most importantly, in its claim that the Department lacks integrity, Nevada fails to address the fact that DOE is the agency that Congress has entrusted to undertake an enormous range of activities related to energy, the environment and the national defense, not the least of which is its charter “[t]o maintain the safety, reliability, and security of the United States nuclear weapons stockpile.” 50 U.S.C. § 2534(a)(1). It is therefore unreasonable to suggest that DOE does not have the character or integrity to build and operate this repository.

### **(3) None of Nevada’s Specific Allegations Raise a Genuine Dispute**

Ultimately, this contention is based on six discrete allegations that are intended to place DOE’s character and integrity into dispute. These allegations relate to isolated and dated events and therefore fail to show a systemic integrity breakdown across DOE, OCRWM, or the Yucca Mountain Project.

For perspective, there are well over three million documents currently in the LSN, the vast majority generated by DOE over the long life of this project. Nevada seizes upon isolated groups of these documents, reads them out of context, fails to provide any subsequent documents that might put in context the disjointed quotes it relies upon, and then extrapolates from those quotations a claim that the entire United States Department of Energy lacks the integrity to hold an NRC license. Thus, as explained in detail below, Nevada fails to raise any litigable issues regarding DOE’s integrity.

#### **(a) Safety-Conscious Work Environment**

Nevada begins its claim with vague allusions to the NRC’s emphasis on a “safety conscious work environment” (“SCWE”), and seeks to compare its allegations to certain NRC enforcement actions against other licensees, purportedly “[o]n grounds less compelling than those described below.” Petition at 17. Nevada, however, utterly fails to explain, with reference to any specific facts, how its allegations against DOE are more “compelling” than the facts of the various enforcement orders that it cites. *See id.* In any event, none of the alleged comparable cases cited by Nevada formed the basis for NRC to revoke or deny a license. In all of the cases cited by Nevada on this point, even though NRC enforcement was involved, the NRC nonetheless permitted continued licensed activities.

Moreover, SCWE is an NRC Staff policy, not a regulatory requirement. This is clear from Nevada's citations to a Staff Inspection Manual Chapter (for *operating reactors*) and an Inspection Procedure (again for *operating reactors*). Because SCWE is not a regulatory requirement, nor is it a licensing criterion under Part 63, SCWE-related claims are not litigable in this proceeding.

DOE nevertheless takes SCWE very seriously. Indeed, as discussed below, when read in context, the very documents Nevada cites in its remaining allegations primarily serve to illustrate the Yucca Mountain Project's deep commitment to healthy safety culture, including SCWE.

**(b) The 2004 PAPO Board Decision**

Nevada selectively quotes from the PAPO Board's decision overturning DOE's initial LSN certification, claiming this as an example of DOE "violati[on] of NRC regulations." Petition at 18. The cited PAPO Board decision resolved certain factual and legal disputes between Nevada and DOE over the regulations governing the LSN. *U.S. Dep't of Energy* (High-Level Waste Repository), LBP-04-20, 60 NRC 300 (2004) (PAPO Board Decision). At all times in the course of that proceeding DOE raised and argued its points in good faith, and nothing in Nevada's citation to this earlier dispute calls DOE's integrity into question.

Any deficiencies identified in the PAPO Board Decision have now been remedied. DOE has certified its LSN compliance, and the PAPO Board upheld that certification against Nevada's challenge. *See U.S. Dep't of Energy* (High-Level Waste Repository: Pre-Application Matters), LBP-08-01, 67 NRC \_\_ (January 4, 2008), *aff'd*, CLI-08-12, 67 NRC \_\_ (June 17, 2008). Historical deficiencies that have been subsequently corrected are insufficient to raise an integrity or management issue in an NRC proceeding. *Dominion Nuclear Conn.*, CLI-01-24, 54 NRC at 366; *see Houston Lighting & Power Co.*, ALAB-799, 21 NRC at 373-74.

In addition, Nevada fails to explain how the Board's statements that DOE's approach "strain[ed] credulity" or that "DOE and its agents did not get their act together in time" or identifying "fundamental and system-wide problem[s]" raise integrity, candor, or character issues. Petition at 18. Indeed, the parties did not raise, nor did the PAPO Board adjudicate, any such issues. Nevada essentially rewrites a narrow Board decision on disputed legal and factual matters. It does so by juxtaposing unfounded "integrity" allegations—allegations that the Board did not identify or address—against certain selected quotations from the Board's opinion.

**(c) Project Documents from 2006 and 2007**

Nevada identifies certain Yucca Mountain Project documents that, it argues, show that the project's June 30, 2008 LA submittal goal led to compromises on safety. Allegedly, the documents show that, "[e]xamples abound indicating that DOE abetted or tolerated, if not established, a culture in which meeting artificial schedules was more important than safety or compliance, and withheld material safety information from the NRC, with apparent willful intent." Petition at 18.

As explained in further detail below, the information cited by Nevada in support of its serious allegation fails to raise a genuine dispute for four reasons. First, Nevada unjustifiably draws general conclusions from its selective quotation of three LSN documents. Second, Nevada fails to explain how setting a schedule, by itself, indicates an integrity issue within the Yucca Mountain Project. Third, when the project's statements are looked at as a whole, they show that the Yucca Mountain Project has taken a balanced approach to safety, quality, and schedule. Finally, Nevada's allegations are unsupported by the very documents Nevada identifies.

Nevada claims that a federal agency lacks integrity based on quotations taken out of context from three documents that it has hand-picked from a collection of millions of DOE LSN documents. Nevada's examples are isolated events that are not symptomatic of a pattern of ongoing management deficiencies, much less of ongoing, safety significant, integrity-related regulatory violations. *Cf. USEC, Inc.*, CLI-06-10, 63 NRC at 465; *Union Elec. Co.*, ALAB-740, 18 NRC at 346. Nor has Nevada made or supported any reasonable argument demonstrating that such isolated events are symptomatic of a pattern of integrity deficiencies. As explained further below, Nevada fails to show such a pattern through the requisite clear evidence. *U.S. Dept. of Energy*, CLI-08-11, 68 NRC \_\_\_\_, (slip op. at 8).

Establishing time-minded goals and a management emphasis on schedule are not by themselves indicative of an integrity (or competence) issue. Simply because management establishes and holds its team to a schedule does not show that safety is compromised.

Moreover, in this contention, Nevada criticizes DOE's *current* project team for sticking to a schedule established by management. In NEV-SAFETY-02, however, Nevada takes the reverse approach: criticizing DOE management for failing to meet such deadlines in the past. *E.g.*, Petition at 32. That is, under NEV-SAFETY-01, if DOE meets the schedule it lacks the integrity to slow down and do it right, but under NEV-SAFETY-02, if it exceeds the schedule it lacks management competence. Read together, NEV-SAFETY-02 and this contention illustrate Nevada's willingness to contradict itself in an effort to "throw the kitchen sink" at DOE.

When looked at as a whole, DOE's project management team's statements show that the Yucca Mountain Project has taken an appropriate balance between safety, quality, and schedule. Nevada provides no specific example of where the Yucca Mountain Project gave priority to schedule over safety and quality. This is primarily because the project's management has

repeatedly emphasized, in its statements inside and outside the project, that safety, quality, and schedule discipline are all equally expected. For example, as Ward Sproat, the Director of OCRWM stated to Congress, “the concepts of safety, quality and schedule discipline are not mutually exclusive. This concept is demonstrated by world class nuclear organizations on a daily basis and I intend to hold my organization and its contractors to the same standards.” Hearing Before the Subcomm. on Energy and Air Quality of the H. Comm. on Energy and Commerce, 109th Cong. (July 19, 2006) (Statement of Edward F. Sproat III, Director, OCRWM, DOE) at 3 (*available at*: <http://archives.energycommerce.house.gov/reparchives/108/Hearings/07192006hearing1986/Sproat.pdf>) (Attachment NEV-SAFETY-01-1).

Finally, contrary to Nevada’s assertions, the documents Nevada cites in support of its contention are neither numerous nor do they clearly show that DOE, the Yucca Mountain Project, or its contractors placed an artificial schedule over safety or compliance. Rather, when read in their entirety, those documents demonstrate that DOE’s “Lead Lab,” Sandia National Laboratories (“Sandia”) and Bechtel SAIC Company, LLC, the management and operating (“M&O”) contractor for the Yucca Mountain Project, in cooperation with DOE, prepared safety analyses intended to support a credible and defensible License Application that DOE submitted to the NRC on June 3, 2008. Each of the documents cited by Nevada in this contention are addressed in detail below.

**(i) The First Document Does Not Support Nevada’s Contention**

The first document Nevada cites is an internal Sandia e-mail dated October 2, 2006, concerning Analysis Modeling Report (“AMR”) schedule status as of that date. LSN No. DN2002359161. As background, the AMRs, among other things, constitute the basis for the

Total System Performance Assessment (TSPA) form and function. What Nevada does not explain is that DOE and Sandia needed to have the TSPA form and function stable by December 15, 2006, in order to complete a TSPA to meet OCRWM's June 2008 date for submittal of a docketable Application. Nevada alleges that the referenced e-mail concerning AMRs "indicates that schedule clearly drives the product." Petition at 19.

This first document correctly asks its recipient(s) to identify what can and cannot be delivered by the December 2006 deadline. LSN No. DN2002359161 at 1 ("Delays are not acceptable. *Instead please identify in detail what can be delivered by the 12/15/06 dead line and what cannot.*") (emphasis added). Importantly, however, the document continues to focus on TSPA adequacy notwithstanding schedule targets in stating that "[w]e need to identify risks and then mitigate them in such a way that we have product that is docketable and adequately defensible for submittal in June of 08." *Id.* Thus, the author of this document is directing that the inputs to the TSPA be docketable and defensible, while simultaneously acknowledging the reality of an external schedule. Nothing in this e-mail suggests that its author—or the project in general—lacks the requisite integrity, candor, or character to obtain a license to construct the Yucca Mountain repository.

**(ii) The Second Document Does Not Support Nevada's Contention**

The second document Nevada cites is another internal Sandia e-mail dated October 10, 2006. LSN No. DN2002319598. It was sent by the Near-Field Environment ("NFE") Group manager to his group. For perspective, the NFE Group is responsible for the few postclosure analyses related to changes in chemistry within the emplacement drifts, the radionuclide source term, and coupled processes and seepage. Nevada focuses on three statements in this two-page document: (1) "My responsibility, as NFE Manager, is to ensure that the 3 priorities – schedule,

defensibility, credibility – in that order, are satisfied”; (2) “If we do not meet the June 30 deadline, ‘we are all out of a job’”; and (3) “Any slips in schedule will be recovered by cutting scope. There is no allowance for not meeting schedule.” Petition at 19-20.

Nevada ignores the remainder of the document which, when considered, refutes Nevada’s allegations. Specifically, Nevada ignores the fact that the NFE Group manager states that “Our mandate as a part of the Lead Lab organization is to produce a credible (i.e., technically competent) and defensible (i.e., compliant with 10 CFR 63 and traceable) License Application on or before June 30, 2008 (i.e., on schedule).” LSN No. DN2002319598 at 1. He also states that although *he* is focused on schedule, “[d]etailed technical direction, integration, and decisions about necessary work scope will be provided by the two Technical Leads . . . .” *Id.* at 2. These statements confirm what Mr. Sproat told Congress; namely, that the concepts of safety, quality, and schedule are not mutually exclusive.

It is also inappropriate for Nevada to construe the quote: “we are all out of a job” in an absolutely literal manner. The author of the second document obviously placed this phrase in quotes to make it clear that it was not a literal threat. LSN No. DN2002319598 at 1. Instead, the quoted language was intended to call attention to a belief that the entire Yucca Mountain project, already more than a decade behind schedule, risked losing Congressional and public support if it failed to show progress in meeting reasonable milestones. *Cf.* Petition at 32. The “we” is thus not the NFE Group (or the Sandia YM team as Nevada asserts), but rather the entire Yucca Mountain Project. In any event, by no stretch of logic can this one isolated statement by a single individual reasonably be interpreted to call into question the integrity of either DOE or the Yucca Mountain Project.

**(iii) The Third Document Does Not Support Nevada's Contention**

The third document is a *draft* technical work plan for the defensibility for technical products supporting the license application. LSN No. DN2002502865. Nevada uses the third document to speculate that “it was acceptable to DOE if the LA filed with the NRC included known but undisclosed ‘residual vulnerabilities’ in safety evaluations, but, if NRC Staff, Nevada, or some other stakeholder were to find out about them, DOE (with Sandia's assistance) would need to be ready with some explanation.” Petition at 20.

This allegation is also completely unfounded and derived from an out of context reading of the cited document. This document specifically states that *if* correcting an issue is not possible, then Sandia will attempt to “mitigate its impacts so that no important licensing considerations are compromised.” LSN No. DN2002502865 at Encl. at 1.<sup>43</sup> And if the issue cannot be appropriately mitigated, Sandia will raise it with DOE, “and will work with the DOE to arrive at a solution that is consistent with . . . public health and safety, and protection of the environment.” *Id.* In addition, Sandia is expected to “[p]erform a vulnerability assessment . . . and implement mitigation plans to eliminate identified vulnerabilities . . . .” *Id.* at 2.

Accordingly, this document provides evidence that Sandia planned to work diligently to ensure that the LA *would be credible and defensible* as required by 10 C.F.R. Part 63. Read as a whole and in context, it does not suggest, as Nevada speculates, that Sandia intended to ignore 10 C.F.R. § 63.11(a), but rather that Sandia worked to eliminate vulnerabilities through appropriate analyses.

---

<sup>43</sup> The project could have accomplished this by incorporating additional conservatisms in the analysis in order to bound the uncertainty or problem that could not be quantitatively resolved due to financial or schedule constraints. For example, Sandia might hypothetically be able to resolve a problem with a \$50 million analysis that would take two more years to complete. Mitigating the risk by using additional conservatisms under such a circumstance would be the prudent thing to do. It would be neither improper, nor, as Nevada alleges, illegal.

In sum, Nevada selectively cites and mischaracterizes the three isolated Yucca Mountain Project documents it relies upon. Read as a whole, these documents do not, individually or collectively, raise any technical issues with respect to the Yucca Mountain LA, much less do they show a pattern of safety-significant “integrity” issues with respect to DOE, the Yucca Mountain Project, or its contractors.

**(d) “Earlier” E-mail Messages**

Nevada complains of certain “earlier e-mail messages [that] are even worse.” Petition at 20. All but one of these e-mails are more than ten years old, and all are more than six years old. *All of these statements are in e-mails involving a single individual*, and that same individual authored nearly all of the quoted statements. *See id.* at 20-21 (citing LSN Nos. DEN001231578 at 1, DEN001222278 at 1, DN2000734458 at 1, DEN001212230 at 1, DEN001225591 at 1, DN2001131123 at 4.<sup>44</sup> As noted above, to support a character or integrity contention, Nevada bears the burden of showing that its allegations are of “more than historical interest,” and of showing a “direct and obvious relationship between the character issues and the licensing action in dispute.” *E.g., Dominion Nuclear Conn., CLI-01-24*, 54 NRC at 365. Nevada fails to draw any such connection, either by showing that the specific individuals involved were in management positions or remain in management positions in the Yucca Mountain Project, or by showing that these incidents are part of a pattern of misconduct that impacts this project today. *See La. Energy Servs., L.P., CLI-05-28*, 62 NRC at 724 (proponents of a management contention bear the burden of linking the individuals involved in alleged historical deficiencies to current personnel or practices).

---

<sup>44</sup> A cursory review of the cited e-mail messages also reveals that the author clearly felt free to express his opinions without fear of retribution, which attests to the SCWE of the project. The e-mails also focus on personalities.

**(e) Toxic Silica Allegations from the 1990s**

Nevada claims that, “because of concerns about schedule and possible litigation, DOE failed to implement any controls or respiratory protection” to protect workers at the Exploratory Studies Facility (“ESF”) from “toxic respirable silica” during the 1990s. Petition at 21. This issue fails to raise a genuine dispute on a material issue of law or fact because it is not relevant to this licensing proceeding. Nevada fails to demonstrate the requisite nexus, in time and subject matter, between these allegations and this licensing proceeding.<sup>45</sup> As described in Section (1), above, for an integrity or character-related contention to be admissible, there must be a “direct and obvious relationship between the [alleged] character issues and the licensing action in dispute.” *Dominion Nuclear Conn., Inc.*, LBP-04-15, 60 NRC at 95 (2004) *aff’d*, CLI-04-6, 60 NRC 631 (2004).

Nevada fails to show the requisite direct and obvious relationship between its toxic silica-related allegations and this proceeding. This is because non-radiological health and safety issues, including this type of occupational hazard, are not regulated by the NRC and are therefore generally not relevant to NRC proceedings. Specifically, the NRC does not regulate non-radiological hazards such as “local codes, OSHA regulations, or national standards on fire safety, occupational safety, and building safety.” *Curators of the Univ. of Mo.*, CLI-95-8, 41 NRC 386, 393 (1995). This is because the NRC “is not a general fire safety or occupational health agency.” *Id.* (internal quotations omitted); *see also Private Fuel Storage, LLC* (Independent

---

<sup>45</sup> Moreover, some of Nevada’s representations related to this issue are not only unsupported but false. For example, Nevada asserts that the Nuclear Waste Technical Review Board (“NWTRB”) reported to Congress that “DOE failed to incorporate necessary engineering controls, dust management on the tunnel boring machine . . . despite knowing that silica dust would likely be a hazard to all in the tunnels.” Petition at 22 (citing LSN# DN2001635791, (“Underground Exploration and Testing at Yucca Mountain – A Report to Congress and the Secretary of Energy, Nuclear Waste Technical Review Board, October, 1993,”) at vii and 23). A review of the NWTRB’s report, however, reveals absolutely no discussion of dust controls or silica-related issues, much less any support for Nevada’s assertions.

Spent Fuel Storage Installation), LBP-00-35, 52 NRC 364, 388 (2000) (relying on *Curators* to reject Utah’s claim that the NRC should review the applicant’s Emergency Plan and fire-fighting capability for “all fires onsite, whether or not they result in a radiological release” and noting that the applicant would be subject to State, local, and Federal OSHA regulatory requirements).

These toxic silica-related allegations are also, as Nevada admits, merely of historical interest. The allegations relate to events that took place during the 1990s, or, as Nevada puts it, “during the ESF/ECRB construction period” Petition at 25, which ended some ten years ago. *See id.* at 24. Nevada even identifies how DOE addressed silica-related issues: by instituting a “Silicosis Screening Program” in 2004. *Id.* at 25. Thus, Nevada’s own pleading demonstrates that there is no ongoing health and safety issue, nor is there an ongoing integrity issue. *See Houston Lighting & Power Co.* (South Texas Project, Units 1 and 2), LBP-84-13, 19 NRC 659, 688 (1984), *aff’d* ALAB-799, 21 NRC at 360, 373-74 (1985) (evaluations of character and integrity must include an evaluation of corrective actions). Nevada cannot use “integrity” or “character” as a mechanism to bootstrap issues into this proceeding that would otherwise be far beyond its scope, or otherwise insufficiently related to the current Yucca Mountain Project management or the adequacy of the LA. Nevada seeks to use “integrity” as a Trojan horse to introduce into this proceeding historical OSHA-related issues with no direct and obvious relationship to the Application. The Board must reject Nevada’s invitation to turn this litigation into a sweeping inquiry into such extraneous topics.

**(f) The ORISE Infiltration Study**

Nevada cites to an April 30, 2008 study by Oak Ridge Institute for Science and Education (“ORISE”). LSN Nos. DEN001594989 and DEN001595302 (“ORISE Study”). Nevada alleges that the ORISE Study concludes that DOE’s “model report does not provide a technically

credible spatial representation of net infiltration at Yucca Mountain.” Petition at 26 (quoting ORISE Study at v). Nevada further alleges that, because SAR Section 2.3.1.3.2.1.3 does not “mention this report,” DOE has committed a “willful omission of important safety information.” Petition at 26. Like all of the previous allegations proffered in this contention, this claim has no merit and the Board should reject it.

DOE’s position is that the existing infiltration model and infiltration estimates underlying the LA are sufficiently conservative to address the matters raised in the ORISE Study. Nevada disagrees, and has submitted contentions that rely upon the ORISE Study. *See, e.g.*, DOE’s responses to NEV-SAFETY-20; NEV-SAFETY-23, NEV-SAFETY-25 below. Nevada’s disagreement with DOE’s technical judgments does not raise an “integrity” issue.

Indeed, DOE explained its technical position on this matter in its response to Nevada’s second unauthorized attempt to prevent the Application from being docketed. U.S. Department of Energy Response to the State of Nevada’s Supplemental Pre-Docketing Petition to Reject the Yucca Mountain License Application (July 31, 2008) at 14 n.57. Thus, Nevada was on notice that this was purely a technical disagreement, but nevertheless chose to again accuse DOE of “a lack of integrity” with respect to the ORISE Study. Petition at 26. Further confirming the baseless nature of Nevada’s claims of “willful omission,” DOE made no effort to conceal the ORISE Study or otherwise address its significance in anything less than a fully candid manner. The ORISE Study has been publicly available on the LSN since June 25, 2008 and therefore accessible to all parties and potential parties, including the NRC Staff and Nevada.

For all these reasons, none of the allegations made in this contention, either individually or collectively, raise a genuine dispute on a material issue of law or fact.

## **2. NEV-SAFETY-02 - Doe Management**

The LA cannot be granted because DOE lacks the requisite management ability to construct and operate a safe repository.

### **RESPONSE**

In this contention Nevada alleges that DOE lacks the requisite management ability to obtain a license from the NRC because of alleged instances of mismanagement of the Yucca Mountain Project and “other large projects.” Petition at 28.

This contention is Nevada’s second attempt, after NEV-SAFETY-01, to redirect this proceeding away from an adjudication of the technical adequacy of the application. Under the NWPA and the regulations in Part 63, this proceeding does not include an inquiry into the general management competence or “technical qualifications” of the applicant. Instead, Congress identified DOE as the applicant in this proceeding because of such qualifications. Even if such an inquiry were authorized in this proceeding—which, again, it is not—Nevada fails to present credible evidence of a systemic management competence issue within DOE, OCRWM, or the Yucca Mountain Project. On the contrary, this contention, like NEV-SAFETY-01, presents certain selected information, much of it years old or unrelated to this Application or both, that Nevada reads out of context in another failed effort to undermine DOE’s qualifications.

DOE is committed to having personnel with the requisite knowledge and experience in charge of the construction and operation of the Yucca Mountain repository and will comply with all NRC requirements in this regard. Nevada, however, seeks to go beyond those requirements and initiate an open-ended inquiry into DOE’s management record. Such an inquiry is outside

the scope of this proceeding. This contention also lacks an adequate factual premise and fails to raise a genuine dispute of law or fact; and, for the reasons more fully discussed below, it should be denied.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is outside the scope of this proceeding because, as explained below, it impermissibly challenges the NWPA, 42 U.S.C. § 10101 *et seq.*, and the Commission's regulations, and because it impermissibly raises allegations of non-radiological harm. In sum, Nevada has attempted to redirect this proceeding away from an adjudication of the technical adequacy of the *application*,<sup>46</sup> towards an impermissible and wide-ranging inquiry into the general management competence of a department of the United States government, which is the statutory *applicant*.

**(1) Impermissible Challenge to the NWPA**

This contention is outside the scope of this proceeding because it impermissibly challenges Congress' determination, in the NWPA, that DOE is the appropriate applicant for the license at issue in this proceeding and that its general technical qualifications or management

---

<sup>46</sup> The Commission's Notice of Hearing, which defines the scope of this proceeding states, in pertinent part, that "The matters of fact and law to be considered are whether the *application* satisfies the applicable safety, security, and technical standards of the AEA and NWPA and the NRC's standards in 10 CFR Part 63 for construction authorization for a high-level waste repository . . . ." Hearing Notice, 73 Fed. Reg. at 63,029 (emphasis added).

competence should not be further adjudicated. Congress designated DOE as the applicant, and it is not for the NRC to reconsider that designation. It is well established that a petitioner may not challenge applicable statutes as part of an adjudicatory proceeding. *Carolina Power & Light* (Shearon Harris Nuclear Power Plant Unit 1), LBP-07-11, 65 NRC 41, 57-58 (2007) (citing *Phila. Elec. Co.* (Peach Bottom Atomic Power Station, Units 2 and 3), ALAB-216, 8 AEC 13, 20 (1974)) (stating that any contention that collaterally attacks applicable statutory requirements must be rejected by the Board as outside the scope of the proceeding).

Section 121(b) of the NWPA authorizes the Commission to “promulgate technical requirements and criteria that it will apply . . . in approving or disapproving *applications* for authorization to construct repositories . . .” 42 U.S.C. § 10141(b) (emphasis added). This provision, unlike the more general license application specifications in AEA § 182a (42 U.S.C. § 2232a), contains no reference to a general evaluation of the applicant’s management and technical qualifications, showing that this proceeding is limited to an inquiry into the technical adequacy of the application, not the management competence or general technical competence of the applicant.

Section 114(b) of the NWPA also directs DOE to apply for a license to construct and operate a geologic repository for the disposal of HLW. 42 U.S.C. § 10134(b) (“If the President recommends to Congress the Yucca Mountain Site . . . the Secretary [of Energy] shall submit to the Commission an application for a construction authorization for a repository . . .”). In so doing, Congress concluded that DOE, as an agency of the federal government, not only possesses the requisite attributes of an applicant, but is the *only* appropriate applicant for this license.

The legislative history of the NWPA confirms that Congress selected DOE because of its management and technical qualifications. During the debates on the NWPA in 1982, one of the key Senate sponsors of the bill explained the reason for the choice of DOE as the applicant for a high-level waste repository—and why no new independent agency was necessary:

There is no doubt in my mind that the current structure of the Department of Energy as is now established by statute is capable of carrying out the responsibilities that will be imposed upon them under this legislation . . . . [Further, DOE has] the administrative capability and the structural capability to deal with the administration of this program under the existing administrative framework.

128 Cong. Rec. S4127 (Apr. 28, 1992) (statements of Sen. McClure). Simply put, if Congress had doubts about DOE’s ability to manage this project, it could have created an independent agency. *See id.* However, after considering this option, Congress chose DOE. *Id.* Thus, the legislative history of the NWPA confirms that Congress selected DOE as the *only* applicant for this license *because of its unique technical and management qualifications*. Nevada’s contention directly and impermissibly attacks this Congressional judgment.

Nevada’s contention is therefore a challenge to Congress’ exclusion of generalized management inquiries from this proceeding and to its selection of DOE as the appropriately qualified applicant and, as such, constitutes an impermissible collateral attack on the NWPA.

If Nevada’s contention were admitted, it would place the NRC in the untenable position of potentially denying the application not because of any identified technical inadequacy, but because of a dispute over the general management qualifications of the applicant. In that case, the NRC would be overruling Congress’s choice of DOE as the applicant. *Cf. U.S. Dep’t of Energy, CLI-04-17, 59 NRC at 375.* In *U.S. Dep’t of Energy*, the Commission held that, in the nuclear export arena, the “Executive Branch’s noninimicality determinations involve ‘strategic

judgments’ and foreign policy and national security expertise regarding the common defense and security of the United States, and the NRC may properly rely on those conclusions.” *Id.* In this proceeding, the situation is even more compelling in that the determination that Nevada seeks to challenge—Congress’ choice of DOE as the appropriate applicant for this license—has been made by the Legislative Branch and this decision carries with it the force of law.

## (2) Impermissible Challenge to Commission Regulations

This contention is also outside the scope of this proceeding because it is an impermissible challenge to NRC’s regulations implementing the NWPA and the Atomic Energy Act of 1954 (“AEA”). As explained in Section (1), above, Section 182a of the AEA sets forth general requirements for NRC license applications. Congress provided more specific direction in this proceeding in NWPA § 121(b). As noted above, this provision authorizes the Commission to “promulgate *technical requirements and criteria* that it will apply . . . in approving or disapproving” this construction authorization license application. 42 U.S.C. § 10141(b) (emphasis added). It does not specify an adjudication of the general “technical qualifications of the applicant.”

In implementing these statutory directives, the NRC promulgated Part 63 without any reference to an evaluation of management competence or the general technical qualifications of the applicant. Such an evaluation would be unauthorized and unnecessary because, as explained in Section (1), above, Congress already determined that DOE possessed the requisite technical and management qualifications. In contrast to Part 63, Part 50 specifies that power reactor licensees must demonstrate their technical qualifications during the licensing process. *See* 10 C.F.R. § 50.34(a)(9) (requiring a showing of the technical qualifications of an applicant for a construction permit); *id.* § 50.34(b)(7) (requiring a showing of the technical qualifications of an

applicant for an operating license). Other NRC licensing regimes require a similar analysis of prospective licensees. *See id.* § 30.33(a)(3) (requiring the Commission to find that a byproduct material license applicant “is qualified by training and experience”); *id.* § 70.23(a)(2) (specifying a similar required finding for special nuclear materials license applicants); *id.* § 40.32(b) (specifying a similar required finding for source material license applicants). No such provisions appear in Part 63, however.

Thus, unlike proceedings under Part 50 and similar licensing regimes, in this proceeding there is no adjudication of the *general* technical and management qualifications of the applicant. The cases Nevada cites in support of its overly broad claim that “an applicant’s management competence is a proper consideration in a licensing proceeding,” Petition at 28, are all therefore inapposite, because they address licensing actions under these other regulations. *See Piping Specialists, Inc.* (Kansas City, Mo.), CLI-92-16, 36 NRC 351, 351 (1992) (Part 30); *La. Energy Servs., LP* (Claiborne Enrichment Center), LBP-91-41, 34 NRC 332, 332 (1991) (Part 70); *Sequoyah Fuels Corp.* (Sequoyah UF-6 to UF 4 Facility), CLI-86-17, 24 NRC 489, 489 (1986) (Part 40).

Part 63 does specify, like other regulatory regimes, that the LA must include a description of the Yucca Mountain Project’s “organizational structure,” its “key positions” with responsibility for safety, personnel qualifications, and other programmatic items. *See* 10 C.F.R. § 63.21(c)(22). As explained above, however, and in contrast to other NRC licensing regulations, Part 63 omits any more general inquiry into the applicant’s technical qualifications. Thus, although certain narrow aspects of the Yucca Mountain Project’s organizational structure

and specified other programmatic topics are within the scope of this proceeding, a wide-ranging inquiry into DOE's management competence is not.<sup>47</sup>

Thus, Nevada's contention impermissibly challenges Commission regulations, contrary to 10 C.F.R. § 2.335, and is outside the scope of this proceeding.

### **(3) Outside the Scope of the Notice of Hearing**

The Commission's Notice of Hearing, which defines the scope of this proceeding states, in pertinent part, that "The matters of fact and law to be considered are whether the application satisfies the applicable safety, security, and technical standards of the AEA and NWPA and the NRC's standards in 10 CFR Part 63 for construction authorization for a high-level waste repository . . . ." Hearing Notice, 73 Fed. Reg. at 63,029 (emphasis added). Like the regulations in Part 63, the Notice of Hearing limits the scope of this proceeding to an adjudication of the technical adequacy of the license application, as opposed to a wide-ranging inquiry into the general management competence or technical qualifications of the applicant. Thus, this contention is also outside the scope of this proceeding as defined in the Notice of Hearing.

#### **d. Whether the Issue is Material to the Findings that the NRC Must Make**

As discussed above, Nevada's challenge to DOE's general management competence goes beyond the information required by 10 C.F.R. § 63.21(c)(22) and, therefore, its general fitness to hold the construction authorization is not material to the findings the NRC must make in this proceeding.

---

<sup>47</sup> In any case, the LA provides the information required under 10 C.F.R. § 63.21(c)(22) in the programmatic sections of the application, *i.e.*, Chapter 5 of the SAR. Nevada fails to identify any specific disputes with this information. Indeed, it admits that "no particular sections of the application are directly pertinent" to the issues raised in this contention. Pet. at 44. Thus, Nevada's contention could be construed as either a demand to produce information not required by regulation, or a demand that the Commission change its regulations. Neither claim is permissible. *See* 10 C.F.R. § 2.335.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Even assuming that Nevada's "management" allegations are cognizable in this proceeding, they are still unsupported by adequate facts or expert opinion. Many of Nevada's allegations are based on a misreading of documents or otherwise represent attempts to manufacture "management" issues where none exist. As explained in the Legal Standards section above, Boards must carefully scrutinize factual allegations and the documents cited in support of contentions. This includes a review of the cited documents to confirm that they support the proposed contention. Section f, below, discusses each of these documents in detail and explains why they fail, individually and collectively, to provide the requisite factual support for a contention challenging DOE or OCRWM's management competence. Thus, this contention is not supported by references to sufficient facts.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Again, even if this contention were not an improper challenge to the NWPA, NRC regulations, and the Commission's Notice of Hearing, it still fails to raise a genuine dispute on a material issue of fact or law. Nevada's principal allegation is that over the past 20 or more years, "DOE has been involved in a number of high-dollar, high profile projects, establishing an abysmal track record along the way, with schedule, cost, and contractor oversight particularly out of control." Petition at 30. Notably, this language fails to allege any clear connection between the Yucca Mountain Project and Nevada's accusations. Most of the claims in this contention have no direct relationship to radiological health and safety or the protection of the environment at the GROA. As explained below, the remaining claims are not symptomatic of an ongoing pattern of management incompetence.

**(1) Legal Standards Governing Management Competence-Related Allegations**

Historical actions by an entity are not relevant to its current fitness as an applicant unless “there [is] some direct and obvious relationship between the [alleged] character [or management] issues and the licensing action in dispute.” *Dominion Nuclear Conn.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC 349, 365 (2001); *see also Ga. Inst. of Tech.* (Georgia Tech Research Reactor), CLI-95-12, 42 NRC 111, 120 (1995) (stating that “[a]llegations of management improprieties or poor ‘integrity,’ of course, must be of more than historical interest: they must relate directly to the proposed licensing action”). Accordingly, a petitioner may not use allegations of historical DOE deficiencies or management improprieties as a basis for a contention. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC 349, 365-66 (2001), *recons. denied*, CLI-02-1, 55 NRC 1 (2002).

Since *Millstone*, the Commission has consistently followed this principle. For example, in *USEC, Inc.* (American Centrifuge Plant), the Commission upheld the Board’s rejection of a management contention because the intervenors failed to show that their allegations of improprieties were anything more than of historical interest, and because most of the intervenors’ allegations related to events at other facilities “5 to 8 years ago.” CLI-06-10, 63 NRC 451, 464 (2006); *see also La. Energy Servs., Inc.* (National Enrichment Facility), CLI-06-22, 64 NRC 37, 46 n.38 (2006) (quoting *Millstone* as follows: “We have placed strict limits on management and character contentions. . . . When character or integrity issues are raised, we expect them to be directly germane to the challenged licensing action.”) (citations and quotations omitted).

Moreover, a single violation of NRC requirements—or even multiple violations—are insufficient by themselves to raise a valid “management” contention. *See USEC, Inc.*, CLI-06-10, 63 NRC at 465 (upholding the Board rejection of a management competence contention

because intervenor's claims did not "present any *ongoing* pattern of violations or disregard for regulations that might be expected to occur in the future") (emphasis in original); *cf. Union Elec. Co.* (Callaway Plant, Unit 1), ALAB-740, 18 NRC 343, 346 (1983) (a contention alleging a systemic quality assurance breakdown must be "of sufficient dimensions to raise legitimate doubt as to the overall integrity of the facility and its safety-related structures"). The NRC also recognizes that applicants may make errors, so evaluations of competence must include an evaluation of corrective actions. *Houston Lighting & Power Co.* (South Texas Project, Units 1 & 2), ALAB-799, 21 NRC 360, 373-74 (1985).

Nevada also fails to recognize that DOE is already an NRC licensee, and raises no specific management-related issues with respect to DOE's conduct under its existing NRC licenses. For example, since 1999 DOE has held an independent spent fuel storage facility ("ISFSI") license for the Three Mile Island-2 ISFSI (Materials License SNM-2508). *See also Plutonium Export*, CLI-04-17, 59 NRC at 375 (rejecting an intervention petition and authorizing issuance of a license to DOE to export 140 kg of plutonium oxide to France). Nevada fails to identify any inspection report documenting any general management concerns from an NRC inspector, much less provide evidence of such management concerns that are sufficiently linked, in time and subject matter, to the instant proceeding.

Most importantly, Nevada fails to address in its claim that the department lacks management competence the fact that DOE is the agency that Congress has entrusted to undertake an enormous range of activities related to energy, the environment and the national defense, not the least of which is its charter to maintain the safety, reliability, and security of the United States nuclear weapons stockpile. 50 U.S.C. § 2534(a)(1). It is therefore nonsensical to suggest that it does not have the management competence to build and operate this repository.

As explained below, *all* of Nevada’s management competence-related allegations relate to historical deficiencies, technical matters that have been corrected, or otherwise fail to raise any recognizable management issue.

**(2) None of Nevada’s Allegations Raise a Genuine Dispute**

Ultimately, this contention is based on four types of allegations intended to place DOE’s general management competence into dispute. First, Nevada raises a series of historical allegations of poor DOE oversight of contractors. Most of these allegations do not directly relate to the Yucca Mountain Project. Petition at 30-35. Second, Nevada briefly describes three LSN documents purportedly showing instances of poor contractor oversight within the Yucca Mountain Project. *Id.* at 35-36. Then Nevada discusses—at length—various occupational health and safety-related allegations related to events at the ESF in the 1990s. *Id.* at 36-42. The contention ends with brief and vague discussions of four purported technical deficiencies in the application. *Id.* at 42-44. None of these allegations are specific, credible, or sufficiently connected to this project to show a systemic, ongoing management breakdown across DOE, OCRWM, or the Yucca Mountain Project, as required. *See USEC, Inc., CLI-06-10, 63 NRC at 465.*

**(a) Historical Allegations**

Nevada begins this contention with a recitation of historical GAO Reports, Congressional testimony, and other historical “admissions” of DOE incompetence by various unnamed individuals. Petition at 30-35. Most of these allegations are more than seven years old, and most do not specifically relate to the Yucca Mountain Project. *See generally id.* For example, Nevada cites to an unnamed “high ranking DOE official, who, “a decade ago,” opined in written and oral testimony to the U.S. Senate on the need to reform DOE. *Id.* at 30. The cited testimony

discusses DOE's record and recommended reforms in general terms, but Nevada seizes upon and quotes the only sentence in the entire 1996 report that mentions the Yucca Mountain Project. *Id.* at 31. None of these generalized historical allegations are permissible topics for litigation in this proceeding. *Ga. Tech*, CLI-95-12, 42 NRC at 120-121.

With respect to the Yucca Mountain Project, Nevada criticizes DOE for historical delays in submitting this application, and for not submitting the application in 2004. Petition at 31-2. The application has now been submitted, so any previous "repeated postponement[s]" fail to raise any current management issues. *Id.* at 32; *cf. Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC at 365-66; *South Texas Project*, ALAB-799, 21 NRC at 373-74. Moreover, since July 2006, when OCRWM set its application submittal schedule, it has met all of its milestones despite significant budget reductions from Congress.

Notably, in NEV-SAFETY-01, Nevada takes the opposite position from this contention. In NEV-SAFETY-01, Nevada criticizes DOE's *current* project team for adhering to a schedule to meet its statutory and regulatory obligations. Petition at 18-20. Under NEV-SAFETY-01, Nevada contends that if DOE meets the schedule it lacks the integrity to slow down and do it right, and then proceeds to contend under NEV-SAFETY-02 that if DOE exceeds the schedule it lacks management competence. As noted previously, when read together, NEV-SAFETY-01 and this allegation merely serve to illustrate Nevada's willingness to contradict itself in an effort to "throw the kitchen sink" at DOE.

Nevada also implies, based on hearsay from a newspaper article, that DOE gave a "multimillion dollar bonus" to its technical contractor for completing the Application, immediately before it "pulled the plug" on the 2004 Application submittal. Petition at 31.

Nevada does not, however, even allege that DOE's contractor *received* this "bonus for completing the License Application in a timely manner," nor does Nevada explain why DOE decided not to submit the 2004 application.

Finally, following a lengthy discussion of various GAO reports and other studies with no specific relationship to Yucca Mountain, Petition at 32-35, Nevada criticizes DOE for "ballooning" its cost estimates for Yucca Mountain. *Id.* at 35. Nevada fails to explain, however, how a 33% increase, over seven years, in the cost estimate for a major federal project provides any evidence of management incompetence or lack of technical qualifications. This is particularly true as the budget is subject to inflation and changing project objectives.

#### **(b) Contractor Oversight**

Next, Nevada focuses on certain instances of DOE's alleged "failed oversight" of contractors on the Yucca Mountain Project. Petition at 35-36. Specifically, Nevada alleges that Sandia "erred by hundreds of feet in locating geologic faults" near the aging facility, *id.* at 35, and that Lawrence Livermore National Laboratory ("LLNL") used "improperly calibrated Visaila temperature humidity probes," and "inept laboratory techniques" thereby undermining certain corrosion experiments. *Id.* at 36.

All of these purported deficiencies have been addressed by the Yucca Mountain Project. The document Nevada describes as demonstrating a "monumental" error in locating geologic faults actually states that, "*Preliminary data* from the recent drilling phase indicate the location of the Bow Ridge fault in northern Midway Valley *may* be farther east than projected." LSN No. DN2002502636 at 3 (emphasis added). Ultimately, this discovery led to a slight realignment and reconfiguration of the aging pads to reflect a small lateral change in the interpreted location of the fault. *See generally* LSN Nos. DN2002396259; DN2002438083; DN2002411969;

DN2002410591. Thus, the Yucca Mountain Project addressed this item, and Nevada fails to explain how the application that is before this Board does not adequately address the location of the Bow Ridge Fault. In other words, Nevada’s “contractor oversight” issue is a sham, developed by reading project documents out of context.

Nevada’s claims of DOE contractor oversight problems regarding LLNL are equally overstated. Following the QA audit documented in LSN No. DN2002478075,<sup>48</sup> the Yucca Mountain Project evaluated the problematic data and ultimately determined that they were no longer required to support analyses in the Application. *See* Letter from W. Boyle, OCRWM to A. Mohseni, NRC, “Response to U.S. Nuclear Regulatory Commission (NRC) Rely to U.S. Department of Energy (DOE) Response to the NRC Observation Audit Report (OAR) OAR-05-05, dated March 15, 2007,” (Apr. 10, 2008) at 2, *available at* ADAMS Accession No. ML081070408. Similarly, the Technical Work Plan (“TWP”) Nevada cites describes a deficiency that the Yucca Mountain Project recently self-identified and is in the process of correcting.

Notwithstanding the various subjective opinions offered by Nevada regarding corrosion experiments, Nevada has offered no evidence that such isolated events are representative of the entire Yucca Mountain Project, nor that such isolated events are supportive of Nevada’s broad claim of inadequate oversight by DOE.

In sum, the documents Nevada cites fail to show any pattern of problems in contractor oversight within the Yucca Mountain Project. Nevada should have submitted contentions

---

<sup>48</sup> Nevada mis-cites this document as LSN No. DN20002478075.

challenging the resolution of these technical issues, but has not done so.<sup>49</sup> Nevada’s identification of a few historical instances—within a massive federal project—where potential deficiencies were identified and later corrected does not raise a genuine dispute in the form of a litigable “management competence” issue. *See USEC, Inc.*, CLI-06-10, 63 NRC at 465.

**(c) Toxic Silica Allegations from the 1990s**

Next, Nevada rehashes its “toxic silica” allegations from NEV-SAFETY-01 when it claims that, “DOE failed its duty to incorporate and implement engineering controls in order to protect the workers from the known silica-dust hazards that would result from dry-drilling the [ESF] tunnels in Yucca Mountain.” Petition at 36; *see also id.* at 36-42 (alleging more non-radiological health and safety and other project management deficiencies at the ESF in the 1990s, most related to the silica dust issue).

This issue fails to raise a genuine dispute on a material issue of law or fact because it is not relevant to this proceeding. Nevada fails to demonstrate the requisite nexus, in time and subject matter, between these allegations and the application.<sup>50</sup> As described in Section (1), above, for a management competence or technical qualification contention to be admissible, there must be a “direct and obvious relationship” between the alleged management issues and the licensing action in dispute. *Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC at 365.

Non-radiological health and safety issues, including this type of occupational hazard, are not regulated by the NRC and are therefore generally not relevant to NRC proceedings.

---

<sup>49</sup> Nevada has submitted a variety of corrosion-related contentions, *see* NEV-SAFETY-77 through -110, but does not appear to have submitted any specific single-issue technical contention regarding the impact of the Bow Ridge Fault on the aging facility. *See generally* DOE’s responses to these contentions below.

<sup>50</sup> Moreover, as in NEV-SAFETY-01, some of Nevada’s representations related to this issue are disingenuous. *Compare* Petition at 37-38 (falsely implying a connection between the NWTRB’s 1993 report, LSN No. DN2001635791, and Nevada’s toxic silica-related allegations) *with* note 45, above.

Specifically, the NRC does not regulate non-radiological hazards such as “local codes, OSHA regulations, or national standards on fire safety, occupational safety, and building safety.” *Curators of the Univ. of Mo.*, CLI-95-8, 41 NRC 386, 393 (1995). This is because the NRC is “not a general fire safety or occupational health agency.” *Id.* (internal quotations omitted); *see also Private Fuel Storage, LLC* (Independent Spent Fuel Storage Installation), LBP-00-35, 52 NRC 364, 388 (2000) (relying on *Curators* to reject Utah’s claim that the NRC should review the applicant’s Emergency Plan and fire-fighting capability for “all fires onsite, whether or not they result in a radiological release” and noting that the applicant would be subject to State, local, and Federal OSHA regulatory requirements). Thus, Nevada fails to show the requisite direct and obvious relationship between its toxic silica claims and DOE’s technical qualifications with respect to radiological health and safety or protection of the environment.

Nevada also admits that its additional toxic silica-related allegations in this contention are merely of historical interest when it acknowledges that DOE corrected any purported problems *over nine years ago*: “DOE resorted to taking over construction management” at the ESF. Petition at 42 (citing LSN No. NEV000003547, dated *May 1, 1999* (emphasis added)). Thus, Nevada’s own petition demonstrates that there is no ongoing management competence issue. *E.g. USEC, Inc.*, CLI-06-10, 63 NRC at 465.

**(d) Technical Disputes with the Yucca Mountain License Application**

Nevada concludes this contention with a series of vague and wide-ranging technical challenges to various aspects of the Application. Nevada points to an alleged DOE admission that its “proposal to install some 11,000 drip shields” is “far from reality.” Petition at 42. It then criticizes DOE’s use of expert elicitation—ignoring the authorization to use expert elicitation in 10 C.F.R. § 63.21(c)(1), and failing to explain why it disputes such use, beyond the unsupported

assertions of Nevada's counsel. Next, Nevada takes issue with DOE's rock fall analyses by alleging, with no citation to any document, that DOE "failed" to "resolve" the Center for Nuclear Waste Regulatory Analysis' evaluation of potential degradation of emplacement drifts. Finally, it alleges that DOE's Probabilistic Volcanic Hazards Assessment ("PVHA") is inadequate because it fails to address an update to this expert elicitation document that was incomplete at the time the Application was filed. Petition at 43-44.

DOE's application addresses all of these issues. The design for the drip shields is described at length in SAR § 1.3.4. DOE's use of expert elicitation is described, in accordance with Part 63, in SAR § 5.4. DOE has analyzed the potential for emplacement drift degradation in detail in SAR § 1.3.4. DOE addresses PVHA-related issues in SAR § 2.2.2.2.<sup>51</sup> Nevada was authorized to submit specific, single-issue contentions challenging DOE's analysis on any or all of these topics. *See U.S. Dept. of Energy* (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board), LBP-08-10, 67 NRC \_\_ (slip op. at 6, 8); *see also U.S. Dept. of Energy* (High-Level Waste Repository: Pre-Application Matters), CLI-08-20, 68 NRC \_\_ (slip op. at 2) (2008) ("legal or factual challenges related to the application[] are appropriately considered as proposed contentions in the context of a merits hearing *on the application*") (emphasis added). Regardless of any purported dispute over these technical issues, Nevada's apparent disagreements with aspects of DOE's Application cannot support admission of a management competence contention.

For all these reasons, none of the allegations made in this contention, either individually or collectively, raise a genuine dispute on a material issue of law or fact.

---

<sup>51</sup> DOE has subsequently received the final PVHA update, and has reviewed it for its impact on the prior work. DOE determined that the update did not impact the material in the LA and provided a letter to the NRC to that effect and transmitted a copy of the update to the NRC and interested parties. LSN Nos. DEN001606520; DEN001598805. *See also* DOE's response to NEV-SAFETY-157, below.

### **3. NEV-SAFETY-03 - Quality Assurance Implementation**

SAR Subsections 5.0, 5.1, 5.1.2, and similar subsections and DOE's QARD (incorporated by reference in the License Application in Chapter 5), which promise DOE compliance with quality assurance (QA) requirements in the future, ignore the facts that DOE has been and continues to be unable to implement an adequate QA program and that there exists no basis for a reasonable assurance that DOE will do so in the future.

#### **RESPONSE**

Nevada in this contention sets forth a recitation of historic information related to the Yucca Mountain quality assurance (QA) program including instances where DOE's audits, assessments and surveillances identified weaknesses in quality assurance compliance. On the basis of this recitation and, without any analysis, Nevada alleges that there can be no reasonable assurance that DOE will implement an adequate QA program in the future. However, the recitation of past information confirms that DOE is an applicant that is committed to identifying and correcting shortcomings in its QA program. Moreover, Nevada ignores those elements of DOE's QA record that demonstrate continuous improvement in its QA program. Furthermore, the contention contains no information or analysis that calls into question that: (1) the QARD meets the requirements in §§ 63.21(c)(20) and 63.31(a)(3)(iii) to describe the QA program to be applied, including a discussion of how the criteria of § 63.142 will be met; (2) DOE will implement the QA program described in the QARD; and (3) applicable QA requirements have been satisfied for all information and analysis on which the LA is based.

**a. Statement of Issue of Law or Fact to be Controverted**

Nevada provides a litany of historic information, from which it draws to speculate that DOE will not be able to implement the QA program described in the QARD in a manner that supports issuance by NRC of a construction authorization. Nevada's contention, however, does not adequately specify an issue of law or fact to be controverted and therefore, must be dismissed. The contention is so broad that it defeats its admissibility in that it references, without identifying specific sections, the entire QARD (which is 160 pages) and QA related events occurring during the more than 20 years of this project. This scatter-shot approach is inconsistent with the requirements of 10 C.F.R. §2.309(f)(1)(i), as well as the requirements of the June 20, 2008 Case Management Order, to provide a specific statement of the issue of law or fact to be raised or controverted, and thereby should be dismissed.

**b. Brief Explanation of Basis**

Nevada's stated basis for this contention is neither the adequacy of DOE's QA program, nor compliance of the QARD (which describes the requirements of the QA program) with applicable NRC requirements. Instead, Nevada argues that issues identified in connection with DOE's past and present implementation of the QA program demonstrate that DOE will not implement its QA program adequately in the future. Contrary to Nevada's assertion, however, this historic QA record demonstrates that DOE has a robust and functioning QA program through which it has identified areas needing improvement and addressed those areas via its corrective action program. In sum, Nevada does not identify any basis, much less provide an explanation, for the allegation that DOE will not implement its QA program in conformity with subpart G of 10 C.F.R. Part 63, because none exist.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is outside the scope of this proceeding because Nevada, in much the same manner as it has attempted in NEV-Safety-01 and 02, attempts to redirect this proceeding away from an adjudication of the technical adequacy of the application, into a broad, vague and ultimately impermissible inquiry into the past practices and character of DOE. The Commission's Notice of Hearing, which defines the scope of this proceeding, states, in pertinent part, that "[t]he matters of fact and law to be considered are whether the application satisfies the applicable safety, security, and technical standards of the AEA and NWPA and the NRC's standards in 10 CFR Part 63 for a construction authorization for a high-level waste geologic repository. . . ." Hearing Notice, 73 Fed. Reg. at 63,029 (emphasis added).

The specific QA-related questions that are within the scope of this proceeding are: (1) whether the description of the QA program in the application is adequate; and (2) whether the QA program's compliance with subpart G is sufficient. *See, e.g.*, 10 C.F.R. §§ 63.21(c)(20); 63.31(a)(3)(iii). The adequacy of DOE's QA program in the past is outside the scope of this proceeding. As specifically discussed below, this Nevada tactic, which attempts to divert the NRC from appropriate areas for potential challenge to the LA, is misplaced in this proceeding. In short, if DOE fails to implement its QA program as Nevada speculates, then such noncompliance will be appropriately addressed through the NRC's inspection program, not by an adjudicatory proceeding such as this one.

The appropriate subject of this proceeding with regard to Part 63 and DOE's QA program is whether the Application contains a description of the QA program and whether the QA program complies with subpart G. *See* 10 C.F.R. §§ 63.21(c)(20) and 63.31(a)(3)(iii). NEV-SAFETY-03 does not challenge compliance with these requirements—nor can it—so it attacks

DOE's abilities by claiming that DOE is "unable" to implement a QA program in the future because of its past performances. This challenge, however, is outside the scope of this proceeding, because Part 63 does not require DOE to demonstrate as part of its Application how well it has implemented QA programs in the past.

As previously discussed, the appropriate subject of any hearing on the license application with respect to DOE's QA program is whether "DOE's quality assurance program complies with the requirements of subpart G of this part [i.e., 10 C.F.R. Part 63]." *See* 10 C.F.R. §63.31(a)(3)(iii). Nevada does not appear to contest this issue of law, or the issue of fact that the QARD as currently written satisfies the regulatory requirements. Rather, Nevada seeks to expand the scope of the hearing into an examination of whether DOE's past performance demonstrate that DOE will be unable to implement a QA program consistent with the requirements of subpart G. This contention is outside the scope of this proceeding because it asks the Commission to make a judgment regarding the likelihood of DOE's future compliance with its QA program, the requirements of which are specified in the QARD and NRC's regulations at 10 CFR § 63.142. Future compliance with the legal requirements of its QA program is more appropriate for NRC inspection and enforcement during construction rather than an administrative hearing on construction authorization.<sup>52</sup> Similarly, contentions asserting a general fear of future noncompliance are not admissible. *See Dominion Nuclear Conn.* (Millstone Nuclear Power Station, Units 2 and 3), 54 NRC 349, 366 (2001) ("We cannot allow admission of contentions premised on a general fear that a licensee cannot be trusted to follow regulations of any kind.").

---

<sup>52</sup> NRC stated in response to concerns about future QA implementation that "if NRC were to issue a license to DOE, NRC would periodically perform inspections of selected DOE activities at the Yucca Mountain site, at DOE support facilities, and at DOE subcontractor facilities to ensure that DOE's QA program is being effectively implemented." 66 Fed. Reg. 55,732, 55,764 (November 2, 2001).

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that is material to the findings that the Commission must make in this proceeding, and therefore must be dismissed. As noted above, Nevada does not challenge DOE's compliance with applicable NRC regulations. Therefore, by definition, Nevada's spurious challenge that DOE is "unable" to implement the QA program because of its past practices does not raise an issue material to the finding the Commission must make. Failing to assert a material issue of noncompliance with a standard in the regulations, Nevada invents a new standard in its attempt to raise a material issue—whether DOE's past practices make it impossible to have reasonable assurance that DOE will comply with 10 C.F.R. § 63.142 and 10 CFR § 63.143 in the future. *See* Petition at 46. This is not an issue that is material to a finding that the NRC must make in issuance of its construction authorization.

It must also be emphasized that Nevada's recitation of past issues in the QA program does not rise to a material issue, because identified past weaknesses of the QA program are not *per se* material to DOE's ability to construct a repository in the future. In short, while citing a litany of QA-related issues, Nevada never attempts to provide a reasoned basis linking these issues to any impact on the safety determinations that the Commission must make in this proceeding. 10 CFR §63.31. "Allegations of management improprieties or poor 'integrity' . . . must be of more than historical interest: they must relate directly to the proposed licensing action." *Dominion Nuclear Conn.* (Millstone Nuclear Power Station, Units 2 and 3), 54 NRC 349, 366 (2001) (quoting *Ga. Inst. of Tech.* (Georgia Tech Research Reactor), 42 NRC 111, 120 (1995)). License proceedings are not a forum "to litigate historic allegations' or past events with no direct bearing on the challenged licensing action." *See id.* (quoting *Georgia Power Co.* (Vogtle Electric Generating Plant, Units 1 and 2), 38 NRC 25, 36 n.22 (1993)). As such, the

contention fails to raise an issue that is material to a determination that the Commission must make because it never shows the link between any of the QA findings and the determinations the Commission must make.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention contains only unsupported assertions of counsel; and (2) the contention does not reference any expert opinion. This falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention fails on two basic issues applicable to challenges to quality assurance programs: (1) it fails to show a nexus between past lapses and the QA program at issue in the proceeding; and (2) it fails to allege that the lapses are safety significant, relevant to the adequacy of the application, indicative of a pervasive programmatic breakdown and incurable.<sup>53</sup>

**(1) Absence of a Nexus Between Past and Present**

Nevada attempts to create a material issue of fact by reciting a litany of previously identified lapses and criticism of the QA program in the approximately 20 years of the project

---

<sup>53</sup> DOE does not dispute point-by-point the alleged QA weaknesses identified by Nevada in the contention because none of those alleged lapses, individually or collectively, raises a material issue of fact and because Nevada does not adequately demonstrate why those recitations are indicative of a QA program that warrants an admissible contention. The recitation of alleged weaknesses, particularly those in Table 2 which are mainly findings from QA audits, assessments and surveillances, actually prove that DOE has a robust QA program that is open and raises issues for resolution, as the regulations demand.

before submittal of the license application (Table 1) and for the period of time since submittal of the license application on June 3, 2008 (Table 2) without demonstrating a nexus between those events and the issues under review by the Commission in this proceeding.<sup>54</sup> The historic criticisms of the QA program listed in Table 1 of the contention are not (individually or collectively) a material issue of fact or law because Nevada has not met its burden to show any relationship between these earlier reviews of the QA program and the QA program and team that are before the Commission with this Application.

Nevada's failure to show this nexus between the historic evaluations of the program described in Table 1 is explainable by the fact that the most recent evaluation of the QA program has found that the program before the Commission is functioning properly. During September 2008, the 2008 Quality Assurance Management Assessment (QAMA) was performed at the Office of Civilian Radioactive Waste Management (OCRWM) for the Yucca Mountain Project. The focus of the assessment was to evaluate the effectiveness of the Office of Quality Assurance's oversight of the OCRWM and its QA program. The Yucca Mountain QA program was measured against nuclear industry excellence standards by a team of senior-level QA professionals from the Nuclear Energy Institute, Southern Company, Pacific Gas and Electric, Florida Power and Light and Constellation Energy. *See* 2008 QAMA (LSN# NEN000000782 at 1). This independent assessment team reviewed the current QA program and "concluded that the OCRWM has a good QA program" and that the "QA program meets requirements...." *Id.* at iii.

---

<sup>54</sup> Nevada has extensively used selected quotes from reports and independent assessments as well as issues self-identified by DOE as examples of a broken QA program. Nevada has judiciously avoided including any quotes from these reports that show areas of improvement or provide context to the findings. These problem statements cited by Nevada in fact show a healthy and effective QA program that is finding problems and tracking their resolution. *See* Office of Civilian Radioactive Waste Management Quality Assurance Management Assessment, September 2008 Assessment of the Office of Civilian Radioactive Waste Management Quality Assurance Program, (October 21, 2008) (LSN No. NEN000000782 at 12-13) (2008 QAMA).

To further place the historic criticism of the QA program in context, the 2008 QAMA described the difference in overall QA performance between the program in 2006 during the Nuclear Energy Institute evaluation, which is cited by Nevada, and the current QA program as “like night and day.” *Id.* As such, not only has Nevada failed to raise a material issue of fact by showing a nexus between historic criticisms of the QA program and the current program, but neglects to inform the Commission that the most recent evaluation of the QA program shows that DOE’s QA program is properly functioning.

**(2) Failure to meet the legal standard for challenging QA programs**

Nevada further fails to raise a material issue of fact or law because its litany of alleged shortcomings in the QA program fails to satisfy the legal standard for contentions challenging nuclear QA programs. NRC case law from reactor licensing proceedings provides that a breakdown in QA is only meaningful if the errors have not been cured and that they demonstrate a pervasive breakdown of quality assurance that impacts safety performance in service. *See Ga. Power Co.* (Vogtle Electric Generating Plant, Units 1 and 2), 26 NRC 127, 142 (1987) (“the fact that deficiencies occur during the course of construction of a nuclear power plant does not mean that there has been a pervasive failure of the quality assurance program . . . [and could] constitute[] evidence that the applicants’ program was working as intended.”). Quality assurance lapses are expected in complex projects, and, by themselves, do not raise a material issue of fact. *See, e.g., Union Electric Co.* (Callaway Plant Unit 1), 18 NRC 343, 346 (1983) (“[i]n any project even remotely approaching in magnitude and complexity the erection of a nuclear power plant, there inevitably will be some construction defects tied to quality assurance lapses.”). As such, it is not sufficient for a prospective intervenor to assert that quality assurance lapses have occurred, “[r]ather, the focus perforce is on the implications of the asserted deficiencies in terms of safe

plant operation.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), 33 NRC 299, 325 (1991). Nevada has not made this showing.

Table 2, which purports to describe QA-related deficiencies occurring after the submittal of the LA, however, also does not raise a material issue of law or fact because all it shows is a robust QA program that is identifying issues, developing corrections and tracking performance as required by 10 C.F.R. § 63.142(q). Most of the documents cited in Table 2 (i.e., assessments, audits, surveillances) are tools used in the QA program to ensure quality. For example, stop work orders, among other things, demonstrate that DOE has aggressively monitored its suppliers for the quality of their work and stopped work until problems were fixed. This is what one expects to see in a properly functioning QA program. Identification of conditions adverse to quality is the hallmark of a properly functioning corrective action component of a quality assurance program, not an indication that there is a pervasive breakdown of quality assurance. *Ga. Power Co.* (Vogtle Units 1 and 2), 26 NRC at 142. No quality assurance effort can be expected to be flawless. *Id.* As such, Nevada’s attempt to list QA-related issues does not create a material issue of fact for a hearing, but rather confirms that DOE has a functioning QA program that can identify and track problems.

#### **4. NEV-SAFETY-04 - Content Of Quality Assurance Program**

Legal issue: SAR Subsection 5.1.2, which states that the Quality Assurance Requirements and Description (QARD) addresses design, analysis, fabrication, construction and testing of the repository, fails to comply with applicable quality assurance criteria because the SAR does not address repository operation, permanent closure, and decontamination and dismantling of surface facilities.

#### **RESPONSE**

In this contention, Nevada contends that the Yucca Mountain repository cannot be licensed because the Quality Assurance Requirements and Description (QARD) document, which describes the requirements of the quality assurance (QA) program to be applied to quality-related activities in the project and is incorporated by reference in the SAR, does not address repository operation, permanent closure and decontamination and dismantling of surface facilities.

##### **a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

##### **b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

##### **c. Whether the Issue is Within the Scope of the Proceeding**

This contention is outside of the scope of the proceeding because this proceeding relates to DOE's application for construction authorization for the repository; and this contention

challenges aspects of the quality assurance program that relate to repository operation, closure and decontamination and dismantling of surface facilities, which the NRC already has determined are outside the scope of activities that DOE's QA program must encompass at this time. In response to questions regarding "[w]hich elements of [DOE's] QA program should be in place at the time of license application submittal," the NRC had the following to say:

The DOE quality assurance program and associated quality assurance program controls and implementing procedures regarding activities performed must be in place before activities begin. *These activities include site characterization; acquisition, control, and analysis of samples and data; tests and experiments; scientific studies; facility and equipment design and construction; and performance confirmation.*

Yucca Mountain Review Plan, NUREG-1804, Rev. 2, Final Report 68 Fed. Reg. 45,086, 45,103 (July 31, 2003) (quotations omitted) (emphasis added). It is clear from this statement that the NRC does not anticipate receiving from DOE, at this time, QA program information on repository operation, permanent closure and decontamination and the dismantling of surface facilities. Had the NRC wanted this information at the time of LA submittal, it would have said so and, in fact, likely would not have accepted the Application for docketing.

Petitioner does not cite any legal authority that expands the scope of what the NRC declared the QA program must cover for the purposes of the instant proceeding.<sup>55</sup>

The Notice of Hearing that Petitioner cites as support for this contention only further supports dismissal of the contention. Specifically, section II, paragraph 1 of the Notice of Hearing, as referenced by Petitioner, states that "the matters of fact and law to be considered are

---

<sup>55</sup> Notably, the portion of the Yucca Mountain Review Plan, NUREG-1804, that covers the subject of QA does not yet include operation, permanent closure, and decontamination and dismantling of surface facilities. *See* Yucca Mountain Review Plan, NUREG-1804 Rev. 2, § 2.5.1.3 at 2.5-4 (July 2003); 68 Fed. Reg. at 45,103 ("The Yucca Mountain Review Plan will be modified, at the appropriate time, to include facility operation, permanent closure, and decontamination and dismantling of surface facilities.").

whether the application satisfies the applicable safety, security, and technical standards of the AEA and NWPA and the NRC's standards in 10 CFR Part 63 for a *construction authorization* for a high-level waste geologic repository . . . ." 73 Fed. Reg. 63,029 (Oct. 22, 2008) (emphasis added). As such, the contention must be dismissed as exceeding the scope of the proceeding to the extent it seeks a determination regarding the sufficiency of the QARD, DOE's controlling QA document, as applied to activities that DOE is not yet performing or allowed to perform. Any other conclusion would, in effect, allow Petitioner to advocate for stricter requirements than NRC rules require at this stage, which is not allowed. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff'd*, CLI-01-17, 54 NRC 3 (2001).

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that is material to the findings that the NRC must make because it alleges an absence of quality assurance requirements relating to the operation and closure of the repository, when the NRC is being asked to only make findings with respect to the construction of the repository. Petitioner does not cite any legal authority requiring that the SAR or QARD, submitted as part of the LA for construction authorization, include the quality assurance program for activities that relate to operations, closure and decontamination and dismantling of surface facilities of the repository—because there is no such legal authority. Indeed, the applicable regulations explicitly contemplate that DOE would change its QA program following the submittal of the LA. *See generally* 10 C.F.R. § 63.144. SAR section 5.1 and the QARD, which is incorporated by reference and, therefore, also part of the LA, reflect this same concept. *See* SAR § 5.1 at 5.1-2 ("The QARD will be revised at appropriate times to address future activities related to facility operations, permanent closure of the repository, and

decommissioning and dismantlement of the surface facilities.”); Quality Assurance Requirements and Description (QARD), DOE/RW-033P (2008), Rev. 20 at 19 (“Introduction”) (“This QARD will be revised prior to the receipt of a license to receive and possess HLW/SNF to address activities associated with facility operation.”).

Notwithstanding this specific DOE commitment, Petitioner claims a deficiency that does not exist by citing 10 C.F.R. § 63.31(a)(3) as support for the proposition that the NRC cannot authorize construction in the absence of a QA program that covers activities from site characterization through decontamination and dismantling of surface facilities. But Petitioner is wrong as a matter of law. The plain language of the regulation clearly states that DOE’s QA program’s compliance with Subpart G (including 10 C.F.R. § 63.142) is one of several issues for the Commission to “consider” in making its safety determinations. *Nothing* in either 10 C.F.R. § 63.31(a)(3) or 10 C.F.R. § 63.142 requires that DOE’s QA program cover activities beyond those activities for which authorization is sought, i.e., construction authorization. Any other interpretation flies in the face of the NRC’s acceptance criteria and the multi-phased nature of the licensing process described by the NRC in the Statements of Consideration for Part 63:

[P]art 63 provides for a multi-staged licensing process that affords the Commission the flexibility to make decisions in a logical time sequence that accounts for DOE collecting and analyzing additional information over the construction and operational phases of the repository. The multi-staged approach comprises four major decisions by the Commission: (1) construction authorization; (2) license to receive and emplace waste; (3) license amendment for permanent closure; and (4) termination of license. The time required to complete the stages of this process . . . is extensive and will allow for generation of additional information. Clearly, the knowledge available at the time of construction authorization will be less than at the subsequent stages.

Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, Nevada, 66 Fed. Reg. 55,732, 55,738 (Nov. 2, 2001).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For reasons discussed above, this contention also fails to raise a genuine dispute on a material issue of law or fact because there is no legal requirement that the SAR or QARD submitted as part of the LA identify the elements of the QA program applicable to operations, closure and decontamination and dismantling of surface facilities. The applicable regulations and guidance explicitly contemplate that DOE will amend its QARD to address operations, closure and decontamination and dismantling activities sometime after receipt of construction authorization. Simply put, the NRC is not currently being asked to consider the appropriateness of the QA program for operation, closure and post-closure activities at the repository. Nor should Petitioner be allowed to somehow force that consideration upon the NRC Staff before DOE has requested NRC approval of related activities.

It should also be noted that Petitioner's characterization of SAR 5.1.2 as meaning that "the QARD does not apply the QA program to facility operation, permanent closure, or decontamination and dismantling of surface facilities," Petition at 75, fails as well to establish a dispute on a material issue of law. In short, SAR 5.1.2 *does not* say that the QARD does not apply to facility operation, permanent closure, or decontamination and dismantling of surface facilities. The QARD applies to such activities and, as discussed above, will be amended

pursuant to 10 C.F.R. 63.144 to address those activities at the appropriate time. Until that time, any contentions alleging that DOE does not intend to update the QARD to cover activities up to and including the decontamination and dismantling of surface facilities are speculative and premature. *See Duke Energy Corp.* (McGuire Nuclear Station, Units 1 and 2; Catawba Nuclear Station, Units 1 and 2), CLI-02-14, 55 NRC 278, 294 (2002) (“An NRC proceeding considers the application presented to the agency for consideration and not potential future amendments that are a matter of speculation at the time of the ongoing proceeding.”).

**5. NEV-SAFETY-05 - Emergency Plan**

SAR Subsection 5.7 (and subsections therein), which states that an emergency plan will be provided to the NRC no later than 6 months prior to the submittal of the updated application for a license to receive and possess spent nuclear fuel and high-level radioactive waste, contains a mere commitment to develop an emergency plan as opposed to the plan itself or even a description of the plan.

**RESPONSE**

This contention argues that the Application does not comply with 10 C.F.R. Part 63 because SAR Section 5.7 does not contain a description of the emergency plan that includes all the information that is currently available.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention fails to raise an issue that is material to the findings that the NRC must make. Nevada argues that the LA does not comply with 10 C.F.R. § 63.31(a)(3), which

“provides that a construction authorization will not be issued unless the Application satisfies the requirements of 10 C.F.R. § 63.21 and the emergency plan complies with the requirements of 10 C.F.R. Part 63, Subpart I.” Petition at 77. But none of the provisions cited by Nevada requires that the Application contain a complete emergency plan or even a description of a complete emergency plan. To the contrary, as Nevada acknowledges, all that is required at this stage is a description of the plan; and that description need only contain all the information that was reasonably available *at the time of docketing*. Petition at 78. See 10 C.F.R. § 63.21(c)(21) (requiring “[a] description of the plan for responding to, and recovering from, radiological emergencies”); 10 C.F.R. § 63.21(a) (requiring that the Application “be as complete as possible in light of information that is reasonably available at the time of docketing”).

Nevertheless, Nevada argues that the section of the Application that describes the emergency plan—SAR section 5.7—does not contain all of the information that is reasonably available *now* and, as support for this assertion, lists seven items which DOE commits to include in the completed emergency plan. *Id.* at 76-77. But Nevada misstates the requirements of 10 C.F.R. Part 63 and, in any event, offers no evidence that the “missing” information actually is available, let alone that it was reasonably available at the time of docketing. Nor does Nevada explain why this information, even if it were available, should have been included in the Application. As a result, Nevada fails to establish how the contention would “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Accordingly, this contention should be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

The legal standards that require adequate factual support or expert opinion in order for a contention to be admitted are discussed in Section V.A.3 above. This contention fails to meet

those standards because, as discussed in that Section, it presents only unsupported arguments of counsel and the affidavit of an expert who merely “adopts” paragraph 5 of this contention. This falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Indeed, the contention does not even mention the expert’s affidavits. Nevada’s failure to cite any factual materials in the contention cannot be salvaged by this disconnected affidavit. *See USEC, CLI-06-10, 63 NRC at 472.*

Nevada is obligated to provide a concise statement of the facts or expert opinions supporting the contention, along with appropriate citations to supporting scientific or factual materials. Yet Nevada cites nothing to demonstrate that any of the seven items that it claims are now available for inclusion in the emergency plan are actually available, let alone that they were available at the time of Application submittal.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention also should be dismissed because it fails to raise a genuine dispute on a material issue of law or fact. As described above, Nevada ultimately does not dispute that 10 C.F.R. Part 63 does not require that the Application contain a complete emergency plan or even that the Application contain the description of a complete plan at this time. Nevada appears to only dispute whether SAR section 5.7 includes all the information that is now available to DOE now. Petition at 78. Nevertheless, Nevada fails to offer a shred of evidence that any of the information believed to be “missing” from SAR section 5.7 is reasonably available now or (more importantly) that it was reasonably available at the time of docketing. Accordingly, the contention is totally unsupported and presents no real dispute.

Indeed, this contention fails to demonstrate that the emergency plan description contained in SAR section 5.7 is deficient in any way whatsoever. SAR section 5.7 contains more than 50

pages of discussion about the plan, including various tables and figures. It also addresses each of the 16 subjects listed in 10 C.F.R. § 72.32(b). *See* 10 C.F.R. Part 63, Subpart I (providing that “[t]he emergency plan must be based on the [16] criteria of § 73.32(b) of this chapter”). These subjects include:

1. Facility Description (SAR subsection 5.7.2)
2. Types of Potential Accidents (SAR subsection 5.7.3)
3. Classification of Potential Accidents (SAR subsection 5.7.3)
4. Detection of Accidents (SAR subsection 5.7.4)
5. Mitigation of Consequences (SAR subsection 5.7.5)
6. Assessment of Releases (SAR subsection 5.7.6)
7. Responsibilities (SAR subsections 5.7.1 and 5.7.7.)
8. Notification and Coordination (SAR subsection 5.7.8)
9. Information to be Communicated (SAR subsection 5.7.9)
10. Training (SAR subsection 5.7.10)
11. Safe Condition (SAR subsection 5.7.11)
12. Exercises (SAR subsection 5.7.12)
13. Hazardous Chemicals (SAR subsection 5.7.13)
14. Comments on the Plan (SAR subsection 5.7.14)
15. Offsite Assistance (SAR subsection 5.7.15)
16. Arrangements Made for Providing Information to the Public (SAR subsection 5.7.16)

DOE’s discussion of these and other subjects demonstrates that the description of the emergency plan in SAR section 5.7 is more than sufficient at this stage. Furthermore, as noted

above, nowhere in the contention does Nevada demonstrate that NRC regulations actually require that any of the seven specific items of information cited in the contention be included in the Application at this time. Even if it did, the fact that DOE makes commitments to include the items when the emergency plan is complete, before the introduction of radionuclides to the repository occurs, does not make the description deficient. Nor does it somehow signal that the information to be included is now available to DOE or was reasonably available at the time of docketing. To the contrary, such commitments are consistent with applicable NRC regulations and expectations.

These commitments are also consistent with the multi-phased nature of the licensing process and the level of detail that the NRC expects to see at this early stage. The NRC addressed this point in the Statements of Consideration for 10 C.F.R. Part 63:

[P]art 63 provides for a multi-staged licensing process that affords the Commission the flexibility to make decisions in a logical time sequence that accounts for DOE collecting and analyzing additional information over the construction and operational phases of the repository. The multi-staged approach comprises four major decisions by the Commission: (1) Construction authorization; (2) license to receive and emplace waste; (3) license amendment for permanent closure; (4) termination of license. The time required to complete the stages of this process . . . is extensive and will allow for generation of additional information. Clearly, the knowledge available at the time of construction authorization will be less than at the subsequent stages.

Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, Nevada, 66 Fed. Reg. 55,732, 55738 (Nov. 2, 2001). Thus, it is beyond dispute that the Application contains a sufficient description of the emergency plan to be developed by DOE. Moreover, as indicated above, insofar as DOE makes commitments to provide additional information at a later time, Nevada fails to explain how the information sought was reasonably available at the time of docketing and/or that omitting this information at this early stage would

preclude the NRC from making the requisite safety determinations. Accordingly, this contention is inadmissible and must be dismissed.

**6. NEV-SAFETY-06 - Part 21 Compliance**

Legal issue: SAR Subsections 1.5.1 and 5, which state that DOE will identify and evaluate deviations and failures to comply and will report defects and failures to comply associated with activities for and basic components supplied to the Yucca Mountain repository, fails to address the elements of the program to govern such activities or the procedures for implementing such activities, and therefore there is no assurance that such activities are currently in place or functioning.

**RESPONSE**

This contention alleges that the LA does not address the elements of a program to implement the requirements of 10 C.F.R Part 21 (Part 21), or reference any repository procedures to implement such requirements, and, therefore, concludes that DOE must not have a functioning program to ensure compliance with the requirements of Part 21.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies 10 C.F.R. §§ 63.31(a)(2) and (3), 63.73, 21.1 and 21.2(a)(2). *See* Petition at 80-81. Nevada concludes this general description of various sections of 10 C.F.R. Parts 63 and 21 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 81. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7.), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Nevada fails to demonstrate that the issue raised by this contention is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits, however, none of them purports to provide expert opinions to support this contention. In fact, paragraph 1 of this contention labels this as a legal issue. It does not appear, however, that any legal issue is raised by this contention that would distinguish this contention from other contentions that assert that the Application does not contain required information.

The only facts Nevada provides to support this contention are: (1) statements in the Application that DOE "will comply" with Part 21; (2) statements in the Application that DOE "will comply" with 10 C.F.R. § 63.73(b); and (3) statements in an NRC Inspection Procedure and Manual Chapter indicating that DOE would become subject to Part 21 if and when the Application was docketed. Petition at 81, 82.

With respect to the statements in the Application that DOE will comply with Part 21, Nevada asserts that such statements suggest that a Part 21 program is not already in place. Nevada also asserts that the Application does not address the elements of the program to govern such activities. Nevada has apparently overlooked the fact that the program elements are addressed in the Office of Civilian Radioactive Waste Management (OCRWM) Quality Assurance Requirements and Description (QARD) (LSN#: DEN001574022), which is

incorporated by reference in the Application at SAR subsection 5.1 at 5.1-1. The QARD includes requirements for: (1) procurement documents to identify when Part 21 is applicable (QARD at 52); (2) dedication of commercial grade items in accordance with Part 21 (QARD at 72); (3) reviewing nonconformances to determine the need for reporting in accordance with Part 21 (QARD at 92); and (4) reviewing conditions adverse to quality to determine the need for reporting in accordance with Part 21 (QARD at 95).

Contrary to Nevada's suggestions that DOE has no related procedures, these requirements are also covered in DOE procedures, including OCRWM Procedure "AP-15.5Q Identification, Evaluation and Reporting of 10 CFR Part 21/50.55(e) Defects and Noncompliance" (LSN#: DEN001595238), which establishes the responsibilities and process followed by DOE and its prime/principal contractors for identification, evaluation, documentation, review and approval, notifications and reporting of defects and noncompliance as described in 10 C.F.R. Part 21 and 10 C.F.R. § 63.73; and "AP-16.1Q Condition Reporting and Resolution (LSN#: DEN001602973), which establishes the responsibilities and processes to be used to ensure that conditions related to, but not limited to, the environment, safety, health, waste isolation, operations, security, or quality of items and services associated with OCRWM work activities are promptly identified, controlled, evaluated (including review for reportability under Part 21), and corrected. Thus, this assertion does not provide any support for this contention.

With respect to the statement in the Application that DOE will comply with 10 C.F.R. § 63.73(b), Nevada notes that § 63.73(b) covers reporting that is also required by § 21.21, and then asserts that the statement that "methods will be in place" to implement these requirements implies that they are not already in place. Petition at 82. Nevada is wrong in suggesting that a statement about compliance with § 63.73(b) also conveys information about compliance with

Part 21. Although Part 21 and § 63.73(b) have related purposes, and use similar language, they are separate regulatory requirements, and are addressed separately in the Application. See SAR Table 5.2-2 at 5.2.9. They also are addressed separately in the QARD, which addresses the need to review both nonconforming characteristics and Conditions Adverse to Quality to determine the need for reporting in accordance with 10 C.F.R. § 63.73 as well as 10 C.F.R. Part 21 (QARD at 92, 95). Thus, this assertion does not provide any support for this contention.

Finally, Nevada cites the NRC Inspection Manual and an NRC Inspection Procedure to show that NRC expects DOE to have a functioning and effective Part 21 program, since it stated that such a program would be required once the Application was docketed. Petition at 82-3. This, of course, also does not provide any support for Nevada's contention that DOE does not have a program and procedures in place to comply with Part 21. In fact, it appears that NRC on-site representatives had been reviewing DOE's implementation of Part 21 even before the Application was docketed. *See* U.S. Nuclear Regulatory Commission On-Site Licensing Representatives' Quarterly Report Number OR-08-01, On The Yucca Mountain Project, For January 1, 2008 Through March 31, 2008 (LSN#: NRC000029599, ADAMS ML081220555), at Table 1, page 7 (indicating closure of open item OR 02-10 concerning "evaluation and documentation of the design control attributes associated with requirements of . . . 10 CFR Part 21.").

In sum, none of the facts cited by Nevada provides support for the contention that DOE does not have a program for carrying out the requirements of Part 21.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As shown above, Nevada has failed to identify the relevant information in the QARD, and has not cited facts or expert opinion sufficient to show that there is a genuine dispute on any

material issue of law or fact. Moreover, the essence of this contention is Nevada's assertion that, based on its conclusion that the Application did not describe the elements of DOE's Part 21 program, the NRC should assume that "DOE does not have a functioning Part 21 program." *Id.* at 81-82. Such an assumption would be completely unfounded; and Nevada must do more than make an unsupported assertion that DOE does not intend to comply with the commitments it makes in the Application in order for its contention to be admissible. Indeed, Nevada must provide "clear evidence." See *U.S. Department of Energy (High Level Waste Repository: Pre-Application Matters)*, CLI-08-11, *slip op.* at 8 ("Absent 'clear evidence to the contrary,' we presume that public officers will 'properly discharge[] their official duties.'"). Here, Nevada provides *no* evidence.

## 7. NEV-SAFETY-07 - Retrieval Plans And Qa

DOE's description of its plans for retrieval and its QA program are deficient because structures, systems and components necessary for retrieval to be accomplished are not all subject to QA.

### RESPONSE

This contention is impossible to summarize because it is impossible to determine precisely what Nevada is alleging. On the one hand, Nevada appears to allege that not all structures, systems and components (SSCs) necessary for retrieval are classified as important to safety (ITS) or important to waste isolation (ITWI). Nevada then assumes that, as a result, some SSCs are not covered by DOE's quality assurance (QA) program, and argues either that all SSCs should be covered by the QA program or that they should be classified as ITWI. This lack of clarity fails to put DOE on notice of whether the contention is intended to relate to DOE's QA program or to the description of its retrieval plans.

#### a. Statement of Issue of Law or Fact to be Controverted

This contention must be dismissed because it does not "explain, with specificity, particular safety or legal reasons requiring rejection of the contested [application]." *Dominion Nuclear Conn., Inc.* CLI-01-24, 54 NRC at 359-60. Nor does it even come close to "articulat[ing] . . . the specific issues [it] wish[es] to litigate." *Duke Energy Corp.*, CLI-99-11, 49 NRC at 338. Instead, relying exclusively on the glossary of the SAR, Nevada makes a series of vague statements that are impossible to decipher. Initially, Nevada argues that:

The SAR glossary at xlvi defines some [SSCs] . . . that are necessary for retrieval as ITS, but the glossary at xlvi does not clearly define any [SSC] that is necessary for retrieval as ITWI. This means that the QA status of a [SSC] that is necessary for

retrieval depends only on whether it is needed to provide reasonable assurance retrieval will not lead to excessive doses in normal operation and in category 1 and 2 event sequences, ignoring post-closure waste isolation. *DOE should have defined all structures, systems and components which are necessary for retrieval as ITWI.*

Petition at 84 (emphasis added). Nevada then goes on to argue that “important [SSCs] that are necessary for retrieval [are] being *omitted from the QA program.*” *Id.* at 85 (emphasis added).

Taken together, these statements *appear* to raise various questions about: (1) whether SSCs necessary for retrieval have been properly classified as ITS/ITWI or non-ITS/non-ITWI; (2) whether these SSCs are covered by DOE’s QA program; (3) whether these questions in any way implicate DOE’s QA program; and/or (4) whether these questions in any way implicate DOE’s ability to retrieve waste. DOE cannot be expected to speculate as to which of these questions this contention attempts to put into issue in this proceeding.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

10 C.F.R. § 2.309(f)(1)(iv) requires a petitioner to show that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See*

*Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Regardless of whether this contention ultimately relates to the sufficiency of DOE’s QA program or the description of its retrieval plans, Nevada fails to present a material issue. To the extent the contention relates to DOE’s QA program, Nevada implies that certain SSCs were improperly classified, which resulted in certain SSCs falling outside of the QA program. Beyond offering no evidence that any SSCs were, in fact, improperly classified, however, Nevada fails to realize that DOE’s QA program applies to ITS and ITWI SSCs, *as well as* non-ITS and non-ITWI SSCs. *See* Quality Assurance Requirements and Description (QARD), Rev. 20 at 19 (providing that non-ITS/ITWI that are important to worker and public safety and the environment are covered by the QA program using a graded approach). Because Nevada has yet to establish that the SSCs at issue are not covered by DOE’s QA program, it cannot credibly argue that this contention relates to DOE’s QA program in any material way.

Likewise, there is no material issue with respect to DOE’s description of its retrieval plans. Specifically, nothing in this contention even suggests that an SSC’s ITS or ITWI classification, or even whether it is covered by DOE’s QA program, would have any bearing on DOE’s ability to retrieve waste from the repository, as governed by 10 C.F.R. § 63.111(e). Indeed, insofar as Nevada’s real concern is that all SSCs necessary for retrieval be classified as

ITWI, the contention makes no sense whatsoever. The function of an ITWI SSC is to assist with isolating waste, whereas the function of retrieval equipment is to remove waste from isolation. *See* 10 C.F.R. § 63.2 (defining ITWI SSCs as “those engineered and natural barriers whose function is to provide a reasonable expectation that high-level waste can be disposed of without exceeding the requirements of § 63.113(b) and (c)”).

Thus, whether QA-related or related to the subject of retrieval, this contention, fails, twice, to raise an issue that is material to the findings that the NRC must make in this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet these standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above: (1) the contention does not reference any documents, other than the LA; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. This contention falls far short of the requirement to provide conclusions supported by reasoned bases or explanation, and therefore must be dismissed. The contention appears to automatically assume that, among other things, treating particular SSCs as ITS or ITWI will determine whether that SSC is covered by DOE’s QA program, which, in turn, could have an impact on either DOE’s QA program or DOE’s ability to retrieve waste. But Nevada offers no evidence to support this assumption.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact,  
With Supporting References to the License Application**

This contention also fails to raise a genuine dispute on a material issue of law or fact because Nevada offers nothing to show that any of the SSCs that are necessary for retrieval have been incorrectly classified. Thus, there is no real question as to whether or not any of the SSCs necessary for retrieval have been properly classified as ITS/ITW or non-ITS/non-ITWI. Nevada offers no evidence on any of these matters. Nor does Nevada establish that any of the SSCs at issue are, in fact, not covered by DOE's QA program. Finally, Nevada even fails to draw a connection among an ITS/ITWI classification, the QA program and DOE's ability to retrieve waste. Accordingly, this contention must be dismissed.

**8. NEV-SAFETY-08 - Alara And The Aging Facility**

The discussion of the Aging Facility in SAR Subsection 1.2.7, and related subsections, is insufficient to establish compliance with NRC requirements that occupational exposure to radiation be “as low as reasonably achievable” (ALARA).

**RESPONSE**

This contention asserts that SAR Subsection 1.2.7 does not establish that the Aging Facility will comply with ALARA requirements because the SAR discussion of ALARA uses simplifying assumptions.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies 10 C.F.R. §§ 63.31(a)(2) and (3), 63.21(c)(2) and (6), 63.111(a)(1), 20.1101(b), 63.111(c), 63.112(e)(2) and (5) in the contention. *See* Petition at 87-8. Nevada concludes this general description of various sections of 10 C.F.R. Parts 63 and 20 with the mere assertion that “this contention alleges noncompliance with these

regulatory provisions and therefore raises a material issue.” *Id.* at 88. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Nevada has not demonstrated that this contention raises an issue that would prevent the NRC from making any finding required for the NRC to authorize construction of the repository. Moreover, the discussion in e. and f. below shows that this contention does not raise an issue that is material to any of the required findings.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains only unsupported assertions of

counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach an affidavit (by Michael C. Thorne), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavit simply “adopt[s]” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

In paragraph 2 of this contention, Nevada asserts that the SAR does not provide specific overpack shielding design, Aging Facility layout and loading plans, and that as a result, there is not a credible demonstration that ALARA requirements have been met because the SAR uses simplifying assumptions. Nevada does not identify any supporting facts or expert opinion for these assertions in paragraph 2 or paragraph 5. As the following list illustrates, the SAR does include such information, but Nevada has not referenced the relevant portions of the SAR or specified the allegedly omitted information.

- Overpack Shielding Design
  - SAR Subsection 1.2.7.6.3 “Shielding Design” (at 1.2.7-12);
  - Figure 1.2.7-6 “Typical Vertical Aging Overpack”(at 1.2.7-28); and
  - Table 1.10-6 “Dimensions of Aging Overpack” (at 1.10-52).
- Aging Facility Layout
  - SAR Subsection 1.2.7.1.2 “Location and Functional Arrangement” (at 1.2.7-12);
  - Figure 1.2.7-2 “Aging Pad Area Locations” (at 1.2.7-23);
  - Figure 1.2.7-3 “Aging Pad 17P Plan” (at 1.2.7-24);
  - Figure 1.2.7-4 “Aging Pad 17 R Plan” (at 1.2.7-25); and

- Figure 1.1-3 “Surface Geologic Repository Operations Area Showing Changes of Restricted Area and Protected Area during Phased Repository Development” (at 1.1-335).
- Loading Plans and ALARA
  - SAR Subsection 1.2.7.2 “Operational Processes” (at 1.2.7-8);
  - SAR Subsection 1.2.7.6.5 “As Low as is Reasonably Achievable Design” (at 1.2.7-12);
  - SAR Section 1.10 “Meeting The As Low As Is Reasonably Achievable Requirements For Normal Operations And Category 1 Event Sequences” (at 1.10-1);
  - SAR Section 5.11 “Operational Radiation Protection Program” (at 5.11-1).

Paragraph 5 of this contention makes three basic assertions, that: (1) a Hazards Analysis Report for the Aging Facility indicates that routine personnel activities will require occupancy exceeding administrative time limits and can result in personnel radiation dose exceeding the Project Design Criteria design goal (Petition at 88-9); (2) dose estimates for the Aging Facility are not credible because shielding of the aging overpacks is not yet designed and worker tasks are not detailed sufficiently to analyze dose consequences of operating the Aging Facility (Petition at 89-90); and (3) the security fence around the Aging Facility allows non-involved workers and visitors to receive exposures up to 2.5 mrem/hr (Petition at 90).

None of these assertions identifies a violation of a regulatory requirement. Moreover, the documents upon which Nevada relies do not provide an adequate foundation for any assertion that the facility design or proposed operations would be inconsistent with any regulation, or prevent the NRC from making the findings necessary to support issuance of construction authorization. Consequently, Nevada has not demonstrated that this contention raises an issue

that is material to the findings that the NRC must make to support issuance of construction authorization.

Nevada's first assertion is based on a DOE report, "Hazards Analysis Report: Aging Facility" (04/2008), LSN# DEN001591110. Petition at 88-9. Nevada asserts that the DOE report "concludes that these operations are not in keeping with ALARA pursuant to 10 C.F.R. Part 20." *Id.* at 89. The DOE report does not conclude that there is any such finding. The conclusion of the DOE report is that "overall the safety of the [Aging Facility], and the associated systems and design processes, is acceptable at this stage of design. Adequate design mitigation for pertinent hazards is incorporated in design requirements, or is in process." *Id.* at 14. The DOE report acknowledges that the ALARA requirements will be met, but indicates that dose reduction measures should be incorporated during completion of design to satisfy DOE's preference for reducing hazards through design rather than through the use of administrative controls. *Id.* at 50. The DOE hazard analysis cited by the petitioner is part of an early, systematic review of the design to ensure that due consideration is given to the hazards associated with the activities at the repository. DOE report at 8-9. Conducting such reviews very early in the design process is consistent with NRC guidance, which describes that "[t]he principal benefits arising from this evaluation process occur during the period of preliminary design since many of the ALARA practices are part of the design process." Regulatory Guide 8.19 "Occupational Radiation Dose Assessment In Light-Water Reactor Power Plants Design Stage Man-Rem Estimates," Rev. 1 at 1. The DOE report identifies concerns that should receive attention during completion of the design. DOE report at 9. A follow up review was scheduled to be done later as the design progressed. *Id.* at 11. A more recent DOE ALARA review of worker doses, based upon best estimate source term and throughput, estimated the dose to an Aging Facility operator

as 200 mrem/yr and to an Aging Facility health physics technician as 300 mrem/yr, which is well below the DOE goal to maintain the doses to workers at the repository to below 500 mrem/yr. LSN# DEN001574948, Table 1.0. In short, the DOE report is part of the process for complying with the ALARA requirements and does not provide support for a contention that the design does not meet those requirements. Consequently, Nevada's first assertion does not demonstrate that this contention raises an issue that is material to the findings that the NRC must make to support issuance of construction authorization.

Nevada's second assertion, concerning the credibility of dose estimates for operating the Aging Facility relies on a very general statement in the SAR explaining that dose estimates in the SAR are conservative, and will likely be reduced as the design advances. *See* SAR Subsection 1.10.2.11.1 at 1.10-20. The general statement does not mention the Aging Facility. *Id.* Contrary to Nevada's assertion that this general statement shows that aging overpack shielding is not yet designed and worker tasks not determined, configuration of an Aging Overpack is depicted in SAR Figure 1.2.7-6 (page 1.2.7-28), Aging Overpack shielding dimensions are given in SAR Table 1.10-6 (page 1.10-52), and worker tasks for operations with horizontal aging modules are depicted in SAR Figure 1.2.7-7 (page 1.2.7-29). Nevada does not cite any regulatory requirement suggesting that such information is not sufficient for construction authorization. Nevertheless, Nevada states, with regard to the Aging Facility," the License Application does not conform to two of the ALARA design principles stated in SAR Subsection 1.10.2 at 1.10-5." Petition at 89. Nevada does not cite any design detail or document that might substantiate such a claim, and it is not borne out by the facts. In fact, the SAR describes specific design features of the Aging Facility that implement the two principles in Subsections 1.2.7.6. 3 and 1.2.7.6.5 (SAR at 1.2.7-12-13). Consequently, Nevada's second assertion also does not provide support for this

contention or demonstrate that it raises an issue that is material to the findings that the NRC must make to support issuance of construction authorization.

Nevada's third and final assertion is that the security fence surrounding the Aging Facility does not fully limit access to visitors and non-involved workers into an area where they could receive up to 2.5 mrem/hr. Nevada does not cite any regulation or guidance that would be violated, or even a reason why any change would be desirable. The location of the Aging Facility areas is distant from the handling facilities and construction workers to reduce worker exposures. SAR Subsection 1.2.7.1.2 ("Location and Functional Arrangement") (page 1.2.7-4). Thus, there will be little occasion for non-involved workers or visitors to be in such areas. It should also be recognized that 2.5 mrem/hr is half of the dose rate of areas that require posting with a caution sign under 10 C.F.R. § 20.1903(c). Consequently, this assertion also does not violate any regulatory requirement, and does not demonstrate that this contention raises an issue that is material to any finding that the NRC must make to support issuance of construction authorization.

Thus, Nevada has failed to provide adequate support for this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in d. and e. above, the information Nevada has provided to support this contention is not sufficient information to show that a genuine dispute exists with DOE on a material issue of law or fact. Nothing that Nevada states in connection with this contention constitutes a reasoned statement of why the LA is unacceptable in some material respect. Consequently, this contention should be dismissed.

**9. NEV-SAFETY-09 - Increasing Co2 Levels On Future Climate Projections**

SAR Subsections 2.3.1.2.1.2, 5.1.6.5, and similar subsections, which state that the infiltration model used for Yucca Mountain applies current meteorological data for the generation of meteorological conditions for predicted future climates in the Yucca Mountain region over the next 10,000 years, fail to acknowledge that atmospheric CO<sub>2</sub> concentrations are increasing at a rate of 1 to 2 ppmv per year, and as a result, the climate states adopted by DOE for the next 10,000 years cannot be justified.

**RESPONSE**

This contention claims that DOE's infiltration model, as discussed in SAR Subsections 2.3.1.2.1.2 and 5.1.6.5, and similar subsections, does not acknowledge that atmospheric CO<sub>2</sub> concentrations are increasing at a rate of 1 to 2 ppmv per year, and as a result, the climate states adopted by DOE for the first 10,000 years after permanent closure cannot be justified. Petition at 92. This contention must be dismissed for the reasons set forth below.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

To the extent that Nevada argues that DOE is required to take into account in its climate analysis potential climate changes caused by ever increasing CO<sub>2</sub> concentrations resulting from human activity, the contention is inadmissible as outside the scope of this proceeding.

Nevada's contention would require DOE to predict how future human activity may, or may not impact the Earth's future climate. This, in turn, would require DOE to predict the future amounts and variations in amounts of CO<sub>2</sub> concentrations due to human activities. This is precisely the type of speculative endeavors that the NRC does not require DOE to undertake. For instance, in promulgating 10 C.F.R. § 63.305(b), the NRC explained that any attempt to foretell the impacts of changes to future human behavior was inappropriate as entirely speculative:

The natural systems of the biosphere are allowed to vary (*e.g.*, climate change) because the geologic record provides evidence of past climate over a long time frame, which provides a strong basis for predicting future changes. Because human behavior cannot be similarly predicted, a similar approach cannot be used for the RMEI and the influence the local population has on the biosphere. Thus, it is necessary to emphasize current conditions for the RMEI... The suggestion that NRC consider alternative futures related to human behavior is speculative and leads to problems deciding which alternative futures are credible and which are unrealistic. Such questions have no scientific or technical answer.

66 Fed. Reg. at 55757 (Nov. 2, 2001). Therefore, Nevada's contention would have DOE speculate, in contradiction of the basis for applicable regulations, about future changes in human activity for the first 10,000 year period which are inconsistent with NRC regulations at 10 C.F.R. § 63.305(b) and after that time, which is inconsistent with proposed § 63.342(c)(2). It is well settled that, absent a waiver, "no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding." 10 C.F.R. § 2.335(a). This licensing proceeding is an improper

forum for parties to challenge NRC regulations or proposed rules. *See* 10 C.F.R. § 2.335(a); *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, & 3), CLI-99-11, 49 NRC 328, 345 (1999) (extending that prohibition to challenges on the subject of an NRC rulemaking). This includes a contention that advocates stricter requirements than those imposed by the Commission's regulations or that otherwise seeks to litigate a generic determination established by a Commission rulemaking. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff'd*, CLI-01-17, 54 NRC 3 (2001). Accordingly, this contention must be dismissed.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that is material to the findings that the Commission must make in this proceeding, and must be dismissed. First, as noted above, the impact of future anthropogenic greenhouse gases on climate is outside the scope of this proceeding and, therefore, by definition the contention does not raise an issue material to the finding the Commission must make.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” Petition at 93. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a

difference in the outcome of the proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing. Indeed, Nevada fails to address what effect, if any, that including increasing concentrations of CO<sub>2</sub> into the DOE analysis would have, even on infiltration. It does not claim that doing so would result in infiltration estimate beyond that in the license application or that DOE’s estimates are not conservative. Absent any discussion on what effect the contention has on infiltration estimates, Nevada has clearly not met its burden to demonstrate that the resolution of the issue would

prevent the NRC from finding that there is reasonable expectation that the radioactive materials can be received, possessed and disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31.

The method the DOE used in addressing the infiltration model is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (Jonathan Overpeck and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada does provide two references for one of its statements in paragraph 5 of the contention, that "insolation and greenhouse gas concentrations are fundamental forcing factors of climate change." However, one of the documents, "Development and Application of a Methodology for taking Climate-Driven Environmental Change into Account in Performance Assessments," is 298 pages long, and the other, "Climate Change 2007," is 21 pages in length. Yet, Nevada does not cite any particular paragraph or page of either of these references as support. Such vague references to documents are not permissible. Rather, a petitioner must

identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). Moreover, the mere incorporation of massive documents, such as Nevada has done, is unacceptable. *See Tenn. Valley Auth.* (Browns Ferry Nuclear Plant, Units 1 and 2), LBP-76-10, 3 NRC 209, 216 (1976). Therefore, the reference to these documents is not sufficient to satisfy Section 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada's central claim is that a USGS report entitled "The Climate and Hydrologic History of Southern Nevada During the Late Quaternary," was "a primary basis document" for the license application, and because the report fails to "address the consideration that both insolation and greenhouse gas concentrations are fundamental forcing factors of climate change," DOE's climate analysis "cannot be supported." Petition p. 94. Nevada's contention is incorrect on all of these points. Nevada's assertion that the USGS report is a "primary basis document" for the climate analysis is misleading, and ignores the fact that there are 70 other references cited in SAR section 2.3.1, "Climate and Infiltration." Even limiting this to the SAR subsection specifically referenced in the contention, subsection 2.3.1.2.1.2, the USGS is only one of eleven references. Nevada has no basis for characterizing the USGS report as a "primary basis document."

Further, contrary to Nevada's claim that the USGS report does not consider greenhouse gas concentration to be a climate change forcing function, the USGS report clearly acknowledges that potential. This is readily apparent from the following quote taken from the report's "Central Hypothesis," at page 7:

Climate responds to forcing functions that operate on all time scales from a year or less to millions of years. Short-term forcing

functions involve factors, such as variability of solar output, of ocean/atmosphere heat exchange, such as the El Niño Southern Oscillation (ENSO), of volcanic eruptions, and of human-caused global warming. Long-term (million-year) forcing functions involve factors, such as continental drift, tectonics, and changes in ocean configuration. Change in Earth orbital characteristics occur on a millennial scale. Nonetheless, many factors must contribute to climate change, and the forcing functions likely operate on all time scales.

Even had the USGS report not acknowledged greenhouse gas concentrations as a climate change forcing factor, it would not create a dispute on a material issue because the license application did not cite to this report for its views on climate forcing functions. Rather, the license application cites it solely for its data and analysis of fossil ostracodes and diatoms from Owens Lake, California. As stated by another licensing board, “[T]he Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage, L.L.C.* (Independent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998), *aff’d on other grounds*, CLI-98-13, 48 NRC 26 (1998). In this case, the USGS report does not support the statements made in this contention. Thus, it is not surprising that the only references to the USGS report in SAR section 2.3.1 are in SAR subsection 2.3.1.2.1.2.4 "Reconstruction of Past Climate Details Using Data about Fossil Ostracodes in Owens Lake and Sizes of Prehistoric Lakes in the Great Basin," 2.3.1.2.2.1.2, "Owens Lake Ostracode and Diatom Record," 2.3.1.2.2.1.3, "Correlation of Owens Lake Paleolimnology and Devils Hole Oxygen Isotope Records," and a subsubsection of 2.3.1.2.3.1.1, entitled "Owens Lake Paleoclimate Record."

The contention urges DOE to analyze the effects of increasing atmospheric CO<sub>2</sub> concentrations for predicted future climates and avers that "atmospheric CO<sub>2</sub> concentrations are increasing at a rate of 1 to 2 ppmv per year." Petition p. 92. Nevada provides no reference to

support these figures. Nevertheless, even if these increases are correct from a historic perspective, Nevada's speculation that atmospheric CO<sub>2</sub> concentrations will increase at a rate of 1 to 2 ppmv per year indefinitely into the future is insufficient to form a basis for the contention and fails to present a genuine dispute of material law or fact. Nevada does not cite to technical or scientific references to substantiate this claim, or provide any reasoned basis whatsoever. As the Commission has held: "an expert opinion that merely states a conclusion (e.g., the application is 'deficient,' 'inadequate,' or 'wrong') without providing a reasoned basis or explanation for that conclusion is inadequate because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion." *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (emphasis added) (quoting *Private Fuel Storage, L.L.C. (Independent Fuel Storage Installation)*, LBP-98-7, 47 NRC 142, 181 (1998), *aff'd on other grounds*, CLI-98-13, 48 NRC 26 (1998)). In fact, Nevada's own document indicates that any attempt to predict changes into the future is "subject to considerable uncertainty":

[T]he future variations in greenhouse-gas concentrations in the atmosphere are subject to considerable uncertainty. One cause of this is that emissions of carbon dioxide from the burning of fossil fuels are difficult to quantify, as they depend on a complex mix of socio-economic and political considerations.

"Development and Application of a Methodology for taking Climate-Driven Environmental Change into Account in Performance Assessments," p. 26. Yet, unlike greenhouse gas emissions, insolation can be predicted quite accurately for millions of years into the future:

The characteristics of the orbit of the Earth enter into consideration because they affect the spatial and temporal pattern of short-wave radiation delivered to the top of the atmosphere. On timescales of up to a few million years into the future, accurate calculations of these variations in insolation have been made using well-justified models of celestial mechanics. Thus, this forcing factor can be

considered as a well-defined input that is not subject to significant uncertainty on the timescales of interest.

*Id.*

The document cited by Nevada further indicates that greenhouse gases such as CO<sub>2</sub> warm the atmosphere. *See* “Development and Application of a Methodology for Taking Climate-Driven Environmental Change into Account in Performance Assessments,” pp. 40-41. Indeed, this document is replete with numerous scenarios and possible future climate variations resulting from increased CO<sub>2</sub> concentrations. For instance, on pp.178-179 it predicts greenhouse gas emissions to result in a climate with much *dryer* conditions:

The combination of higher temperatures throughout the year and somewhat decreased summer precipitation rates would imply a reduction in groundwater resources. Indeed, there might be an extended period of depletion by over-utilisation before a new sustainable water-management regime was established. The reduction in water availability is implied in the data for yearly precipitation and evapotranspiration given in the WP2 simulations. Whereas the current climate provides an annual excess of water that can either run off into the rivers or recharge groundwater resources, in each of the simulations except E (see below) values of precipitation and evapotranspiration are nearly equal. This means, that winter rain is not sufficient to recharge groundwater supplies, because there is always some run-off associated with heavy rain. The consequences of a climate change for agriculture will be time-dependent. The first consequence is likely to be poor harvests, as farming practice may take some time to adjust to the increased frequency of summer drought. After some years, there would be a switch to other species and varieties of grain that are adapted to the warmer and dryer climate, and irrigation practices in family gardens would be intensified.

This helps demonstrate the futility of any type of predictions based on increased production of greenhouse gases by future human activity, and the appropriateness of the NRC’s direction not to attempt to do so. Moreover, dryer conditions, as predicted by Nevada’s own reference will reduce infiltration, making DOE’s model that does not include CO<sub>2</sub> concentrations resulting

from future human activity conservative. Accordingly, there is no genuine dispute as to a material issue.

As discussed in Section V.A.3 above, contentions expressing only generalized “uncertainties’ in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from this deficiency.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the infiltration model properties at the proposed repository site or to specifically state the radiological impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada’s contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists.

This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

Finally, the contention's reference to two internal USGS memoranda is entirely immaterial. These memoranda document the internal USGS review of the draft version of the report, together with the substantive responses of the author addressing the comments he received. The documents provide no support for Nevada's assertion that the report "takes ... a limited and inadequate view of factors that will affect future changes in climate." Petition p. 95. To the contrary, the USGS reviewer made it clear that he considered the draft report to be "a very important document representing several dozen man-years of work by top notch scientists in the Yucca Mountain Project (YMP)." LSN DEN001358010 at 82.

**10. NEV-SAFETY-10 - Consideration Of Forcing Functions On Future Climate Projections**

SAR Subsections 5.2.5.3 (and subsections therein) and 5.2.5.4 and similar subsections, ignore basic aspects of climate forcing relevant to the prediction of climate change over the next 10,000 years, and thus conclusions regarding long-term climate projections are inaccurate and incomplete.

**RESPONSE**

In this contention, Nevada alleges that DOE's long-term climate projections are inaccurate and incomplete because "SAR Subsections 5.2.5.3 (and subsections therein) and 5.2.5.4 and similar subsections ignore basic aspects of climate forcing relevant to the prediction of climate change over the next 10,000 years." Petition at 97. In particular, Nevada alleges that DOE should have included the following four "forcing functions": (1) emissions of greenhouse gases resulting from human activities; (2) changes in ice sheets and ocean circulation, again resulting from a human-induced increase in greenhouse gas concentrations; (3) possible decadal-to millennial-scale future climate variability; and (4) possible abrupt climate change. This contention must be dismissed for the reasons set forth below.

**a. Statement of Issue of Law or Fact to be Controverted**

This contention does not provide a specific statement of the issue of law or fact to be raised, because the contention fails to specify what "conclusions" regarding DOE's climate change projections are inaccurate and incomplete. In addition, the contention's cites to SAR Subsections 5.2.5.3 and 5.2.5.4 are inaccurate insofar as the SAR does not contain any such subsections. Indeed, SAR Section 5.2 and the subsections it contains pertain to "Records,

Reports, Tests, and Inspections,” and, therefore, have no relevance to DOE’s climate predictions. Clearly, Nevada’s reference to “similar subsections” is likewise irrelevant.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

In essence, Nevada’s core claim is that DOE’s climate analysis is flawed because it fails to take anthropogenic greenhouse gases into account when predicting future climate states. For instance, Nevada alleges at page 99 of the Petition that “human activities are resulting in massive emissions of greenhouse gases ....” The contention goes on and speculates that these greenhouse gas emissions “could result in major changes in ice sheets and ocean circulation ....” *Id.* Nevada’s argument that DOE is required to take into account in its climate analysis potential climate changes caused by increasing greenhouse gases resulting from human activity is inadmissible as outside the scope of this proceeding. It is well settled that, absent a waiver, “no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding.” 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission’s regulations or that otherwise seeks to litigate a generic determination established by a Commission rulemaking. *See Fla. Power & Light Co. (Turkey Point Nuclear Generating Plant, Units 3 and 4)*, LBP-01-6, 53 NRC 138, 159, *aff’d*, CLI-01-17, 54 NRC 3 (2001). Section 63.305 contains no requirement that climate forcing functions resulting from human activities be included in DOE’s future climate analysis. An attempt by the petitioner to mandate inclusion of factors that are not required by the Commission’s regulations is, accordingly, inadmissible.

Furthermore, the inclusion of such forcing functions resulting from human activities, for instance emissions of greenhouse gases and the claimed changes in ice sheets, ocean circulation, and other things resulting from these emissions, would require DOE to predict how future human activity may, or may not impact the Earth's future climate. This, in turn, would require DOE to predict the future amounts and variations in amounts of greenhouse gas emissions due to human activities. This is precisely the type of speculative endeavors that the NRC does not require DOE to undertake. For instance, in promulgating 10 C.F.R. § 63.305(b), the NRC explained that any attempt to foretell the impacts of changes to future human behavior was inappropriate as entirely speculative:

The natural systems of the biosphere are allowed to vary (*e.g.*, climate change) because the geologic record provides evidence of past climate over a long time frame, which provides a strong basis for predicting future changes. Because human behavior cannot be similarly predicted, a similar approach cannot be used for the RMEI and the influence the local population has on the biosphere. Thus, it is necessary to emphasize current conditions for the RMEI...The suggestion that NRC consider alternative futures related to human behavior is speculative and leads to problems deciding which alternative futures are credible and which are unrealistic. Such questions have no scientific or technical answer.

66 Fed. Reg. at 55757 (Nov. 2, 2001). Nevada's contention would have DOE speculate about future changes in human activity for the first 10,000 year period which is inconsistent with NRC regulations at 10 C.F.R. §§ 63.305(b) and after that time, which is inconsistent with 63.342(c)(2) (proposed). This licensing proceeding is an improper forum for parties to challenge NRC regulations or proposed rules. *See* 10 C.F.R. § 2.335(a) (stating that "no rule or regulation of the Commission . . . is subject to attack . . . in any adjudicatory proceeding"); *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, & 3), CLI-99-11, 49 NRC 328, 345 (1999) (extending that

prohibition to challenges on the subject of an NRC rulemaking). Accordingly, this contention must be dismissed.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that is material to the findings that the Commission must make in this proceeding, and must be dismissed. First, as noted above, the impact of future anthropogenic greenhouse gases on climate is outside the scope of this proceeding and, therefore, by definition the contention does not raise an issue material to the finding the Commission must make.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp. (Oconee Nuclear Station, Units 1, 2, and 3)*, CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would

make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing. Indeed, Nevada fails to address what effect, if any, that including the asserted forcing functions into the DOE analysis would have, even on infiltration. It does not claim that doing so would result in infiltration estimate beyond that in the license application or that DOE’s estimates are not conservative. Absent any discussion on what effect the contention has on infiltration estimates, Nevada has clearly not met its burden to demonstrate that the resolution of the issue would prevent the NRC from finding that there is reasonable expectation that the radioactive materials can be received, possessed and disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31.

The method the DOE used in addressing long-term climate projections is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance,

(3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3, *supra*, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (Jonathan Overpeck and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5

of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada does provide three references purportedly as the basis for their claim that DOE’s climate change assessment “methodology is flawed in that it ignores basic aspects of climate forcing and change relevant to the prediction of climate change over the next 10,000 years.” Petition p. 98. Yet, Nevada does not cite any particular paragraph or page of any of these references as support. Such vague references to documents are not permissible. Rather, a petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). Indeed, the Commission’s caution that the mere incorporation of massive documents is unacceptable, *see Tenn. Valley Auth.* (Browns Ferry Nuclear Plant, Units 1 and 2), LBP-76-10, 3 NRC 209, 216 (1976), is particularly relevant here. One of the cited documents, “Scientific Assessment of the Effects of Global Change on the United States,” is 271 pages in length, while the other two are 36 and 21 pages long. The fourth and final reference provided in this contention, “Abrupt Climate Change,” is 244 pages in length. Therefore, the contention’s reference to these documents is not sufficient to satisfy Section 2.309(f)(1)(v).

Nevada speculates that “increasing atmospheric greenhouse gas concentrations, unless abated, *could* result in major changes in ice sheets and ocean circulation, that *could*, in turn, create future climates even more distinct from past climates, and those assumed for the future by DOE.” Petition p. 99. Even if this claim was supported by an expert opinion, which it is not, it would fail. It is an indefinite claim that amounts to mere unfocused speculation which does not provide adequate support for a contention. A contention “will be ruled inadmissible if the

petitioner ‘has offered no tangible information, no experts, no substantive affidavits,’ but instead only ‘bare assertions and speculation.’” *Fansteel, Inc.* (Muskogee, Oklahoma Site), CLI-03-13, 58 NRC 195, 203 (2003) (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

Similarly, Nevada’s other claims are speculative on their face and, accordingly also are insufficient support for the contention. This includes the following assertions:

- “[P]ossible decadal- to millennial-scale variability...is known to have been substantial in the past, and *could* thus be so in the future,” Petition p. 99,
- “[A]brupt climate change has occurred in the past, and *could* thus occur in the future.” Petition p. 100.
- “[F]uture climates at Yucca Mountain *could* be different from those assumed by DOE. In particular, those climates *could* be without modern analog.” *Id.*

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed above, DOE has already demonstrated that Nevada’s claims are outside the scope of the proceeding and are also not material. Accordingly, Nevada’s claims of noncompliance also do not raise a genuine dispute of material fact or law. But the contention also contains other arguments which, as DOE demonstrates below, raise no genuine issue on a material issue of fact or law.

DOE modeled climate change consistent with the NRC regulations and regulatory intent. Contrary to Nevada’s claims regarding the first two allegedly omitted functions, DOE appropriately *does* consider climate change and, in predicting that climate change for the first 10,000 year period, considers the impact of past and present human activities. *See* FEP: 1.3.01.00.0A (Climate Change), Features, Events, and Processes for the Total System

Performance Assessment: Analyses, 6-215, 6-218, LSN# DEN001584824 (Mar. 2008). For the first 10,000 years after disposal, DOE modeled climate change using historical climate change records. *See id.* at 6-215. Those records “include effects of modern society over the duration of the historical record.” FEP 1.4.01.00.0A (Human Influences on Climate), Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN# DEN001584824 (Mar. 2008).

Furthermore, forcing functions noted by Nevada, could result in a dryer climate, and less potential for infiltration. For instance, one of the documents Nevada cites to in support of NEV-SAFETY-09, found as much with regard to a sudden climate change: “Towards the limit of the Lower-Middle Pleistocene (780 ka BP), a sudden climate change resulted in a dryer period with relative deficits of water and with intermediate episodes of climatic amelioration.”

“Development and Application of a Methodology for Taking Climate-Driven Environmental Change into Account in Performance Assessments,” at 18-19. Similarly, this document indicates that increased greenhouse gas concentration warms the atmosphere. *See id.* at 40-41. Indeed, this document is replete with numerous scenarios and possible future climate variations resulting from increased CO<sub>2</sub> concentrations. For instance, on pages 178-179, it predicts greenhouse gas emissions to result in a climate with much *dryer* conditions:

The combination of higher temperatures throughout the year and somewhat decreased summer precipitation rates would imply a reduction in groundwater resources. Indeed, there might be an extended period of depletion by over-utilisation before a new sustainable water-management regime was established. The reduction in water availability is implied in the data for yearly precipitation and evapotranspiration given in the WP2 simulations. Whereas the current climate provides an annual excess of water that can either run off into the rivers or recharge groundwater resources, in each of the simulations except E (see below) values of precipitation and evapotranspiration are nearly equal. This means, that winter rain is not sufficient to recharge groundwater

supplies, because there is always some run-off associated with heavy rain. The consequences of a climate change for agriculture will be time-dependent. The first consequence is likely to be poor harvests, as farming practice may take some time to adjust to the increased frequency of summer drought. After some years, there would be a switch to other species and varieties of grain that are adapted to the warmer and dryer climate, and irrigation practices in family gardens would be intensified.

This helps demonstrate the futility of any type of predictions based on increased production of greenhouse gases by future human activity, and the appropriateness of the NRC's direction not to attempt to do so. Moreover, dryer conditions, as predicted by Nevada's own reference will reduce infiltration, making DOE's model that does not include CO<sub>2</sub> concentrations resulting from future human activity conservative. Accordingly, there is no genuine dispute as to a material issue.

As discussed in Section V.A.3 above, contentions expressing only generalized "uncertainties" in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from this deficiency.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the long-term climate projection properties at the proposed repository site or to specifically state the radiological impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada's claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada's contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**11. NEV-SAFETY-11 - Human-Induced Climate Changes On Prediction Of The Next Glacial Period**

SAR Subsection 5.2.5.4 and similar subsections, which state that a cooling trend will be initiated within the first 10,000 years leading to a period of full glacial conditions at about 30,000 years after present, fail to accurately calculate the characteristics of the trend in climate or the timing of the next glacial period because recent studies suggest that, due to human-induced climate changes, it is possible that the Earth will not enter another glacial period for at least 200,000 to 500,000 years, and thus precipitation in excess of that predicted could occur at Yucca Mountain.

**RESPONSE**

Nevada states that “SAR Subsection 5.2.5.4 and similar subsections” fail to accurately predict climate change for the next 10,000 years in light of certain studies that predict that human impact on climate will postpone the next glacial period for at least 200,000 to 500,000 years and result in increased precipitation at Yucca Mountain relative to DOE’s prediction.

**a. Statement of Issue of Law or Fact to be Controverted**

This contention does not provide a specific statement of the issue of law or fact to be raised, because the contention cites to SAR Subsection 5.2.5.4. The SAR does not contain any such subsection. Indeed, SAR Section 5.2 and the subsections it contains pertain to “Records, Reports, Tests, and Inspections,” and, therefore, have no relevance to DOE’s climate predictions. Clearly, Nevada’s reference to “similar subsections” is likewise irrelevant.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention states that DOE should have considered certain predictions regarding the future impact of human activities on climate change. Petition at 105 (“recent studies suggest that, due to human-induced climate changes, the scientific expectation is of a warming trend initiated within the next 10,000 years and resulting in a suppression of glacial conditions for 200,000 years or more. Therefore, SAR Subsection 5.2.5.4 and similar subsections fail to satisfy the requirements of 10 C.F.R. § 63.305(c)”). The following paragraphs demonstrate that such considerations are contrary to NRC regulations and are therefore outside the scope of this proceeding, thereby violating 10 C.F.R. § 2.309(f)(1)(iii).

NRC regulations require that DOE vary factors related to climate based on present knowledge of those factors, but not attempt to predict changes in human activity. Proposed 10 C.F.R. § 63.305 states:

(a) Features, events, and processes that describe the reference biosphere must be consistent with present knowledge of the conditions in the region surrounding the Yucca Mountain site. (b) DOE should not project changes in society, the biosphere (other than climate), human biology, or increases or decreases of human knowledge or technology. In all analyses done to demonstrate compliance with this part, DOE must assume that all of those factors remain constant as they are at the time of submission of the license application. (c) DOE must vary factors related to the geology, hydrology, and climate based upon cautious, but reasonable assumptions consistent with present knowledge of factors that could affect the Yucca Mountain disposal system during the period of geologic stability [(i.e., from repository closure to 1,000,000 years after closure)] and consistent with the requirements for performance assessments specified at § 63.342.

70 Fed. Reg. 53,313, 53,319 (Sept. 8, 2005). Proposed 10 C.F.R. § 63.342 prescribes the climate and infiltration model that DOE should employ for analysis of the post-10,000 year period, as discussed further below. *See id.* at 53,319-20.

DOE modeled climate change consistent with these regulations. As shown in included FEP 1.3.01.00.0A, "Climate Change," DOE modeled climate change for the first 10,000 years after disposal using historical climate change records. *See Features, Events, and Processes for the Total System Performance Assessment: Analyses*, LSN# DEN001584824, 6-215 (Mar. 6, 2008). The use of historical climate records is consistent with the NRC's guidance that "[p]rojections of future climate change are based on evaluation of paleoclimate information over the past 500,000 years." *See Yucca Mountain Review Plan*, NUREG-1804, rev. 2, Section 2.2.1.3.5.3: AC 1(7). The climate records used to predict climate change in the LA also "include effects of modern society over the duration of the historical record," that is, they account for human impact on climate. *See Features, Events, and Processes for the Total System Performance Assessment: Analyses*, LSN# DEN001584824, 6-235 (Mar. 6, 2008). Even without inherent inclusion of that impact, the paleoclimate record for the Yucca Mountain region, specifically Owens Lake, includes evidence of strong monsoonal climate incursions for sustained periods of time. *See SAR 2.3.1.2.3.1.2 at 2.3.1-29; SAR Fig. 2.3.1-14; see also Future Climate Analysis*, ANL-NBS-GS-000008 REV 01, Las Vegas, Nevada: Bechtel SAIC Company, LSN# DN2002481558, Sec 6.6.2 at 6-47 – 6-948 (2004). Monsoonal climate incursions result in warmer and wetter climate conditions than present, similar to some modeled global warming scenarios, in the Yucca Mountain region. *See SAR 2.3.1.2.3.1.2 at 2.31-29; SAR Fig. 2.3.1-14. Future Climate Analysis*, ANL-NBS-GS-000008 REV 01, Las Vegas, Nevada: Bechtel SAIC Company, LSN# DN2002481558 Sec 6.6.2 at 6-47 – 6-49 (2004). The infiltration model domain for monsoon climate incorporates approximately 60% greater average annual precipitation than present-day values. *See SAR 2.3.1 at 2.3.1-6*. In addition, the DOE precipitation model used in net infiltration modeling is stochastic and includes the effects of

extreme precipitation events that greatly exceed any observed during the historical record near Yucca Mountain; daily precipitation can reach as high as 983 mm (maximum daily observed in Nevada) See SAR 2.3.1.3.2.1.1 at 2.3.1-37 and -38. *Simulation of Net Infiltration for Present-Day and Potential Future Climates*, MDL-NBS-HS-000023 Rev. 01 (May 2007) LSN# DN2002481680 at Table I-1 at I-5.

Although DOE evaluated human impact on climate when modeling climate change in accordance with NRC regulations at 10 C.F.R. § 63.305(b), as described above, DOE did *not* engage in speculation regarding future impacts of human activities on climate change. See Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN# DEN001584824, 6-235 (Mar. 6, 2008). In promulgating 10 C.F.R. § 63.305(b), the NRC explained that any attempt to foretell the impacts of changes to future human behavior was inappropriate as entirely speculative: “The natural systems of the biosphere are allowed to vary (*e.g.*, climate change) because the geologic record provides evidence of past climate over a long time frame, which provides a strong basis for predicting future changes. Because human behavior cannot be similarly predicted, a similar approach cannot be used for the RMEI and the influence the local population has on the biosphere. Thus, it is necessary to emphasize current conditions for the RMEI.... The suggestion that NRC consider alternative futures related to human behavior is speculative and leads to problems deciding which alternative futures are credible and which are unrealistic. Such questions have no scientific or technical answer.” 66 Fed. Reg. at 55,757 (Nov. 2, 2001).

At several points throughout the contention, Nevada references the impact of human influence on climate change in the post-10,000 year period. Petition at 102 – 105 (“the Earth will not enter another glacial period for at least 200,000 to 500,000 years” ... “[t]his difference in

the trend in climate characteristics over time has the potential to affect the characteristics of precipitation at Yucca Mountain both within the next 10,000 years and thereafter”). To the extent that this contention challenges DOE’s climate and infiltration modeling for the *post*-10,000 year period, that position constitutes an impermissible challenge to Commission regulations and is therefore outside the scope of this proceeding. *See* 10 C.F.R. § 2.335(a) (“no rule or regulation of the Commission...is subject to attack...in any adjudicatory proceeding subject to this part”). For the period from 10,000 years after permanent closure through the period of geologic stability, proposed 10 C.F.R. § 63.342(c)(2) specifies that DOE’s assessment of the effects of climate change “may be limited to the effects of increased water flow through the repository as a result of climate change, and the resulting transport and release of radionuclides to the accessible environment,” and should be modeled through the use of a “constant value ... based on a log uniform probability distribution for deep percolation rates from 13 to 64 mm/year (0.5 to 2.5 inches/year).” 70 Fed. Reg. at 53,319-20. Consistent with proposed 10 C.F.R. § 63.342(c)(2), DOE limited the climate change analysis for the post-10,000 year period to the effects of increased water flow through the repository. *See* Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN# DEN001584824, 6-215, 6-216 (Mar. 6, 2008).

Nevada would have DOE speculate about future human impact on climate change for the first 10,000 year period and consider human impact on climate change in the post-10,000 year period, both of which are inconsistent with the requirements of NRC regulations at 10 C.F.R. §§ 63.305(b) and 63.342(c)(2) (proposed). This licensing proceeding is an improper forum for parties to challenge NRC regulations or proposed rules. *See* 10 C.F.R. § 2.335(a); § 2.335(b) (stating that “no rule or regulation of the Commission . . . is subject to attack . . . in any

adjudicatory proceeding”); *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, & 3), CLI-99-11, 49 NRC 328, 345 (1999) (extending that prohibition to challenges on the subject of an NRC rulemaking). Accordingly, this contention fails to meet the requirements of 10 C.F.R. § 2.309(f)(1)(iii) and must be dismissed.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that is material to the findings that the Commission must make in this proceeding, and must be dismissed. First, as noted above, the impact of future anthropogenic production of greenhouse gases on the timing of the next glacial period is outside the scope of this proceeding and, therefore, by definition the contention does not raise an issue material to the finding the Commission must make.

Similarly, to the extent that Nevada’s contention alleges that DOE must consider how changes to future human activities might affect climate change and, thus, the repository, this contention fails to raise an issue that is material to the findings the NRC must make. DOE considered climate change and human influence on climate change in its LA, but did not speculate about possible future changes in human activities or how those changes could affect climate. *See Features, Events, and Processes for the Total System Performance Assessment: Analyses*, LSN# DEN001584824, 6-235 (Mar. 2008). As described above, DOE has drawn this distinction because NRC regulations governing postclosure performance objectives explicitly prohibit DOE from projecting changes in human knowledge, society, or technology. *See* 10 C.F.R. § 63.305(b). Because NRC regulations direct that DOE should not consider future changes in human activities, such considerations are not material to NRC’s findings.

Moreover, as noted above, proposed 10 C.F.R. § 63.305(c) requires DOE to make “reasonable assumptions consistent with present knowledge” when assessing climate change

through the period of geologic stability. Thus, with regard to § 63.305(c), for the contention to be material to this proceeding, Nevada must allege and provide sufficient support to show that DOE's assumptions were *unreasonable*. Nevada, however, makes no such claim.

Further, to the extent that this contention challenges DOE to consider certain predictions in climate change in the post-10,000 year period, this contention fails to raise an issue that is material to the findings the NRC must make. As discussed above, NRC regulations at proposed 10 C.F.R. § 63.342(c)(2) prescribe the climate and infiltration analyses for the post-10,000 year period. Accordingly, any consideration of alternative climate states for that time period is not material to the NRC's findings in this proceeding.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists a number of regulations in paragraph 4 in this contention. *See* Petition at 102-103. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 103. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would

make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing climate change is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

For the aforementioned reasons, this contention fails to raise issues material to the findings NRC must make and therefore, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. To the extent that it relies on expert opinion, this contention fails to meet those standards. Nevada does attach several affidavits (by Jonathan Overpeck and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

In its contention, Nevada cites a handful of supporting documents, which stand for limited propositions, but do not directly refute the climate models presented by DOE in SAR Section 2.3.1. Moreover, Nevada merely opines that the conditions predicted in these supporting documents have “the *potential* to affect the characteristics of precipitation at Yucca Mountain.” Petition at 104 (emphasis added). Licensing boards have found that “[m]ere assertions without appropriate explanation and support do not satisfy the requirements of the contention rule.” *See Duke Energy Corp.* (McGuire Nuclear Station, Units 1 & 2, Catawba Nuclear Station, Units 1 & 2), LBP-02-4, 55 NRC 49, 84 (2002). Indeed, Nevada simply does not attempt to engage the specifics of the extensive data and analysis presented in SAR Section 2.3.1 and underlying supporting documents.

In addition, Nevada fails to point to a specific page or section of the document for support in the aforementioned documents. A petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). Consistent with that requirement, the Case Management

Order directs petitioners to ensure that documentary references “be as specific as reasonably possible.” *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 7). Nevada’s contention also fails in this regard.

Accordingly, this contention lacks a sufficient foundation to “warrant further exploration” by the Board and should be dismissed. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 & 2), ALAB-942, 32 NRC 395, 428 (1990) (citation omitted).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated above that this contention is outside of the scope of this proceeding and also not material to any finding the NRC must make. Accordingly, the contention does not raise a genuine dispute on a material issue of law or fact. But the contention also contains other assertions which, as DOE demonstrates below, raise no genuine dispute of a material issue of fact or law.

Nevada fails to raise a genuine dispute with DOE regarding whether a delay in the next full glacial period would lead to greater infiltration than that which is predicted by the present DOE climate forecast. In DOE’s analysis of potential future climate conditions, full glacial climates are characterized by cooler temperatures and wetter conditions, and hence, increased infiltration, than during either the glacial-transition climate or the present climates that precede it. *See, e.g.*, SAR Subsection 2.3.1.2.3.1.1; *see also* SAR Section 2.3.1 at 2.3.1-6; and Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN# DEN001584824, 6-215 (Mar. 6, 2008). Therefore, any delay in the onset of the next full glacial period would result in *less* precipitation and *less* infiltration over that intervening time period than that estimated by DOE’s future climate analysis. Accordingly, this contention fails to “state the applicant’s position and the petitioner’s opposing view,” or otherwise provide sufficient

information to show a genuine dispute exists. Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. at 33,170; *Dominion Nuclear Conn., Inc.*, CLI-01-24, 54 NRC at 358.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material, and therefore fails to meet Nevada's burden to show that its contention raises an issue that is material to this proceeding. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. Nevada proposes an alternative climate model, but does not specify the implications of its alleged deficiencies in the LA's climate model, or the resulting dose to the RMEI or release to the accessible environment. Accordingly, this contention suffers from that deficiency. In fact, it appears that Nevada's proposed alternative would most likely lessen the dose to the RMEI, since it would tend to prolong the period before conditions became wetter.

In summary, this contention does not establish a genuine dispute of material issue. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

**12. NEV-SAFETY-12 - Projections Of Future Wetter Climate Conditions**

SAR Subsection 2.3.1.2.3.1.2 at 2.3.1-27 through 2.3.1-31, and similar subsections, which define the Analogue Meteorological Stations used for the Yucca Mountain climate forecast for the next 10,000 years, fail to account for the significantly greater summer monsoon rainfall amounts that could occur as a result of continued global warming.

**RESPONSE**

This contention claims that DOE's climate forecast for the next 10,000 years is inaccurate or incomplete because the analog sites used as a proxy for future climate states fail to account for greater monsoon rainfall that could occur as a result of continued global warming. Petition at 107. In essence, Nevada claims that unless DOE takes the effect of future anthropogenic greenhouse gases on monsoon rainfall into account when predicting future climate states over the next 10,000 years, it cannot satisfy applicable regulatory requirements, in particular, 10 C.F.R. § 63.505(c), which requires DOE to vary factors related to climate based on cautious but reasonable assumptions. This contention must be dismissed for the reasons set forth below.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Nevada's core claim is that DOE's climate analysis is flawed because it fails to take production of greenhouse gases into account when predicting future climate states. It is clear that what is at issue is the effect of future human-production of greenhouse gases on climate. For instance, in Nevada document "Climate Change 2007: The Physical Science Basis, Contribution of Working Group I to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change" (IPCC, 2007) (Solomon, S., et al. (eds.), Cambridge University Press, 32 Avenue of the Americas, New York, NY 10013-2473), the reporting Working Group at page 2 states: "[g]lobal atmospheric concentrations of carbon dioxide, methane, and nitrous oxide have increased markedly as a result of human activities ...." The Group goes on to state at page 3 that: "The understanding of anthropogenic warming and cooling influences on climate has improved since the [Third Assessment Report] ...." Thus, it is clear that Nevada's issue relates not to naturally occurring greenhouse gases, but those that will be produced in the future by humans. Nevada's argument that DOE is required to take into account in its climate analysis the potential for greater monsoon rainfall as a result of a result of global warming in this contention is inadmissible as outside the scope of this proceeding. It is well settled that, absent a waiver, "no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding." 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission's regulations or that otherwise seeks to litigate a generic determination established by a Commission rulemaking. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff'd*, CLI-01-17, 54 NRC 3 (2001). Section 63.305 contains no requirement that speculation over the impact of global warming on monsoon rainfall be included in the DOE's future climate analysis. An

attempt by the petitioner to mandate inclusion of factors that are not required by the Commission's regulations is, accordingly, inadmissible.

Nevada's contention would require DOE to predict how future human activity may, or may not, impact the Earth's future climate. This, in turn, would require DOE to predict the future amounts and variations in amounts of greenhouse gas emissions due to human activities. This is precisely the type of speculative endeavors that the NRC does not require DOE to undertake. For instance, in promulgating 10 C.F.R. § 63.305(b), the NRC explained that any attempt to foretell the impacts of changes to future human behavior was inappropriate as entirely speculative:

The natural systems of the biosphere are allowed to vary (*e.g.*, climate change) because the geologic record provides evidence of past climate over a long time frame, which provides a strong basis for predicting future changes. Because human behavior cannot be similarly predicted, a similar approach cannot be used for the RMEI and the influence the local population has on the biosphere. Thus, it is necessary to emphasize current conditions for the RMEI... The suggestion that NRC consider alternative futures related to human behavior is speculative and leads to problems deciding which alternative futures are credible and which are unrealistic. Such questions have no scientific or technical answer.

66 Fed. Reg. at 55757 (Nov. 2, 2001). Therefore, Nevada's contention would have DOE speculate about future changes in human activity for the first 10,000 year period which are inconsistent with NRC regulations at 10 C.F.R. § 63.305(b).

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that is material to the findings that the Commission must make in this proceeding, and must be dismissed. First, as noted above, the impact of future anthropogenic greenhouse gases on climate is outside the scope of this

proceeding and, therefore, by definition the contention does not raise an issue material to the finding the Commission must make.

Second, in its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp. (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).*

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2),

“because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing. Indeed, as discussed in more detail below under section (f), Nevada fails to address what effect, if any, that possible increased summer rainfall amounts would even have on infiltration. It does not claim that doing so would result in infiltration estimates beyond those in the license application or that that DOE’s estimates are not conservative. Absent any discussion on what effect the contention has on infiltration estimates, Nevada has clearly not met its burden to demonstrate that the resolution of the issue would prevent the NRC from finding that there is reasonable expectation that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2).

The method the DOE used in addressing future climate forecast for the next 10,000 years is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as

mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (Jonathan Overpeck and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in

paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada does provide two references in support of its claim that “summer rainfall would likely occur in a manner more intense than present, or as is estimated for the future by DOE.” Petition at 108. However, one of the documents, “Climate Change 2007: The Physical Science Basis, Contribution of Working Group I to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change,” is 1,009 pages long, and the other, “Weather and Climate Extremes in a Changing Climate, Regions of Focus,” is 180 pages in length. Yet, Nevada does not cite any particular paragraph or page of either of these references as support. Such vague references to lengthy documents are not permissible. Rather, a petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). Indeed, the Commission’s caution that the mere incorporation of massive documents is unacceptable, *see Tenn. Valley Auth.* (Browns Ferry Nuclear Plant, Units 1 and 2), LBP-76-10, 3 NRC 209, 216 (1976), is particularly relevant here.

Nevada later cites to one chapter of “Climate Change 2007,” in addition to two other sources, in support of its statement that the last interglacial period “appears” to have been “one of the wettest periods in the last 500,000 years. . . [and] [t]hat period was at least as warm as today, and probably at least 2-3°C warmer in the Western U.S...” Petition at 109. However, just that one chapter of “Climate Change 2007” is 66 pages in length. The other two references used in support of that statement are 3 pages long (“Simulating arctic climate warmth and icefield retreat in the Last Interglaciation”) and 16 pages long (“Climate simulation for 125kyr BP with a coupled ocean-atmosphere general circulation model”). The only other two references cited in

this contention (“Climate and Hydrology of the Last Interglaciation (MIS 5) in Owens Basin, California” and “The millennial atmospheric lifetime of anthropogenic CO<sub>2</sub>”) are both 15 pages in length. The contention’s nebulous reference to these documents is not sufficient to satisfy Section 2.309(f)(1)(v).

Nevada’s contention is also replete with speculative and unsupported statements, none of which are appropriate to form a basis for a contention:

- “SAR Subsection ... fail to account for the significantly greater summer monsoon rainfall amounts that *could* occur as a result of continued global warming.” Petition at 107 (emphasis added).
- “Climate modeling indicates that continued global warming *could* lead to greater summer monsoon rainfall ....” *Id.* (emphasis added).
- “During [certain interglacial] periods, the Subtropical Highs would have expanded and/or intensified, resulting in a northward shift of the southwestern monsoon. Summer precipitation *probably* increased dramatically.” *Id.* at 110 (emphasis added).
- “likelihood that hot monsoonal climates *could* also be much more the norm ....” *Id.* (emphasis added).

These indefinite claims amount to mere unfocused speculation which does not provide adequate support for a contention. A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel, Inc.* (Muskogee, Oklahoma Site), CLI-03-13, 58 NRC 195, 203 (2003) (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). The statements in this contention fall into this speculative category.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention argues that DOE does not comply with 10 C.F.R. § 63.305(c) because its climate prediction analysis “fails to account for significantly greater monsoon rainfall amounts that could occur as a result of continued global warming” due to human activity. Petition p. 111. Nevada alleges that “simulations of future climate under continued global warming, as well as paleoclimatic evidence from the Yucca Mountain region, support the *possibility* that summer monsoonal rainfall *could be* significantly greater, and more intense, than assumed by DOE.” *Id.* at 110 (emphasis added). This contention fails to raise a genuine dispute of material law or fact.

Nevada’s claim that DOE did not consider any effect of human activity on climate change is misplaced. DOE modeled climate change using historical records. Those records “include effects of modern society over the duration of the historical record.” FEP 1.4.01.00.0A (Human Influences on Climate), Features, Events, and Processes for the Total System Performance Assessment: Analyses, 6-235 DOC.20080307.0003 (Mar. 2008); *see also* FEP: 1.3.01.00.0A (Climate Change), Features, Events, and Processes for the Total System Performance Assessment: Analyses, 6-215, 6-218, LSN# DEN001584824 (Mar. 2008).

Nevada’s discussion on paleoclimatic evidence appears to suggest that DOE ignored such evidence. That is not the case. Rather, a comprehensive assessment of paleoclimate records, along with data obtained from analog sites, and other facts, formed one of the bases for predicting future climates at Yucca Mountain. This is made clear in the introduction to SAR Subsection 2.3.1.2.1.2, “Climate and Climate Change,” p. 2.3.1-10:

An analysis was performed to estimate climatic variables for the next 10,000 years by forecasting the timing and nature of climate change at Yucca Mountain. The future-climate forecast is based on an analysis of paleoclimate data for timing, magnitude, and duration of climate change.

DOE's use of such data is also explained in greater detail in SAR Subsection 2.3.1.2.2.

"Paleoclimatological Data and Data Uncertainty," pp. 2.3.1-19 to 23.

This contention also relies heavily on climate models used in the Intergovernmental Panel on Climate Change (IPCC) report, "Climate Change 2007." Yet the IPCC report states that "[c]onfidence in [the climate models' quantitative] estimates [of future climate change] is higher for some climate variables (e.g., temperature) than for others (e.g., precipitation)." "Climate Change 2007," at 87. Also, the report clarifies at the start of the Technical Summary that it is "a report accepted by Working Group I of the Intergovernmental Panel on Climate Change but not approved in detail." *Id.* at 19. The report continues to explain that this "signifies that the material has not been subject to line-by-line discussion and agreement." *Id.* Moreover, while Nevada uses this document in support of its argument that DOE must account for significantly greater monsoon rainfall, the document indicates that any attempt to predict changes into the future is complicated for monsoons: "[T]he uncertain role of aerosols in general, and carbon aerosols in particular, complicates the nature of future projections of monsoon precipitation..." *Id.* at 751.

Nevada states that "[m]ore than one of the 22 climate models used by the Intergovernmental Panel on Climate Change Fourth Assessment simulated an increase in summertime (monsoonal) rainfall in the Southwest, including the region encompassing Yucca Mountain." Petition at 108. Yet, Nevada specifically cites to only one of the 22 climate models, stating that "the simulated increase was enough to at least double the rainfall amounts estimated by the use of monsoon analogue meteorological stations in SAR Subsection 2.3.1.2.3.1.2 if global greenhouse gas emissions to the atmosphere continue at their recent pace." *Id.* at 108. However, Nevada provides no reference to support that global greenhouse gas emissions to the

atmosphere will continue at their “current pace,” or any pace for that matter. It is also not surprising that Nevada only discussed one of the 22 climate models since the report explains that “modeling studies have come to conflicting conclusions regarding changes in monsoon participation.” “Climate Change 2007,” at 716. In fact, in contradiction to this contention’s argument that DOE failed to properly account for possible future wetter climate conditions, the IPCC report concludes that “[a]nnual precipitation is very likely to increase in Canada and the northeast USA, and likely *to decrease in the southwest USA.*” *Id.* at 887.

Nevada’s reliance on paleoclimatic evidence also fails to raise a genuine dispute of material fact or law. This contention merely claims that “both simulations of future climate under continued global warming, as well as paleoclimatic evidence from the Yucca Mountain region, support *the possibility* that that summer monsoonal rainfall *could be* significantly greater, and more intense, than assumed by DOE.” Petition at 110 (emphasis added). Nevada never alleges that such greater summer monsoon rainfall amounts, should they occur, would have the effect of increasing infiltration beyond that estimated by in the license application. The contention does not allege (let alone provide support for an allegation) that DOE’s estimates for infiltration are not conservative or do not bound the amounts of infiltration that would be estimated if Nevada’s approach were adopted. Because Nevada does not allege, much less demonstrate, that any future increase in monsoon rainfall will result in a failure of DOE to meet Part 63 postclosure performance standards, the contention does not establish a genuine dispute of material fact.

Finally, as discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such

alleged deficiencies – fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this infirmity.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the future climate properties at the proposed repository site or to specifically state the radiological impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co. (Turkey Point Plant, Unit Nos. 3 and 4)*, LBP-90-16, 31 NRC 509, 521 (1990).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada’s contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster (Savannah River Mixed Oxide Fuel Fabrication Facility)*, LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**13. NEV-SAFETY-13 - Future Climate Projections Need To Include Extreme Precipitation Events**

SAR Subsection 2.3.1.2.3.1.2 and similar subsections, which define the climate forecast at Yucca Mountain for the next 10,000 years, fail to accurately account for the more frequent intense rainfall or for the large storm-related rainfall events that could occur as a result of continued global warming.

**RESPONSE**

Nevada states that DOE's predictions of rainfall over the next 10,000 years are inaccurate, in light of possible global warming resulting from anthropogenic carbon dioxide emissions, and therefore DOE did not satisfy certain regulatory requirements including those at 10 C.F.R. § 63.305(c).

**a. Statement of Issue of Law or Fact to be Controverted**

This contention does not provide a sufficiently specific statement of the issue, because it fails to provide context for or explain what it means by "more frequent intense rainfall" or "large storm-related rainfall events." Petition at 113. The Commission requires that a contention "explain, with specificity, particular safety or legal reasons requiring rejection of the contested [application]." *Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC 349, 359-60 (2001). This contention, however, does not define the terms that form the crux of its argument. Rather, it provides vague allegations such as "greater rainfall intensity is possible," "greater rainfall amounts are possible," and "DOE's conclusions regarding extreme events (*e.g.*, wet) are based on analog sites and their expanded standard deviations which are flawed." Petition at 115-116. Only once does Nevada provide an actual value to give context to its position: "Rainfall events lasting up to a week (*e.g.*, when a tropical storm collides

with a frontal storm) and exceeding 50 cm are possible.” Petition at 115. However this solitary reference does not constitute a specific statement of this issue, especially in light of its presentation as a mere theoretical possibility.

The contention also fails because the issue in dispute apparently shifts from subject to subject throughout the contention. In Paragraph 1, its statement of the contention, Nevada states that “SAR Subsection 2.3.1.2.3.1.2 and similar subsections, which define the climate forecast at Yucca Mountain for the next 10,000 years, fail to accurately account for the more frequent intense rainfall or for the large storm-related rainfall events that could occur as a result of continued global warming.” Petition at 113. That statement of the issue is repeated again in Nevada’s Paragraph 6. *See* Petition at 117. However, in Paragraph 5, Nevada introduces a new and different area of dispute, that “DOE’s conclusions regarding extreme events (e.g., wet) are based on analog sites and their expanded standard deviations which are flawed for two reasons.” Petition at 116. The contention proceeds to summarize the two reasons, provides no support for its allegations, and does not raise the issue again. *See* Petition at 116-17. This amounts to another (albeit surreptitiously added) dispute, which violates the Board’s Case Management Order requiring petitioners to provide “narrow, single-issue contentions.” *U.S. Dep’t of Energy, LBP-08-10, 67 NRC \_\_ (slip op. at 6).*

As written, the contention fails to give DOE sufficient notice of the issues of law or fact that Nevada seeks to dispute. Moreover, the contention does not comply with the Board’s Case Management Order that contentions be “narrow, single-issue contentions” that are “sufficiently specific as to define the relevant issues” and do not require the Parties or Board to exhaust extensive resources to clarify the issue. *U.S. Dep’t of Energy, LBP-08-10, 67 NRC \_\_ (slip op.*

at 6). Based on the information Nevada has provided, this contention lacks the specificity required by 10 C.F.R. § 63.309(f)(1)(v) and, therefore, must be rejected.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention states that DOE should have considered that, “[b]ecause anthropogenic carbon-dioxide emissions could remain in the atmosphere for thousands, tens of thousands, and even hundreds of thousands of years, greater rainfall intensity is possible at Yucca Mountain during and beyond the next 10,000 years.” Petition at 115. The following paragraphs demonstrate that considerations in the LA of (1) changes in future human activities, and (2) climate changes in the post-10,000 year period, are contrary to NRC regulations and therefore outside the scope of this proceeding, in violation of 10 C.F.R. § 2.309(f)(1)(iii).

Proposed 10 C.F.R. § 63.305 requires that DOE vary factors related to climate based on present knowledge of those factors, but not attempt to predict changes in human activity:

(a) Features, events, and processes that describe the reference biosphere must be consistent with present knowledge of the conditions in the region surrounding the Yucca Mountain site. (b) DOE should not project changes in society, the biosphere (other than climate), human biology, or increases or decreases of human knowledge or technology. In all analyses done to demonstrate compliance with this part, DOE must assume that all of those factors remain constant as they are at the time of submission of the license application. (c) DOE must vary factors related to the geology, hydrology, and climate based upon cautious, but reasonable assumptions consistent with present knowledge of factors that could affect the Yucca Mountain disposal system during the period of geologic stability and consistent with the requirements for performance assessments specified at § 63.342.

70 Fed. Reg. 53,313, 53,319 (Sept. 8, 2005). Proposed 10 C.F.R. § 63.342 prescribes the climate and infiltration model that DOE should employ for analysis of the post-10,000 year period, as discussed further below.

DOE modeled climate change consistent with the NRC regulations and regulatory intent. As shown in included FEP1.3.01.00.0A, "Climate change," DOE modeled climate change for the first 10,000 years after disposal using historical climate change records. *See* Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824, 6-215 (Mar. 6, 2008). The use of historical climate records is consistent with the NRC's guidance that "[p]rojections of future climate change are based on evaluation of paleoclimate information over the past 500,000 years." *See* Yucca Mountain Review Plan, NUREG-1804, rev. 2, Section 2.2.1.3.5.3: AC 1(7). The climate records used to predict climate change in the LA "include effects of modern society over the duration of the historical record," that is, they account for human impact on climate. *See* Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824, 6-235 (Mar. 6, 2008).

Even without inherent inclusion of that impact, the paleoclimate record for the Yucca Mountain region, specifically Owens Lake, includes evidence of strong monsoonal climate incursions for sustained periods of time. *See* SAR 2.3.1.2.3.1.2 at 2.3.1-29; SAR Fig. 2.3.1-14; *Future Climate Analysis*, ANL-NBS-GS-000008 REV 01, Las Vegas, Nevada: Bechtel SAIC Company, LSN# DN2002481558, Sec 6.6.2 at 6-47 – 6-49 (2004). Monsoonal climate incursions result in warmer and wetter climate conditions than present, similar to some modeled global warming scenarios, in the Yucca Mountain region. *See* SAR 2.3.1.2.3.1.2 at 2.3.1-29; SAR Fig. 2.3.1-14; *Future Climate Analysis*, ANL-NBS-GS-000008 REV 01, LSN# DN2002481558 Sec 6.6.2 at 6-47 – 6-49 (2004). The infiltration model domain for monsoon

climate incorporates approximately 60% greater average annual precipitation than present-day values. *See* SAR 2.3.1 at 2.3.1-6. In addition, the DOE precipitation model used in net infiltration modeling is stochastic and includes the effects of extreme precipitation events that greatly exceed any observed during the historical record near Yucca Mountain; daily precipitation can reach as high as 983 mm (maximum daily observed in Nevada), which is much greater than the value of 50 cm stated by Nevada. *Compare* SAR 2.3.1.3.2.1.1 at 2.3.1-37 and 38, *Simulation of Net Infiltration for Present-day and Potential Future Climates*, MDL-NBS-HS-000023 Rev. 01 (May 2007) LSN# DN2002481680 at Table I-1 at I-5, *with* Petition at 115.

Moreover, the extensive climate and infiltration analyses in SAR Section 2.3.1 and supporting documents serve to demonstrate that DOE made *reasonable assumptions* regarding climate change, consistent with proposed 10 C.F.R. § 63.305(c). Nevada thus has an affirmative burden to show that DOE's assumptions were *unreasonable*. However, Nevada makes no attempt to establish – beyond its mere assertion that additional studies should be considered – that the LA's climate model is unreasonable.

Although DOE evaluated human impact on climate when modeling climate change, in accordance with NRC regulations at 10 C.F.R. § 63.305(b), as described above, DOE did *not* engage in speculation regarding future impacts of human activities on climate change. *See* Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824, 6-235 (Mar. 6, 2008). DOE did not, for example, attempt to predict how long or at what rate human activities could continue to produce carbon-dioxide emissions. In promulgating 10 C.F.R. § 63.305(b), the NRC explained that any attempt to foretell the impacts of changes to future human behavior was inappropriate as entirely speculative: “The natural systems of the biosphere are allowed to vary (*e.g.*, climate change) because the geologic record

provides evidence of past climate over a long time frame, which provides a strong basis for predicting future changes. Because human behavior cannot be similarly predicted, a similar approach cannot be used for the RMEI and the influence the local population has on the biosphere. Thus, it is necessary to emphasize current conditions for the RMEI . . . . The suggestion that NRC consider alternative futures related to human behavior is speculative and leads to problems deciding which alternative futures are credible and which are unrealistic. Such questions have no scientific or technical answer.” 66 Fed. Reg. at 55757 (Nov. 2, 2001).

At several points throughout the contention, Nevada references the impact of human influence on climate change in the post-10,000 year period. *See* Petition at 113-17 (“continued global warming could lead to more frequent intense rainfall events and more large moisture-laden remnant tropical storms at Yucca Mountain over the next 10,000 *or more years*”) (emphasis added); *Id.* at 117 (“greater rainfall intensity is possible at Yucca Mountain during *and beyond* the next 10,000 years”) (emphasis added). To the extent that this contention challenges DOE’s climate and infiltration modeling for the *post*-10,000 year period, that position constitutes an impermissible challenge to Commission regulations and is therefore outside the scope of this proceeding. *See* 10 C.F.R. § 2.335(a) (“no rule or regulation of the Commission . . . is subject to attack . . . in any adjudicatory proceeding subject to this part”). For the period from 10,000 years after permanent closure through the period of geologic stability, proposed 10 C.F.R. § 63.342 specifies that DOE’s assessment of the effects of climate change “may be limited to the effects of increased water flow through the repository as a result of climate change, and the resulting transport and release of radionuclides to the accessible environment,” and should be modeled through the use of a “constant value . . . based on a log uniform probability distribution for deep percolation rates from 13 to 64 mm/year (0.5 to 2.5 inches/year).” 70 Fed Reg. at 53,319-20.

Consistent with proposed 10 C.F.R. § 63.342(c)(2), DOE limited the climate change analysis for the post-10,000 year period to the effects of increased water flow through the repository. *See* Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824, 6-215, 6-216 (Mar. 6, 2008).

Nevada would have DOE speculate about future human impact on climate change for the first 10,000 year period and beyond, which is inconsistent with NRC regulations at 10 C.F.R. §§ 63.305(b) and 63.342(c)(2) (proposed). This licensing proceeding is an improper forum for parties to challenge NRC regulations or proposed rules. *See* 10 C.F.R. § 2.335(a) (stating that “no rule or regulation of the Commission . . . is subject to attack . . . in any adjudicatory proceeding”); *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, & 3), CLI-99-11, 49 NRC 328, 345 (1999) (extending that prohibition to challenges on the subject of an NRC rulemaking). Accordingly, this contention fails to meet the requirements of 10 C.F.R. § 2.309(f)(1)(iii) and must be dismissed.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

To the extent that Nevada’s contention alleges that DOE must consider how changes to future human activities might affect climate change and, thus, the repository, this contention fails to raise an issue that is material to the findings the NRC must make. DOE considered climate change and human influence on climate change in its LA, but did not speculate about possible future changes in human activities or how those changes could affect climate. *See* Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN# DEN001584824, 6-235 (Mar. 6, 2008). As described above, DOE has drawn this distinction because NRC regulations governing postclosure performance objectives explicitly prohibit DOE from projecting changes in human knowledge, society, or technology. *See* 10 C.F.R. §

63.305(b). Because NRC regulations direct that DOE should not consider future changes in human activities, such considerations are not material to the NRC's findings.

In addition, to the extent that this contention challenges DOE to consider certain predictions in climate change in the post-10,000 year period, this contention fails to raise an issue that is material to the findings the NRC must make. As discussed above, NRC regulations at proposed 10 C.F.R. § 63.342(c)(2) prescribe the climate and infiltration analyses for the post-10,000 year period. *See* 70 Fed. Reg. at 53,319-20. Accordingly, any consideration of alternative climate states for that time period is not material to the NRC's findings in this proceeding.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists a number of regulations in paragraph 4 in this contention. *See* Petition at 102-103. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 103. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would

make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing climate change is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Nevada merely alleges that SAR Subsection 2.3.1.2.3.1.2 “fails to accurately account for the more frequent intense rainfall, or for the large storm-related rainfall events that *could* occur as a result of continued global warming.” Petition at 117 (emphasis added). The contention does

not identify how the LA analyzed rainfall events or infiltration, explain how the alleged (albeit vague) “more frequent intense rainfall” could affect the safety of the repository, or how the NRC’s ability to make a required finding could be affected.

For the aforementioned reasons, this contention fails to raise issues material to the findings the NRC must make and therefore, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Even if we assume that this contention is cognizable in this proceeding, it should still be dismissed because Nevada fails to provide adequate support for its assertions that DOE’s postclosure performance assessment fails to comply with applicable regulatory requirements, or that DOE’s assumptions regarding climate are *unreasonable*, in violation of 10 C.F.R. § 63.305(c).

Throughout its contention, Nevada makes conclusory statements, references an entire paper or study generally, and fails to provide any explanation for its assertions. Moreover, Nevada’s supporting documents stand for limited propositions and do not directly refute the climate models presented by DOE in SAR Section 2.3.1.3. Indeed, Nevada simply does not attempt to engage the specifics of the extensive data and analysis presented in SAR Section 2.3.1 and underlying supporting documents.

For example, one reference is provided for the statement that “[t]here is also paleoclimate evidence for multiple wetter – and more flood prone – periods in the Southwestern U.S. than previously assumed for the last 7000 years.” Petition at 116. This suffers from several flaws. First, Nevada fails to explain how this statement is inconsistent with DOE’s climate model or provide specific references to contrary findings in the LA. Second, Nevada’s statement mischaracterizes the study. The study discusses the 5000-year paleoflood record, rather than the

7000 years that Nevada states, and it makes no comparison to previous understandings of the flood pattern in the Southwestern U.S. Ely, L.L., Enzel, Y., Baker, V.R., and Cayan, D.R. (1993), “A 5000-Year Record of Extreme Floods and Climate Change in the Southwestern United States,” *SCIENCE*, Vol. 262, No. 5132. Rather, the findings of this study, as summarized in the report itself, are that “[a] 5000-year regional paleoflood chronology ... reveals that the largest floods in the region cluster into distinct time intervals that coincide with periods of cool, moist climate and frequent El Nino events.” *Id.* at 410.

In other examples, Nevada fails to provide *any* support for its conclusory statements. Nevada concludes in one paragraph that “[b]ecause anthropogenic carbon-dioxide emissions could remain in the atmosphere for thousands, tens of thousands, and even hundreds of thousands of years, greater rainfall intensity is possible at Yucca Mountain during and beyond the next 10,000 years,” but provides no support for that conclusion. In fact, entire passages from Nevada’s contention that are laden with speculative conclusions lack any expert support whatsoever:

Also as a result of continued global warming and circulation changes, it is possible that large storm-related rainfall events will be able to reach the Yucca Mountain region with greater frequency than observed in the period of instrumental observation. Rainfall events lasting up to a week (e.g., when a tropical storm collides with a frontal storm) and exceeding 50 cm are possible. Such events could occur several times per year. Already, some areas of the southwest United States experience several intense storms in a year, and climate change has the potential to induce changes in atmospheric circulation that would favor the induction of more such storms, increase the power of individual storms, and increase the likelihood of such storms reaching the area of Yucca Mountain.

Petition at 115-16.

Licensing boards have found that “[m]ere assertions without appropriate explanation and support do not satisfy the requirements of the contention rule.” *See Duke Energy Corp.* (McGuire Nuclear Station, Units 1 & 2, Catawba Nuclear Station, Units 1 & 2), LBP-02-4, 55 NRC 49, 84 (2002). Accordingly, the Board should not accept such hypothetical, unsupported assertions.

In addition, although this contention references six supporting documents, Nevada fails to point to a specific page or section of the documents for support. A petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). Consistent with that requirement, the Case Management Order directs petitioners to ensure that documentary references “be as specific as reasonably possible.” *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 7). Nevada’s failure in this regard is especially egregious considering that one of its supporting documents, “Climate Change 2007,” is 989 pages, another, “Scientific Assessment of the Effects of Global Change on the United States,” is 271 pages, and a third, “Weather and Climate Extremes,” is 180 pages. Petition at 114-15.

Moreover, to the extent that it relies on expert opinion, this contention fails to meet those standards. Nevada does attach several affidavits (by Jonathan Overpeck and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

For the aforementioned reasons, this contention falls short of the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted, as discussed in Section V.A.3 above. Accordingly, this contention lacks a sufficient foundation to “warrant further exploration” by the Board, *see Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 & 2), ALAB-942, 32 NRC 395, 428 (1990) (citation omitted), and should be dismissed.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention does not show that the LA climate and infiltration models are unreasonable and, therefore, fails to establish a genuine dispute. Proposed 10 C.F.R. § 63.305(c) requires in part that DOE “vary factors related to the geology, hydrology, and climate based upon cautious, but reasonable assumptions consistent with present knowledge of factors that could affect the Yucca Mountain disposal system.” 70 Fed. Reg. at 53,319. As established in SAR Section 2.3.1 and supporting documents, DOE made *reasonable assumptions* regarding climate change, consistent with proposed 10 C.F.R. § 63.305(c). Moreover, DOE’s reasonable assumptions adhere to NRC guidance that “[p]rojections of future climate change are based on evaluation of paleoclimate information over the past 500,000 years.” *See* Yucca Mountain Review Plan, NUREG-1804, rev. 2, Section 2.2.1.3.5.3: AC 1(7); Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824, 6-235 (Mar. 6, 2008). Nevada thus has an affirmative burden to show that DOE’s assumptions were *unreasonable*. Because this contention does not establish the unreasonableness of DOE’s assumptions, it does not establish a genuine dispute of material issue and must be dismissed.

Moreover, this contention fails to raise a genuine dispute with DOE regarding the question of whether the future climate at Yucca Mountain should be modeled as wetter than

present day climate. Nevada alleges that “greater rainfall amounts are possible at Yucca Mountain during and beyond the next 10,000 years,” and that “consideration should be given to such century-to-millennia length wet events occurring again in the future.” Petition at 116. At no point in the contention does Nevada acknowledge that DOE’s climate analysis in SAR Section 2.3.1 assumes that the present day climate will be followed by a much warmer and wetter monsoon climate for approximately 600-2000 years from present (with approximately 60% greater average annual precipitation), a cooler and even wetter glacial-transition climate for approximately 2000-10,000 years from present, and increased infiltration rates at the repository (resulting from cooler and wetter conditions) for the post-10,000 year period. *See* SAR Section 2.3.1 at 2.3.1-6; *see also* Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824, 6-215 (Mar. 6, 2008). As described above, the climate record for the Yucca Mountain region, which DOE used to model future climate changes, includes evidence of strong monsoonal warmer and wetter climate incursions for sustained periods of time. *See* SAR 2.3.1.2.3.1.2 at 2.3.1-29; SAR Fig. 2.3.1-14; *Future Climate Analysis*, ANL-NBS-GS-000008 REV 01, Las Vegas, Nevada: Bechtel SAIC Company, LSN# DN2002481558, Sec 6.6.2 at 6-47 – 6-49 (2004).

The contention does not demonstrate that the alleged “greater rainfall amounts” will produce *more* precipitation for the next 10,000 years than that projected in DOE’s climate analysis. Thus, this contention fails to “state the applicant’s position and the petitioner’s opposing view,” or otherwise provide sufficient information to show a genuine dispute exists. *See* Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. at 33,170; *Dominion Nuclear Conn., Inc.*, CLI-01-24, 54 NRC at 358.

In addition, this contention does not present a genuine dispute of material issue because it postulates a series of theoretical possibilities and does not demonstrate the effect of the hypothetical result. The contention challenges DOE to consider multiple events that “may” occur, but does not demonstrate – and does not even assert - that inclusion of these events would affect the outcome of this proceeding. *See* Petition at 115 - 117 (“greater rainfall intensity *is possible*” ... “[tropical storms and hurricanes] *may* be able to rain out more water in the future” ... “*it is possible* that large storm-related rainfall events will be able to reach the Yucca Mountain region with greater frequency than observed” ... “DOE has failed to consider how the infiltration responds to large events ... that *could* be more common in the future” ... “none of these types of flooding scenarios *may* be true for the analog sites” ... “the same *may* be true for Owens Lake”) (emphasis added). A petitioner must allege not only that more accurate input data could be used in applicant’s model, but the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339-340 (2006). Nevada’s hypothetical assertions, however, do not directly controvert a position taken by the applicant in the application and therefore cannot form the basis for this contention. *See Texas Utils. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

This contention also fails to define or quantify the “greater rainfall intensity” or “extreme events (e.g., wet)” that it alleges “could” occur. Petition at 115-116. Nor does it point to specific portions of the LA that fail to consider such events, or explain the ramifications of the alleged omissions. A contention that alleges some aspect of a license application is “inadequate” or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla.*

*Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990). This contention therefore fails to explain how inclusion of these unspecified events could significantly affect the results of the postclosure analysis, or otherwise make a difference in the outcome of the licensing proceeding.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material, and therefore fails to meet Nevada's burden to show that its contention raises an issue that is material to this proceeding. Petition at 117-18. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from that deficiency. Nevada proposes certain vague considerations for the LA's climate model, but does not specify the implications of its alleged deficiencies in the LA's existing model.

In summary, this contention does not establish a genuine dispute of material issue. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

**14. NEV-SAFETY-14 - Precipitation Model**

The precipitation component of the net infiltration model, which is described in SAR Subsection 2.3.1.3.2 and similar subsections, is fundamentally flawed because it relies upon modeling that fails to represent physical and empirical aspects of the precipitation process, and because no attempt has been made to investigate important aspects of its performance.

**RESPONSE**

This contention claims that DOE’s net infiltration model, described in SAR Subsection 2.3.1.3.2, “and similar subsections,” is “fundamentally flawed,” Petition at 119, because the precipitation component of the model does not adequately incorporate important physical phenomena, uses inappropriate assumptions that are not consistent with certain data, provides results that are not consistent with empirical observations, and does not attempt to evaluate important aspects of the model’s performance, such as extremes.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges non-compliance with these regulatory provisions and therefore raises a material issue.” Petition at 120. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp. (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).*

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic

setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the precipitation model is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Indeed, nowhere in the contention does Nevada allege that the omissions and errors it claims exists in the DOE precipitation model will result in underestimating net infiltration to the unsaturated zone. In fact, extremes are just as likely to result in greater runoff, with reduced infiltration. As stated in SAR Subsection 2.3.1.3.2.1.1 at 2.3.1-43, “very extreme rainfall events are likely to result in significant overland flow and runoff, and will not greatly affect net infiltration.” Similarly, as noted on page 2.3.1-70 of the SAR, “[f]or example, annual precipitation may be very high because of an especially high amount of precipitation occurring on a single day. In such a case, runoff would tend to be higher and net infiltration lower than if several days during the year experienced large amounts of precipitation, but the annual total was less.”

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (Howard S. Wheeler and Richard E. Chandler), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5

of this contention, the affidavits simply “adopt” the otherwise unsupported assertions. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation. Moreover, the contention does not reference any documentation other than DOE’s own description of its infiltration model.

Furthermore, Nevada makes indefinite claims that amount to mere unfocused speculation and, therefore, does not provide adequate support for the contention. In particular, in paragraph 5, Petitioner asserts:

[The] failure to represent seasonality adequately at half of the sites considered and erroneous representation of the rainfall-elevation relationship which is relied upon to generate spatial rainfall for input into the net infiltration model. . . are [both] important physical phenomena that *may* have a substantial impact on net infiltration estimates, whence their omission *may* significantly change estimates of radiological exposure.

Petition at 122. (emphasis added). As the Commission has held, a contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel, Inc.* (Muskogee, Oklahoma Site), CLI-03-13, 58 NRC 195, 203 (2003) (quoting *Gen. Pub. Utils. Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). Accordingly, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected on that basis.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention argues that the precipitation model is flawed because it relies on an erroneous representation of the rainfall-elevation relationship to generate spatial rainfall for input into the net infiltration model. This is not correct. SAR Subsection 2.3.1.3.2.1.1 at 2.3.1-38

provides that “[t]he climate behavior at each site is strongly correlated with elevation, and each of the four probabilistic parameters for each site was adjusted for elevation using a linear lapse rate correction.” SAR Subsection 2.3.1.3.4.1 at 2.3.1-76 further states, “[t]he analysis found that after normalizing (for elevation) the precipitation from the 10 present-day Yucca Mountain meteorological stations, the stimulated and measured data were very closely matched.”

Even if Nevada’s allegations were accepted as true (which they are not), like with its seasonality argument, Nevada simply alleges that DOE’s infiltration results are incorrect – it does not allege that the results are not consistent with the reasonable expectation standards that are discussed in Section V.A.3, above. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

With regard to Nevada’s position that the precipitation model’s assumptions could result in logical impossibilities such as probabilities outside the range (0,1), Petition at 122, DOE addressed and accounted for this by placing constraints on the magnitude of the first-order term. As stated in “Simulation of Net Infiltration for Present-Day and Potential Future Climates, MDL-NBS-HS-000023 REV01”, LSN# DN2002482668, Section F3.2 at F-32:

However, the magnitude of a first-order term is subject to constraints. The magnitude of a first-order term must be less than the magnitude of the zero-order term because neither a Markov probability nor an average precipitation can be less than zero. Also, the first-order term may not cause a Markov probability to exceed 1.0. Therefore, an approximate uncertainty distribution for

the magnitude of a first-order term for the upper-bound Monsoon climate is a uniform distribution from one standard deviation below the lower value to one standard deviation above the upper value, subject to constraints.

Therefore, this argument raises no genuine dispute.

Furthermore, this argument alleges an error without specifying the ramifications or results of the alleged deficiencies. Indeed, the contention makes no attempt to show that, if true, the alleged error would prevent the NRC from making any material finding, or that the proposed repository would not meet any regulatory requirements. Instead, Nevada merely states in paragraph 5 that “the model assumptions are such that it has the potential to produce physically impossible parameter combinations (for example, probabilities outside the range [0,1]).” Petition at 122. Because Nevada has not demonstrated that model assumptions used are not conservative, or that another set of assumptions will result in increased infiltration, it has not established a genuine issue of material fact.

This contention also argues that the precipitation model is flawed because no attempt was made to evaluate important aspects of performance such as extremes. However, it is readily apparent that DOE in fact took extremes into consideration. SAR Subsection 2.3.1.3.2.1.1, at 2.3.1-37, provides:

In order to capture the full range of infiltration uncertainty, the performance assessment must assure that low probability extreme precipitation years have been considered. Therefore, rather than use the meteorological records as direct input, MASSIF characterized each record in terms of periodic functions that summarized the records of precipitation, temperature, and wind speed at each meteorological station. This approach of developing synthetic datasets of precipitation, air temperature, and wind speed enabled the simulation of average infiltration over periods of time that span hundreds and thousands of years.

(citation omitted).

Nevada asserts that “the precipitation input for net infiltration is modeled on a daily time step, but even at this time-scale no evaluation is made of critically important effects such as persistence and extremes. The only features considered...are the reproduction of the seasonal cycle and the distribution of mean annual precipitation (MAP)...” Petition at 121. This allegation mischaracterizes DOE’s model. As discussed in more detail in DOE's response to NEV-SAFETY-34, DOE did not use an average duration for rainfall but instead varied the duration and amount of the rainfall, plus accounted for uncertainties in the duration and amounts. Furthermore, in contrast to the contention’s assertion that extreme events are not evaluated, Petition at 121, DOE’s model does include extreme precipitation events, characterized by daily precipitation amounts as high as 983 mm. (MDL-NBS-HS-000023 REV 01 AD001, Table I-1, LSN# DEN001575070). As another licensing board has recently ruled, a mischaracterization of the application does not establish a genuine issue of material fact. *Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (Sept. 12, 2008), slip op. at 39.

As discussed in Section V.A.3 above, contentions expressing only generalized “uncertainties” in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from this deficiency.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the precipitation model properties at the proposed repository site or to specifically state the radiological impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of

material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada's contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**15. NEV-SAFETY-15 - Alternative Precipitation Models And Weather Variables**

The precipitation and weather components of the net infiltration model described in SAR Subsection 2.3.1.3.2 are not sufficient because alternative conceptual models exist that are consistent with the available data and with current scientific understanding, and by neglecting these, DOE has substantially underestimated the uncertainty inherent in the results of the performance assessment.

**RESPONSE**

This contention claims that the precipitation and weather components of the net infiltration model described in SAR Subsection 2.3.1.3.2 do not comply with 10 C.F.R. § 63.114(c) because DOE “neglect[ed]” alternative conceptual models, thereby “substantially underestimat[ing] the uncertainty inherent in the results of the performance assessment.” Petition at 125. This contention must be dismissed for the reasons set forth below.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

To the extent that Nevada argues that DOE is somehow required to *use* alternate conceptual models in its performance assessment, the contention is inadmissible as outside the scope of this proceeding. It is well settled that, absent a waiver, “no rule or regulation of the

Commission ... is subject to attack ... in any adjudicatory proceeding.” 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission’s regulations or that otherwise seeks to litigate a generic determination established by a Commission rulemaking. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff’d*, CLI-01-17, 54 NRC 3 (2001). Section 63.114(c) requires DOE to “[c]onsider” and “evaluate” alternative conceptual models. Indeed, this is echoed in the NRC Standard Review Plan for the Yucca Mountain Repository at p. 2.2-62, which notes that DOE is to “investigat[e]...[a]lternative modeling approaches.” As explained in section (f) below, DOE has assessed various alternative conceptual models related to infiltration, thereby satisfying the requirements of 10 C.F.R. § 63.114(c). The regulations do not require DOE to consider any particular conceptual model. To the extent Nevada is contending that additional requirements should be imposed on DOE beyond the applicable NRC regulations, its contention constitutes an impermissible challenge to 10 C.F.R. § 63.114(c).

Additionally, as discussed in the applicable Legal Standards section above, contentions expressing only generalized “uncertainties” in DOE models or analyses represent an improper challenge to Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from that deficiency. Nevada merely alleges that “DOE has substantially underestimated the uncertainty inherent in the results of the performance assessment.” Petition at 128. Nevada does not define what is meant by “substantially underestimated,” nor provide any data to demonstrate that the precipitation and weather components used in DOE’s net infiltration model are not conservative. This is an improper challenge to Part 63, which recognizes that such uncertainties exist and cannot be eliminated. Furthermore, Nevada has the

burden to raise an admissible contention and attempting to shift this burden to DOE is an improper challenge to 10 C.F.R. §2.309.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that is material to the findings that the Commission must make in this proceeding, and must be dismissed. First, as noted above, generalized “uncertainties” in DOE models or analyses are outside the scope of this proceeding and, therefore, by definition the contention does not raise an issue material to the finding the Commission must make.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp. (Oconee Nuclear Station, Units 1, 2, and 3)*, CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would

make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the precipitation and weather components of the net infiltration model is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as

mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (Howard S. Wheeler, Richard E. Chandler and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 and/or 6 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 and/or 6 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada asserts that the precipitation model used by DOE is based on Woolhiser, D.A. and Pegram, G.G.S., “Maximum Likelihood Estimation of Fourier Coefficients to Describe Seasonal Variations of Parameters in Stochastic Daily Precipitation Models,” and then cites to one reference, “The Weather Generation Game: A Review of Stochastic Weather Models,” to support its allegation that “[t]his type of model is known to perform poorly with respect to a number of hydrologically important features.” Petition at 126-27. This reference document is 30 pages long; yet, Nevada does not cite any particular paragraph or page as support. Such vague references to documents are not permissible. Rather, a petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H. (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989)*. To the extent that Nevada is attempting to demonstrate that DOE’s model performs poorly based on this reference, it must fail for lack of specificity. Nevada does not identify what particular “hydrologically important features” the DOE model supposedly fails to model well, or whether those features exist or are relevant to the Yucca Mountain repository. Therefore, the reference to this document is not sufficient to satisfy Section 2.309(f)(1)(v). With the exception of the one reference document discussed, the contention does not reference any other documentation other than DOE’s own description of its infiltration model.

Furthermore, Petitioner makes indefinite claims that amount to mere unfocused speculation and, therefore, does not provide adequate support for the contention. In particular, in paragraph 5 Petitioner asserts:

Since net infiltration is a nonlinear function of weather inputs, any failure to account for variability in the inputs would *potentially* affect the estimates of average infiltration and hence, ultimately radiological exposure. It is therefore necessary to consider alternative conceptual models that allow for variability in the

inputs, and to evaluate the effects that the use of such models would have on the performance of the repository.

Petition at 128. (emphasis added). As the Commission has held, a contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits,’ but instead only ‘bare assertions and speculation.’” *Fansteel, Inc.* (Muskogee, Oklahoma Site), CLI-03-13, 58 NRC 195, 203 (2003) (quoting *Gen. Pub. Utils. Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000) (GPU)). Accordingly, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected on that basis.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention also fails to raise an issue that is material to the findings that the Commission must make in this proceeding, and must be dismissed. First, as noted above, generalized “uncertainties” regarding the precipitation and weather components of DOE’s net infiltration model are outside the scope of this proceeding. Therefore, by definition the contention does not raise an issue material to the finding the Commission must make.

Second, DOE did assess various alternative conceptual models related to infiltration, thereby satisfying 10 C.F.R. § 63.144(c). For example:

- DOE performed an alternative set of simulations assuming wetter initial water content conditions for soil moisture content. SAR, p. 2.3.1-69.
- DOE performed an alternative model study using variations in soil saturated hydraulic conductivities. SAR at 2.3.1-70 to 71.
- DOE compared its model of precipitation with other models of precipitation. SAR at 2.3.1-75 to 77.

Therefore, the SAR satisfies 10 C.F.R. § 63.114(c). DOE also performed separate sensitivity evaluations of uncertainties. *See* SAR Section 2.3.1.3.3.2.2. Thus, this contention does not establish a genuine issue of material fact.

Furthermore, as discussed above, this contention only consists of bare assertions and speculation, which fail to provide a genuine dispute of material fact. Nevada first asserts in this contention that “[t]he precipitation component of the net infiltration model is deficient in several important respects.... Advanced precipitation models are available that could overcome these deficiencies and avoid use of these [simplifying] assumptions.” Petition p. 126. Yet, Nevada does not specifically mention one model. Nevada later asserts that “[a]dvanced models have been developed over the last 30 years that perform much better with respect to features such as extremes and inter-annual variability, have more flexibility to represent complicated seasonal patterns and also avoid problems such as the potential to produce negative probabilities.” *Id.* at 127. Once again, Nevada fails to specify an advanced model, any expert support, or what constitutes “much better” performance.

Nevada also provides no support for its claim that DOE’s precipitation model is deficient. As mentioned above, the reference Nevada provides to support this assertion, “The Weather Generation Game,” at page 329 states that it “reviews the historical development of statistical weather models.” While Nevada uses this reference in support of its allegation that DOE’s precipitation model is deficient, the document simply notes that the use of the mixed exponential distribution discussed in “Maximum Likelihood Estimation of Fourier Coefficients to Describe Seasonal Variations of Parameters in Stochastic Daily Precipitation Models” “has been reported to provide substantially better overall fits to daily precipitation data than the gamma distribution” and “reports better representation of the frequencies of the very largest precipitation amounts.”

“The Weather Generation Game,” p. 337. There is no assertion, much less any demonstration, of the effect of such “improved” representation, should it actually exist, of these specific terms on the ultimate probability-distributed results of infiltration calculations. Thus it is impossible to tell from this speculative kind of claim whether there is a genuine dispute over an issue of material fact to be litigated; and Nevada cannot shift its burden of going forward to DOE. Nevada’s allegation that “the use of annual relationships masks the variability that can be expected for daily precipitation,” Petition at 127, mischaracterizes DOE’s model. As discussed in more detail in our response to NEV-SAFETY-34, DOE did not use an average duration for rainfall but instead varied the duration and amount of the rainfall, plus accounted for uncertainties in the duration and amounts. As another licensing board has recently ruled, a mischaracterization of the application does not establish a genuine issue of material fact. *Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (Sept. 12, 2008), slip op. at 39.

In regards to DOE’s remark in LSN# DN2002482668 at 6-25 that while “a more complicated model might allow precipitation to occur in parts of the domain while other parts of the domain remain dry[,] [s]uch sophistication was deemed unnecessary for the current development,” Nevada alleges that “[i]t is necessary to quantify the effect in order to justify the claim that ‘such sophistication was deemed unnecessary for the current development.’” Petition at 127. However, no such quantification by DOE is necessary. DOE has made a simplifying assumption that conservatively assumes that when precipitation occurs, it “is assumed to occur at the same time in all parts of the domain.” LSN# DN2002482668, Table 5-1. In other words, given a precipitation event, a more “complicated” or “sophisticated” model might actually result in less precipitation across the model domain, as there would be “dry spots” where no

precipitation has occurred. Therefore, DOE's simplifying approach results in more precipitation available across the entire model domain for infiltration and is therefore conservative.

Nevada fails to acknowledge that the purpose of the precipitation model is not to represent “complicated seasonal patterns” of precipitation, but rather to bound the range and uncertainty of “steady-state” net infiltration rates for three potential future climate states: Present-Day, Monsoon, and Glacial Transition, which span hundreds to thousands of years each. As stated in SAR § 2.4.2.3.2.1.1, “the three climate states used in the TSPA model for the first 10,000 years after permanent repository closure are: (1) present-day climate for the first 600 years after waste emplacement; (2) monsoon climate for the 600 to 2,000 years after waste emplacement; and (3) glacial-transition climate for the period 2,000years after waste emplacement to 10,000 years after closure (SNL 2008a, Section 6.3.1.2).” At the time-scales of interest for these three climate states, for which MASSIF is intended to provide steady-state net infiltration rates, inter-annual or seasonal variability in precipitation is not a significant contributing factor.

Nevada does not allege that DOE’s infiltration results are not consistent with the reasonable expectation standard discussed in section V.A.3.C. If Nevada believes that quantification would show that DOE’s infiltration results are not consistent with that standard because of this effect, the burden is on Nevada to do so, as well as determine what effect, if any, acceptance of their contention would have on dose to the RMEI. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear

Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

This contention next makes the vague argument that “[e]lsewhere in the weather-related components of the net infiltration model” there are deficiencies because (1) “there are several places...where a quantity of interest is treated as a deterministic function of some other quantities, but where data show considerable scatter about the fitted relationships” and (2) “simplifying assumptions are made for several other weather variables.” Petition at 128. Again, as with the other arguments in this contention, Nevada provides no tangible information, no experts, and no substantive affidavits to support these claims. Nevada, citing to DOE’s own description of its infiltration model, just makes bare assertions and speculations.

As discussed in Section V.A.3 above, contentions expressing only generalized “uncertainties’ in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from this deficiency.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the precipitation and weather components of the net infiltration model at the proposed repository site or to specifically state the radiological impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See*

*Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada's contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**16. NEV-SAFETY-16 - Qualification Of Climate And Infiltration Models**

SAR Subsection 2.3.1, which describes the analysis and modeling underpinning the climate and infiltration components of the TSPA, fails to provide details of data qualification procedures used in this work and fails to identify any formal peer reviews used in its preparation.

**RESPONSE**

This contention alleges that SAR Subsection 2.3.1 fails to provide details of data qualification procedures used in climate and infiltration components of the TSPA and fails to identify any formal peer reviews used in its preparation.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations without identifying specific violated provisions. Petition at 130. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-

compliance with these regulatory provisions and therefore raises a material issue within the scope the licensing proceeding.” Petition at 131. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Nevada asserts that DOE must include a description of the quality assurance program to be applied to the structures, systems and components important to safety. Petition at 130. However, as discussed below, DOE did do exactly what Nevada seeks. As such, Nevada fails to demonstrate that its issue is material to any finding the NRC must make to authorize construction of the repository.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not

reference any documents, other than the Application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach affidavits of Howard S. Wheeler and Richard E. Chandler, which purportedly provide expert opinions to support this contention. Rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation. As such, the contention should be dismissed.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

In addition to the reasons described in Section d above, this contention fails to raise a genuine dispute on a material issue of law or fact for the following reasons: (1) there is no legal requirement for peer review of the specified model components of the TSPA; (2) there is no legal requirement that section 2.3.1 of the SAR contain the description of the quality assurance program that Nevada seeks; and (3) Nevada does not allege any impacts to safety resulting from the absence of peer review nor that peer review would change the TSPA.

**(1) No Legal Requirement for Peer Review**

DOE is required to include in the SAR "a description of the quality assurance program to be applied to all structures, systems, and components important to safety, to design and characterization of barriers important to waste isolation, and to related activities," which includes "acquisition, control, and analysis of samples and data." 10 C.F.R. § 63.142(a). The regulations at 10 C.F.R. § 63.142 go on to set forth the 18 criteria that are required to be addressed by DOE's quality assurance program. *See* 10 C.F.R. §§ 63.142(b)-(s). Nowhere in 10 C.F.R. § 63.142 is there a requirement to use peer review.

Nevada asserts in paragraph 5 of the contention that peer review is required by NUREG-1804, section 2.2.1.3.5.3. NUREG-1804, however, is a guidance document issued to the NRC staff to assist it in reviewing the Application. As a guidance document, NUREG-1804 is not binding upon DOE's preparation of the Application and does not carry the binding effect of regulations. *See, e.g., Int'l Uranium (USA) Corp.*, CLI-00-1, 51 NRC 9, 19 (2000) (upholding the rejection of a contention alleging a lack of compliance with a guidance document because "NRC NUREGs and Regulatory Guides . . . are routine agency policy pronouncements that do not carry the binding effect of regulations"). "It is well established . . . that NUREGs and Regulatory Guides, by their very nature, serve merely as guidance and cannot prescribe requirements." *Curators of University of Missouri* (Byproduct License No. 24-00513-32; Special Nuclear Materials License No. SNM-247), CLI-95-1, 41 NRC 71, 98 (1995). "[C]ompliance with [them] is not legally required and thus not litigable." *Entergy Nuclear Vermont Yankee* (Vermont Yankee Nuclear Power Station), LBP-04-28, 60 NRC 548, 559 (2004). As such, Nevada fails to raise a genuine issue of law or fact because, regardless of whether peer review was applied to the climate and infiltration components of the TSPA, there is no legal requirement for DOE to follow NUREG-1804.

## **(2) The Application Provides a Description of the QA Program**

DOE is required to include in the SAR "a description of the quality assurance program to be applied to all structures, systems, and components important to safety, to design and characterization of barriers important to waste isolation, and to related activities," which includes "acquisition, control and analysis of samples and data." 10 C.F.R. § 63.142(a). The regulations at 10 C.F.R. § 63.142 go on to set forth the 18 criteria that are required to be addressed by DOE's

quality assurance program. *See* 10 C.F.R. §§ 63.142(b)(s). Nowhere in 10 C.F.R. § 63.142 is there a requirement to use peer review.

The absence of a description of data qualification procedures from SAR subsection 2.3.1 is not material because the QARD, which is incorporated by reference into the SAR, and DOE's commitment to NUREG-1298, provide the quality assurance program for acquisition, control and analysis of samples and data. *See* Quality Assurance Requirements and Description rev. 20, (2008) (QARD), Supplement III.2.7.A.1 at 133 (commitment to "NUREG-1298 (1988) Qualification of Existing Data for High-Level Nuclear Waste Repositories"). "Qualified data" is "data collected under an approved QA program that meets the requirements of 10 C.F.R. 63.142 (or previously implemented 10 CFR 60 QA program) (i.e., qualified from origin) or unqualified data that have undergone a qualification process. (NUREG-1298, 2/88)." QARD at 155. Qualification of data is that formal process intended to provide a desired level of confidence that data is suitable for its intended purpose. *Id.*

Section 5.1 of the SAR incorporates the QARD by reference. The QARD provides that the QA program shall apply to, among other things, "acquisition, control, and analysis of samples and data." QARD, § 2.2.2.D, at 30. The QARD describes the manner by which this quality assurance program applies to the acquisition, control and analysis of samples and data by describing how DOE implements the 18 criteria of 10 C.F.R. § 63.142, plus relevant supplements regarding sample control (QARD, Supplement II), scientific investigations (QARD, Supplement III) and control of the electronic management of information (QARD, Supplement V). Since Nevada does not allege that the QARD fails to meet the quality assurance requirements of 10 C.F.R. 63 subpart G, the contention fails to raise a material issue of fact

because the QARD describes the data qualification procedure and Nevada has not alleged any deficiencies in the QARD with respect to data qualification.

For that data collected before the QARD and DOE's implementation of a quality assurance program under 10 C.F.R. 63, DOE has adopted NUREG-1298. *See also* SAR at 2.3.1. NUREG-1298 "provides guidance on a set of alternative conditions which may be used to qualify data not initially collected under a 10 CFR 60, Subpart G QA program." Qualification of Existing Data for High-Level Nuclear Waste Repositories, NUREG-1298 at 1 (February 1988). Nevada does not challenge compliance with NUREG-1298.

As such, Nevada fails to raise a genuine dispute on a material issue of fact because the QARD provides the description of the 10 C.F.R. Part 63 subpart G quality assurance program that serves to qualify the acquisition, control and analysis of samples and data, supplemented by NUREG-1298 for the qualification of data that was not collected under DOE's QARD.

**(3) No Showing of Harm From Absence of QA Description and Peer Review.**

Finally, Nevada fails to raise a genuine dispute on a material issue of fact because it fails to describe the ramifications of the absence of a description of the data qualification procedures and peer review from SAR subsection 2.3.1 with respect to the climate and infiltration components of the TSPA. Nevada has failed to articulate any harm or different results that could flow from an absence of a description of the data qualification procedures or peer review, and therefore, there is no material issue.

**17. NEV-SAFETY-17 - Calibration And Simulation Of Precipitation Model**

The procedures used to calibrate and simulate the precipitation component of the precipitation model, as referenced in SAR Subsection 2.3.1.3.2, are non-standard, not generally accepted and, in the case of the simulation procedure as described, incorrect.

**RESPONSE**

This contention claims that the precipitation model referenced in SAR Subsection 2.3.1.3.2 does not comply with 10 C.F.R. § 63.21(c)(9) and (c)(15) because the procedures used to calibrate and simulate it “are non-standard, not generally accepted and, in the case of the simulation procedure as described, incorrect.” Petition p. 133. In particular, Nevada alleges that: (1) the net infiltration model is calibrated using a nonstandard least squares procedure that is not generally accepted; (2) the simulation methodology as described adopts the procedure of using the same random number to generate both rainfall occurrence and amounts of rainfall; and (3) the procedure used for sampling from a lognormal distribution is not generally accepted. This contention must be dismissed for the reasons set forth below.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Nevada argues that DOE should have used “more widely accepted superior procedures” to calibrate the precipitation component of the net infiltration model, instead of the one actually

used. Petition at 134. Similarly, Nevada asserts that DOE should have used “[m]odern methods” to generate “pseudo-random numbers from lognormal distributions.” *Id.* at 135. Because DOE’s modeling did not use these other (unspecified) procedures and methods, Nevada claims that DOE violated 10 C.F.R. § 63.21(c)(9) and (c)(15). *Id.* at 133. It is well settled that, absent a waiver, “no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding.” 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission’s regulations. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff’d*, CLI-01-17, 54 NRC 3 (2001). No regulation DOE must meet imposes the requirement that it consider any particular procedure or methodology to calibrate and simulate a precipitation or infiltration model. Accordingly, Nevada’s contention should be dismissed as outside the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing. Indeed, Nevada fails to address what effect, if any, that using a different particular procedure or methodology to calibrate and simulate a precipitation or infiltration model would have, even on infiltration. It does not claim that doing so would result in infiltration estimate beyond that in the license application or that that DOE’s estimates are not conservative. Absent any discussion on what effect the contention has on infiltration estimates, Nevada has clearly not met its burden to demonstrate that the resolution of the issue would prevent the NRC from finding that there is reasonable expectation that the radioactive materials

can be received, possessed and disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31.

The method the DOE used in addressing the precipitation model is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (Howard S. Wheeler and Richard E. Chandler), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

With the exception of one reference document, the contention does not reference any other documentation other than DOE's own description of its infiltration model. With regard to the one document Nevada cites, "Statistical Models," Nevada does not identify where in this document can be found the support for which it is cited. Vague references to documents are not permissible. Rather, a petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H. (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989)*. Therefore, the reference to this document is not sufficient to satisfy Section 2.309(f)(1)(v). Indeed, even had Nevada referenced the document with sufficient specificity, it is cited merely to support the proposition that "[m]odern methods for simulating from lognormal distributions rely on the relationship between the lognormal and normal distributions, and the

availability of efficient and exact methods for sampling from the latter.” Petition at 135.

However, whether or not the methods DOE chose to use in its model “rely on the relationship between the lognormal and normal distributions, and the availability of efficient and exact methods for sampling from the latter” is not at all material to this proceeding, and, therefore, this statement provides no support the contention.

Finally, many of the statements Nevada asserts provide the factual support for its contention provide no objective information, and rely on vague, subjective terms. Such inadequate conclusory statements include:

- “This procedure is flawed because more widely accepted superior procedures are available and in common use.” Petition at 134.
- “[T]he method utilized by DOE for generating pseudo-random numbers from lognormal distributions ... is not generally accepted.” *Id.* at 135.
- DOE’s simulation methodology is “*slow and could be relatively inaccurate.*” *Id.* (emphasis added).

This is precisely the type of “expert opinion” that the Commission has repeatedly rejected as inadequate “because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion.” *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (emphasis added) (quoting *Private Fuel Storage, L.L.C. (Independent Fuel Storage Installation)*, LBP-98-7, 47 NRC 142, 181 (1998), *aff’d on other grounds*, CLI-98-13, 48 NRC 26 (1998)). Because the contention provides no reasoned basis or explanation for such conclusions, the contention is not properly supported and should be rejected pursuant to 10 C.F.R. § 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated above that Nevada's claim that DOE's procedures used to calibrate and simulate its precipitation model "are non-standard, not generally accepted and, in the case of the simulation procedure as described, incorrect," Petition at 133, are not material. Accordingly, they do not raise a genuine dispute on a material issue of law or fact. But the contention also contains other assertions which, as DOE demonstrates below, raise no genuine issue on a material issue of fact or law.

Nevada's argument that DOE's calibration procedure is "flawed" merely "because more widely accepted superior procedures are available and in common use," Petition at 134, does not present a genuine dispute of a material fact. The mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Electric Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). Because the contention neither alleges, nor provides a basis for concluding that DOE's results are not inconsistent with the reasonable expectation standard, it does not establish a genuine issue of material fact. Furthermore, the contention never explains the basis for its statement that DOE uses a method "that is not generally accepted," Petition at pages 133, 135-136, nor does it ever explain how DOE's approach violates the principle regulatory provisions that it cites, 10 C.F.R. § 63.21(c)(9) and (c)(15).

Nevada's claim that DOE's implementation of the infiltration model is "incorrect since it uses the same pseudo-random number to determine both the occurrence and amount of rainfall" is simply wrong. A contention is inadmissible if "the Petitioner's assertion that the application[] [is] deficient is simply based upon a failure to read or perform any meaningful analysis of the

application[.]” *Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 & 3), LBP-04-15, 60 NRC 81, 95 (2004). Although the algorithm described on Page F-36 of “Simulation of Net Infiltration for Present-Day and Potential Future Climates, MDL-NBS-HS-000023 REV01” (05/24/2007), LSN# DN2002482668, uses the same symbol R to indicate the use of two pseudo-random numbers in Equations F-50 and F-51, in the implementation of the model these two equations use uncorrelated, independent random numbers, as is made clear by repetition of the phrase “select a random number.”

Finally, as discussed in Section V.A.3 above, contentions expressing only generalized “uncertainties” in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from this deficiency.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the precipitation model properties at the proposed repository site or to specifically state the radiological impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

**18. NEV-SAFETY-18 - Use Of Climate Data From The Analog Sites**

SAR Subsection 2.3.1.2.3 and similar subsections, which describe the use of analog sites to represent future climate states, make inappropriate use of information from the analog sites.

**RESPONSE**

This contention claims that “SAR Subsection 2.3.1.2.3 and similar subsections,” make inappropriate use of information from analog sites used as proxies for future climate states. Nevada alleges that “there are substantial differences between sites that are supposed to represent the same climate,” Petition at 138, and concludes that “the chosen sites cannot possibly all represent the same climate regime, and the results obtained by pooling results from different sites are not shown to correspond to any physically plausible climate state.” *Id.* at 139. This contention must be dismissed for the reasons set forth below.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Nevada argues that, rather than “using a fixed parameter set drawn from the pooled [analog sites’] results,” DOE should have used “*the correct way* to represent ... [variance] in a 1,000-year climate simulation,” which is “by allowing the parameters to vary within the simulation so as to reflect the actual process that is expected to occur.” Petition at 139 (emphasis

added). Because DOE's modeling did not use this allegedly "correct way," Nevada claims that DOE violated 10 C.F.R. § 63.21(c)(15). *Id.* It is well settled that, absent a waiver, "no rule or regulation of the Commission ... [is] subject to attack ... in any adjudicatory proceeding." 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission's regulations. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff'd*, CLI-01-17, 54 NRC 3 (2001). That is the case here. No NRC regulation, including those cited by Nevada, mandate that the DOE performance assessment allow the parameters to vary within the simulation in order to represent variance in a 1,000-year climate simulation. Accordingly, Nevada's contention should be dismissed as outside the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific

citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing. Indeed, because the climate analysis provides input to DOE’s infiltration model, it is notable that Nevada has not asserted that the DOE’s analysis underestimates infiltration and will continue to do so unless the issues identified in the contention are adopted. Instead, Nevada merely asserts that the manner in which DOE’s uses information from the analog sites is “inappropriate” because “the chosen sites have quite different climatologies ....” Petition at 137. Nevada has not established how the contention resolution would make a difference in the outcome of the proceeding. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed. Similarly, Nevada also does not allege, even qualitatively, that use of Nevada’s so-called “correct way to

represent this [variance] in a 1,000-year climate simulation,” Petition at page 139, would result in an increase in infiltration. Indeed, while Nevada claims that “the data from the analog sites have therefore been used inappropriately,” Petition at 139, it does not allege that DOE’s infiltration results are inconsistent with the reasonable expectation standard.

As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

The method the DOE used in addressing climate analysis is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are

immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (Jonathan Overpeck, Howard S. Wheeler, and Richard E. Chandler), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Moreover, the contention does not reference any documentation other than DOE’s own description of its infiltration model. Accordingly, the contention is devoid of support for its claim that:

[T]he correct way to represent this in a 1,000-year climate simulation is not by using fixed parameter set drawn from the pooled results, but rather by allowing the parameters to vary within the simulation so as to reflect the actual process that is expected to occur. The data from the analog sites have therefore been used inappropriately, and therefore the requirement in 10 C.F.R. § 63.21(c)15 – that ‘[a]nalyses and models will be used to assess performance of the geologic repository must be supported by using an appropriate combination of such methods as . . . natural analog studies’ – has not been met.

Nevada also provides no explanation for its conclusory assertion that its proposed method is “the correct way,” or any reference or further explanation for its claim that “the parameter values derived do not comply with the requirement of 10 C.F.R. § 63.114(b), in that the technical basis for the parameter ranges used to describe future climatic conditions is flawed.” *Id.*

Yet, even if these claims were construed to have been submitted by an expert, they constitute the type of “expert opinion” that the Commission has repeatedly rejected as inadequate “because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion” of the alleged basis for the contention. *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (quoting *Private Fuel Storage, L.L.C. (Independent Fuel Storage Installation)*, LBP-98-7, 47 NRC 142, 181 (1998), *aff’d on other grounds*, CLI-98-13, 48 NRC 26 (1998)). Because the contention provides no reasoned basis or explanation for such conclusions, the contention is not properly supported and should be rejected pursuant to 10 C.F.R. § 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada’s claim articulated in this contention is not material. DOE has also demonstrated that Nevada has failed to proffer adequate factual support or expert opinion. Accordingly, Nevada’s claim of noncompliance with this regulation also does

not raise a genuine dispute of material fact or law. The contention's arguments also raise no genuine dispute of material fact or law for the reasons set forth below.

First, Nevada has failed to perform a meaningful analysis of the SAR. For example, Nevada's claim that DOE's use of analog sites to represent future climate states "is inappropriate" because the sites have "quite different climatologies" is simply wrong. The selection of more than one climate station (called "pooling" in this contention) is entirely *appropriate* to fully characterize climate conditions at a single analog location. For instance, weather station data from Nogales, Arizona, and Hobbs, New Mexico, were combined to represent the monsoon climate state because using only one would not appropriately represent the range of potential monsoon conditions that could impact the Yucca Mountain site. *See* "Simulation of Net Infiltration for Present-Day and Potential Future Climates," MDL-NBS-HS-000023 REV 01 (May 2007), LSN# DN2002481680, at 7-11 ("Even if their average annual precipitation is similar, the two upper-bound sites have different behavior over the year: Hobbs features a longer but less intense monsoonal period, while Nogales presents a shorter (2 months) but more intense monsoonal period."). That is because monsoon characteristics vary depending on whether the air mass originates in the northern Gulf of California (wet Arizona monsoons) or in the southern Gulf of California or tropical eastern Pacific Ocean (New Mexico monsoons). Mitchell, D.L., Ivanova, D., Rabin, R., Brown, T.J., and Redmond, K., 2002, "Gulf of California sea surface temperatures and the North American Monsoon: Mechanistic Implications from Observations," *Journal of Climate*, 15(17): 2261–2281, 2261 (2002). Including data from both stations incorporates all sources of monsoonal storm tracks which better represents potential future monsoonal storm events at Yucca Mountain.

Likewise, stations in Rosalia, St. John, and Spokane, Washington are close to each other, but do not have identical meteorological records. “Future Climate Analysis,” ANL-NBS-GS-000008 Rev. 001” (9/3/2004), LSN# DN2001637047 at 6-52 to -53. These stations were selected to collectively represent the upper bound transition climate state to minimize the influence of local meteorological phenomena on the input to the infiltration model. *Id.* The selected analog climate stations and the simulated climate in the infiltration model are intended to represent a range of future climate variability for each climate state.

As discussed in the applicable Legal Standards Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts the Application fails to address an issue that the Application does address, is defective. As just shown, Nevada’s contention ignores relevant analyses performed in support of the Application. In short, this contention is inadmissible because “the Petitioner’s assertion that the application[] [is] deficient is simply based upon a failure to read or perform any meaningful analysis of the application[.]” *Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 & 3), LBP-04-15, 60 NRC 81, 95 (2004).

Second, Nevada erroneously asserts in this contention that “DOE makes an attempt to justify the pooling for the monsoon climate – ‘The climate during this period would vary from episodes of intense summer rain to present-day-like climates with relatively more winter and less summer precipitation.’” Petition at 139 (quoting SAR at 2.3.1-41). A closer reading of the SAR in context demonstrates that the quoted statement is not a justification; it is a description of past monsoon climate based on paleoecological data from Owens Lake, hydrology, current microfossil species distribution, and precipitation and temperature data, among other

paleoenvironmental information and, therefore, does not create a genuine dispute. LSN# DN2001637047, at Section 6.5.

Furthermore, as discussed in Section V.A.3 above, contentions expressing only generalized “uncertainties” in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from this deficiency.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the climate analysis properties at the proposed repository site or to specifically state the radiological impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

**19. NEV-SAFETY-19 - Future Infiltration Projections Need To Include Reduced Vegetation Cover**

SAR Subsection 2.3.1.3.2.1.5 and related subsections, which state the nature of vegetation cover predicted for the future at Yucca Mountain, fail to account accurately for the possible impact of reduced vegetation cover that could result in increased rates of infiltration.

**RESPONSE**

Nevada states that SAR Subsection 2.3.1.3.2.1.5 “and related subsections,” do not consider how human impacts on climate change could affect vegetation cover, resulting in increased rates of infiltration, and therefore, DOE did not satisfy applicable regulatory requirements, including 10 C.F.R. § 63.305(c).

**a. Statement of Issue of Law or Fact to be Controverted**

Because Nevada is, in essence, challenging existing regulatory requirements, the contention has no basis in existing law.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

The essence of Nevada’s claim, like the claims it makes in a number of other contentions, is that DOE has not taken into account the effect of climate change resulting from future anthropogenic production of greenhouse gases. In this contention, Nevada alleges that such human-induced future climate change may reduce the amount of vegetative cover on the surface of the Yucca Mountain repository. Petition at 142. Nevada’s argument that DOE is required to take potential climate changes caused by increasing greenhouse gases resulting from human

activity into account and any effect that this climate change may have, is inadmissible as outside the scope of this proceeding. NRC's regulations do not impose this requirement onto DOE. Therefore, Nevada's attempt to do so makes this contention inadmissible. Absent a waiver, "no rule or regulation of the Commission . . . is subject to attack . . . in any adjudicatory proceeding." 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission's regulations or that otherwise seeks to litigate a generic determination established by a Commission rulemaking. *See Fla. Power & Light Co. (Turkey Point Nuclear Generating Plant, Units 3 and 4)*, LBP-01-6, 53 NRC 138, 159, *aff'd*, CLI-01-17, 54 NRC 3 (2001).

Furthermore, attempting to determine the impact of reduced vegetative cover on infiltration, would necessarily require DOE to determine the effect of future human activity on the Earth's climate. This, in turn, would require DOE to predict the future amounts and variations in amounts of greenhouse gas emissions due to human activities. In short, DOE would have to somehow foretell human behavior for thousands of years into the future. This is precisely the type of speculative endeavor that the NRC does not require DOE to undertake. The NRC made this clear when promulgating 10 C.F.R. § 63.305(b), explaining that:

The natural systems of the biosphere are allowed to vary (*e.g.*, climate change) because the geologic record provides evidence of past climate over a long time frame, which provides a strong basis for predicting future changes. Because human behavior cannot be similarly predicted, a similar approach cannot be used for the RMEI and the influence the local population has on the biosphere. Thus, it is necessary to emphasize current conditions for the RMEI . . . . The suggestion that NRC consider alternative futures related to human behavior is speculative and leads to problems deciding which alternative futures are credible and which are unrealistic. Such questions have no scientific or technical answer.

66 Fed. Reg. 55,732, 55,757 (Nov. 2, 2001).

Nevada also appears to challenge DOE's climate and infiltration modeling for the *post-*10,000 year period. *See* Petition at 143. That position also constitutes an impermissible challenge to Commission regulations and is, therefore, outside the scope of this proceeding. *See* 10 C.F.R. §§ 2.335(a) and (b). NRC's proposed 10 C.F.R. § 63.342 (c)(2) makes it clear that DOE need not predict the possible effects of climate change for the period from 10,000 years after permanent closure through the period of geologic stability, and DOE accordingly did not do so. *See* 70 Fed. Reg. at 53,319. DOE must, instead, adhere to the prescribed analysis for climate and infiltration in the post-10,000 year period, set forth at proposed 10 C.F.R. § 63.342(c)(2). *See id.* Because this contention would impose different requirements than those mandated by NRC's regulation, it fails to meet the requirements of 10 C.F.R. § 2.309(f)(1)(iii) and must be dismissed.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that is material to the findings that the Commission must make in this proceeding, and must be dismissed. As noted above, the effect of possible reduced vegetation cover resulting from climate changes caused by future anthropogenic production of greenhouse gases is outside the scope of this proceeding and, therefore, the contention does not raise an issue material to the finding the Commission must make.

Additionally, to identify an issue as material, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is reasonable expectation that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31. Nevada makes no such showing, making only the nebulous assertion that "reduced vegetation cover ... *could* result in increased rates of

infiltration.” Petition at 142. Nevada does not claim that it would result in infiltration estimates beyond those in the license application, or that DOE’s estimates are not cautious or reasonable.

Moreover, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

Furthermore, 10 C.F.R. § 63.305(c) requires DOE to make “reasonable assumptions consistent with present knowledge” when assessing climate change. Thus, for the contention to be material to this proceeding, Nevada must also allege and provide sufficient support to show that DOE’s assumptions were *unreasonable*. Nevada, however, makes no such claim or showing. Indeed, Paragraph 6 of the contention essentially admits that Nevada does not know whether it poses a material issue. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 146. Absent any discussion on what effect the contention has on infiltration estimates, Nevada has clearly not met its burden to demonstrate that the resolution of the issue would prevent the NRC from finding that there is reasonable expectation that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2).

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists a number of regulations in paragraph 4 in this

contention. *See* Petition at 102-103. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 103. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

For the aforementioned reasons, this contention fails to raise issues material to the findings the NRC must make and therefore, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for many statements and assertions, the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the

contention does not reference any expert opinion. Nevada does attach several affidavits (by Jonathan Overpeck and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada provides no documentary support whatsoever for a number of conclusory statements, including those contained in the following paragraph from page 144 of the Petition:

[Human induced climate change] will likely result in temperatures at Yucca Mountain that are much hotter than assumed by DOE, as well as precipitation regimes that are both drier on average during the winter, with episodic, likely more intense, rainfall at irregular intervals, particularly in the summer or during increasingly infrequent wet winters. The hotter (5 to 10 or more degrees F warmer than present) and drier climate will make it more difficult, at least during extended dry periods, for vegetation to grow. Reduced vegetation growth will reduce the capture of soil moisture by above- and below-ground vegetation. This means that during dry periods in the future, less frequent but more intense rainfall should be able to infiltrate more freely than current, or DOE-predicted, vegetation cover allows. Thus, by assuming a particular vegetation cover at Yucca Mountain, DOE has underestimated the potential for infiltration.

Licensing boards have found that “[m]ere assertions without appropriate explanation and support do not satisfy the requirements of the contention rule.” *See Duke Energy Corp.*

(McGuire Nuclear Station, Units 1 & 2, Catawba Nuclear Station, Units 1 & 2), LBP-02-4, 55 NRC 49, 84 (2002). Accordingly, the Board should not accept any of Nevada’s unsupported assertions.

Finally, the documentary materials Nevada does cite are immaterial to the contention’s central issue: whether the DOE’s model appropriately accounts for variations in vegetation

cover when estimating infiltration. Moreover, the two documents Nevada cites in support of the proposition that “[f]uture climate changes will likely result in substantial periods of time during which the vegetation cover is reduced below that predicted by DOE,” Petition at 144, are both hundreds of pages in length, yet Nevada fails to provide specific pages or sections on which support for the proposition can be found. A petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). Consistent with that requirement, the Case Management Order directs petitioners to ensure that documentary references “be as specific as reasonably possible.” *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 7). Nevada’s contention fails in this regard.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated above that Nevada’s claim is outside of the scope of this proceeding and also not material to any finding the NRC must make. The contention also contains other assertions which, as DOE demonstrates below, raise no genuine dispute on a material issue of fact or law.

First, contrary to Nevada's claim that DOE has underestimated possible infiltration, Petition at 145, DOE’s infiltration model takes into account climatic impact of evapotranspiration rates: “[e]vapotranspiration rates are controlled by a combination of soil and vegetation properties, and vegetation properties are highly dependent on climate.” SAR Subsection 2.3.1.3.1.4 at 2.3.1-36. DOE described parameters and data uncertainty relevant to its infiltration model -- including evapotranspiration -- in SAR Section 2.3.1.3.2 and 2.3.1.3.3. Because the contention does not show that the DOE models and related parameters are not reasonable, it fails to establish a genuine dispute. *See* 10 C.F.R. § 63.305(c).

Second, this contention fails to quantify the “reduced vegetation cover,” “increased rates of infiltration,” or “possible impact” that it alleges could occur. Petition at 145. A petitioner must allege not only that more accurate input data could be used in applicant’s model, but the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339 (2006). This contention therefore fails to explain how inclusion of these unspecified events could significantly affect the results of the postclosure analysis, or otherwise make a difference in the outcome of the licensing proceeding.

Third, the study on which Nevada bases its assertion that infiltration will increase if vegetation is reduced, “Ecological controls on water-cycle response to climate variability in deserts,” Petition at 143, compared vegetated and non-vegetated areas (that is, areas in which vegetation occurred naturally, but was continually removed) under similar climate conditions, that is, similar amounts of precipitation. However, this only addresses the amount of moisture that the vegetation is capable of removing by evapotranspiration. Yet, the other primary determinant of net infiltration is precipitation, which DOE’s infiltration model also takes into account. *See* SAR Section 2.3.1.3.1.4 at 2.3.1-36. In other words, a decrease in vegetation results from a decrease in annual precipitation, not an increase in temperature. The precipitation decrease would likewise decrease mean net infiltration over the site. *See* SAR Section 2.3.1.3.3.2.2 at 2.3.1-74.

Finally, as discussed in the applicable Legal Standards section and section (d) above, this contention alleges potential errors, omissions, and alternative approaches -- without specifying the ramifications or results of such alleged deficiencies. Here, Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Accordingly,

Nevada has failed to raise a genuine dispute of material fact or law and therefore, this contention is inadmissible. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises genuine dispute on a material issue of fact or law in this proceeding. Paragraph 6 essentially shifts Nevada's burden to DOE and, therefore this contention should be rejected.

**20. NEV-SAFETY-20 - Net Infiltration Alternative Conceptual Model**

SAR Subsection 2.3.1.3.3.1 and similar subsections, which state that the MASSIF model estimates net infiltration at the Yucca Mountain site based on daily water balance calculation of the near-surface soils, fails to apply alternative conceptual models to evaluate the performance of the geologic repository.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must

make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Additionally, this contention asserts that DOE did not “apply” any alternate modeling approaches for net infiltration. Nevada goes on to identify a number of alternate infiltration model codes DOE “could have used,” such as HYDRUS-1D, HELP, MIKE-SHE, and KINEROS. Because DOE allegedly did not use these alternative codes to calculate net infiltration, Nevada asserts that DOE failed to satisfy 10 C.F.R. § 63.114(c).

Section 63.114(c) does not require DOE to apply alternate codes such as HYDRUS, HELP, and KINEROS. Rather, the NRC requires DOE to “[c]onsider” alternative conceptual models of “features and processes” and “evaluate the effects that alternative conceptual models have on the performance of the geologic repository.” This is echoed in the NRC Standard Review Plan for the Yucca Mountain Repository at 2.2-62, which notes that DOE is to “investigat[e]” “[a]lternative modeling approaches.” Contrary to this contention, 10 C.F.R. § 63.114(c) does not require that alternative “codes” be used - - it requires that alternative “conceptual models” of features and processes be used. Code and conceptual model are two separate concepts. It is entirely possible and not unreasonable to use the same code to provide different conceptual models of features and processes by varying input and other various parameters.

To the extent that Nevada is contending that additional requirements should be imposed on DOE beyond the applicable NRC regulations, its contention constitutes an impermissible challenge to the 10 C.F.R. § 63.114(c). *See Fla. Power & Light Co.*, LBP-01-6, 53 NRC at 159, *aff’d on other grounds*, CLI-01-17, 54 NRC 3 (contentions that advocate stricter requirements than agency rules impose constitute an impermissible challenge to the regulations).

Although it would have been permissible for DOE to use alternative codes to satisfy 10 C.F.R. § 63.114(c), that regulation does not require DOE to do so. Instead, DOE assessed various alternative conceptual models related to net infiltration using the MASSIF code. For example:

- DOE performed an alternative set of simulations assuming wetter initial water content conditions for soil moisture content. SAR, at 2.3.1-69.

- DOE performed an alternative model study using variations in soil saturated hydraulic conductivities. SAR, at 2.3.1-70-71.
- DOE compared its model of precipitation with other models of precipitation. SAR, pp. 2.3.1-75 to 77.

Therefore, the SAR satisfies 10 C.F.R. § 63.114(c).

Moreover, DOE did consider and evaluate two of the alternate infiltration codes noted in the contention - HYDRUS-1D and HELP. See Simulation of Net Infiltration for Present-Day and Potential Future Climates, Section 6.2.4 “Alternative Models Considered,” (LSN DEN001575070). These two alternate codes were representative of two modeling groups based on how they consider subsurface water movement, either with Richards’ equation or with a water balance approach that uses field capacity. DOE's assessed the capabilities and limitations of these two representative codes. DOE eventually concluded that neither of these two alternate models is suitable to estimate net infiltration at Yucca Mountain.<sup>56</sup>

Additionally, DOE utilized the HYDRUS-1D code to build confidence in the MASSIF code. For example, as discussed in SAR Section 2.3.1.3.4.1, DOE used the HYDRUS-1D code to assess the ability of the MASSIF model to simulate daily actual evapotranspiration and changes in daily soil water storage. MASSIF simulation output was first compared to long-term detailed water balance data collected at lysimeter facilities at the Nevada Test Site and at the Reynolds Creek Experimental Watershed. DOE then applied the HYDRUS-1D to the same water balance data and compared the results from the alternative (HYDRUS-1D) with MASSIF.

---

<sup>56</sup> Additionally, DOE examined various conceptual models used to represent the component processes of the water balance equation. See LSN DEN001575070, Section 6.2.2 "Modeling Processes Controlling Net Infiltration." Section 6.2.2 provides additional description of possible alternative representations for each of the component terms. Rational for selection of the component terms implemented in MASSIF is provided in the Section 6.2.3, “Criteria for Selection of Net Infiltration Model Components.”

Notably, these comparisons show that MASSIF simulations compare well to the results of HYDRUS-1D. SAR at 2.3.1-78. DOE also used the HYDRUS-1D code to validate MASSIF, showing that MASSIF produces annual net infiltration estimates that are very close to the estimates obtained by HYDRUS-1D. SAR Section 2.3.1.3.4.2.3.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Although this contention asserts that DOE should have applied alternative codes to essentially reproduce the results of the selected model (MASSIF), the contention does not allege that doing so would have produced results that are significantly different than the results of the MASSIF code for net infiltration. Therefore, the contention does not establish a genuine issue of material fact. As stated by the licensing board in *Duke Energy Corp.* (McGuire Nuclear Station, Units 1 and 2; Catawba Nuclear Station Units 1 and 2), LBP-03-17, 58 NRC 221, 240 (2003):

The Board views this proposed contention or subpart as an attempt to challenge the use by Duke of various models used in its calculation of accident consequences. But the Intervenors have made no showing either that the models used by Duke are defective or incorrect for the purpose used or that those models were used incorrectly by Duke. Nor have the Intervenors demonstrated that the models they are recommending are superior in any way to those employed by Duke. The Intervenors merely point out that, by using their models in the manner they are recommending, a different result would be achieved. That is an insufficient basis to formulate a valid contention.

As discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such

alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this failure. Nevada has made no attempt to determine or estimate what effect, if any, acceptance of their contention would have on net infiltration or doses. In fact, the contention makes no mention of dose whatsoever. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As noted above, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**21. NEV-SAFETY-21 - Infiltration Model And Changes In Soil And Rock Properties**

SAR Subsections 2.3.1.3.2.1.2, 2.3.1.3.2.1.3, 2.3.1.3.2.1.4 and similar subsections, which state that the MASSIF infiltration model was developed with bedrock hydraulic conductivity, soil depth and soil properties assumed to be constant for the next 10,000 years, fails to account for biogeochemical and geomorphological processes, including erosion and also fails to account for uncertainties and variabilities in parameter values.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing

by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) as discussed in Section V.A.3 above: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Howard S. Wheeler, Stephan K. Matthäi, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. As discussed in Section V.A.3 above, that approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada does provide a reference for one of its statements in paragraph 5 of the contention, citing that document for the proposition that "there are potentially significant changes to soil depth and rock properties that are expected to occur due to geomorphological processes." Petition at 154. The contention does not cite any particular paragraph or page of that referenced document as support, and therefore the reference to that document is not sufficient to satisfy Section 2.309(f)(1)(v). As the Commission has stated, vague references to documents do not suffice—the petitioner must identify specific portions of the documents on which it relies. *Public Service Co. of New Hampshire* (Seabrook Station, Units 1 & 2), CLI-89-03, 29 NRC 234, 240-41 (1989).

Furthermore, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage, L.L.C.* (Independent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998), *aff’d on other grounds*, CLI-98-13, 48 NRC 26 (1998). In this case, the document referenced by Nevada does not support the statements made in the contention. Rather, the document lends support to DOE’s determination that erosion is not consequential, stating: “It may be seen that there is little apparent change [in Yucca Mountain] within the first 1 my [million years] ....” LSN# NEV000005187, p.7. Obviously, this reference has no relevance to this contention, which pertains to processes that could affect Yucca Mountain over the next 10,000 years.

Additionally, in order to predict significant erosion within 500,000 to 5,000,000 years, the document relied upon by Nevada is forced to use “conservative estimates for all involved parameters.” *Id.* at 1. As such, the reference is not material to compliance with 10 C.F.R. § 63.305(c), which requires DOE to vary factors related to geology based upon “cautious, but reasonable assumptions.” Furthermore, the reference is not material to compliance with 10 C.F.R. § 63.101(a)(2), which only requires that there be a “reasonable expectation” that the postclosure performance objectives will be met. *See* Section V.A.3c of this Answer.

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention criticizes DOE for assuming constant soil and bedrock properties over the first 10,000 years after repository closure, rather than varying soil properties due to changes in

vegetation and erosion. For several reasons, this contention does not establish a genuine dispute of material fact.

First, while the contention alleges that there will be changes in soil and bedrock during these 10,000 years which “would widen the range of estimates of infiltration,” the contention never alleges that such changes would have the effect of increasing net infiltration beyond that estimated by in the license application. Since the contention does not allege (let alone provide support for an allegation) that DOE’s estimates for net infiltration are not conservative or do not bound the amounts of net infiltration that would be estimated if Nevada’s approach were adopted, the contention does not establish a genuine dispute of material fact. *See* Section V.A.3 of this Answer.

Second, as discussed above, Nevada’s cited reference does not address erosion within the first 10,000 years, which is the subject of this contention. Therefore, that reference does not establish a genuine issue of material fact.

Third, the contention does not properly characterize the license application. Nevada asserts that “no consideration is given to changes in soil depth, soil properties, or bedrock conductivity over 10,000 years.” Petition at 153. For its base case, DOE did assume that soil depth and properties are constant for the next 10,000 years. SAR, at 2.3.1-45. However, contrary to Nevada’s allegation, DOE also postulated changes in soil depth and in the hydraulic conductivity of the most common bedrock units, as part of its uncertainty analysis. SAR at 2.3.1-73. That analysis determined that assumptions related to the depth of class 4 soils have a significant contribution to the uncertainty in net infiltration. SAR at 2.3.1-74. Accordingly, DOE took a conservative approach to specifying soil depth of the soil class 4 to ensure that the depth is not overestimated (an overestimate of soil depth could result in an underestimate of net

infiltration). SAR, at 2.3.1-47. Thus, this contention has mischaracterized the analyses performed by DOE. As a previous licensing board has ruled, if a petitioner alleges that the application does not address a particular issue, but the allegedly missing information is indeed in the license application, then the contention does not raise a genuine issue. *See Florida Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 & 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada’s contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* Section V.A.3 of the Answer for a more detailed discussion of this point.

In summary, for all of the reasons set forth above, this contention does not establish a genuine issue of material fact. Therefore, it should be rejected.

**22. NEV-SAFETY-22 - Net Infiltration Model Water Balance**

SAR Subsections 2.3.1.3.2 and 2.3.1.3.3 and similar subsections, which address the hydrological processes represented in the net infiltration model, are inadequate because they fail to address lateral subsurface flow and allow for the generation of surface runoff only when the soil layers are saturated.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must

make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention asserts that DOE's infiltration model has not addressed lateral flow or given appropriate consideration to runoff. For the reasons discussed below, this does not establish a genuine issue of material fact.

The contention acknowledges that DOE's model considers runoff, but then essentially asserts that DOE's model only considers runoff when soil layers are saturated, thereby excluding runoff under other conditions. The contention mischaracterizes DOE's model. As clearly stated in SAR Section 2.3.1.3.3.1, "Runoff can occur if the net precipitation exceeds the ability of the thin surface soil layer to store and transmit water to underlying soil layer," as well as when soil layers are saturated. SAR, pp. 2.3.1-56. Additionally, DOE has validated its model of runoff against actual data from streamflow gauges. That validation shows that DOE's model correctly predicts the timing and magnitude of the runoff. SAR, pp. 2.3.1-79 and 80. Therefore, Nevada's assertions that DOE has not considered runoff under certain conditions fail to raise a genuine dispute of material factor or law, as required by 10 C.F.R. § 2.309(f)(1)(vi).

With respect to the assertion regarding the alleged failure to address lateral subsurface flow, the contention relies upon statements in the "Independent Review of Simulation of Net Infiltration for Present-Day and Potential Future Climates" prepared by the Oak Ridge Institute for Science and Education (ORISE). LSN# DEN001595302 (ORISE Report). However, Nevada quotes selectively from the ORISE Report, omitting the fact that the Report is uncertain as to whether subsurface lateral flow would have any net effect on mean net infiltration (which is calculated over the model domain). For example, the ORISE Report states:

Subsurface lateral flow may be important or maybe not. . . . For example, subsurface lateral flow can reduce vertical percolation of water and increase evapotranspiration, thus reducing net

infiltration. Or, lateral flow may increase net infiltration by diversion of water to washes or other likely flow paths to the deep subsurface, such as head slopes, where water is converging, in first order drainage basins. As a result, it is important to consider the impact on net infiltration of subsurface lateral flow that possibly occurs at specific locations experiencing extreme fluxes, rather than assuming the flux is distributed uniformly across a grid cell, hillslope, or catchment.

ORISE Report (LSN# DEN001595302 at 6) As illustrated by the above quotation, the authors of the ORISE Report conceded not knowing whether consideration of lateral subsurface flow would have any effect (much less a material effect) on the results of DOE's model. In fact, such consideration could result in a decrease in net infiltration.

Statements somewhat similar to those in the ORISE Report appear in the report of the expert elicitation panel cited in this contention, "Unsaturated Zone Flow and Transport Modeling Expert Evaluation (UZFTTE) Project" (CRWMS M&O, 1997) (LSN# NRC000010491 at 3-8). The expert panel stated that consideration of lateral flow would lead to calculation of less infiltration along ridge tops and more infiltration within washes. However, the panel did not reach any conclusions on whether there would be an increase in the mean net infiltration.

A petitioner has the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). The ultimate conclusion of Nevada's assertion is that "[t]he inclusion of these missing hydrological processes would widen the range of estimates of infiltration, including those associated with episodic events." Petition at 158. In other words, uncertainty may, to some unquantified degree, be greater than DOE estimates. However, neither this contention nor the ORISE Report provide a basis for concluding that consideration of lateral subsurface flow will lead to any increase in mean net

infiltration results. Accordingly, the contention has not established a genuine issue of material fact and should be rejected.

When viewed in context, it is apparent that the ORISE Report and the expert panel report were concerned about the impact of lateral flow on spatial distribution of net infiltration. *See, e.g.*, LSN# DEN001595302, pg. 10 (an analysis of lateral flow “is necessary to quantify spatial distribution of net infiltration”); LSN# NRC000010491, pg. 3-8. Consistent with the statements in the ORISE Report and the expert elicitation panel, DOE did evaluate the effects of a variation in the location of net infiltration due runoff. SAR at 2.3.1-71 and 2.3.1-80-81. That evaluation demonstrated that spatial variability in net infiltration does not significantly affect the mean net infiltration (as calculated over the model domain), and that in any event the nonwelded Paintbrush unit located over the repository emplacement area will dampen and homogenize downward moving pulses of transient net infiltration events. SAR at 2.3.1-71 and 2.3.1-80-81. Nevada has not contested this conclusion, and therefore has not established a genuine dispute of material fact.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada’s contention is not material. This

assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* Section V.A.3 of the Answer for a more detailed discussion of this point.

In summary, this contention does not establish a genuine dispute of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

**23. NEV-SAFETY-23 - Evaluation Of Alternative Net Infiltration Models**

SAR Subsections 2.3.1.3.2, 2.3.1.3.3, and 2.3.1.3.4 and similar subsections, incorrectly compare the MASSIF net infiltration model with an alternative model using other data sets.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a

difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does

not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach

several affidavits (by Adrian P. Butler and Michael C. Thorne) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Furthermore, even if the statements in this contention were embodied in an affidavit, the statements would not constitute sufficient supporting information. For example, the contention is replete with conclusory statements, such as allegations that “flaws in these comparisons exists,” “there is a fundamental problem in that the comparisons between observed and simulated responses are poor,” “large and important differences occur,” and there are “major discrepancies in the dynamics of the response.” Use of such vague terms does not provide the requisite specificity or demonstrate any noncompliance with regulatory requirements. As discussed in more detail in Section V.A.3 above, “an expert opinion that merely states a conclusion (*e.g.*, the application is ‘deficient,’ ‘inadequate,’ or ‘wrong’) without providing a reasoned basis or explanation for that conclusion is inadequate because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion.” *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (quoting *Private Fuel Storage, L.L.C. (Independent Fuel Storage Installation)*, LBP-98-7, 47 NRC 142, 181 (1998), *aff’d on other grounds*, CLI-98-13, 48 NRC 26 (1998)).

Nevada does provide a reference for one of its statements in paragraph 5 of the contention, stating that the ORISE Report (LSN# DEN001595302, pg. D-11) identifies “some” of the alleged “flaws” in the comparison of the MASSIF to the HYDRUS-1D, as set forth in the five bullets in paragraph 5 of the contention. However, of the five alleged “flaws,” the ORISE

Report discusses only the first two bullets. Indeed, the contention mischaracterizes the ORISE Report in regard to the bullets that are discussed in the ORISE Report. With respect to the first bullet (model calibration was used to fit the data to the model), the ORISE Report does not state that this is a “flaw.” Instead, it states that blind soil tests would have been optimal, but indicates that the calibration of DOE’s MASSIF model did enable it to reproduce the observed runoff and infiltration following modification of the input properties. Rather than supporting the assertion in the second bullet (treatment of boundary conditions was different in the model to those of the data), the ORISE Report states “The soil depth, which should have been modeled as very deep, was not, due to the fact that the bottom boundary condition of a lysimeter is very different from a natural soil profile.” Accordingly, the ORISE Report provides no basis for the otherwise unsupported assertion that the identified bullets are “flaws” that constitute or demonstrate a failure to satisfy 10 C.F.R. § 63.114(g) or any other regulatory requirements.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention alleges that DOE’s corroboration of DOE’s MASSIF infiltration model with the HYDRUS-1D model using lysimeter data was “flawed.” For several reasons, this contention does not establish a genuine issue of material fact.

First, the contention provides five bullets, and alleges that these bullets identify “flaws” in the comparison between MASSIF and HYDRUS-1D using data from lysimeter facilities. However, this is not the case. No regulatory shortfalls were identified or demonstrated in the bullets – but rather only vague allegations. As discussed above, the first two bullets are not “flaws,” according to the ORISE Report cited by Nevada. The third bullet (no overland flow in the lysimeter facilities), fourth bullet (no data for wetting phases at one of the lysimeter facilities), and the fifth bullet (the lysimeter facilities did not evaluate net infiltration) do not

represent or demonstrate a failure to meet the requirements of 10 C.F.R. § 63.114(g) or other applicable regulations, and do not identify any “flaws” in the comparison between MASSIF and HYDRUS-1D or defects in the comparison between MASSIF and the lysimeter data. Thus, none of the bullets indicates any regulatory shortfall with MASSIF. At most, the bullets may indicate some of the physical constraints of the lysimeter facilities. Because the five bullets do not identify any discrepancies in the outputs of MASSIF and HYDRUS-1D and do not identify any problems with the ability of the calibrated MASSIF model to predict evapotranspiration or water storage at the lysimeter facilities, the bullets do not establish a genuine issue of material fact.

Second, the purpose of the model comparison was not to evaluate the ability of MASSIF to simulate net infiltration but instead to evaluate evapotranspiration and soil water storage. SAR, at 2.3.1-77. Thus, it cannot reasonably be claimed that this comparison was “flawed” because it did not compare net infiltration. For the same reason, the alleged “flaws” also provide no basis for the assertion that the MASSIF model's estimation of net infiltration is not credible.

Finally, the contention asserts that the comparisons between the observed and simulated responses are “poor,” citing to 1) a statement on page 7-19 of LSN# DEN001575070 regarding a 40 mm difference between MASSIF and one of the lysimeter facilities during 3 months of a 5 year period, and 2) Figures 7.1.2.1-3 and 7.1.2.2-2 in LSN# DEN001575070. However, Nevada has not properly characterized these data and figures. In fact, the figures show a close comparison between MASSIF results, HYDRUS-1D results, and the lysimeter data.

Nevada’s incorrect reading of LSN# DEN001575070 does not provide an adequate basis for a litigable contention. *See Ga. Inst. of Tech.* (Georgia Tech Research Reactor, Atlanta, Ga.), LBP-95-6, 41 NRC 281, 300 (1995). As has been previously held, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion

supplies the basis for a contention.” *Private Fuel Storage, L.L.C.* (Independent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998), *aff’d on other grounds*, CLI-98-13, 48 NRC 26 (1998). Instead, a licensing board will examine documents to confirm that they support the proposed contentions. *Vermont Yankee Nuclear Power Corp.* (Vermont Yankee Nuclear Power Station), ALAB-919, 30 NRC 29, 48 (1989), *vacated in part on other grounds and remanded*, CLI-90-4, 31 NRC 333 (1990). In this case, examination of the cited documents does not support the allegations in this contention, and therefore Nevada’s allegations regarding those documents do not establish a genuine issue of material fact.

As discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this infirmity. The contention does not assert that the alleged discrepancies result in an underestimation of net infiltration by MASSIF, and Nevada has made no attempt to determine or estimate what effect, if any, acceptance of their contention would have on doses. In fact, the contention makes no mention of dose whatsoever. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001).

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**24. NEV-SAFETY-24 - Precipitation Data In Net Infiltration Model**

SAR Subsections 2.3.1.3.2 and 2.3.1.3.3 and similar subsections, are flawed because there are no reliable data at Yucca Mountain to quantify snowfall, and the network of precipitation gauges is inadequate to characterize the rainfall spatial distribution for modeling of infiltration.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must

make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. §

2.309(f)(1)(v) as discussed in Section V.A.3 above: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Howard S. Wheeler and Richard E. Chandler), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. As discussed in Section V.A.3 above, that approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada does provide two references which date from the first half of the 1990s. Petition at 165. However, both of these documents simply report the results of precipitation monitoring performed during that period and do not present any criticism of DOE's more recent approach to modeling precipitation set forth in SAR Sections 2.3.1.3.2 and 2.3.1.3.3.

In summary, this contention does not sufficiently identify facts or expert opinion to support the contention. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention essentially consists of two assertions: 1) DOE should have collected more data to capture the spatial and temporal distribution of precipitation, including snowfall, at Yucca Mountain, and 2) the precipitation values used in DOE's infiltration model have not been validated with a reasonable level of confidence. Neither of these assertions establishes a genuine issue of material fact.

First, it is undisputed that DOE has, in fact, collected actual precipitation data at numerous locations on and in the vicinity of the Yucca Mountain site. As discussed on page 2.3.1-9 of the SAR and Section 6.3.3.2 of the Yucca Mountain Site Description (LSN DN2002481434), site-specific data for Yucca Mountain have been collected from a meteorological network, parts of which began operating as early as 1985. The monitoring sites were established to provide representative data regarding meteorological conditions on topographically diverse settings at and around Yucca Mountain, including a location on the ridgetop of Yucca Mountain.

Second, it is also undisputed that future climate predictions have uncertainty, which makes it difficult to forecast future climates based on past climate. This is especially true of extreme precipitation years, which may not be captured by meteorological records directly. *See, e.g., SAR, at 2.3.1-31 to 32, and -37.* In order to address this uncertainty, DOE selected upper and lower bounds for the important climatic condition for each future climate state. SAR, pp. 2.31-6, -31, and -37. Nevada's contention does not allege, or otherwise provide any basis for contending, that DOE's bounds are incorrect.

The contention especially attacks what is claimed to be a lack of data on snow. As discussed SAR Section 2.3.1.3.3.2.2, DOE conducted an extended sensitivity study that included snow melt among its parameters (*see SAR Table 2.3.1-25*). As a result of this study, DOE was able to show that the uncertainty related to the parameters in SAR Table 2.3.1-25 (which includes snow melt) were not important to estimating net infiltration (none of the parameters explains more than 3% of the variance). *See SAR, at 2.3.1-75.* This contention does not contest that conclusion, and therefore does not establish a genuine dispute of material fact related to the lack of significance of snow.

Third, the present climate is predicted to last only for another 600 years, to be followed by a warmer and wetter monsoon climate for the subsequent 1400 years, to be followed by a wetter and cooler glacial transition climate for the remainder of the 10,000 years. SAR, at 2.3.1-6. This contention does not dispute that current precipitation data for Yucca Mountain are not appropriate for direct use in forecasting the precipitation for either the monsoon climate or glacial transition climate. DOE modeled these future climates using meteorological data from analogue sites, rather than from Yucca Mountain. Thus, the contention has no relevance whatsoever to DOE's future climate modeling. *See* SAR Section 2.3.1.2.3.1.2.

Finally, contrary to what the assertions in the contention might imply, DOE took steps to build confidence in its infiltration model and has validated the results of its model for the three future climates by comparing those results to the results of other models and comparable environments. This comprehensive effort is described in SAR Section 2.3.1.3.4, which covers 15 pages and cites to underlying analyses. The contention does not provide any information to contest DOE's effort let alone engage the specifics of the extensive effort.

In summary, Nevada's contention that there are no reliable data to quantify snowfall at Yucca Mountain, and that the network of precipitation gauges is inadequate to characterize the spatial distribution of rainfall, does not establish a genuine issue of material fact. DOE has demonstrated that snow melt is not important to estimating net infiltration, and therefore Nevada's assertions related to snow are not material. Furthermore, DOE has used actual meteorological data from Yucca Mountain and appropriate analogue sites. However, DOE has also acknowledged the inherent uncertainty in forecasting future climates based upon existing meteorological data, and has accounted for that uncertainty by selecting bounding values for precipitation. By using bounding values, DOE does not need additional data on snowfall or the

spatial distribution of rainfall. Nevada has not established any genuine dispute of material fact with respect to those bounding values. Therefore, this contention does not establish a genuine issue of material fact. Accordingly, it should be rejected.

**25. NEV-SAFETY-25 - Site-Specific Data In Net Infiltration Model**

SAR Subsections 2.3.1.3.2 and 2.3.1.3.3 and similar subsections contain site-specific data at Yucca Mountain that are too limited to allow for validation of the net infiltration model, and those data that are available demonstrate that performance of the model is unacceptably poor for infiltration modeling.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must

make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention asserts that the site-specific data are too limited to allow for validation of DOE's MASSIF infiltration model, and that the data that are available demonstrate that the performance of the model is unacceptably poor. In other words, Nevada appears to contend that the validity of DOE's MASSIF infiltration model must be assessed against site-specific data. For the reasons discussed below, this contention does not establish a genuine issue of material fact.

First, contrary to the contention, 10 C.F.R. § 63.114 does not require DOE to use only site-specific data to validate a model. Rather, 10 C.F.R. § 63.114(g) states that DOE must:

Provide the technical basis for models used in the performance assessment such as comparisons made with outputs of detailed process-level models *and/or* empirical observations (e.g., laboratory testing, field investigations, and natural analogs). (Emphasis added).

Indeed, there is nothing in § 63.114(g) that would prohibit DOE from using a wide range of information to validate a model - - in fact, such an approach is explicitly allowed. Section 63.114(g) permits DOE to validate a model without the use of any site-specific data.

As is permitted by Section 63.114(g), DOE used a variety of information to validate the MASSIF infiltration model. In addition to site-specific information, DOE compared MASSIF against other models, net infiltration estimates for other locations in the western United States (including Nevada), and the results of the HYDRUS-1D model. *See* SAR Section 2.3.1.3.4.2. To the extent that Nevada is contending that DOE must use only site-specific data to validate MASSIF, its contention constitutes an impermissible challenge to 10 C.F.R. § 63.114(g). *See Fla.. Power & Light Co.*, LBP-01-6, 53 NRC at 159, *aff'd on other grounds*, CLI-01-17, 54 NRC

3 (contentions that advocate stricter requirements than agency rules impose constitute an impermissible challenge to the regulations).

Second, the contention asserts that there is uncertainty in the site-specific data, and uncertainty in the results of the MASSIF model, especially with respect to the spatial distribution of net infiltration. The existence of uncertainty is not sufficient grounds, in and of itself, for rejecting the MASSIF model or the output of the model. As provided in 10 C.F.R. § 63.102(h):

Although there is an extensive geologic record ranging from thousands to millions of years, this record is subject to interpretation and includes many uncertainties. . . . The performance assessment provides an evaluation of the repository performance based on credible models and parameters including the consideration of uncertainty in the behavior of the repository system.

Thus, uncertainty is anticipated and permissible, provided that the TSPA accounts for the uncertainty. This contention does not allege that MASSIF has not properly accounted for the uncertainty. Therefore, to the extent that Nevada is contending that the MASSIF model is unacceptable because there is some uncertainty in the manner in which it models particular conditions, the contention constitutes an impermissible challenge to 10 C.F.R. § 63.102(h).

Third, the specifics of Nevada's allegations regarding the ability of MASSIF to model runoff in the Upper Split Walsh and other washes do not establish a genuine issue of material fact regarding the adequacy of MASSIF. Indeed, as shown in what follows, Nevada repeatedly misconstrues or mischaracterizes the information it cites as support for its contention. For instance, Nevada's Petition at 169 and 170 cites to a 2000 report of an NRC contractor regarding modeling of the Upper Split Wash. However, even a cursory reading shows that this report does not pertain to MASSIF. As the first two sentences makes clear:

The purpose of this report is to provide an independent analysis of run-off and shallow infiltration estimates used by the U.S. Department of Energy (DOE) in their performance assessment of a proposed repository at Yucca Mountain (YM), NV. The DOE uses a run-off and shallow infiltration model developed by the U.S. Geological Survey (USGS).

(LSN# NRC000027373 at iii.). The MASSIF model replaced the USGS infiltration model which is the subject of the cited report.

Similarly, Nevada's Petition at 170-71 contends that monitoring data are inadequate to characterize precipitation and temperature and therefore that validation using streamflow is indeterminate, citing to a DOE report (LSN# DEN001575070) for support. However, that report does not state what Nevada asserts that it states. Instead, the DOE report states that a "comprehensive knowledge" of precipitation and temperature does not exist and, despite the uncertainty in weather data, the MASSIF model is able to produce fairly good calculations of daily runoff in the Upper Split Wash. LSN# DEN001575070, pg. 7-35.

Again, citing to DOE's report in LSN# DEN001575070, Nevada's Petition at 170-71 asserts that the runoff data for Upper Split Wash are "incredibly limited" and do not include any events equivalent to the 100-year return event. However, Nevada misconstrues the purpose of the data. Contrary to Nevada's suggestion, DOE was not attempting (and was not required) to provide comprehensive runoff data for 100 years for Upper Split Walsh. Instead, DOE was providing several years of runoff data in order to compare that data against simulations by MASSIF. DOE determined that MASSIF correctly predicted the timing and magnitude of the runoff. SAR, at 2.3.1-80; LSN# DEN001575070, pg. 7-48. Nevada has not disputed that conclusion.

Citing to Figure 7.1.3-15 of DOE's report in LSN# DEN001575070, Nevada's Petition at 171 asserts that MASSIF's simulated streamflows appear to be an order of magnitude greater than those observed, and that for the largest observed runoff no flow is simulated. However, Nevada has taken that figure out of context. While that figure does show some discrepancies, all of the other figures (Figures 7.1.3-5, 7.1.3-6, 7.1.3-9, 7.1.3-11, 7.1.3-12, 7.1.3-14) show generally good agreement, thereby supporting the conclusions in SAR, at 2.3.1-80 and LSN# DEN001575070, pg. 7-48, that MASSIF correctly predicted the timing and magnitude of the runoff. Accordingly, none of the references Nevada cites establishes a genuine issue of material fact regarding the adequacy of MASSIF.

Based upon DOE's Report LSN# DEN001575070 and the ORISE Report (LSN# DEN001595302), Nevada's Petition at 171-72 states that assumptions related to soil conductivity affect the calculation of streamflow and the spatial distribution of net infiltration (*i.e.*, the amount of net infiltration at specific locations, as distinct from the mean net infiltration). However, the SAR at 2.3.1.-71 and 2.3.1-80 and 81 explicitly acknowledges that the spatial distribution of net infiltration is sensitive to assumptions related to soil conductivity. Therefore, this assertion by Nevada does not establish any dispute on a genuine issue of material fact.

Furthermore, as discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this infirmity. The primary challenge posed in this contention is that "there may be considerably more uncertainty as to where net infiltration is occurring than is represented by 40 realizations used to characterize infiltration uncertainty analysis." Petition at 172. Yet, Nevada has not asserted that DOE has not accounted

for or assessed uncertainty as required by regulation. Rather, Nevada asserts that the bound of uncertainty may be wider than DOE has estimated. This is not sufficient to show a genuine dispute of material fact.

Nevada also has made no attempt to determine or estimate what effect, if any, acceptance of their contention, including increased levels of uncertainty, and spatial variability of net infiltration, would have on mean net infiltration or doses. In fact, the contention makes no mention of dose whatsoever. In contrast, DOE did evaluate the importance of spatial variability. That evaluation shows that spatial variability in net infiltration does not significantly affect the mean net infiltration and that, in any event, the nonwelded Paintbrush unit above the repository emplacement area will dampen and homogenize downward moving pulses of transient net infiltration events. SAR, pp. 2.3.1-71 and 2.3.1-80-81. Nevada has not contested this conclusion, and therefore, has not established a genuine issue of fact regarding the materiality of spatial variability of net infiltration. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Thus, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. Because Nevada has not met its burden of establishing genuine issue of material fact, the contention should be rejected.

**26. NEV-SAFETY-26 - Soil Properties Data In Net Infiltration Model**

SAR Subsections 2.3.1.3.2 and 2.3.1.3.3 and similar subsections fail to properly characterize model net infiltration because data to characterize soil depth and hydraulic properties are limited and thus have no credibility for use in infiltration modeling.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the

relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently

greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Based upon statements from the DOE's infiltration model document (LSN# DEN001575070) and the ORISE Report (LSN# DEN001595302), this contention states that data used to characterize soil depth and hydraulic properties are limited and that these parameters are important to spatial distribution of net infiltration. Based upon this statement, the contention asserts that the net infiltration modeling has no credibility. For several reasons, this contention does not establish a genuine issue of material fact.

As an initial matter, there is no dispute that the data on soil depth and hydraulic properties are limited, or that those parameters are important (especially the soil depth for class 4 soil). In fact, the contention quotes DOE's own report for this proposition. Furthermore, the license application repeats those statements. *See, e.g.*, SAR at 2.3.1-46, -72. The contention also criticizes the pedotransfer of hydraulic conductivity data from Hanford to Yucca Mountain, stating that the soils at Hanford are different from those at Yucca Mountain. However, once again, the license application also states that the pedotransfer function introduces uncertainty. *Id.* Thus, there is no dispute regarding the underlying facts. Any dispute, therefore, is limited to the implications of those facts.

However, Nevada provides no basis whatsoever to support its conclusion that limited soil data means that the infiltration modeling has no credibility. Indeed, this baseless conclusion is contradicted outright in the license application. Not surprisingly, the contention ignores entirely those portions of the license application. As discussed below, the SAR examines the uncertainty that arises from the limited data, and importantly, demonstrates that these limitations have been conservatively accounted for in DOE's infiltration model. Nevada has not contested DOE's assessment and conclusions in the SAR as listed below:

- “The use of the Hanford soil property database is likely to be conservative because the field capacity of the Hanford soils is less than the field capacity reported for Nye County soils, which are likely to be more representative of site-specific soils than Hanford soils (BSC 2006a, Section 6.4.6, Figures 6-20 and 6-21).” SAR at 2.3.1-46.
- “[A] uniform distribution for soil depths between 0.1 m and 0.5 m was selected to represent uncertainty in the upscaled quantity used to represent an effective uniform value of soil depth class 4. This range does not represent the spatial variability of soil depth class 4 (which would have a range of 0 to 3 m). This approach ensures that soil depth is not overestimated (and, therefore, net infiltration is not underestimated because the selected range is large for an upscaled uniform value, and has a bias towards shallower soil depths) (SNL 2008a, Section 6.5.2.4.1[a]).” SAR at 2.3.1-47
- Uncertainty analyses found that soil conductivity does have an effect on spatial distribution of net infiltration. That evaluation also shows that spatial variability in net infiltration does not significantly affect the mean net infiltration. In any event, as discussed in SAR Section 2.3.2.2.1.2, the presence of the nonwelded Paintbrush unit above the repository emplacement area will effectively dampen and homogenize downward moving pulses of transient net infiltration events. SAR at 2.3.1-71, 2.3.1-80-81, and 2.3.1-91.
- Because DOE’s MASSIF model conservatively treats parameter uncertainty such as soil depth, “most of the comparable net infiltration (or recharge) models generally predict less infiltration than MASSIF (Section 2.3.1.3.4.2.2).” SAR at 2.3.1-91.

DOE has agreed that there is uncertainty on soil depth and conductivity, and that this in turn leads to uncertainty on spatial distribution of net infiltration. Thus, there is no dispute

regarding the underlying facts. However, DOE has also demonstrated that it has treated the former uncertainties in a conservative manner, and that the latter uncertainty is not important to performance of the repository. Because this contention does not dispute or even address those conclusions, it does not establish a genuine issue of material fact. As other licensing boards have previously held, a contention that does not directly controvert a position taken by the applicant in the application is subject to dismissal. *See Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (Sept. 12, 2008), slip op. at 18, 29, 39-40, 42; *Tex. Util. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992). Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

Finally, as discussed in the Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this failure. Nevada has made no attempt to determine or estimate what effect, if any, acceptance of their contention would have on net infiltration, let alone doses to the RMEI. In fact, the contention makes no mention of dose whatsoever. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). It is Nevada's burden to show that its contention raises an issue that is material to this proceeding, and it has not satisfied its burden with respect to this contention.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**27. NEV-SAFETY-27 - Rock Properties Data In Net Infiltration Model**

SAR Subsections 2.3.1.3.2 and 2.3.1.3.3 and similar subsections fail to provide adequate data to characterize the spatial distribution of rock properties at the soil-rock interface making it impossible to undertake infiltration modeling that is adequate for assessment purposes.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a

difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does

not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's

supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Adrian P. Butler, Howard S. Wheater) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention makes three assertions related to DOE's modeling of rock properties: "(a) major faults, which are potentially important preferential flow paths, are not represented; (b) uncertainties in the mapping of the rock units are not quantified or analyzed, and (c) data are inadequate to characterize the bulk rock hydraulic properties." As discussed below, none of these assertions establishes a genuine issue of material fact.

Nevada's contention that DOE has not accounted for faults does not properly characterize the license application and the supporting documents. Table 2.3.1-1 of the SAR, at 2.3.1-102, explicitly states that the infiltration model includes heterogeneities in rock properties, including faults. Similarly, LSN# DEN001575070, pg. 6-92 states that the infiltration model includes bedrock types with differing hydrogeologic properties and conductivities. Furthermore, although the contention cites to page 6-93 of LSN# DEN001575070 as support, that page does not state that faults were not considered. Instead, it simply states that each cell was generalized based upon the properties of the center point of the cell, and that such generalization is acceptable given that the model contains over 250,000 cells. Thus, the application does not state what the contention purports, and therefore Nevada's contention regarding this aspect does not establish a

genuine issue of material fact. As stated by another licensing board, a petitioner's imprecise reading of a document cannot be the basis for a litigable contention. *Ga. Inst. of Tech.* (Georgia Tech Research Reactor), LBP-95-6, 41 NRC 281, 300 (1995).

DOE also accounted for the affects of faults in the assessment of bedrock permeabilities. DOE recognized that fracture density generally increases near faults. Therefore, the fracture volume fraction potentially increases near faults. Because fracture data from underground mapping have been collected near faults, an increase in fracture density resulting from faults is included with the fracture-volume-fraction calculation for bedrock permeabilities. See [LSN# DN2002289082](#), page 6-63.

Nevada also contends that uncertainties in the mapping of the rock units have not been quantified or analyzed, because the model did not cover areas on the northern, eastern, and southern edges of the model area, but instead assigned those areas as a single rock type, unit 405. The contention provides no citation for its characterization of DOE's model. DOE assumes that Nevada is referring to page 6-93 of [LSN# DEN001575070](#), which states that the north, east, and south edges of the model are alluvium (infiltration hydrologic units (IHU) 490 and 491), and that the conductivity value of these units is assigned the value for bedrock unit 405. As described in [LSN# DN2002289082](#), page 6-22, IHU 490 represents alluvium/colluvium, while IHU 491 represents basin-fill sediments, undivided and caldera moat-filling sediments, which overlie bedrock. Extrapolation from the area covered by the geologic framework model suggests that most of this alluvium is predominantly underlain by the Tiva Canyon Tuff (IHUs 403 and 405) with IHU 405 more likely in the shallower alluvial areas. It was therefore recommended that the saturated hydraulic conductivity value for IHU 405 be used as the bedrock saturated hydraulic conductivity value for areas mapped as IHUs 490 and 491. [LSN#: DN2002289082](#), page 6-24

and Table 6-3a. In addition, as shown on page 6-95 of LSN# DEN001575070, units 490 and 491 collectively represent 3% of the total cells in the region (plus are on the edge of the modeled area). Given this information, Nevada has not provided a sufficient reason to believe that the conductivity values for units 490 and 491 are important to net infiltration.

Furthermore, as is discussed in more detail in response to NEV-SAFETY-28, DOE has performed sensitivity analyses with respect to the conductivity of bedrock units and these demonstrated that the uncertainty associated with bedrock conductivity is not important. Nevada has not contested this conclusion. Therefore, Nevada's assertions are not sufficient to establish a genuine issue of material fact.

Nevada also contends that the data are inadequate to characterize the bulk rock hydraulic properties, citing to page 6-97 of LSN# DEN001575070 for the proposition that few data are available to quantify the proportion of fractures that are unfilled or their hydraulic aperture. However, Nevada has lifted this statement out of context and exaggerates its importance. The complete statement on pages 6-97 and 6-98 of this report states:

Few data are available to quantify either the proportion of fractures that are unfilled or the hydraulic aperture to characterize them. Reasonable values may be inferred from the sources identified in Data Simulation of Net Infiltration for Present-Day and Potential Future Climates Analysis for Infiltration Modeling: Bedrock Saturated Hydraulic Conductivity Calculation (BSC 2006 [DIRS 176355], Section including the Alcove 1 infiltration test (DTN: MO0605SPAFABRP.004 [DIRS 180539]), and analysis of fracture air-permeability data and fracture frequency data described in Data Analysis for Infiltration Modeling: Bedrock Saturated Hydraulic Conductivity Calculation (BSC 2006 [DIRS 176355]). Figure 6.5.2.6-2 shows a comparison of bedrock saturated hydraulic conductivities calculated using 100- $\mu\text{m}$  and 200- $\mu\text{m}$  aperture fractures for 10%, 50%, and 100% of fractures, and saturated hydraulic conductivities for completely filled fractures, and completely open fractures (data from air permeability measurements). Error bars are included for the plots of completely filled versus completely open fractures. In addition, the inferred

saturated hydraulic conductivity from the Alcove I test (DTN: MO0605SPAFABRP.004 [DIRS 180539]) is included in this figure. Note that the Alcove I data point is approximately halfway between the filled fracture, and the 200- $\mu\text{m}$  aperture fracture saturated hydraulic conductivities. Based on these values, the upper bound of bulk bedrock has been calculated based on the consideration of an additional 200- $\mu\text{m}$  hydraulic aperture with all fractures.

Thus, DOE accounted for the uncertainty associated with unfilled fractures by assigning a bounding value. Nevada has not contested that bounding value, or provided any reason to believe that it is inappropriate. Therefore, Nevada has not established a genuine issue of material fact.

Finally, Nevada has made no attempt to determine or estimate what effect, if any, acceptance of its contention would have on net infiltration or doses. In fact, the contention makes no mention of dose whatsoever. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Thus, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. It has not done so with respect to this contention.

For all of these reasons, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**28. NEV-SAFETY-28 - Net Infiltration Model Rock Properties Uncertainty Analysis**

The uncertainty analysis in SAR Subsections 2.3.1.3.2 and 2.3.1.3.3 and similar subsections is invalid because it uses an arbitrary criterion to exclude from consideration 70 percent of the area of interest.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the

relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently

greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the

contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Richard E. Chandler, Howard S. Wheeler, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention criticizes DOE's uncertainty analysis of its infiltration model, stating that it encompassed the hydraulic conductivity of rock units 405 and 406, but not other rock units that individually accounted for less than 15 percent of the modeled area but collectively accounted for 70 percent of the modeled area. For the reasons discussed below, this contention does not establish a genuine dispute of material fact.

First, the contention mischaracterizes DOE's application. The contention refers to the initial detailed analysis of parameter uncertainty performed by DOE, which screened certain parameters that applied to less than 15% of the area of interest. However, in addition to that analysis, DOE also performed an extended parameter sensitivity study during model development (*see* LSN DEN001575070, Section 7.1.4). The purpose of the extended parameter sensitivity study was specifically to confirm that screening processes and criteria had not inadvertently excluded parameters that could significantly influence mean net infiltration (*see* SAR Section 2.3.1.3.3.2, "Consideration of Uncertainty in the Infiltration Model"). This

extended parameter sensitivity study included every rock type that represents 3% or more of the total cells in the infiltration model (and which, in the aggregate, represent over 90% of the modeled cells). LSN# DEN 001575070, pp. 6-95 and 7-69. Specifically, LSN# DEN 001575070, page 7-67 states that rock units 401-408, 412, 414, and 418 were evaluated in the extended sensitivity study, LSN# DEN 001575070, page 6-95 shows that these rock units comprise more than 90% of the cells that were modeled in the infiltration model (*i.e.*, the UZ grid cells). In short, contrary to the contention, DOE did not arbitrarily exclude rock types from consideration in the uncertainty analysis. In fact, DOE conducted extended parameter sensitivity studies on rock units, comprising more than 90% of the cells within the infiltration model as an integrated part of DOE's confidence building activities related to parameter uncertainty analysis conducted during model development.

Second, the extended sensitivity study varied 42 parameters and confirmed the results of the initial parameter screening. In particular, the study showed that two input parameters (Soil depth of Soil Depth Class 4 and Holding Capacity of Soil Group 5/7/9, both of which are unrelated to rock units), account for approximately 80% of the variance. The study also demonstrated that each of the screened parameters explains less than 3% of the variance and therefore is not important for estimating mean net infiltration. *See* SAR, at 2.3.1-75; LSN# DEN 001575070, pg. 7-69. Therefore, the extended parameter sensitivity study has demonstrated that the other rock units are not important to net infiltration, and Nevada has not contested that study. As a result, the contention does not establish a genuine issue related to a material fact.

Finally, the contention is also deficient because the issue addressed is solely whether DOE has fully accounted for the uncertainty in hydraulic conductivity of certain types of rock. Petition at 183. This does not satisfy Nevada's burden to show that its proposed contention

meets the requirements in 10 C.F.R. § 2.309(f). Nevada has not attempted to determine what effect, if any, an increase in uncertainty would have on net infiltration, let alone the ultimate dose to the RMEI. Indeed, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada’s contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. See Section V.A.3 of the Answer for a more detailed discussion of this point.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**29. NEV-SAFETY-29 - Spatial Variability Of Soils And Vegetation In Net Infiltration Model**

SAR Subsections 2.3.1.3.2 and 2.3.1.3.3 and similar subsections use an invalid analysis because they improperly aggregate data on soils and vegetation and therefore fail to account properly for spatial variability resulting in inappropriate modeling of the amount and spatial distribution of infiltrating water.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "[t]his contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." Petition at 187. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the

findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada's position is that DOE's infiltration model aggregates data on soils and vegetation and does not properly account for their spatial variability, and that these assumptions affect average net infiltration and its spatial distribution. For several reasons, this contention does not establish a genuine issue of material fact.

First, there is no dispute that DOE has combined 40 map units into four soil group units.<sup>57</sup> In fact, the contention quotes DOE's own report for this proposition. Furthermore, the license application repeats those statements. *See, e.g.*, SAR, pp. 2.3.1-45 and 46. Similarly, there is no dispute that DOE used a single maximum rooting depth for each climate state,<sup>58</sup> and used a single mean plant height. *See, e.g.*, SAR at 2.3.1-50 to -51; LSN# DEN001575070 at 6-112, 6-115 to -116. Thus, there is no dispute regarding the underlying facts. The dispute relates to the implications of those facts.

With respect to Nevada's assertions related to soil, the contention is little more than a repeat of NEVADA-SAFETY-26 regarding variations in soil depth and conductivity. In fact, this contention actually repeats the same quotation from LSN# DEN001575070, page 6-18 and refers to the same page V of the ORISE Report that is provided in NEVADA-SAFETY-26 regarding soil depth and conductivity. Petition 187-88. For the reasons discussed in our response to NEVADA-SAFETY-26, Nevada's assertions related to variations in soil depth and conductivity do not establish a genuine issue of material fact. In particular, this contention does

---

<sup>57</sup> Nevada's Petition at 187-88 also asserts that for each simulation uniform soil depth is assumed for each soil unit. This assertion does not accurately characterize the LA. As discussed on page 2.3.1-46 of the SAR, five different soil depth classes were used. Thus a soil unit (which refers to the type of soil) can have different soil depth classes, depending upon location.

<sup>58</sup> Although DOE used a maximum root depth, the actual root depth was specified to be the depth of the soil, when the soil depth was less than the root depth. *See* SAR at 2.3.1-51.

not contest that DOE's MASSIF infiltration model conservatively treats parameter uncertainty such as soil depth, that spatial variability in net infiltration does not significantly affect the mean net infiltration, and that the nonwelded Paintbrush unit above the repository emplacement area will dampen and homogenize downward moving pulses of transient net infiltration events. SAR, at 2.3.1-71, 2.3.1-80 to -81, and 2.3.1-91. As a result, there is no dispute that DOE's infiltration model conservatively accounts for the variability in soil depth and conductivity.

Similarly, DOE has also accounted for variations in root depth and vegetation height. SAR at 2.3.1-50 to 51 and LSN# DEN001575070, pages 6-112, 6-115 to 116. As discussed in SAR Section 2.3.1.3.3.2, DOE performed sensitivity analyses using a range of root depths and plant heights. Based upon those sensitivity analyses, DOE determined that such parameters account for only a small percent of the variance and are not important in estimating mean net infiltration. SAR at 2.3.1-73 to 75. This contention does not contest those conclusions or otherwise provide any information that is inconsistent with those conclusions. As other licensing boards have previously held, a contention that does not directly controvert a position taken by the applicant in the application is subject to dismissal. *See Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (Sept. 12, 2008), slip op. at 18, 29, 39-40, 42; *Tex. Util. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

As discussed in the Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. As noted above, this contention suffers from this failure. In fact, the contention does not even allege that net infiltration would be increased if greater consideration were given

to variations in soil depth and conductivity, plant root depth, or plant height. Instead, it only alleges that such consideration “would be expected to widen the range of estimates of infiltration.” Petition at 188. Since the contention does not dispute that DOE’s estimate of mean net infiltration is conservative, it does not establish a genuine issue of material fact.

Further, Nevada has made no attempt to determine or estimate what effect, if any, acceptance of their contention would have on doses. In fact, the contention makes no mention of dose whatsoever. The petitioner has the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada’s contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**30. NEV-SAFETY-30 - Temporal Variability In Precipitation In Net Infiltration Model**

SAR Subsections 2.3.1.3.2 and 2.3.1.3.3 and similar subsections use an invalid analysis because the net infiltration modeling fails to represent correctly the temporal variability of precipitation, and hence the magnitude and spatial distribution of net infiltration is incorrect.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the

relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently

greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the

most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Richard E. Chandler, Howard S. Wheeler, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada does cite a report prepared by an NRC contractor in 2000 for one of its statements in paragraph 5 of the contention: "smoothing of rainfall intensities ... may lead to errors ...." However, even a cursory reading of this report demonstrates it is inapplicable to the contention. Indeed, the first page of text of the report states:

The purpose of this report is to provide an independent analysis of run-off and shallow infiltration estimates used by the U.S. Department of Energy (DOE) in their performance assessment of a proposed repository at Yucca Mountain (YM), NV. The DOE uses a run-off and shallow infiltration model developed by the U.S. Geological Survey (USGS).

LSN# NRC000027373 at iii. DOE used the MASSIF infiltration model, not the USGS infiltration model to estimate net infiltration in the license application. In addition, Nevada uses this reference merely to support the assertion that smoothing of rainfall intensities may lead to errors. Yet, the subject of the contention is the time steps used in DOE's infiltration model, and that topic is not addressed in the cited page of this reference, which examines the impact of the duration of rainfall on the USGS model (id. at 1-4), again, which was not even used in the license application.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention asserts that the use of daily time steps in DOE's infiltration model leads to incorrect results because it smoothes the temporal variability of the precipitation. For several reasons, this contention does not establish a genuine dispute of material fact.

First, Nevada's assertion that DOE's infiltration model uses only daily time steps is incorrect and mischaracterizes the license application. In fact, in addition to using sub-daily estimates of precipitation as the contention concedes, the DOE infiltration model uses time steps less than 24 hours to account for the duration of the precipitation. This is discussed on page 6-29 of LSN# DEN001575070 (which is one of the pages cited in the contention):

On days with precipitation events with durations less than 24 hours, the water redistribution calculation is conducted twice. First, the calculation is conducted for the duration equal to the precipitation event duration. It is during this calculation that water is added to the top of the cell. In the second calculation, if there is water in excess of field capacity in the bottom layer, it has the opportunity to enter the bedrock during the remainder of the day at a rate limited by the rock hydraulic conductivity. During this calculation, the duration is the difference between a full day and the precipitation event duration.

The contention appears to recognize that allowance is made for sub-daily rainfall, but then states then states that the model uses "an average storm duration [that] smoothes the extreme temporal variability," and further alleges that this temporal smoothing is not addressed in the model parameterization. Petition at 191 and 192. This allegation also mischaracterizes DOE's model. As discussed in more detail in our response to NEVADA-SAFETY-34, DOE did not use an average duration for rainfall but instead varied the duration and amount of the rainfall, plus accounted for uncertainties in the duration and amounts. As another licensing board has recently ruled, a mischaracterization of the application does not establish a genuine issue of

material fact. *Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (slip op. at 39) (Sept. 12, 2008).

Second, the contention simply alleges that DOE's net infiltration results are incorrect - - it does not allege that the results are not conservative. Importantly, even if Nevada's allegations were accepted as true (which they are not), Nevada has not contended that use of shorter time steps would increase the amount of net infiltration to an unacceptable level and what that level may be. In fact, use of shorter time steps is just as likely to result in greater runoff, with reduced net infiltration. As stated in the SAR at 2.3.1-43, "very extreme rainfall events are likely to result in significant overland flow and runoff, and will not greatly affect net infiltration." Similarly, as noted on page 2.3.1-70 of the SAR: "For example, annual precipitation may be very high because of an especially high amount of precipitation occurring on a single day. In such a case, runoff would tend to be higher and net infiltration lower than if several days during the year experienced large amounts of precipitation, but the annual total was less...." Because Nevada has not demonstrated that shorter time steps will increase net infiltration rather than merely increasing runoff, it has not established a genuine issue of material fact. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada’s contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**31. NEV-SAFETY-31 - Calibration Of Net Infiltration Model**

SAR Subsections 2.3.1.3.2 and 2.3.1.3.3 and similar subsections reveal that the MASSIF net infiltration model is invalid because it requires calibration yet has not been and cannot be properly calibrated for present-day conditions.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the

relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently

greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below, (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and

(3) the contention does not reference any expert opinion. Nevada's Petition attaches several affidavits (by Adrian P. Butler and Howard S. Wheeler) that purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Furthermore, even if the statements in this contention were embodied in an affidavit, the statements would not constitute sufficient supporting information. For example, three of the bullets on page 196 of Nevada's petition provide no reference for their characterization of the MASSIF model. Furthermore, the contention is replete with conclusory statements, such as allegations that "the model is based upon crude approximations," there is "no proper attention to parameter up-scaling," "the implications of the use of simplified soil physics for recharge estimation have not been properly addressed," and "appropriate analysis of aggregation effects has not been carried out." As discussed in more detail in Section V.A.3 above, "an expert opinion that merely states a conclusion (*e.g.*, the application is 'deficient,' 'inadequate,' or 'wrong') without providing a reasoned basis or explanation for that conclusion is inadequate because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion." *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (emphasis added) (quoting *Private Fuel Storage, L.L.C. (Independent Spent Fuel Storage Installation)*, LBP-98-7, 47 NRC 142, 181 (1998), *aff'd on other grounds*, CLI-98-13, 48 NRC 26 (1998)).

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention refers to statements in DOE's supporting report on the MASSIF infiltration model (LSN# DEN001575070) and the ORISE Report (LSN# DEN001595302) that describe various simplifications in MASSIF, and then asserts that such simplifications are invalid because they have not been calibrated against site-specific data. For several reasons, this does not establish a genuine issue of material fact.

The NRC has recognized the appropriateness for models used to estimate post-closure performance of the Yucca Mountain Repository to utilize simplified assumptions, and therefore, that in and of itself, is not a basis for criticizing the model. As stated in NUREG-1804, "Yucca Mountain Review Plan," pg. 2.2-2:

In many regulatory applications, a conservative approach can be used to decrease the need to collect additional information or to justify a simplified modeling approach. Conservative estimates for the dose to the reasonably maximally exposed individual may be used to demonstrate that the proposed repository meets U.S. Nuclear Regulatory Commission regulations and provides adequate protection of public health and safety. Approaches designed to overestimate a specific aspect of repository performance (e.g., higher temperatures within the drifts) may be conservative with respect to temperature but could lead to nonconservative results with respect to dose. The total system performance assessment is a complex analysis with many parameters, and the U.S. Department of Energy may use conservative assumptions to simplify its approaches and data collection needs.

The Commission recognized this decades ago in the context of simplified dose calculations:

Mathematical models describing the various sequences of natural phenomena which relate releases of radioactive material to radiation dose vary in detail and complexity. This was frequently observed in the hearing. Through circumstances peculiar to his case, one applicant may be able to present to the Regulatory Staff adequate support for his proposal through the use of simple models and conservative parameter values, while another applicant cannot prove his case so easily. There is no regulatory necessity for performing the most realistic dose estimates that are technologically achievable if a less complex and less expensive analysis can be made to demonstrate compliance with licensing requirements. The use of the simpler procedure may, however, introduce a wider range of uncertainty in estimated doses than a more complicated analysis. Hence the proper choice of parameter values for a simple calculation might be more conservative than values appropriate for a more precise calculation.

*Rulemaking Hearing - - Numerical Guides for Design Objectives and Limiting Conditions for Operation to Meet the Criterion "As Low as Practicable" for radioactive material in Light-Water-Cooled Nuclear Power Reactor Effluents, CLI-75-5, 1 NRC 277, 339 (1975).*

Thus, simplified calculational methods are appropriate provided that they are conservative. As discussed below, the SAR provides ample discussion on the conservative nature of DOE's simplifying assumptions which the contention ignores. Accordingly, there is no legal or factual basis for Nevada's contention that MASSIF is inappropriate because it uses simplified methods.

The simplified assumptions regarding soil depth, soil water holding capacity, and bedrock conductivity, and the assumptions that there are no mechanisms to remove water from bedrock such as plant roots, used by the MASSIF infiltration model provide for a conservative assessment of net infiltration. *See* SAR at 2.3.1-91. This contention does not allege, or provide any basis for alleging, that these assumptions are not conservative. Therefore, Nevada has not provided an adequate basis for contesting these simplifying assumptions in MASSIF. *See also Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_

(Sept. 12, 2008), slip op. at 18, 29, 39-40, 42; *Tex. Util. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992) (a contention that does not directly controvert a position taken by the applicant in the application is subject to dismissal.)

Furthermore, Nevada's contention that MASSIF must be, but has not been, calibrated against site-specific data is factually baseless. Sensitivity studies were conducted to validate the hydrologic processes of run-on and run-off in the MASSIF model by comparison of measured streamflow data with MASSIF predictions of runoff (streamflow) at discharge cells at the base of streamflow watersheds. *See* Section 7.1.3 of LSN# DEN001575070. Furthermore, comparison of net infiltration uncertainty results with net infiltration estimates from other sites in the region provides confidence that the range of net infiltration predicted by the model is reasonable and likely conservative. Additionally, calibration techniques were applied to several of the model input parameters to MASSIF. For example, as discussed in Section 6.5.3.7 of LSN# DEN001575070, the relationship between the Normalized Difference Vegetation Indices (NDVI) measured at the site was calibrated to the transpiration coefficients calculated from site-specific vegetation data. In another example, site-specific precipitation data was used to calibrate a precipitation lapse rate that is used to distribute precipitation across the modeling domain (Appendix F of LSN# DEN001575070). Thus, Nevada has not accurately characterized DOE's actions to calibrate MASSIF.

Additionally, there is no regulatory requirement that a model be calibrated using site-specific data, and Nevada has not contended otherwise. Furthermore, site-specific data, such as runoff has been used to validate elements of MASSIF. *See* SAR, pp. 2.3.1-79 to 81. And, as described more generally in SAR Section 2.3.1.3.4.1, DOE conducted various other activities

while developing the MASSIF model that were designed and intended to build confidence in the model.

Notably, in addition to the calibration and confidence building activities performed during model development, DOE also performed post-model development validation. These activities included comparisons of the model results with data from comparable environments. *See* SAR Section 2.3.1.3.4.2. This validation provides additional assurance that the model is producing conservative results.

Finally, as discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This is precisely what Nevada has done in this contention. Although it is alleged that the MASSIF results “have no validity,” Nevada neither alleges nor provides any basis with which to assess whether the results over-, or under-estimate net infiltration. Petition at 196. Indeed, Nevada does not allege that additional calibration of MASSIF with site-specific data would result in any change in the calculated values of net infiltration, let alone an increase in net infiltration. Similarly, Nevada has made no attempt to determine or estimate what effect, if any, acceptance of their contention would have on doses. In fact, the contention makes no mention of dose whatsoever. As result, Nevada has not established that its allegations would have any material effect on the results of DOE’s calculations.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**32. NEV-SAFETY-32 - Use Of Initial Conditions In Net Infiltration Model**

SAR Subsection 2.3.1.3.3 and similar subsections fail to properly estimate net infiltration because they use an incorrect procedure, in which initial conditions are reset each year, and as a result, the model underestimates the effects of wet years and underestimates net infiltration.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the

relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently

greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. As discussed below, this contention suffers from this infirmity.

The MASSIF infiltration model used by DOE reset the initial conditions each modeled year to dry soil moisture conditions. Quoting from the ORISE Report, LSN# DEN001595302, pg. D-14, Nevada asserts that this approach “is neither physically appropriate nor conservative” for exceptional years.<sup>59</sup> Petition at 199. The contention then states that this approach “is incorrect, because it is likely to underestimate net infiltration following a wet year.” *Id.* Even if these statements were to be accepted as true, they do not establish a genuine issue of material fact.

DOE conducted simulations to investigate the effect, if any, of the MASSIF model's resetting of initial conditions annually on October 1, which corresponds to the start of the water year implemented in MASSIF. Use of a water year more naturally captures the cycle of winter precipitation and annual plant growth that is generally senescent in the Yucca Mountain environment during late summer. To evaluate the significance of the assumption regarding initial soil moisture content for each simulated water year used in MASSIF, DOE ran simulations using a higher initial soil moisture content which would account for the possibility that the soil has more residual moisture content at the start of the MASSIF model simulation due to precipitation occurring at the very end of the prior year. DOE's analysis demonstrated that the

---

<sup>59</sup> Nevada does not quote the full passage from this page of the ORISE Report, which states that “For most years, this assumption is likely valid.”

effects of the higher initial soil moisture content on net infiltration uncertainty are minor, not only for the present day climate, but also for the future, wetter, glacial-transition and monsoon climates. SAR at 2.3.1-69, and Figs. 2.3.1-17, 2.3.1-18, and 2.3.1-19.

Nevada cites the ORISE Report for the proposition that sequentially wet climate years “may not have been realistically simulated” by the approaches of MASSIF (LSN# DEN001595302, pg. D-15). Importantly, however, the ORISE Report does not conclude that these approaches underestimated net infiltration. Indeed, the Report opined merely that DOE's study may not “best represent the impact of sequential climate years ....” *Id.* at D-14. Thus, neither the ORISE Report nor the contention provides any basis for concluding that the alternative runs performed by DOE materially underestimate the net infiltration.

Without any support for its contention, Nevada is essentially requesting that the Licensing Board infer that this issue has a material impact on net infiltration. But, as a licensing board stated in another proceeding:

However, it is the petitioner who is obligated to provide the analyses and expert opinion showing why its bases support its contention. It has not done so and the Board may not make factual inferences on petitioner's behalf.

*Ga. Inst. of Tech.* (Georgia Tech Research Reactor), LBP-95-6, 41 NRC 281, 305 (1995).

Furthermore, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada's contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to

show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada's contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* Section V.A.3 of the Answer for a more detailed discussion of this point.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**33. NEV-SAFETY-33 - Approach To Estimating Percolation**

SAR Subsection 2.3.1.3.3 and similar subsections use a model to estimate infiltration to depth that is invalid.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a

difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does

not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application

and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Adrian P. Butler, Michael C. Thorne, and Howard S. Wheeler) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada does rely on a document, other than the license application and DOE's description of its infiltration model, as support for one assertion, namely that an infiltration model based on field capacity "has been severely criticized." Petition at 203. The entirety of Nevada's support for this statement is three sentences from a 171-page report which represent a separate view of a single member of an expert elicitation panel. Moreover, the statements fail to provide any objective information. Rather, they are conclusory in the extreme. This is precisely the type of "expert opinion" that the Commission has repeatedly rejected as inadequate: "an expert opinion that merely states a conclusion (e.g., the application is 'deficient,' 'inadequate,' or 'wrong') without providing a reasoned basis or explanation for that conclusion is inadequate because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion." *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (quoting *Private Fuel Storage, L.L.C. (Independent Fuel Storage Installation)*, LBP-98-7, 47 NRC 142, 181 (1998), *aff'd on other grounds*, CLI-98-13, 48 NRC 26 (1998)).

The remaining statements in paragraph 5 of the contention suffer from the same defect. For example, Nevada criticizes the MASSIF model used by DOE, stating that the use of

“duration” in calculating percolation “is incorrect,” “has no physical basis,” “is arbitrary,” and has “no justification.” However, the contention provides no reasoned basis or explanation for such conclusions. Therefore, the contention is not properly supported and should be rejected pursuant to 10 C.F.R. § 2.309(f)(1)(v).

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention criticizes the use of the field capacity concept and “duration” in DOE’s MASSIF infiltration model. For several reasons, this contention does not establish a genuine dispute of material fact.

Nevada’s criticism that the field capacity concept and duration are not physically based and are “arbitrary” is not consistent with the explicit definition of those terms in the same DOE document Nevada cites as support. As stated in LSN# DEN001575070, pg. 6-9, “Field capacity for a given soil layer is the amount of water that the soil can hold without significant gravity draining occurring.” Additionally, as provided on page 6-27 of LSN# DEN001575070, “duration” refers to the duration of precipitation.

In this regard, page 5-2 of LSN# DEN001575070 notes that the concept of field capacity “is a simplification of the actual processes that control flow.” However, the mere fact that a model does not provide an exact representation of the actual conditions is not a sufficient basis for rejecting the model. As the Commission has noted in the context of simplified dose calculations:

Mathematical models describing the various sequences of natural phenomena which relate releases of radioactive material to radiation dose vary in detail and complexity. This was frequently observed in the hearing. Through circumstances peculiar to his case, one applicant may be able to present to the Regulatory Staff adequate support for his proposal through the use of simple models and conservative parameter values, while another applicant cannot prove his case so easily. There is no regulatory necessity for performing the most realistic dose estimates that are technologically achievable if a less complex and less expensive analysis can be made to demonstrate compliance with licensing requirements. The use of the simpler procedure may, however, introduce a wider range of uncertainty in estimated doses than a more complicated analysis. Hence the proper choice of parameter values for a simple calculation might be more conservative than values appropriate for a more precise calculation.

*In the Matter of Rulemaking Hearing Numerical Guides for Design Objectives and Limiting Conditions for Operation to Meet the Criterion "As Low as Practicable" for radioactive material in Light-Water-Cooled Nuclear Power Reactor Effluents, CLI-75-5, 1 NRC 277, 339 (1975).*

Nevada's assertions related to "duration" are even more incoherent. Nevada asserts that DOE's process is arbitrary and without physical basis because it uses a two-step process for calculating percolation of water from one soil node to the underlying soil. However, as is explained on page 6-29 of LSN# DEN001575070, the two-step procedure allows for water percolation not only during the duration of the precipitation, but also during the period following the precipitation. This process allows for percolation during the entire day of the precipitation event, and not just during the duration of the event itself (thereby increasing net infiltration into the bedrock). Significantly, Nevada has not asserted that this methodology would understate the projected effects.

As discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this infirmity. The contention merely alleges that use of a more realistic model would “widen the range” of estimates of net infiltration. However, the contention does not claim that a more realistic model (which Nevada fails to name or describe) would increase the amount of net infiltration estimated by DOE. Indeed, Nevada does not state that the MASSIF model is unrealistic. To the contrary, the contention states on page 203 of the Petition that the concept of field capacity does approximate the underlying soil physics, although in Nevada's view “crudely.” It is well-established that the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Electric Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 543-44, 550 (1985). See Section V.A.3.c of this Answer for a discussion of the reasonable expectation standard that 10 C.F.R. 63.31(a)(2) identifies as the general standard for evaluating postclosure matters.

Further, as DOE discusses in some detail on pages 2.3.1-77 and 78 and pages 2.3.1-87 and 88 of the SAR, results from the MASSIF infiltration model were compared against models that use the Richards equation-based model called HYDRUS-1D. The MASSIF results compared well with the results of the HYDRUS-1D model, thereby corroborating the MASSIF model used by DOE. *Id.* The contention does not address or take issue with those conclusions, and therefore does not establish a genuine dispute of material fact.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and

complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada's contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**34. NEV-SAFETY-34 - Representation Of Storm Duration For Net Infiltration Modeling**

SAR Subsections 2.3.1.3.2 and 2.3.1.3.3 and similar subsections use an incorrect representation of storm duration for modeling of net infiltration.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a

difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does

not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's

supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Michael C. Thorne, Adrian P. Butler, Howard S. Wheeler, and Richard E. Chandler) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention alleges that DOE's representation of storm duration is incorrect because it masks extreme variability in duration, in particular, that DOE's approach of fitting actual data to a linear model of total precipitation versus duration of the rainfall will underrepresent short duration, high intensity rainfall events. The contention should be rejected because, for the reasons discussed below, it does not establish a genuine dispute of material fact.

First, contrary to 10 C.F.R. § 2.309(f)(vi), the contention lacks the requisite specificity because, although it refers generally to SAR Sections 2.3.1.3.2 and 2.3.1.3.3, Nevada makes no attempt to focus the Board on any specific portions of those sections which encompass almost 40 pages of detailed information. As a result, it is entirely unclear which statements in the license application are subject to question

Second, DOE's description of its infiltration model, LSN# DEN001575070, pp. 6-56 to 6-59, recognizes that a certain amount of error will result in all cases where actual data is fit to a linear curve. As a result, the model used by DOE includes the calculation of a standard error. *Id.* Nevada has not alleged in this contention that DOE has improperly calculated or accounted

for that standard error. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Indeed, the NRC has recognized that a substantial amount of uncertainty will exist in any model attempting to predict the future of complex systems. *See* 66 Fed. Reg. 55732, 55747 (Nov. 2, 2001) (“The first-of-a-kind nature of the repository and the evaluation over a very long time period result in significant uncertainty being included in the performance assessment.”) For this reason, 10 C.F.R. § 63.114(b) does not require that uncertainties be eliminated or even minimized, but rather only that DOE “[a]ccount for uncertainties and variabilities in parameter values and provide for the technical basis for parameter ranges, probability distributions, or bounding values used in the performance assessment.” This is precisely what DOE has done. As described in SAR, at 2.3.1-44, DOE explicitly notes that there is a large standard error associated with this linear function and, as discussed in Section 2.3.1.3.3.2.2, performed sensitivity analyses for the duration of the daily precipitation parameter (as well as a number of others) (*see* SAR Tables 2.3.1-23 and 24). Based upon the sensitivity analysis, DOE determined that the uncertainty associated with most of the parameters (including duration of daily precipitation) explains less than 3% of the variance in mean net infiltration and therefore that the uncertainty is not important. Nevada’s contention does not challenge this conclusion, and therefore does not establish a genuine issue of material fact.

Third, as stated in the SAR, at 2.3.1-43, “very extreme rainfall events are likely to result in significant overland flow and runoff, and will not greatly affect net infiltration.” Similarly, as noted on page 2.3.1-70 of the SAR: “For example, annual precipitation may be very high because of an especially high amount of precipitation occurring on a single day. In such a case, runoff would tend to be higher and net infiltration lower than if several days during the year experienced large amounts of precipitation, but the annual total was less.” Because Nevada has not demonstrated that greater accuracy in estimating the length of intense rain events of short duration will increase net infiltration rather than merely increasing runoff, it has not established a genuine issue of material fact.

Finally, the contention is also deficient because it fails to allege, let alone determine what effect, if any, acceptance of the contention would have on dose to the RMEI. The contention only states the conclusion, without any stated support, that “potentially” significant changes would result. Petition at 209. This is precisely the type of unsupported, conclusory opinion that the Commission has repeatedly rejected as inadequate. *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (quoting *Private Fuel Storage, L.L.C. (Independent Spent Fuel Storage Installation)*, LBP-98-7, 47 NRC 142, 181 (1998), *aff’d on other grounds*, CLI-98-13, 48 NRC 26 (1998)). Moreover, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster (Savannah River Mixed Oxide Fuel Fabrication Facility)*, LBP-01-35, 54 NRC 403, 422 (2001). Thus, it is Nevada’s

burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada's contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* Section V.A.3 of the Answer for a more detailed discussion of this point.

In summary, this contention does not establish a genuine issue of material fact.

Therefore, the contention should be rejected.

**35. NEV-SAFETY-35 - Episodic Nature Of Infiltration Fluxes In Net Infiltration Analysis**

SAR Subsection 2.3.1.3.3 and similar subsections, which describe the net infiltration analysis, fail to consider the episodic nature of infiltration fluxes and accordingly the model used is incomplete.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "[t]his contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the

relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently

greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the

contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Adrian P. Butler, Michael C. Thorne, Richard E. Clark, and Howard S. Wheeler) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention alleges that the input to the net infiltration (MASSIF) model used by DOE in the TSPA to estimate net infiltration fluxes to the unsaturated zone is an annual average sampled from 1000 years, thereby losing the effect of potential extreme events. For several reasons, this contention does not establish a genuine dispute of material fact.

First, Nevada's assertion appears to be that the input to the MASSIF model (presumably precipitation) smoothes extreme precipitation events. This misreads the LA and suggests a misunderstanding of the model. In contrast to Nevada's assertion, precipitation input to the MASSIF model is not an annual average precipitation but, rather daily amounts. As explained on page 2.3.1-32 of the SAR, "[w]ater enters the infiltration model domain as precipitation, which is simulated from a stochastic model of daily precipitation based on historical weather records from Yucca Mountain and analogue sites." In the same vein, on page 2.3.1-58, the SAR explains that precipitation with an effective duration of hours for each day on which precipitation occurs is input.

Second, in essence, Nevada's challenges DOE's use of an annual mean value for net infiltration flux to the unsaturated zone, apparently, rather than fluxes calculated at a shorter time step. Nevada's assertion is that the calculation of a mean annual flux necessarily discounts or eliminates the effect of extreme precipitation events lasting hours or days. Nevada's assertion is misplaced and, again suggests a misunderstanding of the MASSIF infiltration model. As discussed on page 2.3.1-42 of the SAR, the manner in which the annual mean infiltration flux is calculated in MASSIF recognizes and takes into account the effects of extreme events, but gives them the appropriate weight.

Given the nature of this contention (which asserts, incorrectly, that DOE has not accounted for the temporal nature of net infiltration), it is especially important for Nevada to provide some indication of the significance of its allegation because other portions of the license application indicate that temporal variations in net infiltration are attenuated by the Paintbrush Nonwelded Unit (PTn) that overlays the repository. As stated in Section 2.3.2.4.2.1.2 of the SAR:

The net surface infiltration at the bedrock surface (on top of the TCw unit) is conceptualized as episodic, with significant pulses occurring only once every few years (SNL 2008a, Section 6.5.7.5). Spatially and temporally variable pulses of moisture percolate rapidly through the highly fractured tuffs of the TCw. However, at the TCw-PTn interface—where welded tuffs grade sharply into nonwelded tuffs—flow behavior changes from fracture dominated to matrix dominated flow. The highly porous PTn unit attenuates the episodic infiltration flux significantly such that the net episodic surface infiltration, once crossing the PTn, can be approximated as steady state (SNL 2007a, Section 6.2.2).

Therefore, Nevada's allegations are not material given the attenuation of the temporal pulses provided by the nonwelded tuff.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada’s contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. See Section V.A.3 of the Answer for a more detailed discussion of this position.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

**36. NEV-SAFETY-36 - Corroboration Of Model Results In Post-Model Validation Of Net Infiltration Simulations**

SAR Subsection 2.3.1.3.4.2 and related subsections, which describe confidence building and abstraction of the net infiltration model for post-model development validation, do not provide an adequate basis for safety assessment because comparisons with data and alternative models are inadequate to support the net infiltration results.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must

make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention asserts that the following information is inadequate to corroborate the DOE's infiltration model (which is referred to as the "MASSIF" model): 1) neutron logging data, including the infiltration data from Pagany Wash, as described in Section 7.2.1.1 of LSN# DEN001575070, 2) regional estimates of net infiltration; and 3) a model used by the Center for Nuclear Waste Regulatory Analyses (CNWRA), a contractor to the NRC. Petition at 216-18. As discussed below, Nevada's assertions do not establish a genuine dispute on a material issue of fact or law.

LSN# DEN001575070, "Simulation of Net Infiltration for Present-Day and Potential Future Climates," documents the development and validation of the DOE's MASSIF infiltration model. Nevada's Petition at 217 contends that the neutron logging data as described in Section 7.2.1.1 of LSN# DEN001575070 "are inadequate to support objective evaluation of model performance." DOE agrees. As stated on page 2.3.1-84 of the SAR, "the neutron logging data is not reliable for calculating net infiltration flux due to the preferential pathways through bedrock induced during drilling." Therefore, there is no dispute that it would be inappropriate to use that data for comparison against the results of MASSIF, and DOE has not used that data to support its position in the LA.

Nevada contends that regional estimates of mean net infiltration are not relevant to modeling of mean net infiltration at Yucca Mountain, given the heterogeneity of net infiltration. As support for this assertion, Nevada cites the ORISE Report, LSN# DEN001595302, which states that the "fact that results [of MASSIF] are generally consistent with other regional estimates for mean net infiltration is not proof that they are correct for Yucca Mountain." This

quotation is taken from the Executive Summary of the ORISE Report. The more complete expression of this thought appears at page 4 of the Report, which states:

At the entire-domain scale, the model may adequately represent the regional water balance; its spatially averaged results and uncertainty bounds for the entire site are generally consistent with other regional estimates for mean annual net infiltration. However, this agreement among estimates does not necessarily mean that the spatially averaged results from the MASSIF model correctly represent long-term infiltration rates for the mountain as a whole or, more importantly, that infiltration for significant areas of the domain (such as upland convergent areas and upper reaches of ephemeral streams/washes) is not underestimated by the modeling approach, which assumed uniform conditions over large areas of heterogeneous soils. The spatial representation of the net infiltration at Yucca Mountain is acknowledged by the authors of the report to be of low confidence.

Thus, in context, the concern of ORISE pertains to the ability of MASSIF to model the spatial distribution of net infiltration.

DOE agrees that there is significant uncertainty regarding the ability of MASSIF to predict the spatial distribution of net infiltration. Specifically, the SAR, at 2.3.1-44 states:

Since there is very little direct information about such a spatial distribution, there is considerable and significant uncertainty in the spatial distribution of net infiltration results. Furthermore, because soil and bedrock properties are represented as uniform over a spatial area assumed to define a given soil or rock type, the actual spatial variability of net infiltration is likely underestimated by the model.

For this reason, DOE evaluated the effect of the uncertainty in the spatial distribution in net infiltration. That evaluation shows that spatial variability in net infiltration does not significantly affect the mean net infiltration over relatively large areas, such as the repository footprint.

Thus, there is no material dispute that there is significant uncertainty regarding the ability of MASSIF to predict the spatial distribution of net infiltration. Yet, there is also no material dispute that MASSIF conservatively predicts mean net infiltration (which is the important factor for users of the model output). SAR at 2.3.1-71, 2.3.1-80-81, and 2.3.1-91. As a result, it is appropriate to compare the results of regional estimates of net infiltration against the results of MASSIF for mean net infiltration, which are calculated over the repository emplacement area. Nevada's assertions on this issue are simply not material, because those arguments pertain to the ability of MASSIF to calculate spatial distribution of net infiltration rather than the mean net infiltration over the repository footprint.

In any event, as discussed in SAR Section 2.3.2.2.1.2, the presence of the nonwelded Paintbrush unit above the repository emplacement area will effectively dampen and homogenize downward moving pulses of transient net infiltration events; therefore, the uncertainties in spatial distribution of net infiltration are not considered to be significant to the repository. SAR, pp. 2.3.1-71, 2.3.1-80-81, and 2.3.1-91. As the SAR states, "small scale spatial variations in net infiltration are not important for downstream users of model output." SAR at 2.3.1-44. Nevada has not contested this conclusion.

Nevada also contends that the CNWRA Model does not provide an adequate basis for comparison with MASSIF, because it is a one-dimensional and highly abstracted model. In this regard, Nevada asserts that the CNWRA Model is based upon only ten years of meteorological data, and states (without any explanation or specific reference) that the CNWRA Model suffers from the same deficiencies in soil and rock property data "discussed above." However, the fact that the CNWRA Model has abstractions is not an adequate basis for contesting its adequacy as a basis for comparison with MASSIF. Indeed, the NRC has recognized the appropriateness of

using simplified assumptions in models that estimate post-closure performance of the Yucca Mountain Repository, and therefore, that in and of itself, is not a sufficient basis for criticizing the model. As stated in the Final Report, Yucca Mountain Review Plan, NUREG-1804, Rev. 2 (July 2003) (YMRP):

In many regulatory applications, a conservative approach can be used to decrease the need to collect additional information or to justify a simplified modeling approach. Conservative estimates for the dose to the reasonably maximally exposed individual may be used to demonstrate that the proposed repository meets U.S. Nuclear Regulatory Commission regulations and provides adequate protection of public health and safety. Approaches designed to overestimate a specific aspect of repository performance (e.g., higher temperatures within the drifts) may be conservative with respect to temperature but could lead to nonconservative results with respect to dose. The total system performance assessment is a complex analysis with many parameters, and the U.S. Department of Energy may use conservative assumptions to simplify its approaches and data collection needs.

Indeed, NUREG-1804 on page 2.2-57 recognized this specifically in the context of climate models:

To review the abstraction of climate and infiltrations, recognize that models used in the total system performance assessment may range from highly complex process-level models to simplified models, such as response surfaces or look-up tables. Evaluate model adequacy, regardless of the level of complexity.

YMRP at 2.2-2. The Commission has also noted this in the context of simplified dose calculations:

Mathematical models describing the various sequences of natural phenomena which relate releases of radioactive material to radiation dose vary in detail and complexity. This was frequently observed in the hearing. Through circumstances peculiar to his case, one applicant may be able to present to the Regulatory Staff adequate support for his proposal through the use of simple models

and conservative parameter values, while another applicant cannot prove his case so easily. There is no regulatory necessity for performing the most realistic dose estimates that are technologically achievable if a less complex and less expensive analysis can be made to demonstrate compliance with licensing requirements. The use of the simpler procedure may, however, introduce a wider range of uncertainty in estimated doses than a more complicated analysis. Hence the proper choice of parameter values for a simple calculation might be more conservative than values appropriate for a more precise calculation.

*In the Matter of Rulemaking Hearing Numerical Guides for Design Objectives and Limiting Conditions for Operation to Meet the Criterion "As Low as Practicable" for radioactive material in Light-Water-Cooled Nuclear Power Reactor Effluents, CLI-75-5, 1 NRC 277, 339 (1975).*

With one exception, Nevada has not contested that the CNWRA Model meets the reasonable expectation standard or used assumptions that are cautious but reasonable assumptions that reflect current knowledge. Nevada refers to a statement in the CNRWA Report, which discusses an error in an input file for the Model that was expected to increase evaporation rates by 37 to 46 percent over that assumed in the Model. However, Nevada has taken this statement out of context. The complete quotation is provided below:

The mistyped value would be expected to increase evaporation rates by approximately 37 to 46 percent, thereby reducing bare-soil infiltration. The mistyped value has been used for all analyses using ITYM [the CNRWA Model] to date, but is not expected to strongly affect ITYM infiltration estimates, because the ITYM plant uptake abstraction uses parameters that, in effect, compensate for higher evaporation with reduced transpiration. Stothoff and Walter (2007) compared ITYM estimates (which are based on the mistyped value) to available site and regional observations and concluded that the ITYM estimates were consistent with observations. (LSN# NRC000029713 at xv).

Thus, the very report cited by Nevada essentially concludes that the error has no material effect on the results of the Model. As another licensing board has stated, supporting material provided by a petitioner, including those portions thereof not relied upon, is subject to Board scrutiny, “both for what it does and does not show.” *See Yankee Atomic Elec. Co.*, LBP-96-2, 43 NRC 61, 90 (1996), *rev’d in part on other grounds and remanded*, CLI-96-7, 43 NRC 235 (1996).

Finally, this contention neglects to mention that there are other sources of information that DOE used to validate the MASSIF model. For example, MASSIF was also validated by comparison against the results of the HYDRUS-1D model. *See SAR Section 2.3.1.3.4.2.3 at 2.3.1-87.* Additionally, MASSIF was validated by comparison against other models, such as the Maxey-Eakin Model and the Maurer and Berger Model. *See SAR, at 2.3.1-85.* This contention does not contest the validity of those comparisons. Therefore, even if Nevada’s contention were to be accepted, there is still a sufficient basis for a finding that the MASSIF model has been appropriately validated. Therefore, this contention does not materially affect any conclusions on this point in the LA.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**37. NEV-SAFETY-37 - Net Infiltration Model Methodology**

SAR Subsection 2.3.1.3.2 and similar subsections, which present the procedure for estimating long-term mean net infiltration from the MASSIF computer simulations, use a method that is not generally accepted and is not based on sound statistical principles.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the

relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently

greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the

contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Howard S. Wheeler and Richard E. Chandler) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention criticizes DOE for estimating long-term net infiltration by calculating a weighted mean net infiltration for ten representative years corresponding to various recurrence intervals from 1 to 1000 years. The contention asserts, without any support, that this approach will work only if the within-stratum variation in net infiltration is substantially smaller than the between-strata variation. For several reasons, this contention does not establish a genuine dispute of material fact.

First, the contention provides no explanation or justification for its assertion. Even if this assertion were construed to have been submitted by an expert, the absence of any basis for the opinion makes it insufficient to support the contention. As the Commission has stated, "an expert opinion that merely states a conclusion (e.g., the application is 'deficient,' 'inadequate,' or 'wrong') without providing a reasoned basis or explanation for that conclusion is inadequate because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion" of the alleged basis for the contention. *USEC, Inc. (American Centrifuge Plant)*, CLI-

06-10, 63 NRC 451, 472 (2006) (quoting *Private Fuel Storage, L.L.C.* (Independent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998).

Second, even if Nevada's assertion were to be accepted, the contention provides no basis for believing that it would have any material effect on net infiltration as calculated by DOE. In particular, the contention does not allege, even qualitatively, that use of a different method would result in an increase in net infiltration. Indeed, it merely speculates without basis that a "poor choice of strata may lead to reduced precision ...." Petition at 222. As a licensing board has ruled in another proceeding, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Electric Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 543-44, 550 (1985). Because the contention neither alleges, nor provides a basis for concluding that DOE's results do not represent reasonable expectation, it does not establish a genuine issue of material fact. See Section V.A.3.c of the Answer for a more detailed discussion of the reasonable expectation standard that Section 63.31(a)(2) identifies as the general standard for evaluating post closure matters. Furthermore, the contention never explains the basis for its statement that DOE uses a method "that is not generally accepted," (Petition at 220), nor does it ever explain how DOE's approach violates the principle regulatory provision that it cites (10 CFR § 63.21(c)(15)).

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**38. NEV-SAFETY-38 - Parameter Correlations In Net Infiltration Model**

SAR Subsection 2.3.1.3.3 and similar subsections, which address the treatment of parameter uncertainty in the net infiltration model, fail to properly account for parameter correlations.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the

relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently

greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the

contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Michael C. Thorne, Howard S. Wheeler and Richard E. Chandler) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention states that DOE's use of Latin Hypercube Sampling (LHS) for estimating the effects of uncertainties in parameters is valid only if the parameters are not correlated. The contention then quotes from DOE's description of its net infiltration model, which states that no technical basis for a correlation was identified. Based upon this statement, Nevada then infers that DOE neglected correlations between parameters. Petition at 224-225. For several reasons, this contention does not establish a genuine dispute of material fact.

First, reading the DOE's report confirms that it does not state what the contention suggests that it states, namely that DOE neglected correlations. Rather, the report states:

Correlations between parameters have been considered in order to constrain the LHS sample of input parameters to physically realistic combinations. The sample size of each probabilistic analysis was limited to 20. Up to fifteen parameters were sampled to generate the inputs for each of the 20 realizations. For the physical parameters (parameter related to physical properties of materials), no technical basis justifying imposing correlations between parameters was identified. Therefore, no correlations were applied." (LSN# DEN001575070, at 8-19).

Moreover, the paragraph immediately following the one quoted above demonstrates that contrary to the contention, DOE evaluated correlations, and when evidence existed that a correlation existed, appropriately took this into account in its approach. In that case, DOE identified and accounted for correlations among precipitation parameters. Since a petitioner's imprecise reading of a document cannot be the basis for a litigable contention, *Ga. Inst. of Tech. (Georgia Tech Research Reactor)*, LBP-95-6, 41 NRC 281, 300 (1995), the contention does not establish a genuine issue of material fact.

Second, the contention does not identify or even allege that there should be correlations between parameters that DOE has not applied, or that DOE has applied correlations that should not be present. Furthermore, even if it is assumed that there is such a correlation, the contention does not allege, or provide any basis for an allegation, that DOE has underestimated net infiltration. Therefore, the contention does not establish a genuine issue of material fact.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on repository performance. The petitioner has the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster (Savannah River Mixed Oxide Fuel Fabrication Facility)*, LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada's contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE,

and should be rejected. *See* Section V.A.3 of the Answer for a more detailed discussion of this position.

In summary, this contention does not establish a genuine issue of material fact. Therefore, it should be rejected.

**39. NEV-SAFETY-39 - Temperature Lapse Rate Verification**

SAR Subsection 2.3.1.3.2 and similar subsections, which address the temperature component of the net infiltration model, are inadequate because no attempt is made to verify the temperature lapse rate with elevation or the associated uncertainty using empirical observations.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the

relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently

greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of mean net infiltration.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the

contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Michael C. Thorne, Howard S. Wheeler and Richard E. Chandler) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention criticizes DOE for taking the rate of change in temperature with elevation from a textbook, rather than verifying the rate of change from available temperature data. Based upon this allegation, Nevada asserts that the evapotranspiration component "could be" incorrectly estimated. For several reasons, this contention does not establish a genuine dispute of material fact.

First, this contention does not allege, and provides no basis for an allegation, that DOE's assumption of a 1 degree Celsius decrease per one hundred meter elevation rise is incorrect or unreasonable. That value was taken from the *Handbook of Hydrology*, as discussed on SAR page 2.3.1-39 and LSN# DEN001575070, at 6-46. Furthermore, as discussed in the SAR at 2.3.1-39, DOE in fact used actual data including temperature, obtained from weather stations on Yucca Mountain for its model. Nevada does not point to any actual temperature data that is inconsistent with the data used in DOE's analyses. Nevada also does not contend that the rate of change of temperature taken from the scientific literature was inaccurate or incorrect. Therefore,

this contention does not establish a genuine issue of material fact on the rate of change in temperature.

Second, even if it is assumed that DOE used an incorrect rate of change in temperature, this contention merely postulates that evapotranspiration “could be” incorrectly estimated and the net infiltration could be underestimated. It does not allege, or provide any basis for an allegation, that evapotranspiration was actually incorrectly estimated or that net infiltration was underestimated. Therefore, even if the premise of this contention regarding rate of change in temperature were to be accepted, Nevada has not established such a premise would have any material affect on net infiltration. Indeed it merely speculates without basis that “the evapotranspiration component could be incorrectly estimated, therefore potentially underestimating infiltration ....” Petition at 228.

Thirdly, DOE has demonstrated that uncertainty in the temperature lapse rate has no meaningful effect on uncertainty in the output of the infiltration model (LSN# DEN001575070, Section 7.1.4; temperature lapse rate is variable TEMP\_LR in Table 7.1.4-1). Thus, even if DOE used an incorrect rate of change in temperature, DOE has demonstrated that the estimates of net infiltration would not be different.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 229. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada

that must show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada's contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* Section V.A.3 of the Answer for a more detailed discussion of this position.

In summary, this contention does not establish a genuine issue of material fact.

Therefore, it should be rejected.

**40. NEV-SAFETY-40 - Parameter Uncertainty Treatment In Net Infiltration Model**

The net infiltration modeling, reflected in SAR Subsections 2.3.1.3.2 through 2.3.1.3.4 and similar subsections, is invalid because the representation of parameter uncertainty in the net infiltration modeling is inadequate and the methodology for selecting net infiltration values for unsaturated zone modeling is ad hoc, inconsistent, and incorrect.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must

make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing net infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application

and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Howard S. Wheeler and Richard E. Chandler) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

For example, Nevada's Petition at 232 – 234 presents a series of six bullets, criticizing the uncertainty analyses of DOE. However, five of the six bullets provide no references to any expert opinion or documents (other than DOE's own reports). The remaining bullet at the bottom of page 233 of Nevada's petition does include a citation to an external document; however, Nevada does not cite that document to support its criticism of DOE's methodology but instead as a reference for an alternative methodology. Thus, the bullets appear to represent nothing but the arguments of counsel, and are insufficient to satisfy the standards in 10 C.F.R. § 2.309(f)(1)(v).

Similarly, much of the rest of this contention suffers from the same defect. In fact, in this 7-page contention, Nevada cites to only two external documents for support. The first, the ORISE Report, LSN# DEN001595302, is cited by Nevada at pg. 231 and 235 of their Petition, for the propositions that use of the pedotransfer function introduces substantial uncertainty and the bounds of uncertainty have not been fully defined due to lack of site-specific data for determining spatial variability. Both of those issues are addressed in more detail in DOE's response to NEV-SAFETY-26. For the reasons discussed in that response, this issue does not establish a genuine issue of material fact.

The second document, a report by the Nuclear Waste Technical Review Board (NWTRB), is cited at pg. 235 of the Petition for the proposition that the Generalized Likelihood Uncertainty Examination (GLUE) procedure used by DOE does not have a strong technical basis, and that the NWTRB does not endorse the use of GLUE. However, as described by the NWTRB, the GLUE methodology gives higher statistical probabilities to the lower range of the statistical distribution (the 10th percentile) of the MASSIF estimated net infiltration, a fact that Nevada neglects to mention. *See* LSN# NEN000000673, pg. 14. Thus, GLUE increases the probability calculated by MASSIF that a specified net infiltration will occur. This is depicted graphically in LSN# DEN001581961, Fig. 4. Although use of this process was criticized by the NWTRB, that criticism provides no basis for a contention because the process is cautious but reasonable and thus consistent with the reasonable expectation standard.

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For several reasons, Nevada's criticisms of DOE's uncertainty analyses do not establish a genuine issue of material fact.

First, the Petition at 231-232 incorrectly asserts that DOE did not consider certain uncertainties. As shown below, DOE did address each of those uncertainties:

- The uncertainty associated with deriving soil physical properties from pedotransfer is addressed on SAR pages 2.3.1-46 and 72.
- The effect of sub-grid heterogeneity is addressed on SAR pages 2.3.1-44 to 45.

- Temporal lumping of model parameters is addressed on SAR page 2.3.1-69-70, and Section 2.3.1.3.3.2.2.
- Spatial variation in soil and vegetation properties within a soil class is addressed on SAR pages 2.3.1-44 to 48.
- Spatial distribution of vegetation, soil and rock properties is addressed on SAR page 2.3.1-48-55 and Section 2.3.1.3.3.2.2.

Any contention that mistakenly asserts that the application does not address a relevant issue can be dismissed. *See Sacramento Municipal Utility District (Rancho Seco Nuclear Generating Station)*, LBP-93-23, 38 NRC 200, 247-48 (1993), *review declined*, CLI-94-2, 39 NRC 91 (1994); *Tex. Util. Elec. Co. (Comanche Peak Steam Electric Station, Unit 2)*, LBP-92-37, 36 NRC 370, 384 (1992); *Tenn. Valley Auth. (Bellefonte Nuclear Power Plant Units 3 and 4)*, LBP-08-16, 68 NRC \_\_\_\_ (slip op. at 29, 64-65) (Sept. 12, 2008).

Second, the contention is largely argumentative and does not provide facts or analyses to dispute the statements in the SAR. For example:

- Nevada's Petition at 232 complains about the uniform uncertainty distributions for precipitation and temperature, asserting that the distribution would not be uniform if DOE had used a different model parameterization. However, Nevada provides no facts or analyses that would indicate that a uniform distribution is inappropriate given the model parameterization actually used by DOE.
- Nevada's Petition at 233 criticizes the standard deviation calculated from data from two stations, stating that because there are only two stations, the standard deviation is largely meaningless. However, Nevada has misinterpreted DOE's documents. As indicated in

Section F2.2 of LSN# DEN001575070, DOE calculated the standard deviation of the data from each station, not the standard deviation of the average of each station.

- Nevada's Petition at 233 states that DOE used different estimates of uncertainty for temperature and precipitation, and then asserts that those differences constitute an inconsistency. However, Nevada never explains why it is inappropriate to treat temperature and precipitation differently, and presents no analyses or facts to support its assertions.
- Nevada's Petition at 233 complains about the uncertainty distributions that DOE assigned to the Monsoon Climate, but does not specify what distribution DOE allegedly should have used.
- Nevada's Petition at 234 complains about the uncertainties assigned to DOE's estimates of wind speeds during the three climatic states, but provides no facts to dispute DOE's estimates and does not specify what the wind speeds should be.

Third, the contention mischaracterizes the SAR. For example, on page 234, Nevada's Petition asserts that DOE has not appropriately accounted for the uncertainty in rock properties because its uncertainty analyses allegedly exclude 70% of the modeled area. However, this assertion is essentially a repeat of NEV-SAFETY-28. Our response to that contention demonstrates that Nevada's assertions are both factually and legally defective.

Finally, even if all of Nevada's assertions were to be accepted, Nevada has not shown that it would make any difference to the outcome of this proceeding. Nevada asserts that DOE's estimates of net infiltration are "biased." In fact, DOE has shown that its estimates are biased - - biased in the conservative direction so that they overestimate net infiltration. *See* SAR at 2.3.1-

91. Since this contention does not allege that DOE's estimates are unconservative, it does not establish a genuine issue of material fact.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**41. NEV-SAFETY-41 - Erosion FEP Screening**

DOE's exclusion of land-surface erosion (FEP 1.2.07.01.0A), as reflected in SAR Subsections 2.2.1.1 and 2.2.1.2 and similar subsections, is incorrect because modeling studies and actual observations demonstrate that erosion will significantly affect infiltration and seepage fluxes at Yucca Mountain within the first 10,000 years after closure and will progressively and grossly modify the topography of the mountain within one million years.

**RESPONSE**

This contention states that erosion will significantly affect infiltration and seepage fluxes at Yucca Mountain within the first 10,000 years after closure and will progressively, and grossly, modify the topography of the mountain within one million years. Therefore, it alleges that DOE incorrectly estimated erosion rates at Yucca Mountain and improperly excluded FEP 1.2.07.01.0A, "Erosion/Denudation," from consideration in the TSPA.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Nevada makes various assertions regarding erosion during the time period beyond 10,000 years, after permanent closure of the repository. For instance, Nevada states that "the Paintbrush Tuff may get locally completely eroded between 100,000 years and one million years." Petition

at 241-42. It goes on to assert that “the emplacement drifts may be exposed at the Earth’s surface in 500,000 years.” *Id.* at 242. Nevada asserts that its estimates of erosion are significant because they “demonstrate that the ongoing erosion process will be of significance to safety assessment [sic] both in the period before 10,000 years and in the longer term.” *Id.* at 241.

NRC regulations make it clear that, when assessing FEPs for the potential to adversely impact the performance of the repository, DOE is *not* required to extend its assessment of excluded FEPs to the period beyond 10,000 years after closure. *See* 10 C.F.R. § 63.342. To the contrary, DOE must base any performance assessment conducted for the post-10,000 year period on the “continued effects of the features, events, and processes included in [the performance assessment for the first 10,000 year period].” *See* 70 Fed. Reg. 53,313, 53,318-19 (Sept. 8, 2005) (proposing a revised 10 C.F.R. § 63.114). To the extent that this contention is claiming that DOE is required to evaluate FEPs based on effects in the post-10,000 year period, or provides support regarding only the post-10,000 year period, the contention is immaterial and represents an impermissible collateral attack on NRC regulations at 10 C.F.R. §§ 63.342 and 63.114. Thus, it falls outside the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 238-39. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 239. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant

regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied,” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing erosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in

quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Nevada asserts that DOE improperly excluded FEP 1.2.07.01.0A, “Erosion/Denudation,” because it relied upon allegedly-incorrect erosion rates that are inconsistent with observed debris flows. *See* Petition at 238. However, Nevada fails to demonstrate that this issue could produce any alternative TSPA results, creates no reasonable expectation that postclosure performance objectives cannot be met, or is otherwise material to any finding the NRC must make to authorize construction of the repository. A petitioner must allege not only that “more accurate input data could be used in applicant’s model, but also the use of such data” could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339 (2006).

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3, above, discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the only documents referenced by the contention, other than the license application and DOE's supporting documents, do not support Nevada's position or raise issues outside the scope of this proceeding; (2) the contention mainly contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Steven A. Frishman, Stephan K. Matthäi, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada's bases for its challenge to the exclusion of FEP 1.2.07.01.0A, "Erosion/Denudation," are that observed and modeled erosion rates suggest that erosion will be "much higher" than modeled by DOE. Petition at 240. Nevada fails to provide supporting references for its contention because Stuewe, *et al.*, the document cited for its claim that erosion rates will be much higher than predicted by DOE, in part supports assertions that are outside the scope of this proceeding, and in part does not support certain other statements made in the

contention. *See Private Fuel Storage, L.L.C.* (Independent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998), *aff'd on other grounds*, CLI-98-13, 48 NRC 26 (1998) (“the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention”).

For example, Stuewe *et al.* states: “It may be seen that there is little apparent change [in Yucca Mountain] within the first 1 my [million years], but that the entire Yucca Mountain region is substantially denuded after 5 my.” LSN# NEV000005187 at.7. Additionally, the document predicts significant erosion within 500,000 to 5,000,000 years *only* with “conservative estimates for all involved parameters.” *Id.* at 1. This reference does not directly support Nevada’s contention, and moreover, it shows that Nevada’s proffered erosion rates are not material to compliance with NRC regulations that require that DOE vary factors related to geology based upon “cautious, but *reasonable* assumptions” that could affect Yucca Mountain. 10 C.F.R. § 63.305(c) (emphasis added).

Stuewe *et al.* also does not provide support for this contention because it does not address the effects of erosion in the first 10,000 year period, which is the focus of any FEP screening decision. *See* 10 C.F.R. §§ 63.114 and 63.342; *see also* 70 Fed. Reg. 53,313, 53,319 (Sept. 8, 2005) (providing proposed 10 C.F.R. § 63.342(c), which states in part that “[f]or performance assessments conducted to show compliance with §§ 63.311(a)(2) and 63.321(b)(2), DOE’s performance assessments shall project the continued effects of the features, events, and processes included in paragraph (a) of this section beyond the 10,000 year post-disposal period through the period of geologic stability”); 70 Fed. Reg. at 53,319 (providing proposed 10 C.F.R. § 63.114(b), which states that “[a]ny performance assessment used to demonstrate compliance with § 63.113

for the period of time after 10,000 years through the period of geologic stability must be based on the performance assessment specified in paragraph (a) of this section").

In addition, Stuewe, *et al.* cannot sustain Nevada's contention because it is not a published document, so it is unclear to what extent – if at all – it has been peer reviewed or vetted. In fact, it has merely been submitted for publication to *GEOMORPHOLOGY*. See LSN# NEV000005187 at 24. At best, this “manuscript draft,” see LSN# NEV000005187 at cover page, could be considered a proffered expert statement, as it also lacks an accompanying affidavit.

Nevada also fails to provide adequate support for the other basis for its position that DOE erroneously excluded FEP 1.2.08.01.0A, “Erosion/Denudation.” Nevada alleges that “actual observations demonstrate that erosion will significantly affect infiltration and seepage fluxes at Yucca Mountain.” Petition at 238. Nevada cites two documents for its proposition that “debris flows at Yucca Mountain triggered by thunderstorms in 1984 and 2003 each locally removed much more material than suggested by [the erosion rates estimated by Stuckless and Levich].” Petition at 240. One of these documents is cited only “for description of general characteristics of such events.” *Id.* The other document, Coe, *et al.*, was published in 1997, and thus contains no description, nor anticipation, of a debris flow in 2003. Coe, J.A., Glancy, P.A., Whitney, J.W. "Volumetric Analysis and Hydrologic Characterization of a Modern Debris Flow Near Yucca Mountain, Nevada" *GEOMORPHOLOGY*, Vol. 20 (1997) at 11-28 (hereinafter Coe, *et al.*).

As discussed in what follows, regarding the 1984 event, Coe, *et al.* do not provide support for Nevada's assertion that this observed event demonstrates that erosion will significantly affect infiltration and seepage at Yucca Mountain. Any supporting material provided by a petitioner, including those portions thereof not relied upon, is subject to Board

scrutiny, “both for what it does and does not show.” See *Yankee Atomic Elec. Co.*, LBP-96-2, 43 NRC 61, 90 (1996), *rev’d in part on other grounds and remanded*, CLI-96-7, 43 NRC 235 (1996).

First, the mean depth of erosion for the overall study area as determined by Coe *et al.* is approximately 5 cm, see Coe, *et al.* at 26, which is not inconsistent with the erosion rates proffered by Stuckless and Levich, see LSN# DEN001584824 at 6-182. Those erosion rates necessarily incorporate large-scale erosion and deposition events, such as the 1984 debris flow, rather than represent a constant rate of erosion. See LSN# DEN001584824 at 6-183 (“Debris flows ... are the primary mechanism for hillslope erosion of unconsolidated deposits in the Yucca Mountain region”). It should also be noted that the study area referenced in Coe *et al.* was not at Yucca Mountain, but at Jake Ridge, which is “at the southern extremity of a north-south-trending ridge east of Yucca Mountain.” Coe, *et al.* at 12.

Consistent with Stuckless and Levich’s long-term erosion rates of 0.2 to 6 cm per 10,000 years, Coe, *et al.* predict that the 1984 event was “quite rare.” Coe, *et al.* at 11. They conclude that “[a]lthough the recurrence interval of storms of the same intensity as the July 21, 1984 storm appears to be on the order of 500 years or greater, the recurrence of an erosional event comparable to the July, 1984 event is probably much longer.” *Id.* at 26. Moreover, they “suggest that the amount of hillslope erosion caused by the 1984 storm has a *significantly longer* recurrence interval than the precipitation event because the amount of erosion is dependent on the intensity of the storm, on the amount of colluvium on the slope, and the maturity of the drainage network.” *Id.* (emphasis added). Especially relevant is their finding that “the erosive ability of successive storms of equal intensity will decrease because such storms would tend to progressively isolate and reduce the amount of colluvium available.” *Id.* at 11. Accordingly, the

study provided by Nevada to support its contention is, in fact, consistent with DOE's FEP exclusion justification and tends to support DOE's erosion rates instead.

In addition to the aforementioned flaws, Nevada simply cites to its reference documents in their entirety, rather than pinpointing a specific page or section for support. Vague references to documents are not permissible. A petitioner has the obligation to identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). In this proceeding, especially, petitioners must ensure that documentary references "be as specific as reasonably possible." *U.S. Dep't of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 7). Therefore, Nevada's references are not sufficient to satisfy Section 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada's contention presents an issue that, in some respects, is not within the scope of this proceeding, and in all respects, not material. For these reasons, and for the reasons discussed below, this contention does not establish a genuine dispute on an issue of material fact.

First, Nevada alleges that the "debris flows at Yucca Mountain triggered by thunderstorms in 1984 and 2003 each locally removed much more material than suggested by [the erosion estimates provided by Stuckless and Levich]." Petition at 240. As established above, Nevada fails to provide *any* support for such an event in 2003, and does not provide adequate support for its position that the 1984 event on Jake Ridge is inconsistent with DOE's predicted erosion rates at Yucca Mountain. Nor does it evaluate the differences in mineralogy and geology between Yucca Mountain and Jake Ridge that could result in differing erosion processes. In addition, Stuckless and Levich (2007) discuss the intense thunderstorms that

occurred in 1984 to illustrate their finding that “precipitation and runoff that produces streamflow in Fortymile Wash generally occurs only during infrequent but intense local thunderstorms.” Stuckless, J.S. and Levich, R.A., eds., “The Geology and Climatology of Yucca Mountain and Vicinity, Southern Nevada and California,” (2007) (LSN# DEN0016066227 at 81). Accordingly, Nevada’s assertion regarding this observed event fails to establish a genuine dispute with respect to the erosion rates modeled in DOE’s FEP exclusion justification.

Second, Nevada’s reference to the erosion rates of Stuewe *et al.*, discussed above, fails to raise a genuine dispute because those erosion rates may result only with “conservative estimates for all involved parameters.” LSN# NEV000005187 at.1. This result does not raise a material issue because it is inconsistent with the requirements of 10 C.F.R. § 63.305(c), which states in part that DOE must vary factors related to geology based upon “cautious, but *reasonable* assumptions consistent with present knowledge of factors that could affect Yucca Mountain.” The erosion rates set forth in FEP 1.2.07.01.0A, “Erosion/Denudation” were consistent with this requirement, as established in the supporting documentation. *See* Stuckless and Levich at 83-84. In light of this support and the requirement of 10 C.F.R. § 63.305(c), Nevada nonetheless made no attempt to show that DOE’s assumptions were *unreasonable*.

Moreover, Nevada’s proffered erosion rates are inconsistent with the geologic record, and therefore *not consistent with present knowledge* of factors that could affect Yucca Mountain, contrary to 10 C.F.R. § 63.305(c). Located on both the east and west flanks of Yucca Mountain are fans that contain the Bishop Tuff (758 Ka). *See* Quaternary Paleoseismology and Stratigraphy of the Yucca Mountain Area, Nevada (LSN# DEN001584628 at 20). These well-dated fan deposits, some up to 700 thousand years old, indicate long term stability as relates to erosion at Yucca Mountain. *See id.* at 42. This example of relevant site data illustrate the

*unreasonableness* of Nevada’s proffered erosion rates, contrary to the requirements of 10 C.F.R. § 63.305(c).

Third, 10 C.F.R. § 63.114(e) – which Nevada cites in its contention – requires DOE to provide the technical basis for inclusion or exclusion of a FEP if the dose to the RMEI or release to the accessible environment would be “*significantly* changed” by its omission. *See* 10 C.F.R. § 63.114(e) (emphasis added). Petitioner falls far short of this standard, in that it fails to quantify how inclusion of this FEP could *significantly* change the outcome of the TSPA, and therefore does not establish a genuine dispute on a material issue.

Furthermore, as discussed above, Nevada’s cited reference to Stuewe *et al.* does not address erosion within the first 10,000 years, which is the focus of any FEP screening decision. *See* 10 C.F.R. §§ 63.114 and 63.342; 70 Fed. Reg. at 53,318-19; SAR § 2.2.1.2. Therefore, that reference does not establish a genuine dispute on a material issue of fact, contrary to 10 C.F.R. § 2.309(f)(1)(vi), and should be rejected.

**42. NEV-SAFETY-42 - Validation Of Unsaturated Zone Flow Model By Simulation Of Natural Chloride Distribution In Pore Waters**

In SAR Subsection 2.3.2.5.1.2 and related subsections the method for validating the unsaturated zone (UZ) flow model with observed chloride contents of pore waters makes an unexplained assumption about the chloride content of net infiltration; this means that uncertainties in the method have not been adequately addressed and that alternative models have not been adequately represented.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing

by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing flow in the UZ is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. §

2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Don L. Shettel, Adrian Butler, and Adrian Bath) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Paragraph 5 of the contention does reference two articles for the proposition that chloride concentrations in net infiltration are higher than in precipitation due to concentration by evapotranspiration. However, that principle is not in dispute. See, e.g., LSN# DEN001572665, pg. 6-63. The remainder of the contention does not cite any expert opinion or documents, other than DOE's own supporting documents.

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention contains two allegations: 1) the assumptions in LSN# DEN001572665 related to evapotranspiration are not explained; and 2) the modeled profiles of chloride do not have a good fit with the measured values of chloride in the UZ. As demonstrated below, neither of these allegations is sufficient to establish a genuine issue of material fact.

With respect to evapotranspiration, Nevada has not accurately characterized the application and the supporting documents. For example, SAR, pp. 2.3.1-60 to 66 describes in detail DOE's modeling assumptions related to evapotranspiration, and LSN# DEN001572665, pg. 6-63 explains that evapotranspiration leaves chloride behind. Nevada presents no facts or analysis to dispute any of the statements in LSN# DEN001572665, let alone the license application. In essence, Nevada is stating that it cannot determine whether the statements in LSN# DEN001572665 (and by implication, the SAR), are correct. Such a statement does not establish a genuine dispute of material fact.

With respect to the fit between the measured and calculated chloride values, the SAR states:

The weak diffusion of chloride means that the model cannot be expected to match point measurements, because of the spatial averaging inherent to the model grid structure over distances on the order of 100 m. The model can only be expected to represent an average of the chloride concentration measurements. The number and spatial range of chloride concentration measurements provide a meaningful representation of spatial average values (Figures 2.3.2-18 to 2.3.2-28) for comparison with the model results. (SAR, at 2.3.2-65)

The contention does not address this information in the SAR, or otherwise dispute this conclusion. Therefore, the contention does not establish a genuine issue of material fact.

In any event, Nevada does not claim that acceptance of this contention would have any material effect on the results of the calculation of water flow in the UZ or the impact of any change on dose. As a result, this contention does not establish a genuine issue of material fact.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not

attempted to determine what effect, if any, acceptance of their contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada's contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* Section V.A.3 of the Answer for a more detailed discussion of this position.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**43. NEV-SAFETY-43 - Validation Of Unsaturated Zone Flow Model By Carbon-14 Contents, Strontium Isotope Compositions And Calcite Mineral Precipitate Abundances**

Uncertainties in the interpretations of carbon-14 contents in the gas phase of the unsaturated zone (UZ), in strontium (Sr) contents and strontium isotope compositions of pore waters, and of the amounts of calcite mineral that have accumulated in pore spaces could be greater than calculated by DOE as described in SAR Subsection 2.3.2.5.1.2 and related subsections, and assumptions and simplifications have not been explained, so the support that these data sources give to the UZ flow model and to the low values of modeled infiltration rates is weak.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63

with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing flow in the UZ is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the analysis in the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Maurice E. Morgenstein, Don L. Shettel, and Adrian Bath), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada's contends that uncertainties "could" be greater than calculated by DOE, and that the support provided by the data on C-14, strontium, and calcite is "weak." However, Nevada does not contend that DOE's calculations of flow in the UZ are incorrect or unconservative. As a result, Nevada has not established that this issue has a material effect on the results of DOE's calculations. Consequently, this contention should be dismissed, without the need to address Nevada specific allegations in paragraph 5 of the contention. Nevertheless, as explained below,

even if the allegations in paragraph 5 are considered, they do not establish a genuine dispute of material fact.

For example, the contention speculates that the strontium contents and strontium isotope compositions of pore water, and the amount of calcite in pore spaces, could be greater than calculated by DOE. However, Nevada has not provided any support for such speculation. In fact, paragraph 5 of the contention, which purportedly provides the facts that support this contention, does not even discuss strontium or calcite, other than to refer to unidentified and unspecified “uncertainties in interpretative models.” Therefore, Nevada’s allegations related to calcite and strontium are vague and unsupported, and do not establish a genuine issue of material fact. As stated by the Commission, a contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

Furthermore, DOE has accounted for the uncertainties in strontium concentrations, as show on Figure 7.6-1 of LSN# DEN001572665, which plots measured strontium concentrations against various percentiles of strontium concentrations calculated by DOE’s model. Similarly, DOE has accounted for uncertainties in calcite through the use of different net infiltration rates (including upper and lower bounding rates) in the calcite model, as discussed in Section 7.7.4.3 of LSN# DEN001572665. Thus, Nevada has not accurately characterized DOE’s evaluations.

Nevada asserts that travel times obtained from DOE’s model simulations are higher than the measured C-14 ages. However, as indicated in the SAR, at 2.3.2-88, the percolation rates calculated using the C-14 data are smaller than the net infiltration rates in the UZ as used in DOE’s model; therefore, the net infiltration rates are conservative for use in predicting repository

performance. Nevada does not allege that these calculated rates are not consistent with the reasonable expectation standard discussed in section V.A.3.C. If Nevada believes that quantification would show that DOE's rates are not consistent with that standard, the burden is on Nevada to do so, as well as determine what effect, if any, acceptance of their contention would have on dose to the RMEI. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim

Based upon Section 7.5 of LSN# DEN001572665, Nevada also asserts that the measured C-14 ages are single values and not ranges, because uncertainties have not been considered. Section 7.5 of LSN# DEN001572665 discusses that the purpose of using the C-14 ages was to validate DOE's model. As shown in Figures 7.5-1 and 7.5-2, DOE did compare the C-14 ages against DOE's 10th and 30th percentile UZ flow models, which provides a measure of the uncertainty in DOE's model. As such, the contention is incorrect in its assertion that DOE did not consider uncertainties. Therefore, this contention does not raise a genuine issue of material fact.

Nevada also asserts that DOE's documents do not provide detailed information regarding 1) the assumption that the C-14 of pore waters is 50 to 100% of atmospheric carbon dioxide, or

2) the extent of C-14 loss to solid carbonates that precipitate from pore waters. However, Nevada has not disputed the information in the application, nor has it contended that the application is legally required to contain more information on this topic. Therefore, Nevada's assertion does not establish a genuine dispute of fact or law.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada's contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* Section V.A.3 of the Answer for a more detailed discussion of this position.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention should be rejected.

**44. NEV-SAFETY-44 - Flow In The Unsaturated Zone From Episodic Infiltration**

Screening of FEP 2.2.07.05.0A “Flow in the UZ from episodic infiltration” from performance assessments in SAR Subsection 2.2.1.2 and related subsections and as specifically stated at SAR Table 2.2-3 at 2.2-127 is not justified.

**RESPONSE**

This contention alleges that episodic infiltration will persist through the UZ to repository depth, and therefore DOE wrongly excluded FEP 2.2.07.05.0A, “Flow in the UZ from Episodic Infiltration,” on the basis of low consequence. Petition at 254. Nevada claims that the PTn will not effectively damp episodic infiltration, as evidenced by (1) chlorine-36 data, and (2) studies showing the existence of fault zones and resulting fast pathways through the PTn.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada’s contention does not present a material issue. Nevada asserts that DOE did not comply with regulations regarding postclosure performance assessments and FEP screening. *See*

Petition at 257. Essentially, it alleges that the PTn unit may not effectively damp episodic infiltration. *See id.* at 256-257.

Nevada, however, fails to establish how inclusion of the subject FEP will “significantly change[.]” “the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment.” 10 CFR § 63.114(e). Notably, Nevada has not established how inclusion of this FEP would “significantly” change the performance assessments, which is the basis for any FEP screening decision under 10 C.F.R. § 63.342. Indeed, at best, Nevada asserts that the exclusion of this FEP may have resulted in an underestimation of “local infiltration rates” during brief episodes of high precipitation. Petition 254. Yet, it has not asserted what effect, if any; brief increases in infiltration of a localized nature will have on performance. Nevada has also not claimed that exclusion of the FEP underestimates *net* infiltration over longer periods of time. Indeed, although Nevada bases its contention almost exclusively upon chlorine-36 (Cl-36) data suggesting so-called “fast pathways,” (something that DOE has acknowledged, yet concluded it was of no significance in the low consequence exclusion justification for FEP 2.2.07.05.0A, *see* LSN# DEN001584824 at 6-935), Nevada admits that it is unaware of what proportion of infiltration during these short episodes may result from these limited pathways: “the proportion of infiltration that [fast pathways] could represent is not quantifiable....” Petition at 256. This, as well as the contention’s assertion that “[e]pisodic infiltration with transiently high rates of downwards movement of pore waters *would potentially* change the overall rate of infiltration ...,” Petition at 255 (emphasis added), indicates that Nevada itself is not clear as to whether the issue is material. As such, Nevada has not established that the contention’s resolution would make a difference in the outcome of the proceeding.

Specifically, Nevada also fails to establish that the Cl-36 evidence gives rise to a material issue, especially with respect to DOE's predicted infiltration rates. This contention proposes the following "back of the envelope," unsupported analysis of the Cl-36 evidence:

As an illustration, it is estimated that such a chlorine-36 anomaly in a fracture at ESF depth would indicate a local infiltration rate of around 1350 mm/yr (i.e., percolation through 450 meters of UZ, typical porosity 0.15, infiltration of Cl-36 in precipitation at ground surface at ~50 years ago).

Petition at 256. Nevada provides this summary to illustrate its assertion that infiltration rates will be "considerably more than the assumed average flux of 32 mm/yr." Petition at 254. It also states that:

It has been suggested that the quantity of water that penetrates the PTn through fast pathways is about 1% of the total infiltration. ... DOE claims that this small proportion of potential "fast pathway" infiltration is negligible. This is not consistent with the Cl-36 evidence.

Petition at 256 (citations omitted). Nevada neglects, however, to provide any explanation of how Cl-36 evidence challenges DOE's estimation. Nor does it specifically challenge DOE's incorporation of the Cl-36 evidence in its analyses, provided in FEP 2.2.07.05.0A and supporting documents. *See* LSN#DEN001584824 at 6-935.

In Appendix H of the UZ Flow Model referenced in the subject FEP exclusion justification, Cl-36 groundwater transport times were modeled using the three-dimensional UZ Model grid with a present-day, mean infiltration rate in order to investigate groundwater transport times from the ground surface to the repository level and Cl-36 transport phenomena under steady-state unsaturated zone flow conditions. UZ Flow Models and Submodels, LSN# DN2001630459 at H-6 – H-8 (Nov. 1, 2004). The modeling results show that there is an approximately 1 % mass breakthrough during 10 to 100 years after tracer release on the ground.

*See id.* This indicates the existence of possible fast flow pathways (with a transport time of 50 years) from the ground surface to the repository level, even under the steady state unsaturated zone flow condition. *See id.* The average groundwater transport times from the surface to the repository level are estimated to be between 5,000 to 20,000 years using the 50 percent mass breakthrough curves of from the four simulation results. *See id.*

This indicates that the UZ Flow Model results using steady flow are generally consistent with the observed CI-36 data and that rapid transport implied by the CI-36 data can be explained without transient flow processes. *See id.* It also is consistent with DOE's "low consequence" FEP exclusion justification, which concludes that flow through fast pathways is "negligible with respect to repository performance," LSN# DEN001584824 at 6-935, and that exclusion of the subject FEP "will not result in a *significant adverse change* in the magnitude or time of radiological exposures to the RMEI or radionuclide release to the accessible environment." *Id.* at 6-936 (emphasis added) Nevada has not shown otherwise, and therefore has failed to establish the materiality of its allegations.

In addition, in its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 254-255. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." *Id.* at 255. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would

make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Petitioner has not made any showing in this regard.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing episodic infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in

quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and

(3) the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (by Howard S. Wheeler, Don L. Shettel, Jr., Adrian P. Butler, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Apart from its references to Commission regulations, the SAR, and the FEP AMR, Nevada cites only to DOE reference documents, and then only to support its summary of DOE’s analyses. Therefore, they do not support Nevada’s allegation that DOE’s FEP 2.2.07.05.0A, “Flow in the UZ from Episodic Infiltration” was wrongly excluded. To the contrary, these documents demonstrate the thoroughness and reasonableness of DOE’s screening justification.

Therefore, apart from these two documents, which support the reasonableness of DOE’s FEP exclusion, Nevada fails to provide *any* references or support, contrary to its burden to present “claims rooted in fact, documents, or expert opinions.” *Yankee Atomic Elec. Co.*, CLI-96-7, 43 NRC at 262 (referencing 10 C.F.R. § 2.714, the predecessor to 10 C.F.R. § 2.309).

A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). As written, Nevada’s bare assertions and unsupported conclusions amount to little more than pure speculation by counsel, and therefore do not provide the support for the contention that is required by the regulation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada's claim regarding DOE's exclusion of FEP 2.2.07.05.0A, "Flow in the UZ from Episodic Infiltration," presents an issue that is not material. In addition, as discussed above, the contention is also unduly speculative, provides references that negate its position, and neglects to specify the ramifications of its alleged errors. Accordingly, it does not establish a genuine dispute of material fact.

In particular, as noted above, Nevada's reference documents support a finding that exclusion from the TSPA of episodic flow in the UZ was reasonable and consistent with regulatory requirements. First, 10 C.F.R. § 63.342(a) provides that DOE's performance assessments conducted to show compliance with the postclosure protection standards need not consider those FEPs that would not *significantly* impact the results of the performance assessment.

Additionally, Nevada's reference documents illustrate DOE's adherence to 10 C.F.R. 63.305(c), which requires in part that DOE "vary factors related to the geology, hydrology, and climate based upon cautious, *but reasonable* assumptions consistent with present knowledge of factors that could affect the Yucca Mountain disposal system" (emphasis added). Zhang *et al.* (2006) concludes that "[s]imulation results show the existence of damping effects within the PTn unit and also indicate that the assumption of steady-state flow conditions below the PTn unit is reasonable." K. Zhang, Y. Wu & L. Pan, "Temporal Dumping Effect at the Yucca Mountain Fractured Unsaturated Rock on Transient Infiltration Pulses" (Feb. 10, 2006) (LSN# DN2002209213 at 235).

Similarly, beyond simply alleging that it did, Nevada neglects to demonstrate that DOE did not comply with 10 C.F.R. § 63.114(e), which requires that DOE provide the technical basis

for inclusion or exclusion of FEPs, and evaluate FEPs in detail if their omission would significantly affect the magnitude or timing of the release of radionuclides or the dose to the RMEI. To the contrary, even a cursory reading of DOE's FEP exclusion justification shows that DOE fully complied with this requirement. This also can be seen in the documents Nevada cite. For example, "UZ Flow Models and Submodels" concludes that:

[The PTn] has been shown to effectively damp spatial and temporal variations in percolation flux. Therefore, water flow through the UZ is modeled to occur under steady-state conditions. Transient "fast pathway" flow is considered to contribute insignificantly to the total flow below the PTn through the UZ.

LSN# DN2001630459 at 6-19 (citations omitted). These results support DOE's finding that "[t]he influence of rapid flow through preferential pathways formed by fractures in the PTn is considered to be volumetrically insignificant compared to flow through the matrix. Episodic infiltration would therefore have no significant effect on radionuclide releases to the accessible environment." Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824, 6-933 (Mar. 6, 2008).

If anything, this contention merely alleges that the Cl-36 evidence raises uncertainties regarding the amount of infiltration that could persist through fast pathways during short-lived events, over localized areas. As discussed above, Nevada has not established the materiality of this issue, nor has it provided sufficient information to give rise to a genuine dispute with DOE's treatment of the Cl-36 evidence as summarized in FEP 2.2.07.05.0A. *See* LSN# DEN001584824 at 6-935. Moreover, the NRC has recognized that a substantial amount of uncertainty will exist in any model attempting to predict the future of complex systems. *See* Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, Nevada, 66 Fed. Reg. 55,732, 55,747 (Nov. 2, 2001) ("The first-of-a-kind nature of the repository and the

evaluation over a very long time period result in significant uncertainty being included in the performance assessment.”) For that reason, 10 C.F.R. § 63.114(b) does not require that uncertainties be eliminated or even minimized, but that DOE “[a]ccount for uncertainties and variabilities in parameter values and provide for the technical basis for parameter ranges, probability distributions, or bounding values used in the performance assessment.” This is precisely what DOE has done. As described in SAR Section 2.3.2, DOE explicitly notes that there is variability and uncertainty regarding description of the site conditions, and, as discussed in Section 2.3.2.3, it considered a probabilistic range of properties. DOE also used alternative representations of flow through faults in the UZ flow model to account for uncertainties in flow. *See* SAR Section 2.3.2.6, at 2.3.2-96. Nevada’s contention does not challenge DOE’s uncertainty analyses, and therefore does not establish a genuine issue of material fact. *See Duke Energy Corp.*, LBP-03-17, 60 NRC at 236-38, *aff’d*, CLI-03-17, 58 NRC 419.

Lastly, as discussed in the applicable Legal Standards section and section (d) above, this contention alleges potential errors, omissions, and alternative approaches -- without specifying the ramifications or results of such alleged deficiencies. Nevada’s language at Paragraph 6 essentially admits that it does not know whether this contention is material, and attempts to shift the burden to DOE to demonstrate that its contention is *not* material, contrary to the requirements of 10 C.F.R. § 2.309(f)(1)(vi). *See* Petition at 257-258; *see also Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 43, 422 (2001). For this and the aforementioned reasons, this contention does not establish a genuine dispute of a material issue and therefore must be dismissed.

**45. NEV-SAFETY-45 - Effects Of Episodic Flow**

SAR Subsection 2.3.2.4.2.1.2, and similar subsections, which states that one of the two primary large-scale processes that prevents or substantially reduces the movement of water through the unsaturated zone (UZ) and into the emplacement drifts of the repository is the damping of episodic pulses of precipitation and infiltration, fails to provide an appropriate technical basis for excluding FEP 2.2.07.05.0A (Flow in the UZ) from episodic infiltration as the effects of horizontal heterogeneity have not been adequately represented.

**RESPONSE**

This contention alleges that, in “SAR Subsection 2.3.2.4.2.1.2, and similar subsections,” DOE incorrectly modeled the PTn layer, ignoring the horizontal heterogeneity of the rock formation and wrongly concluding that it could attenuate episodic flow, and therefore erroneously excluded FEP 2.2.07.05.0A, “Flow in the UZ from Episodic Infiltration.” Petition at 259.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada asserts that DOE did not comply with regulations regarding postclosure performance assessments and FEP screening. *See* Petition at 262-63. Essentially, it alleges that DOE did not adequately consider the effects of horizontal heterogeneity on damping in the PTn unit. *Id.* at 259.

Nevada, however, fails to establish how inclusion of the subject FEP will “significantly change[]” “the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment.” 10 CFR § 63.114 (e). Notably, Nevada has not established how inclusion of this FEP into DOE performance assessment will produce any alternative TSPA results. The simple conclusion presented in Paragraph 5 that “the assumption that the PTn is able to attenuate episodic events sufficiently to allow the assumption that flow in the underlying Topopah Spring Tuff formation ... is constant ... is inappropriate,” Petition at 262, does not suffice to present a litigable issue. A petitioner must allege not only that “more accurate input data could be used in applicant’s model, but the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339-40 (2006). Similarly, Nevada’s assertion that “[a] changed pattern of flow will affect both the amount of composition of water impacting on the engineered barrier system with consequences for rates of corrosion and release and transport of radionuclides from degraded waste packages,” Petition at 262, lacks the specificity necessary to demonstrate a material issue.

In addition, in its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 259-60. Nevada concludes this general description of various sections of 10 C.F.R. Part 63

with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 260. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Nevada has not made the required showings in the instant contention.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing episodic infiltration is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. To the extent it relies on expert opinion, this contention fails to meet those standards. Nevada's Petition attaches several affidavits (by Howard S. Wheeler, Don L. Shettel, Jr., Adrian P. Butler, and Michael C. Thorne) that purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada's contention regarding DOE's exclusion of FEP 2.2.07.05.0A, "Flow in the UZ from Episodic Infiltration," presents an issue that is not material. For this reason, and for the reasons set forth below, this contention does not establish a genuine dispute of material fact.

This contention includes certain mischaracterizations of DOE's analysis of episodic flow events. Nevada erroneously states that "[various modeling studies relied upon by DOE] have not considered the effect of horizontal heterogeneity in the PTn layer, in particular the large number of faults present in the rock formation." Petition at 261. As summarized in Nevada's referenced document, however, these studies *have* included those considerations. First, explaining the modeling study of damping effects conducted by Zhang et al. (2006), "UZ Flow Models and Submodels" states that "[t]he three-dimensional model incorporates a wide variety of field-

specific data for the highly heterogeneous formation at the site.” “UZ Flow Models and Submodels” at 6-125, LSN# DEN001572665. Second, it states that the results of the modeling study show that “a small percentage of percolation flux is diverted into faults,” and that “[a]long fault columns, both lateral flow and rock water storage play an important role.” “UZ Flow Models and Submodels” at 6-126, LSN# DEN001572665. Third, it reports that field tests “suggested that the PTn matrix has few discrete flow paths that can transmit water quickly.” “UZ Flow Models and Submodels” at 6-126, LSN# DEN001572665.

The contention also erroneously claims that one-dimensional modeling analyses of episodic flow fail to account for heterogeneity on flow pathways. Petition at 262. The statement that one-dimensional models ignore heterogeneity is incorrect because rock properties in the one-dimensional systems were extracted from the heterogeneous three-dimensional site-scale UZ model and therefore, hydrological properties varied with depth. *See* “UZ Flow Models and Submodels,” SNL 2007 p. 6-126, LSN# DEN001572665. While a one-dimensional model does not represent flow focusing resulting from lateral flow, calculations with the three-dimensional site-scale model indicated that lateral flow above the repository is negligible. *See* SAR Subsection 2.3.2 at 2.3.2-79. Accordingly, to the extent that Nevada failed to understand DOE’s methodology and rationale, this contention fails to raise a genuine dispute.

As discussed in the applicable Legal Standards Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts that the Application fails to address an issue that the Application does address, is defective. Nevada’s contention suffers from this deficiency. Nevada completely ignores the relevant portions of the Application and fails to explain how the alleged defects in the Application will significantly affect the performance assessments. In short, this contention is inadmissible because “the Petitioner’s

assertion that the application[] [is] deficient is simply based upon a failure to read or perform any meaningful analysis of the application[].” *Dominion Nuclear Conn., Inc.*, LBP-04-15, 60 NRC at 95 (2004) *aff’d*, CLI-04-6, 60 NRC 631 (2004).

Nevada’s reference documents support a finding that exclusion from the TSPA of episodic flow in the UZ was reasonable and consistent with regulatory requirements. First, 10 C.F.R. § 63.342(a) provides that DOE’s performance assessments conducted to show compliance with the postclosure protection standards need not consider those FEPs that would not *significantly* impact the results of the performance assessment. Nevada’s referenced documents support the low consequence exclusion of FEP 2.2.07.05.0A, “Flow in the UZ from Episodic Infiltration,” consistent with 10 C.F.R. § 63.342(a). For example, Zhang et al. (2006) concludes that its 3-D model, which “incorporates a wide variety of field-specific data for the highly heterogeneous formation at the site,” and its 1-D vertical column model show that only “a small percentage of percolation flux is diverted into faults.” Zhang et al., LSN# DN2002209213 at 246-247. These results support DOE’s finding that “the volume of flow through pathways that could lead to episodic flow in the repository host rock has been shown to be small,” Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824, 6-935 (Mar. 6, 2008), and, ultimately, that “episodic infiltration would therefore have no significant effect on radionuclide releases to the accessible environment,” LSN# DEN001584824, 6-933.

Additionally, Nevada’s reference documents illustrate DOE’s adherence to 10 C.F.R. 63.305(c), which requires in part that DOE “vary factors related to the geology, hydrology, and climate based upon cautious, *but reasonable* assumptions consistent with present knowledge of factors that could affect the Yucca Mountain disposal system” (emphasis added). Zhang et al.

(2006) concludes that “[s]imulation results show the existence of damping effects within the PTn unit and also indicate that the assumption of steady-state flow conditions below the PTn unit is reasonable.” LSN# DN2002209213 at 235.

Similarly, beyond simply alleging that it did, Nevada neglects to demonstrate that DOE did not comply with 10 C.F.R. § 63.114(e), which requires that DOE provide the technical basis for inclusion or exclusion of FEPs, and evaluate FEPs in detail if their omission would significantly affect the magnitude or timing of the release of radionuclides or the dose to the RMEI. To the contrary, Nevada references DOE’s technical basis and exclusion justification for the subject FEP, *see* Petition at 259, and does not establish – and does not even assert – that episodic flow in the UZ could significantly affect radionuclide transport and release.

If anything, this contention alleges that DOE did not adequately consider the uncertainties in UZ flow and infiltration that may result from horizontal heterogeneity in the PTn unit. Indeed, the NRC has recognized that a substantial amount of uncertainty will exist in any model attempting to predict the future of complex systems. *See* Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, Nevada, 66 Fed. Reg. 55,732, 55,747 (Nov. 2, 2001) (“The first-of-a-kind nature of the repository and the evaluation over a very long time period result in significant uncertainty being included in the performance assessment.”) For that reason, 10 C.F.R. § 63.114(b) does not require that uncertainties be eliminated or even minimized, but that DOE “[a]ccount for uncertainties and variabilities in parameter values and provide for the technical basis for parameter ranges, probability distributions, or bounding values used in the performance assessment.” This is precisely what DOE has done. As described in the SAR at 2.3.2-96, DOE explicitly notes that there is variability and uncertainty regarding description of the site conditions, and as discussed

in Section 2.3.2.3, considered a probabilistic range of properties – including distribution and characteristics of fractures and faults – for the site-scale UZ flow model. DOE also used alternative representations of flow through faults in the UZ flow model to account for uncertainties in flow. *See* SAR Section 2.3.2.6, at 2.3.2-96. Nevada’s contention does not challenge DOE’s uncertainty analyses, and therefore does not establish a genuine issue of material fact. *See Duke Energy Corp.*, LBP-03-17, 58 NRC 221, 236-38, *aff’d*, CLI-03-17, 58 NRC 419.

Because Nevada has not demonstrated that DOE’s allegedly inadequate representation of horizontal heterogeneity will increase release and transport of radionuclides, it has not established a genuine issue of material fact. Nevada does not allege that the resulting increase in release and transport is inconsistent with the reasonable expectation standard discussed in section V.A.3.C. If Nevada believes it is not consistent with that standard, the burden is on Nevada to show what effect, if any, acceptance of their contention would have on dose to the RMEI. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim

Finally, this contention alleges potential errors, uncertainties, omissions, and alternative approaches -- without specifying the ramifications or results of such alleged deficiencies.

Nevada's language at Paragraph 6 essentially admits that it does not know whether this contention is material, and attempts to shift the burden to DOE to demonstrate that its contention is *not* material, contrary to the requirements of 10 C.F.R. § 2.309(f)(1)(vi). *See* Petition at 263; *see also Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 43, 422 (2001). For this and the aforementioned reasons, this contention does not establish a genuine dispute of a material issue and therefore must be dismissed.

**46. NEV-SAFETY-46 - Extreme Events Undefined**

SAR Subsection 2.1.2.1.2, and similar subsections, which state that one of the two primary large-scale processes that prevents or substantially reduces the movement of water through the unsaturated zone (UZ) and into the emplacement drifts of the repository is the damping of episodic pulses of precipitation and infiltration, fail to provide an appropriate technical basis for excluding FEP 2.2.07.05.0A (Flow in the UZ from episodic infiltration) as the effects of extreme events on UZ flow have not been considered in a rigorous manner because an extreme event has not been formally defined or appropriately modeled.

**RESPONSE**

This contention alleges that DOE failed to define or justify the “extreme event” used to model episodic infiltration in the UZ, and therefore the conclusions drawn from relevant analyses are “unreliable” and cannot support the exclusion of FEP 2.2.07.05.0A, “Flow in the UZ from Episodic Infiltration.” Petition at 266-267.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 264-265. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” Petition at 265. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic

setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing episodic flow is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Nevada asserts that DOE did not comply with regulations regarding postclosure performance assessments and FEP screening. *See* Petition at 264. Essentially, it faults DOE for failure to define or defend its interpretation of “extreme events” related to precipitation and infiltration. *See id.* However, as stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide

even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Nevada neglects to establish how exclusion of the subject FEP or additional defense for the extreme infiltration events modeled could produce any alternative TSPA results. The simple conclusion presented in Paragraph 5 that “[w]hilst this approach may appear to represent an extreme event, no support for this ... has been provided” does not suffice to present a litigable issue. Petition at 266. Nevada fails to provide any qualitative, let alone *quantitative*, results of this alleged deficiency. Nor does Nevada even claim that the hypothetical extreme event used was not conservative.

Likewise, Nevada’s assertion that DOE’s use of infiltration rates for an “extreme event,” (as opposed to precipitation rates), leads to conclusions that are “unreliable,” also fails to present a litigable issue. Petition at 267. Nevada asserts that DOE’s use of infiltration rates “ignores the connection of rainfall, surface runoff, infiltration and subsurface flows.” Petition at 267. Yet Nevada fails to note that, for the same reasons, use of infiltration rates is *more conservative* than using precipitation. Nor does it even allege that DOE was not conservative.

A petitioner must allege not only that “more accurate input data could be used in applicant’s model, but the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339-340 (2006). As these two examples illustrate, Nevada falls far short of that requirement, as it fails to even *allege* that more accurate data could be used.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference *any* documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Howard S. Wheeler, Don L. Shettel, Jr., Adrian P. Butler, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Apart from its references to Commission regulations, the SAR, and the FEP AMR, Nevada cites only to DOE reference documents and then only to support its summary of DOE's analyses. Although these documents provide support for the limited propositions for which they are cited, they do not support Nevada's conclusion that FEP 2.2.07.05.0A, "Flow in the UZ from Episodic Infiltration," was erroneously excluded. *See Private Fuel Storage, L.L.C.* (Independent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998), *aff'd on other grounds*, CLI-98-13, 48 NRC 26 (1998) ("the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention").

To the contrary, these documents provide substantial support for DOE’s screening justification. For example, one of Nevada’s cites finds the extreme condition used “is conservative for the investigation of the PTn damping effect.” K. Zhang, Y. Wu & L. Pan, “Temporal Dumping Effect at the Yucca Mountain Fractured Unsaturated Rock on Transient Infiltration Pulses” (Feb. 10, 2006) (LSN# DN2002209213). It also concludes that “[t]his study justifies the reasonableness of assuming steady-state flow conditions below the PTn unit.” LSN# DN2002209213 at § 4. These references do not support Nevada’s contention because they show that DOE’s FEP exclusion was consistent with 10 C.F.R. § 63.342 and reasonable, in compliance with 10 C.F.R. § 63.305(c).

Apart from the DOE reference documents, Nevada fails to provide any references or support for *its own* assertions, notwithstanding its burden to present “claims rooted in fact, documents, or expert opinions.” *Yankee Atomic Elec. Co.*, CLI-96-7, 43 NRC at 262 (referencing 10 C.F.R. § 2.714, the predecessor to 10 C.F.R. § 2.309). Without support, Nevada’s contention amounts to little more than bare speculation, and should be dismissed. *See Fansteel*, CLI-03-13, 58 NRC at 203.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada’s contention regarding DOE’s exclusion of FEP 2.2.07.05.0A, “Flow in the UZ from Episodic Infiltration,” presents an issue that is not material. In addition it is also unduly speculative, misconstrues DOE’s analysis, and neglects to specify the ramifications of its alleged errors. Accordingly, this contention does not establish a genuine dispute of material fact.

This contention mischaracterizes DOE’s analysis of episodic flow events. Nevada erroneously states that “the episodic events used in these studies were arbitrarily selected, both in

terms of intensity, duration, and frequency.” Petition at 266. However, DOE based the water flux boundary conditions for one-dimensional episodic flow simulations on infiltration model results for the maximum annual infiltration rate that had a 333-year return period. *See* “UZ Flow Models and Submodels,” LSN# DEN001572665 at 6-127. Thus, the statements in the contention that claim that no return period was specified are incorrect. *See* Petition at 266. The episodic periods were conservatively selected to occur more frequently, every 50 years, rather than every 333 years. *See* “UZ Flow Models and Submodels,” SNL 2007, LSN# DEN001572665 at 6-127. Because episodic infiltration generally occurs over only a few days in a given year, Simulation of Net Infiltration for Present-Day and Potential Future Climates, SNL 2008, LSN# DEN001575070 Figure 6.5.7.7-6[a], this annual infiltration was focused into a one-week period for the year. The remainder of the period between infiltration episodes was set to the average infiltration rate for the post-10,000 year period, 32 mm/yr. UZ Flow Models and Submodels, SNL 2007 p. 6-127, LSN# DEN001572665. Thus, the specification of the boundary condition was not arbitrary.

The contention also claims that one-dimensional modeling analyses of episodic flow ignore heterogeneity and flow focusing. Petition at 267. The statement that one-dimensional models ignore heterogeneity is incorrect because rock properties in the one-dimensional systems were extracted from the heterogeneous three-dimensional site-scale UZ model and therefore, hydrological properties varied with depth. *See* “UZ Flow Models and Submodels,” SNL 2007 p. 6-126, LSN# DEN001572665. While a one-dimensional model does not represent flow focusing resulting from lateral flow, calculations with the three-dimensional site-scale model indicated that lateral flow above the repository is negligible. *See* SAR Subsection 2.3.2 at 2.3.2-79. To

the extent that Nevada failed to understand DOE's methodology and rationale, this contention fails to raise a genuine dispute.

As discussed in the applicable Legal Standards Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts that the Application fails to address an issue that the Application does address, is defective. Nevada's contention also suffers from this deficiency. Nevada completely ignores the relevant portions of the Application and fails to explain how the alleged defects in the Application will significantly affect the performance assessments. In short, this contention is inadmissible because "the Petitioner's assertion that the application[] [is] deficient is simply based upon a failure to read or perform any meaningful analysis of the application[]." *Dominion Nuclear Conn., Inc.*, LBP-04-15, 60 NRC at 95 (2004) *aff'd*, CLI-04-6, 60 NRC 631 (2004).

As noted above, documents referenced in this contention support a finding that exclusion from the TSPA of episodic flow in the UZ was reasonable and consistent with regulatory requirements. 10 C.F.R. § 63.342 provides that DOE's performance assessments conducted to show compliance with the postclosure protection standards need not consider those FEPs that would *not significantly* impact the results of the performance assessment.

Nevada's referenced documents support the low consequence exclusion of FEP 2.2.07.05.0A, "Flow in the UZ from Episodic Infiltration," consistent with 10 C.F.R. § 63.342. For example, "UZ Flow Models and Submodels," summarizes studies conducted to evaluate the damping effect of the PTn unit in response to episodic infiltration pulses. It reports that one- and two-dimensional models illustrate the damping effect of the PTn in response to infiltration pulse. LSN# DEN001572665 at 6-125. It explains that Guerin's one-dimensional models, also cited by Nevada in its contention, *See* Petition at 266, showed that "the PTn unit damped infiltration

pulses no matter what infiltration scenarios were applied.” LSN# DEN001572665 at 6-125. It also reports that other models and field studies show that at the bottom of the PTn unit, episodic flow variations are small relative to the uncertainties incorporated in the TSPA. LSN# DEN001572665 at 6-125.

These studies support DOE’s finding that the PTn effectively damps episodic flow, and that “[e]pisodic infiltration would therefore have no significant effect on radionuclide releases to the accessible environment.” Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824, 6-933 (Mar. 6, 2008). Nevada has not otherwise established – or even alleged – that inclusion of the subject FEP would *significantly change* the results of the performance assessment.

Additionally, Nevada’s reference documents illustrate DOE’s adherence to 10 C.F.R. 63.305(c), which requires in part that DOE “vary factors related to the geology, hydrology, and climate based upon cautious, *but reasonable* assumptions consistent with present knowledge of factors that could affect the Yucca Mountain disposal system” (emphasis added). Zhang et al. (2006) finds that the extreme event modeled “is conservative for the investigation of the PTn damping effect,” Zhang et al., LSN# DN2002209213 at 238, and concludes that “[s]imulation results show the existence of damping effects within the PTn unit and also indicate that the assumption of steady-state flow conditions below the PTn unit is reasonable.” Zhang et al., LSN# DN2002209213 at 235. Nevada has not demonstrated that DOE's assumption in this regard are otherwise *unreasonable*.

Similarly, beyond simply alleging that it did, Nevada neglects to demonstrate that DOE did not comply with 10 C.F.R. § 63.114(e), which requires that DOE provide the technical basis for inclusion or exclusion of FEPs, and evaluate FEPs in detail if their omission would

*significantly affect* the magnitude or timing of the release of radionuclides or the dose to the RMEI. To the contrary, Nevada references DOE's technical basis and exclusion justification for the subject FEP, *see* Petition at 264, and does not establish – and does not even assert – that episodic flow in the UZ could *significantly affect* radionuclide transport and release.

Lastly, as discussed in the applicable Legal Standards section and section (d) above, this contention alleges potential errors, omissions, and alternative approaches -- without specifying the ramifications or results of such alleged deficiencies. Nevada's language at Paragraph 6 essentially admits that it does not know whether this contention is material, and attempts to shift the burden to DOE to demonstrate that its contention is *not* material, contrary to the requirements of 10 C.F.R. § 2.309(f)(1)(vi). *See* Petition at 268; *see also Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 43, 422 (2001). For this and the aforementioned reasons, this contention does not establish a genuine dispute of a material issue and therefore must be dismissed.

**47. NEV-SAFETY-47 - Physical Basis Of Site Scale Unsaturated Zone Flow**

SAR Subsection 2.3.2.4 and similar subsections, which describe the development of the site-scale UZ flow model, fail to provide a reasonable physical basis to support the characterization of the subsurface hydraulic properties at the site of the proposed repository and do not, therefore, provide reliable bounding estimates for drift seepage calculations under present and future climates.

**RESPONSE**

This contention argues that SAR Subsection 2.3.2.4 fails to provide a reasonable physical basis to support the characterization of the subsurface hydraulic properties at the site of the proposed repository and does not, therefore, provide reliable bounding estimates for drift seepage calculations under present and future climates.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada alleges that the LA fails to provide a reasonable physical basis to support its characterization of the hydraulic properties at the subsurface of the proposed repository, and that it accordingly fails to accurately estimate drift seepage calculations under present and future climates.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.31(a)(3), 10 C.F.R. §63.21, 10 C.F.R. §63.21(c)(9), 10 C.F.R. §63.113, 10 C.F.R. § 63.114(c), 10 C.F.R. § 63.114(e), and 10 C.F.R. §63.114(g)). *See* Petition at 269-70. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp. (Oconee Nuclear Station, Units 1, 2 and 3)*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC

from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing water flow through the unsaturated zone is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a

contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

While Nevada alleges that DOE fails to provide bounding estimates for drift seepage under present and future climate conditions because it allegedly has failed to provide a reasonable physical basis to support characterization of subsurface hydraulic properties, Nevada has not alleged an increase in the mean dose above regulatory limits, and has not otherwise established how the contention's resolution would make a difference in the outcome of the proceeding. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada claims that the layers of fractured and faulted tuff at the site of the proposed repository are “highly complex and heterogeneous” (Petition at 269) and that the parametric relationships used to represent their hydraulic properties lack a physical basis and do not adequately characterize the site. Nevada, however, does not provide the requisite supporting facts, expert opinion, or references in support of its contention. Accordingly, this contention must be dismissed.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the

most part, the contention does not reference any documents, other than the LA and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach several affidavits (by Howard S. Wheeler, Adrian Butler, and Stephan K. Matthäi), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada claims that the LA fails to provide a reasonable physical basis to support characterization of hydraulic properties at the subsurface of the geologic repository, and that in failing to do so, has not provided reliable bounding estimates for drift seepage calculations under present and future climates. DOE used the dual continuum method to model fracture flow and matrix flow within the unsaturated zone. In implementing the dual continuum method, DOE used the active fracture model (AFM) which made use of the Genuchten relationship to model permeability of the rock matrix. This contention includes a number of criticisms regarding discrete aspects of these modeling methods, followed by a conclusion which essentially states that DOE's calculation of fluxes in the unsaturated zone is not reliable given those criticisms. As demonstrated below, neither the discrete criticisms nor Nevada's overall conclusion establishes a genuine issue of material fact. Accordingly, this contention must be dismissed.

First, Nevada makes a number of discrete claims regarding the van Genuchten model and the AFM, but fails to demonstrate how these claims raise a genuine dispute with DOE's results of calculations of flow through the unsaturated zone as demonstrated in the LA. Specifically, Nevada states that a detailed comparison of the AFM with a discrete fracture network model (DFM) showed that the AFM "improved the ability of the dual continuum approach to predict flow," but that the AFM is not fully sufficient to capture the complexity of the flow processes in a one cubic meter discrete fracture network. Petition at 272. SAR § 2.3.2.4.1.1.2 states that while DFMs "are useful as tools for concept evaluation and modeling small-scale systems, they are not feasible for dealing with large-scale applications – such as the Yucca Mountain unsaturated zone." SAR § 2.3.2.4.1.1.2 at 2.3.2-42. Thus, there is no genuine dispute that DFM is useful for modeling small scale applications, such as applications on the scale of a cubic meter. However, the information and citation provided by Nevada are not material to the adequacy of the DFM for modeling large scale applications, such as Yucca Mountain, and do not raise any material dispute regarding the adequacy of the AFM to model large-scale applications.

Next, Nevada states that there is no physical basis for the use of  $m=1-1/n$  in the van Genuchten relationship. Petition at 272. Even if Nevada's claim were to be accepted, the contention provides no basis for believing that it would have any material effect on seepage rates as calculated by DOE. If Nevada believes that the use of  $m=1-1/n$  in the van Genuchten relationship would be inconsistent with the reasonable expectation standard, the burden is on Nevada to do so, as well as determine what effect, if any, acceptance of their contention would have on dose to the RMEI. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not

provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Nevada then claims, citing to an article by Schaap and Leij (2000) (Schaap, M.G. and Leij, F.J. (2000), "Improved Prediction of Unsaturated Hydraulic Conductivity with the Mualem-van Genuchten Model," SOIL SCIENCE SOCIETY OF AMERICA JOURNAL, Vol. 64 at 843-851), that there is no physical basis for the tortuosity term in the Mualem model used in the van Genuchten relationship, where the degree of saturation ( $S_e$ ) is raised to the power of  $L$ , where  $L$  equals 0.5. Petition at 272-73. Instead, Nevada suggests that  $L$  should be assigned a negative number, such as  $L = -0.5$ . Petition at 273. However, Nevada has inappropriately taken statements from this article out of context, in the following manner.

First, while the article pertains to soils and sands, not the geological formations in the unsaturated zone at Yucca Mountain, Nevada has not provided any basis for applying this article to Yucca Mountain. Second, the conclusions reported in the article do not support Nevada's assertions. For example, Figure 4 in the article shows, that for clay soils, setting  $L=0.5$  produced results that generally are within the 90% confidence band of the results where  $L = -1.26$ , and the results were even closer when  $L$  was set to  $-1.0$ . Although there was more discrepancy when sand was used as the medium, even then setting  $L=0.5$  produced results that are within the 90% confidence band of the results where  $L = -0.73$ , if the relative saturation of the sand is less than 0.4. The article concludes:

This ultimately suggests that the models proposed by Mualem (1976) or Burdine (1953) give too-simplified conceptualization of the hydraulic conductivity of a porous medium. Still, as shown by Kosugi (1999) and the current study, these pore-size distribution models can be used to successfully predict unsaturated hydraulic conductivity from water retention parameters.

Nevada has not accurately characterized the article. In doing so and for other reasons discussed herein, Nevada has failed to raise a genuine dispute of material fact or law. Nevada's incorrect reading of the article does not provide an adequate basis for a litigable contention. *See Ga. Inst. of Tech. (Georgia Tech Research Reactor), LBP-95-6, 41 NRC 281, 300 (1995).*

Additionally, Nevada states that there are no grounds for assuming that the parameters are horizontally homogeneous. This statement, however, ignores the study discussed in SAR § 2.3.2.4.1.1.4, which assumed small-scale heterogeneity within a geologic layer. SAR § 2.3.2.4.1.1.4 at 2.3.2-45 to -46. The results of this study showed that the heterogeneities within each geologic layer have only a minor effect on site-scale flow processes. *Id.* Nevada has not contested or even addressed this study. As a result, Nevada's contention related to heterogeneities does not establish a genuine issue of material fact.

Furthermore, based upon the assertions discussed above, Nevada concludes that DOE's calculation of water flux through the unsaturated zone is unreliable. However, Nevada never suggests that there are any better or preferable models. More importantly, Nevada never alleges that DOE has underestimated the flux in the unsaturated zone. In short, Nevada never demonstrates that its assertions are material.

Nevada does not allege that DOE's water flux calculations are not consistent with the reasonable expectation standard discussed in section V.A.3.C. If Nevada believes that quantification would show that DOE's water flux calculations are not consistent with that

standard, the burden is on Nevada to do so, as well as determine what effect, if any, acceptance of their contention would have on dose to the RMEI. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the subsurface hydraulic properties at the proposed repository site. Accordingly, it is impossible to assess what effect, if at all, this would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Petition at 275, Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 275. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster*

(Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001).

Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* Section V.A.3 of the Answer for a more detailed discussion of this position.

In summary, this contention does not establish a genuine issue of material fact.

Therefore, the contention should be dismissed.

**48. NEV-SAFETY-48 - Multi-Scale Thermal-Hydrologic Model**

SAR Subsection 2.3.5.4, and similar and related subsections, which state or assume that the multi-scale thermal-hydrologic model accurately models the movement of heat and mass (liquids and gases) from the in-drift to the mountain scale, are incorrect because they ignore the presence of ground support items, especially the hundreds of thousands of ungrouted super Swellex-type stainless steel rock bolts that are to be installed in the emplacement drifts.

**RESPONSE**

In this contention, Nevada alleges that in SAR Subsection 2.3.5.4 and “similar and related” (though unspecified) subsections, DOE’s multi-scale thermal-hydrologic model is “incorrect.” Petition at 276.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations in section (e) of this contention.

Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp. (Oconee Nuclear Station, Units 1, 2, and 3)*. CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate

that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Here, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit

being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and as explained in the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits of Michael C. Thorne, Don. L. Shettel, Jr., Stephen K. Matthai, which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada is obligated to provide "a concise statement of the facts or expert opinions supporting the contention, along with appropriate citations to supporting scientific or factual materials." Petition at 277. Yet other than citing the license application, Nevada supplies only one reference, the "Total System Performance Assessment Data Input Package for the Multiscale Thermohydrologic Model" (LSN# DN 2002426865), to support a statement about DOE's conclusion regarding the nominal effect of liners on drift-wall emissivity—a conclusion that Nevada does not challenge. *Id.* at 278.

Not having cited any scientific or factual materials to support its so-called factual assertions, Nevada thus makes a variety of unsubstantiated claims about the possible performance of the rock bolts in the ground support system. First, Nevada's entire contention is premised on the assumption that despite the ventilation of the drifts for the expected 100-year preclosure period, *see* SAR at 1-3, 1.3.1-2, 1.3.1-3, water introduced into the bolts during their installation will remain in the rock bolts for a significant period of time. Petition at 278. Nevada offers no scientific or factual materials to support this assertion, leaving the entire premise of the contention unsubstantiated.

Second, Nevada makes the equally unsupported assertion that the "rock bolts will affect heat transfer from the drifts" and "facilitate heat transfer into the rock." Petition at 278. Nevada then hypothesizes that each rock bolt "may act as a small-scale heat pipe" that will cause water to be boiled at the drift wall end and then to condense at the deeper end in the drift wall, eventually dripping back to repeat the cycle. *Id.* Nevada makes these assertions about the performance of the rock bolt without citing any technical references, documents, or expert affidavits. Thus, these assertions are nothing more than attorney argument, and therefore do not satisfy the requirements of section 2.309(f)(1)(v).

Third, Nevada draws a speculative conclusion about the impact of the rock bolts on the modeling. Nevada claims that the rock bolts "have the *potential* to change the heat distribution around the emplacement drifts, gas phase movement, and saturation patterns in the drift wall rocks." Petition at 278 (emphasis added). Again, however, Nevada cites no technical references and provides no analysis or calculations to substantiate this conclusion. Yet, that is exactly what Nevada was required to do in order to meet its burden of establishing that this contention is admissible. *See Dominion Nuclear Conn.*, CLI-08-17, 68 NRC \_\_\_\_ (slip op. at 11). Nevada is

not entitled to adjudication of a contention such as this, where arguments of counsel are substituted for the requisite references to documentation or expert opinion.

Fourth, there are three, boilerplate expert affidavits that “adopt” this contention, but they are wholly inadequate. *See* Petition Attachment No. 3 ¶ 6, Attachment No. 10 ¶ 5, and Attachment No. 21 ¶ 5. These one-page affidavits contain no reasoning or substantive discussion whatsoever. The inadequacy of these affidavits is underscored by the fact that the contention itself does not even mention them. Nevada’s failure to cite supporting scientific or factual materials in the contention cannot be salvaged by these paltry affidavits. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006).

Finally, the contention challenges DOE’s conclusion that rock bolts, like other man-made, small scale items in the ground support systems for the emplacement drifts, will not affect the outcome of the modeling. *See* Petition at 279. While admitting that rock bolts are part of the ground support system, *id.* at 278, the contention implies that rock bolts should be treated differently than other aspects of the ground support system simply because of the sheer number of rock bolts expected to be used. *Id.* at 276 (referring to hundreds of thousands of rock bolts); *Id.* at 278 (referring to thousands of rock bolts). Yet, Nevada offers no data, studies, or scholarly references to show that DOE’s assumptions about the ground support system in general would not apply to the rock bolts. Once again, because of Nevada’s failure to provide any support for its position, the contention must be dismissed.

In summary, the contention does not identify any documents or expert opinion to support it and is therefore inadmissible.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention also must be dismissed because it does not establish that a genuine dispute exists with DOE on a material issue of law or fact.

First, as noted above, the contention alleges that DOE ignored the impact of ground support items, and rock bolts in particular, on the modeling outcome. It clearly is not the case that DOE ignored either ground support items generally, or rock bolts in particular. In fact, the contention admits that DOE concluded that man-made, small-scale features such as ground support items have little or no effect on the outcomes of the modeling. Petition at 279.

Moreover, The “Features, Events, and Processes [FEPs] for the Total System Performance Assessment: Analyses” (LSN# DEN001584824) is replete with FEPs relating to the ground support system, as well as the rock bolts, and shows unequivocally that DOE analyzed the various aspects of the ground support system, including the rock bolts.

For example, regarding FEP 1.1.01.01.0B, which pertains to “Influx Through Holes Drilled in Drift Wall or Crown,” DOE considered the “boreholes drilled through the walls of emplacement drifts [that] are designed for rock bolts and ground support.” LSN# DEN001584824 at 6-24. Similarly, FEP 1.1.07.00.0A, addresses the “repository design,” including the EBS, the ground support system, rock bolts, steel liner, cement, and wire mesh. *Id.* at 6-48. It analyzed the “the ways in which the design influences the evolution of the in-drift environment.” *Id.* at 6-47. Yet another example is FEP 2.1.06.02.0A, “Mechanical Effects of Rock Reinforcement Materials in EBS.” *Id.* at 6-509. Here, DOE screened the degradation of rock bolts, as well as wire mesh and other materials used in ground control that may affect the long-term performance of the repository. *Id.* In FEP 2.1.06.04.0A, DOE analyzed the “Flow Through Rock Reinforcement Materials in EBS,” including the possibility that groundwater may

occur flow through the ground support materials (*e.g.*, wire mesh, rock bolts, and grout). *Id.* at 6-512. In each of these instances, DOE conducted a rigorous screening analysis and determined that the FEP either needed to be included or could be excluded from the TSPA. Thus, Nevada cannot claim credibly that DOE “ignored” ground support items, including the rock bolts. Indeed, the contention itself cites DOE’s consideration of Bernold-type liners. Petition at 278.

Second, Nevada claims that “if any water remains inside [the rock bolts]” after being installed with high-pressure water, the bolts may act as “a small-scale heat pipe.” Petition at 278. Based on this scenario where water remains in the rock bolt, Nevada posits that the water in the rock bolts will boil and then condense, and that this cycle will repeat. *Id.* This entire argument is premised on Nevada’s unsupported view that water might be sealed in the rock bolts after installation, but in fact the rock bolts will left open after installation. *See* “Ground Control for Emplacement Drifts for LA” (July 2007) LSN# DN2002491254 at Figure 6-30. Thus, Nevada does not raise a genuine dispute of material issue of law or fact about whether the rock bolts will act as small scale heat pipes.

Third, Nevada argues that the rock bolts in the ground support system for the emplacement drifts “have the potential to change the heat distribution around the emplacement drifts, gas phase movement, and saturation patterns in the drift wall rocks.” Petition at 278. According to Nevada, DOE’s failure to take into account these “potential” effects of the rock bolts renders “incorrect” DOE’s multi-scale thermal-hydrologic model (which models the movement of heat and mass from the in-drift to the mountain scale).

Nowhere in the contention, however, does Nevada quantify this “potential change” or even allege that the change would have a material effect on the accuracy of the multi-scale thermal-hydrologic model. The multi-scale thermal-hydrologic model takes into account

uncertainty and variability in rock thermal conductivity and percolation flux. See SAR figure 2.3.5-32 at 2.3.5.-214; see also “Multiscale Thermahydrologic Model” (July 2005), LSN# DEN 001575312 at 6.3.16[a]. Nevada has not argued, much less shown, how the rock bolts would have any material impact on the outcome of the model in light of the variabilities and uncertainties that the model includes. Nor has Nevada shown that the rock bolts would have any adverse effect on the EBS. Indeed Nevada could not make such a claim because, according to the risk sensitivity analysis of the TSPA results, host rock thermal conductivity is identified as a “key uncertain input” only for the early failure of waste package scenario. See “Total System Performance Assessment Mode/Analysis for the License Application,” LSN# DEN001579005, at Table K9-1[a], p. K-35[a]). In turn, the early failure of waste package scenario contributes only a very small fraction of the total dose. See SAR Figure 2.4-18, p. 2.4-432 (drip shield and waste package early failure cases combined).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, the contention fails to raise a genuine dispute of a material issue of fact or law and must be dismissed.

**49. NEV-SAFETY-49 - Models Of Fluid Movement In The Unsaturated Zone**

SAR Subsections 2.3.2 and 2.3.5.3, and similar and related subsections, which state or assume diametrically opposed methods of aqueous fluid movement in the unsaturated zone, are inconsistent with each other and will give rise to different chemical results for seepage waters that may contact the engineered barrier systems at some future time.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of Nevada's Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must

make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that the petitioner must show that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3c *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing flow in the UZ is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

As discussed in more detail below in Subsection (f), the issue raised by this contention does not materially affect the results of the calculation of flow in the UZ.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. §

2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Don L. Shettel, Adrian Butler, and Adrian Bath) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention asserts that SAR Subsection 2.3.5.3 (which assumes plug flow in the Topopah Spring Tuff (TSw)) is inconsistent with SAR Subsection 2.3.2, which assumes that the predominate method of flow in the TSw is fracture flow. Petition at 281. This assertion does not establish a genuine issue of material fact.

The contention correctly states that SAR Subsection 2.3.2 assumes that flow in the TSw is predominately fracture flow (which differentiates between flow in the rock fractures versus flow in the rock matrix), and that SAR Subsection 2.3.5 assumes plug flow in the TSw (which does not discriminate between fracture and matrix flow and instead assumes equilibrium between the water in the fracture and matrix). SAR at 2.3.5-23. However, there is nothing inconsistent in these different assumptions. The purpose of SAR Subsection 2.3.2 is to describe the calculation of the flow in the UZ. In contrast, the purpose of SAR Subsection 2.3.5.3 is to describe the calculation of chemistry of the water seeping into the drift. Nevada does not identify anything inappropriate in assuming plug flow for the purposes of calculating water chemistry, and fails to

recognize that the discussion in SAR Subsection 2.3.2 is not intended to assess the chemistry of seepage water.

In this regard, SAR at 2.3.5-30 shows that there is compositional equilibrium between the matrix and matrix-fracture waters, which supports the use of plug flow for the purpose of calculating water chemistry. Nevada does not dispute that conclusion in the SAR. Therefore, the contention does not establish a genuine issue of material fact.

Furthermore, SAR at 2.3.5-43 and 44 explain that the plug flow model is a simplification of the fracture flow model used in SAR Subsection 2.3.2. Transport times simulated using matrix-fracture flow and calculated from plug flow showed minor differences. Thus, contrary to Nevada's assertions, the modeling of flow and transport in SAR Subsections 2.3.2 and 2.3.5.3 is not inconsistent. The contention does not dispute or even address this discussion in the SAR.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 285. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially asserts that DOE must show that Nevada's contention is not material. This assertion constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* Section V.A.3 of the Answer for a more detailed discussion of this position.

In summary, this contention does not establish a genuine issue of material fact.  
Therefore, the contention should be rejected.

**50. NEV-SAFETY-50 - Alternative Discrete Fracture Flow Models**

SAR Subsection 2.3.2.3 and similar subsections demonstrate that DOE has not used discrete fracture network models, which are in common use for representing water flows and radionuclide transport in fractured rocks in the context of postclosure performance assessments; as a consequence, the DOE approach introduces a bias into the TSPA because flow focusing and peak flow rates are underestimated whereas transport distances and times are overestimated.

**RESPONSE**

In this contention, Nevada argues that the LA improperly utilizes a dual porosity conceptual model rather than discrete fracture network (DFN) models to determine water flow and radionuclide transport in fractured rocks in the unsaturated zone, and that accordingly, the LA underestimates the degree of flow focusing and maximum seepage flux through the repository, thereby introducing a bias into the TSPA.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada alleges that DOE's failure to use a DFN model to analyze water flow and radionuclide transport in fractured rocks ultimately results in underestimation of flow focusing and peak flow rates. In an attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.31(a)(3), 10 C.F.R. §63.21, 10 C.F.R. §63.21(c)(3)(ii), 10 C.F.R. §63.21(c)(14), 10 C.F.R. §63.102(h), 10 C.F.R. §63.113, and 10 C.F.R. §63.114). *See* Petition at 286-87. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2),

“because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing water flow through the unsaturated zone is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit

being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada claims that DOE's application of the dual porosity conceptual model rather than DFN models to unsaturated zone flow is improper because the dual porosity model improperly relies on assumptions and does not adequately represent the physical characteristics of the unsaturated zone at Yucca Mountain. Nevada, however, does not provide the requisite supporting facts, expert opinion, or references in support of its contention. Accordingly, this contention must be dismissed.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the LA and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach two affidavits (by Adrian P. Butler and Stephan K. Matthäi), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada argues that DOE improperly failed to utilize DFN models in analyzing water flow and radionuclide transport in the unsaturated zone, resulting in underestimation of flow focusing and peak flow rates and overestimation of transport times and distance, thereby introducing a bias into the TSPA. As shown below, however, Nevada fails to raise a genuine dispute of material fact or law, because it fails to demonstrate that the dual porosity conceptual model is inadequate to analyze fracture flow and solute transport in the unsaturated zone, and because it fails to show that use of DFN models would lead to a materially different result. Accordingly, this contention must be dismissed.

Nevada claims that the models used in the LA “substantially underestimate[] the degree of flow focusing and the maximum seepage flow through the repository and therefore underestimate[] the dose to the RMEI.” Petition at 290. Nevada does not, however, allege or demonstrate that use of DFN models will show that the LA has inadequately analyzed flow in the unsaturated zone and that, as a result, the repository cannot comply with performance requirements. While failing to specifically criticize the dual porosity model or demonstrate that it is inadequate, Nevada alleges that use of DFN models would lead to more accurate results. Nevada may not rely, however, on a mere allegation that other models are available or that other models might lead to other results as the basis for its claim that the model used by DOE is inappropriate. Because Nevada fails to demonstrate that DOE’s use of the dual porosity conceptual model is improper, this contention must be dismissed. As a licensing board has ruled in another proceeding, the mere fact that a model may not provide completely accurate results, or

does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). A contention challenging the use of a model, in order to be admitted, must show that the model used is defective or incorrect for the purpose used, that the model was used incorrectly or that the model recommended by the petitioner is superior. *Duke Energy Corp.* (McGuire Nuclear Station, Units 1 and 2; Catawba Nuclear Station, Units 1 and 2), LBP-03-17, 58 NRC 221, 229 (2003), *aff'd on other grounds*, CLI-03-17, 58 NRC 419 (2003). Here, Nevada has failed to make any of those showings. Nevada fails to show that the model DOE uses is defective or incorrect for the purpose used.

Nevada argues that the “dual porosity (DP) abstraction of fracture flow that DOE uses to assess infiltration . . . underestimates flow focusing and peak flow rates and overestimates transport distances and times.” Petition at 287. Nevada then claims that “[d]iscrete fracture network (DFN) models are available that could overcome these deficiencies and avoid use of the assumptions associated with volume averaging that the DP approach relies on.” Petition at 288. In doing so, Nevada fails to allege, much less demonstrate, that DOE’s failure to utilize DFN models would result in a mean dose to the RMEI that exceeds regulatory limits. Instead, Nevada merely claims that the model Nevada alleges that DOE uses “underestimates the dose to the RMEI.” Petition at 290.

Furthermore, the conceptual models utilized in the LA to analyze water flow and radionuclide transport in fractured rocks is based on conservative assumptions. SAR § 2.3.2.6 at 2.3.2-97. Specifically, the “dual-permeability modeling approach . . . leads to increased flow and transport in the fractures, and shorter radionuclide transport times to the water table” than “is indicated by geologic and geochemical data and observations of past flow.” *Id.* Thus, contrary

to Nevada's assertions, the model used by DOE actually overestimates both water flow and radionuclide transport. The existence of concerns about the reliability of a model does not preclude the use of a model, provided that the analysis is performed in a conservative manner and margins of safety exist. *See Cleveland Electric Illuminating Co. (Perry Nuclear Power Plant, Units 1 and 2)*, LBP-85-35, 22 NRC 543-44, 550 (1985). Because DOE's use of dual-permeability modeling in analysis of unsaturated zone flow is conservative, this contention must be dismissed.

Moreover, the LA demonstrates that the modeling approach taken by DOE was appropriate. As an initial matter, contrary to Nevada's claim, DOE does not actually use a dual porosity conceptual model to represent water flows and radionuclide transport in fractured rocks. *See SAR § 2.3.2.1 at 2.3.2-5, 2.3.2.4.1.2.1 at 2.3.2-46.* Instead, it uses a dual-permeability model, which appropriately considers global flow within the matrix continuum, thereby more accurately capturing overall flow and transport processes in fractured rock. Nevada alleges that "DFN models were not considered because of a scarcity of information on fracture geometry and hydrologic properties on the scale of individual fractures, citing to the section of the SAR analyzing water seepage into emplacement drifts," SAR § 2.3.2.4.1.1.2 at 2.3.2-42. Petition at 289. As the LA demonstrates, and contrary to Nevada's claim, DOE considered discrete fracture network methods, but found them to not be "suitable for large-scaled fractured systems . . . such as the Yucca Mountain unsaturated zone. *Id.* Indeed, "the simplicity of the continuum conceptual model [in light of consistent results in a study that compared a DFN model and simplified calibrated fracture continuum model] is considered an advantage over the complexity of the discrete-fracture network model." SAR § 2.3.3.2.3.7.1 at 2.3.3-47.

Finally, Nevada essentially admits, in paragraph 6 of this contention, that it does not know whether this contention raises a genuine dispute of a material issue: allegedly due to the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions” (Petition at 291), Nevada has not determined what effect the contention would have on dose. Yet Nevada bears the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), including showing that the contention raises a genuine dispute of an issue material to this proceeding. *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Because it has not done so, the contention should be dismissed. Nevada’s position constitutes an improper attempt by Nevada to shift its burden to DOE, and provides an additional basis for rejection.

For the reasons stated above, there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and this contention must be dismissed.

**51. NEV-SAFETY-51 - Potential Convective Self Organization Of 2-Phase Flow**

The simulation grids used in the mountain-scale thermal-hydrologic seepage model (see SAR Subsections 2.3.2 and 2.3.3.3.1, and similar subsections; see also Wu, Y.S.; Mukhopadhyay, S.; Zhang, K.; and Bodvarsson, G.S. (2006), “A Mountain-Scale Thermal-Hydrologic Model for Simulating Fluid Flow and Heat Transfer in Unsaturated Fractured Rock,” JOURNAL OF CONTAMINANT HYDROLOGY, Vol. 86 at 128-159, Fig. 2 are too coarse to capture the spatial self-organization and accompanying localization of single and two-phase (steam and condensed water) flow which is likely to occur in the thermal loading phase of the repository.

**RESPONSE**

Nevada argues that numerical grids used for certain simulations described in SAR Subsections 2.3.2 and 2.3.3.3.1 and similar subsections, which describe the mountain-scale thermal-hydrologic seepage model, is inadequate, because the model is discretized too coarsely to capture the spatial self-organization and accompanying localization of single and two-phased flow that Nevada believes are likely to occur during the thermal phase following repository closure.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada alleges that the numerical grids used in DOE's thermal-hydrologic seepage model are too coarse to capture flow and saturation patterns and flow localization expected following repository closure. But Nevada is silent as to how such purported modeling "inconclusive[ness]" would result in DOE failing to comply with 10 C.F.R. Part 63. Therefore, Nevada has not demonstrated why this proposed contention – even if true – would be material to the findings the NRC must make in this proceeding.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.31(a)(3), 10 C.F.R. §63.21, 10 C.F.R. §63.21(c)(3)(ii), 10 C.F.R. §63.21(c)(14), 10 C.F.R. §63.102(h), 10 C.F.R. §63.113, and 10 C.F.R. §63.114. *See* Petition at 293. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2 and 3), CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be

read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing water flow through the unsaturated zone is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as

mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada claims that the TSPA thermal-hydrologic model is “discretized too coarsely to capture the two-phase flow and saturated patterns and the localization of the flow” expected during the thermal phase after closure of the repository. Petition at 295. Nevada, however, does not provide the requisite supporting facts, expert opinion, or references in support of its contention. Nevada also cites a number of technical papers without indicating where in those papers its positions are supported. As such, those documents are no more than background information. Accordingly, this contention must be dismissed.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the LA and DOE’s

supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach two affidavits (by Adrian P. Butler and Stephan K. Matthäi), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada asserts that the TSPA mountain-scale thermal-hydrologic seepage model is too coarse to capture the spatial self-organization and localization of single and two-phase flow or the convective circulation in the plane of permeable faults. Nevada's claims, however, are vague and unsupported. Nevada may not rest its claim on such assertions that do not allege or demonstrate that any purported inadequacies in mountain-scale thermal-hydrologic model will have any effect on repository performance or dose. Accordingly, this contention fails to raise a genuine dispute of fact or law and must be dismissed.

Nevada does not assert, much less demonstrate, that its claimed "inadequacies" will have any effect on repository design or performance. Nowhere in this contention does Nevada specifically address what will happen if DOE relies on a "spatial resolution of 81 m" or if localized flow and self-organized saturation patterns are not "resolved in three dimensions." Petition at 294. Instead, Nevada provides unsupported allegations about the model's coarseness

that fail to allege what effect, if at all, this would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Nevada's unsupported assertions challenging DOE's mountain-scale thermal-hydrologic models are an insufficient basis for rejecting the model. In particular, the contention does not allege or demonstrate that the use of a different or more discretized method would result in more accurate modeling of the mountain-scale and would lead to conclusive results.

Nevada does not allege that DOE's modeling is not consistent with the reasonable expectation standard discussed in section V.A.3.C. The burden is on Nevada to determine what effect, if any, acceptance of their contention would have on dose to the RMEI. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Nevada has alleged only that the mountain-scale thermal-hydrological simulation grids are too coarse, failing to allege or demonstrate that the models are inconsistent with the reasonable expectation standard. In neglecting to do so, Nevada fails to raise a genuine dispute of material fact or law.

Nevada claims that the mountain-scale submodel component of the multiscale thermal-hydrologic TSPA model, “refined to a most detailed spatial resolution of 81 m,” is too coarse to capture the two-phase flow and saturation patterns and localization of flow. Petition at 294.

Nevada further claims that higher resolution thermal-hydrological simulation models exist only at the two-dimensional level, but that these models do not represent first-order heterogeneities and other instabilities “need[ed] to be resolved in three dimensions.” *Id.*

These claims fail to raise a genuine dispute of material fact or law. Thermal-hydrologic modeling at Yucca Mountain is divided into one-, two-, or three-dimensional approaches as required for detail. *See* “Multiscale Thermohydrologic Model,” January 29, 2008, LSN# DEN001575312 at Section 6.2.1. As a consequence, DOE can adequately assess the three-dimensional nature of the heated repository footprint, mountain-scale heat flow, and in-drift components of the engineered barrier system (EBS). More efficient two-dimensional models are used to model thermal-hydrologic parameters in detail, up to several grid elements per meter, within the emplacement drifts and adjoining host rock.

The 81 m spatial resolution of the mountain-scale submodel of the multiscale thermal-hydrologic model refers to the smeared-heat-source, mountain-scale, thermal-conduction submodel grid discretization. *See* “Multiscale Thermohydrologic Model,” January 29, 2008, LSN# DEN001575312 at Section 6.2.5. This submodel discretely represents each emplacement panel and each emplacement drift by using rows of heated gridblocks that are 20 meters in the longitudinal direction, 81 meters perpendicular to the drift axis, and 6 meters thick in the vertical direction. *See id.* at 6.2.5.1. As such, contrary to Nevada’s claim, this submodel is adequately refined for its intended purpose, and is complemented by more finely meshed submodels with appropriate discretization for their intended purposes.

Furthermore, Nevada's claim that the higher resolution thermal-hydrologic simulation models and simulation results exist only in two-dimensions and therefore do not contain first-order heterogeneities like faults is incorrect. As explained in 6.2.1.2 of "Drift-Scale Coupled Processes (DST and TH Seepage) Models," the use of two-dimensional representation of the drift-scale thermal-hydrologic processes used in the thermal-hydrologic seepage model is adequate for its intended analysis of thermal seepage. "*Drift-Scale Coupled Processes (DST and TH Seepage) Models*," MDL-NBS-HS0-000015 REV 02, LSN# DN2001895599.

As explained in Section 6.1 of "Mountain-Scale Coupled Processes," this three-dimensional mountain-scale model uses a coarse grid with spatial resolution of 81 m at the repository horizon. See "Mountain-Scale Coupled Processes," August 24, 2005, MDL-NBS-HS-000007 REV 03, LSN#s DN2002186537 and DEN001592615 at Section 6.1. This resolution better represents the expanded domain the model provides, and because its intended use is limited to the analysis of far-field effects, its use is appropriate.

For the reasons stated above, there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and this contention must be dismissed.

**52. NEV-SAFETY-52 - Ebs And Near-Field Modeling Approach**

SAR Subsection 2.3.3 and similar subsections describe a sequential and unidirectional linked modeling approach for the engineered barrier system and near-field that is untenable because that modeling approach suppresses emergent behavior and ignores the influence that coupled repository processes have on one another.

**RESPONSE**

This contention claims that DOE's approach for modeling seepage, thermal seepage, and seepage composition, described in "SAR Section 2.3.3 and similar subsections," in its performance assessment for the engineered barrier system and near-field is "untenable" because DOE ignores couplings that are important to predicting these responses. Petition p. 297. This contention must be dismissed for the reasons set forth below.

**a. Statement of Issue of Law or Fact to be Controverted**

Sections 1 and 5 of the contention mention SAR subsections 2.3.3, and similar subsections. This description is unduly broad because SAR Section 2.3.3 addresses the engineered barrier system and near-field modeling approaches throughout 150 pages. Moreover, Nevada does not specify what process interactions are at issue. As a result, Nevada has not met the pleading specificity requirements of 10 C.F.R. § 2.309(f)(1)(i) and the related obligations of the June 20, 2008 Case Management Order. Accordingly, this contention should be dismissed.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp. (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).*

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be

disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing. Indeed, Nevada has not established how the contention’s resolution would make a difference in the outcome of the proceeding. Nevada has not demonstrated that DOE’s modeling approach underestimates seepage, or the effect of seepage on corrosion.

The method the DOE used in addressing seepage, thermal seepage, and seepage composition for the engineered barrier system and near-field is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are

immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

The contention also does not allege, even qualitatively, that the use of a different method would result in more accurate modeling of seepage, thermal seepage, and seepage composition in the engineered barrier system and near-field. If Nevada believes that analysis would show that DOE’s modeling is not consistent with the reasonable expectation standard, the burden is on Nevada to do so, as well as determine what effect, if any, acceptance of their contention would have on dose to the RMEI. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Not only has DOE been conservative in its modeling approach, as discussed in section (f) below, but also Nevada ignores the demonstration of the conservatism presented by DOE in SAR Section 2.3.3.3 (discussing the thermal seepage model, its abstraction, and supporting information) and in SAR Section 2.3.5.2 (discussing additional basis information

for chemical coupling). Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) the contention contains unsupported assertions of counsel; and (2) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (Adrian P. Butler and Stephan K. Matthäi), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation. Furthermore, although Nevada cites five documents, as discussed below, three of the documents do not actually support the statement for which they are cited, and the other two documents are used to support statements that are not related to the subject of the contention.

As mentioned, Nevada cites five documents. As an initial matter, Nevada does not cite any particular paragraph or page of any of these references. The page ranges provided simply indicate the first and last page of the respective report. Such vague references to documents are not permissible. Rather, a petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989).*

Three of the citations immediately follow the below statements from Paragraph 5 of the contention:

Furthermore, many of the laboratory findings and numerical modeling results obtained for small-scale flow processes at Yucca Mountain point to process interdependencies that are inconsistent with how these processes are abstracted in the most-recent TSPA models. Examples of such small-scale processes include vaporizing water flow [citing Pruess, K. (1997)...] [and] gravity-driven infiltration instabilities in the fractures [citing Nicholl, MJ et. al. (1994) ...] and film flow [citing Tokunaga, T.K. et. al. (2000)].

Petition at 299. The fair reading of this passage is that Nevada cites these three documents as examples of works describing “small-scale flow processes at Yucca Mountain.” Yet, none of these documents present or describe the experimental or research activities at Yucca Mountain, and only one of the references, “On Vaporizing Water Flow in Hot Sub-Vertical Rock Fractures,” *Transport in Porous Media* (Pruess, 1997), even mentions Yucca Mountain. Yet, the author of that document indicates that Yucca Mountain was not the subject of research. Rather, “[o]ur main focus is on water injection into vapor-dominated geothermal systems but we also present results for conditions applicable to the nuclear waste isolation problem.” *Id.* at 339. Indeed, the author acknowledges difficulties existed using their simulation for the nuclear repository case, stating that “the present series of simulations is more difficult than the geothermal injection problem.” *Id.* at 356. The author also notes the substantial physical differences between the geothermal case and a waste repository, indicating that “[i]n the geothermal injection problem, vaporizing flow of water down fractures occurs at relatively high rates, typically 10-100 kg/s, and at temperature and pressure conditions in the range of (T, P) ~ (240°C, 10 bar),” while “[i]n the nuclear waste problem, flow rates in individual water seeps are expected to be orders of magnitude smaller than for geothermal injection, and relevant

temperature and pressure conditions are more modest, typically around (T, P) ~ (100°C, 1 bar).”  
*Id.* at 337.

Finally, the value the author used to simulate seepage is orders of magnitude beyond that which could realistically occur at Yucca Mountain. SAR Fig. 2.3.3-47 shows seepage rate per waste package 10, 30, 50 and 90 percent infiltration scenarios for the four time periods of interest (*i.e.*, present day, monsoon, glacial, and post-10,000 years). The highest value is the 90th percentile in the monsoon climate at 500 kg/yr ( $1.6 \times 10^{-5}$  kg/s) per waste package. At 356 of the cited paper, the author identifies the input for the simulation of a waste repository:

Water with an enthalpy of 100.4 kJ/kg, corresponding to a temperature of approximately 24°C, is then injected into the fracture at a constant rate of  $3.169 \times 10^{-3}$  kg/s (approximately 2741 per day). Although no field data are available to support this choice of seepage rate, it is believed to be reasonable and in fact quite modest, given the large rates at which vaporization and condensation would occur from the waste heat. For example, a single multi-purpose canister (MPC) with a thermal power of approximately 14 kW at emplacement (Saterlie et al., 1996) could vaporize water at a rate of approximately 461 kg per day. This vapor would be driven away towards cooler rock and subsequently condense at some distance from the heat source.

Using the author's assumption of 274 L/day of water into a vertical fracture of 20 m horizontal length, and assuming a fracture spacing of about 0.5 m and only one vertical fracture set, the injection rate compares to a downward flux of about 10,000 mm/year ( $274 \times 365 / (0.5 \times 20)$ ). This about *1,000 times higher than the approximate ambient percolation at Yucca Mountain*. The maximum downward fluxes for Yucca Mountain, as shown in Figures 6.3.2.1-5 and 6.3.2.1-7 of BSC, *Drift-Scale Coupled Processes (DST and TH Seepage) Models*, MDL-NBS-HS-000015 REV 02, at Fig. 6.3.3-3, p. 6-152 (LSN# DN2001895599) (2005), are only up to 12 or 13 times higher than the average ambient percolation, *much less than the assumed fluxes in the Pruess document*. Interestingly, running the author's simulation at a low injection rate, which is more

applicable to Yucca Mountain, supports the DOE's model (*i.e.*, vaporization of water flowing through the rock into the heated zone):

In an effort to gain a better understanding of the interplay of fluid flow and heat transfer processes in injection plumes, we now focus on the simpler problem of low-rate injection into homogeneous fractures. A series of numerical experiments was carried out in which water was injected at rates 3.2 - 25.4 gls into homogeneous anisotropic fractures of 20 m vertical and 14 m horizontal extent. ... At the low injection rates used here, most of the injected fluid is vaporized.”

*Id.* at 361.

Nevada does reference two additional documents in the contention. *See* Petition p. 300. However, these are cited simply to support its assertions that anthropogenic <sup>36</sup>Cl was discovered near a fault in the repository, and that DOE at times has re-examined its model. Neither of these statements relate to the subject of this contention and, therefore, are not material to whether or not Nevada's support is adequate.

Finally, the contention includes numerous conclusory statements that have no basis and, therefore, do not provide sufficient support for admissibility under NRC rules of practice. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006). For example, Nevada states:

During the thermal phase of the repository, steam/moist air is *likely* to convect in the fractured rock mass surrounding the emplacement drifts, and where this steam condenses it can bring the seeping water to boiling, changing its path. Additionally, moisture from below the drifts *may become* entrained into this circulation, locally increasing the seepage flux. All such instabilities, which will increase in magnitude with time, and the resulting process interactions, are suppressed by DOE's sequential modeling approach and abstraction of the seepage flux which prescribes process linking as opposed to letting it evolve as an emergent coupled feature of the model.

Petition p. 299 (emphasis added). Nevada provides no references to support the above speculative statements. Indeed, contrary to Nevada's claim that such "instabilities" will increase in magnitude, thermally driven processes, such as unsteady flow in fractures, will in fact decrease with time as the heat output of the repository diminishes." SNL, "Multiscale Thermohydrologic Model," REV 03 AD 02, at Section 6.1.2, pp. 6-5 to 6-6 (LSN# DEN001575312)(2008).

Nevada also provides no reference to relevant scholarship or other basis for its claim that:

[i]n an appropriate fully coupled engineered barrier system and near-field model, the vigorous recirculation of liquid water and steam would strongly alter the composition and amount of water interacting with the engineered barriers. Corrosion would be enhanced and flows of water and steam into the degraded waste packages *could be* increased leading to increases in radionuclide releases and doses to the RMEI.

Petition p. 300 (emphasis added). Nevada does not explain this conclusory assertion. Even had this been provided by an expert, it is precisely the type of "expert opinion" that the Commission has repeatedly rejected as inadequate "because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion" as it is alleged to provide a basis for the contention. *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (emphasis added) (quoting *Private Fuel Storage, L.L.C. (Independent Fuel Storage Installation)*, LBP-98-7, 47 NRC 142, 181 (1998), *aff'd on other grounds*, CLI-98-13, 48 NRC 26 (1998)).

For the reasons set forth above, Nevada has not satisfied the requirements of Section 2.309(f)(1)(v), and the contention should be dismissed.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada's claim articulated in this contention is not material, and that Nevada has failed to proffer adequate factual support or expert opinion.

Accordingly, Nevada's claim of noncompliance with 10 C.F.R. § 63.114(a)-(b) and (f) also does not raise a genuine dispute of material fact or law. The contention's arguments also raise no genuine dispute of material fact or law for the reasons set forth below.

First, Nevada has not correctly characterized the Application. Nevada incorrectly claims that the DOE model suppresses "emergent behavior" and ignores coupled process effects on seepage occurrence and magnitude. That is not accurate. The thermal seepage model (SAR Section 2.3.3.3) consists of a family of process-level numerical simulations, and an abstraction that bounds the seepage responses from these simulations. The simulations combine spatially heterogeneous permeability and calibrated hydrologic properties from the ambient seepage model (SAR Section 2.3.3.2) with thermal loading. A wide range of percolation flux boundary conditions were simulated. Liquid water reflux associated with a boiling zone in the host rock above the drifts is a common feature of these simulations. BSC, "Drift-Scale Coupled Processes (DST and TH Seepage) Models", MDL-NBS-HS-000015 REV 02, at Fig. 6.3.3-3, p. 6-152 (LSN# DN2001895599) (2005). The process-level simulations also included convection of steam and air, condensation, and boiling. SAR Fig. 2.3.3-42, p. 2.3.3-140. Therefore, this bounding approach does *not* suppress process interactions.

As discussed in the previous section, not only was it erroneous for Nevada to allege that DOE's process-level simulations are inconsistent with the cited laboratory studies, but also DOE in fact addressed the potential for unsteady flow suggested by these physical model studies. To evaluate the effect of episodic flow on thermal seepage, thereby addressing the potential for unsteady flow, the thermal seepage model supporting information (SAR Section 2.3.3.3.3.2, pp. 2.3.3-65 to -67) includes comparison with an alternative conceptual model of episodic liquid water flow in fractures in superheated rock. Results from the alternative model confirm that

refluxing of condensate water above the drifts does not result in seepage when the drift crown is above 100°C because of the combined effects of vaporization and capillary diversion. *Id.* at p. 2.3.3-66.

The contention also incorrectly implies that DOE's thermal seepage model does not include reflux (or counterflow of steam and liquid water), and suggests that DOE has not appropriately evaluated the effects from reflux on the amount and composition of seepage. *See* Petition p. 300. However, SAR Section 2.3.5.2.3 (pp. 2.3.5-17 through -20) evaluates both of these behaviors. In fact, DOE's extensive analysis of thermally driven, thermal-hydrologic-chemical (THC) coupled processes has shown that: (1) the residual effects from plugging of porosity by mineral precipitation, on the occurrence frequency and magnitude of seepage, are insignificant, and (2) the composition of seepage when it can occur after the thermal period, is dilute. As another licensing board has recently ruled, a mischaracterization of the application does not establish a genuine issue of material fact. *Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (Sept. 12, 2008), slip op. at 39.

As discussed in Section V.A.3 above, contentions expressing only generalized "uncertainties" in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from this deficiency.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the seepage, thermal seepage, and seepage composition properties at the proposed repository site or to specifically state the radiological impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada's claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or

alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

**53. NEV-SAFETY-53 - Application Of The Fracture Matrix Dual Continuum Model To All Unsaturated Zone Flow Processes**

In SAR Subsection 2.3.2.3 and similar subsections, DOE states that fluid flow in the fractured rock at Yucca Mountain is modeled using the dual continuum idealization in conjunction with the Van Genuchten relative permeability/capillary pressure model for the fractures, but experimental studies show that multiphase fluid flow through larger aperture fractures cannot be described by this model and this calls into question all of DOE's conclusions regarding in-drift seepage and infiltration rates.

**RESPONSE**

Nevada argues that DOE's application of the dual continuum model to unsaturated zone flow processes in SAR Subsection 2.3.2.3 and similar subsections is inadequate because multiphase fluid flow through larger aperture fractures cannot be adequately described by the Van Genuchten (VG) relative permeability/capillary pressure model for fractures, calling into question DOE's conclusions regarding in-drift seepage and infiltration rates.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada alleges that the application of the dual continuum model to unsaturated zone processes is inadequate because the model is deficient in capturing multiphase fluid flow through fractures, and that the VG model is unable to “deal with” fingering in fracture planes. Petition at 303. Nevada claims that accordingly, DOE's analysis of in-drift seepage and infiltration may be inadequate. But Nevada is silent as to how such purported underestimation would result in DOE failing to comply with 10 C.F.R. Part 63. Therefore, Nevada has not demonstrated why this proposed contention -- even if true -- would be material to the findings the NRC must make in this proceeding.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.31(a)(3), 10 C.F.R. §63.21, 10 C.F.R. §63.21(c)(3)(ii), 10 C.F.R. §63.21(c)(14), C.F.R. §63.102(h), 10 C.F.R. §63.113. and 10 C.F.R. §63.114(g)). *See* Petition at 302. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2 and 3), CLI-99-11, 49 NRC 328, 333 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would

make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing water flow through the unsaturated zone is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or

cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada claims that DOE’s application of the dual continuum model to unsaturated zone flow processes and use of the VG model are inadequate to show multiphase flow through fractures and to assess fingering in fractures, and that infiltration and in-drift seepage rates provided by DOE may be incorrect. Nevada, however, does not provide the requisite supporting facts, expert opinion, or references in support of its contention. Accordingly, this contention must be dismissed.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the LA and DOE’s supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach two affidavits (by Adrian P. Butler and Stephan K. Matthäi), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As previously discussed in Section d, Nevada argues that the use of the dual continuum model to the unsaturated zone process in conjunction with the VG relative permeability/capillary pressure model is inadequate in analyzing multiphase fluid flow, and that the VG-based Yucca Mountain model inadequately assesses fingering in fracture planes. Nevada alleges that accordingly, the in-drift seepage and infiltration rates predicted by DOE may be too low. This contention fails to raise a genuine dispute of material fact or law. As shown below, the LA explains that these models adequately analyze water flow through the unsaturated zone.

Nevada argues that the dual continuum approach for modeling flow in the unsaturated zone is inadequate because "multiphase fluid flow through larger aperture fractures cannot be described by this model," therefore calling "into question all of DOE's conclusions regarding in-drift seepage and infiltration rates." Petition at 301. This assertion fails to raise a genuine dispute of material fact.

The dual-continuum approach, as explained in SAR § 2.3.2.4.1.1.2, was selected as the method "most consistent with available data and suitable for modeling unsaturated flow through

fractured rocks at Yucca Mountain.” SAR § 2.3.2.4.1.1.2 at 2.3.2-42. In this approach, “fractures are ubiquitous and distributed in such a manner that they can be meaningfully described statistically for the large unsaturated zone at Yucca Mountain. *Id.* In selecting this model, the most significant criteria, among others, were “the ability to handle fracture and matrix flow and interaction under multiphase, multicomponent, and isothermal or nonisothermal conditions.” *Id.* Prior to selecting this model, DOE explored alternative modeling methods, but none were found suitable for modeling large-scale fractured systems. *Id.*

Nevada’s contention makes bare and unsupported allegations that the dual continuum model is inadequate, stating that it “calls into question” DOE’s analysis (Petition at 301) and that DOE’s results “may be orders of magnitude too low.” Petition at 303. Nevada does not assert, however, much less demonstrate, how the model is inadequate or that such inadequacies will have any effect on repository design or performance. Nevada also fails to identify alternative models that it believes would more accurately characterize multiphase flow through large aperture fractures in the unsaturated zone. Accordingly, it is impossible to assess what effect, if at all, this would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such allege deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Even if Nevada’s claim were to be accepted, the contention provides no basis for believing that it would have any material effect on infiltration or in-drift seepage as calculated by DOE. In particular, the contention does not allege, even qualitatively, that use of a different method would result in an increase in infiltration.

Nevada does not allege that DOE's modeling is not consistent with the reasonable expectation standard discussed in section V.A.3.C. If Nevada believes that quantification would show that DOE's modeling is not consistent with that standard, the burden is on Nevada to do so, as well as determine what effect, if any, acceptance of their contention would have on dose to the RMEI. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Nevada has only alleged, and without support, that multiphase fluid flow through larger aperture fractures cannot be described by this model, and has failed to allege or demonstrate that the model is inconsistent with the reasonable expectation standard. Indeed, SAR § 2.3.2.6 explains that the dual-permeability modeling approach is conservative because "the grid size employed in the dual-permeability grid permits relatively limited fracture-matrix interaction. This simulation approach leads to increased flow and transport in the fractures, and shorter radionuclide transport times to the water table." SAR at 2.3.2-97. Accordingly, Nevada fails to raise a genuine dispute of material fact or law.

Nevada also alleges that the VG-based Yucca Mountain model is unable to "deal with fingering in the fracture planes," and that accordingly, "infiltration rates predicated by DOE may

be orders of magnitude too low.” Petition at 303. Nevada’s assertions about the VG model, however, are incorrect, and fail to raise a genuine dispute of material fact.

The LA uses an active-fracture model (AFM) in simulating water flow in the unsaturated zone to consider large-scale fingering flow. The AFM is described in SAR § 2.3.2.4.1.1.3. Based on this model, only active fractures, which comprise only a fraction of all fractures in the unsaturated zone, actually conduct water flow in the unsaturated zone. The VG model is not used to describe water flow through the whole fracture continuum, but is instead used only to describe water flow in the active fracture continuum. The validation of the AFM model is documented in *Conceptual Model and Numerical Approaches for Unsaturated Zone Flow and Transport* (BSC 2004, DN2000416468), Section 7.2 of which demonstrates that the AFM is consistent with fractal-distribution behavior, supported by field observations, and is used for assessing fingering flow in the unsaturated zone of Yucca Mountain.

Nevada’s unsupported assertions are insufficient bases for rejecting the VG-based model. In particular, the contention does not allege or demonstrate that the use of an alternative method would result in more accurate modeling, or would lead to different results. As stated above, a contention that alleges an inaccuracy or an omission without stating the ramifications or results of such allege deficiencies, fails to raise a genuine dispute with the LA. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Nevada has not adequately demonstrated that DOE’s VG-based Yucca Mountain model is inaccurate, nor has Nevada demonstrated that the model is inconsistent with the reasonable expectation standard. Accordingly, this contention fails to raise a genuine dispute of material fact or law, and must be dismissed.

**54. NEV-SAFETY-54 - Constitutive Relationships In The Yucca Mountain Infiltration, Thermo-Hydrologic, And Tspa Models**

Whereas DOE's infiltration-, seepage- (see SAR Subsection 2.3.3 and related subsections), thermohydrologic- (see SAR Subsection 2.3.3.3 and related subsections), and TSPA models (SAR Subsection 2.3.3.4 and related subsections) are designed for steady-state conditions, infiltration, thermally driven flow, and fracture seepage have all been documented to be episodic and this means that conditions at Yucca Mountain lie outside the range of applicability of DOE's models.

**RESPONSE**

This contention essentially makes two claims against the use of constitutive relationships in the Yucca Mountain infiltration, seepage, thermo-hydrologic and TSPA models: (1) these models, as described in SAR Section 2.3.3, are designed for steady-steady-state conditions, whereas infiltration, thermally driven flow, and fracture seepage have all been documented to be episodic, and (2) DOE ignores hysteretic behavior by using a single set of relative permeability and capillary pressure curves to model water flow through fractures. As a result of these alleged flaws in DOE's models, Nevada asserts that "the conditions at Yucca Mountain lie outside the range of applicability of DOE's models." Petition, p. 306. This contention must be dismissed for the reasons set forth below.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

To the extent that Nevada argues that DOE must “use separate pairs of experimentally determined relative permeability and capillary pressure curves for imbibition and drainage, respectively,” Petition at page 308, this contention presents an issue that is outside the scope of this proceeding. No NRC regulation applicable to DOE in this proceeding requires DOE to separate pairs of relative permeability and capillary pressure curves. It is well settled that, absent a waiver, “no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding.” 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission’s regulations. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff’d*, CLI-01-17, 54 NRC 3 (2001).

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the

outcome of the proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method DOE used in addressing the Yucca Mountain infiltration, seepage, thermo-hydrologic and TSPA models is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from

assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not

reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (Adrian P. Butler and Stephan K. Matthäi), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation. Nevada does cite two studies to support its claim that there are "[u]nstable regimes of fracture flow which cannot be modeled with the relative permeability approach." Petition p. 306. Yet, Nevada does not cite any particular paragraph or page of any of these references as support. Such vague references to documents are not permissible. Rather, a petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H. (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989)*. Furthermore, neither of the two studies referenced by Nevada indicates that the conditions at Yucca Mountain cannot be modeled with the relative permeability approach. Indeed, one of the studies states that "we can discard the relative permeability approach, because it cannot account for the inertia forces, *which are dominate in our experiment. However this approach could be useful* for flows at smaller Reynolds numbers." Fourar, M., Bories, S., Lenormand, R., and Persoff, P., *Water Resources Research*, Vol. 29, No. 11 at 3706 (1993) "Two-Phase Flow in Smooth and Rough Fractures: Measurement and Correlation by Porous-Medium and Pipe Flow Models," at 3706 (emphasis added). Therefore, this statement provides no support for the contention that the conditions at Yucca Mountain lie outside of the range of applicability of DOE's models because, unlike the experiments in the reference, which had

Reynolds numbers larger than 100, most groundwater flows occur well within the laminar flow range (at a Reynolds numbers which do not exceed a value between 1 and 10) in which Darcy's law is applicable. See Bear, J. (1979) "Hydraulics of Groundwater," at 65-66, McCGRAW-HILL, New York, NY. The flow at Yucca Mountain is within the laminar flow range because the matrix pores in the host rock at Yucca Mountain are small (on the order of a few microns) (Price, R.H., Martin, R.J., and Boyd, P.J., "Characterization of Porosity in Support of Mechanical Property Analysis," LSN# DEN000100013, at p. 3 (1993)) and the fractures have apertures on the order of hundreds of microns (see hydraulic apertures in DTN: "Fracture Properties for UZ Model Layers Developed from Field," LB0205REVUZPRP.001, LSN# DEN000244794 (2002), output from BSC, *Analysis of Hydrologic Properties Data*, ANL-NBS-HS-000042 REV 00, at Section 7.1, p. 7-1, LSN# DN2002407542 (2004)), which is still small enough to ensure low Reynolds number and laminar flow. Freeze, R. A. and Cherry, J. A. (1979) "Groundwater," at 73-74, Prentice Hall, Inc., Englewood Cliffs, NJ (identifying high Reynolds numbers, non-Darcy flow only for wide-aperture fractures with high specific discharge (conditions which do not occur at Yucca Mountain)). Larger voids in the host rock (lithophysae faults) are not liquid saturated (LSN# DEN001572665, at Section 6.1.5, p. 6-22) so only the water film thickness is appropriate for analyzing flow behavior, and the film thickness is on the order of hundreds of microns or less. Thus, the groundwater flows at Yucca Mountain are in the laminar flow regime for both for ambient and thermal responses and, therefore, the relative permeability approach is appropriate for the conditions at Yucca Mountain. Clearly, these studies cited by Nevada do not support this contention.

Nevada provides one additional reference in this contention to support its statement that "it is standard practice in groundwater hydrology or reservoir engineering to use separate pairs of

experimentally determined relative permeability and capillary pressure curves for imbibition and drainage, respectively.” Petition p. 308. This document, “Porous Media: Fluid Transport and Pore Structure,” is 574 pages long; yet, Nevada does not cite to any particular paragraph or page. As discussed, such vague references to documents are not permissible. Moreover, the mere incorporation of massive documents, such as Nevada has done, is unacceptable. *See Tenn. Valley Auth.* (Browns Ferry Nuclear Plant, Units 1 and 2), LBP-76-10, 3 NRC 209, 216 (1976).

Additionally, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998), *aff’d on other grounds*, CLI-98-13, 48 NRC 26 (1998). In this case, the above document referenced by Nevada does not support the statements made in the contention. Even if using separate pairs of experimentally determined relative permeability and capillary pressure curves is “standard practice,” it does not provide any support to the contention that the conditions at Yucca Mountain lie outside of the range of applicability of DOE’s models. Therefore, the reference to this document is not sufficient to satisfy Section 2.309(f)(1)(v).

Finally, this contention has numerous other conclusory statements, which do not provide sufficient support for admissibility under NRC rules of practice. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006). For example, Nevada does not further explain the above wholly-conclusory assertion that using separate pairs of experimentally determined relative permeability and capillary pressure curves is “standard practice.” Petition at 308. Nevada also states, without any support or basis for its claim, that hysteresis of the relative permeability curves is a “well documented process observed in field and in laboratory studies.” *Id.* And, again, Nevada fails to further explain this wholly-conclusory statement. This is

precisely the type of “expert opinion” that the Commission has repeatedly rejected as inadequate “because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion” as it is alleged to provide a basis for the contention. *USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006) (emphasis added) (quoting *Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998), *aff’d on other grounds*, CLI-98-13, 48 NRC 26 (1998)). Because the contention provides no reasoned basis or explanation for such conclusions, the contention is not properly supported and should be rejected pursuant to 10 C.F.R. § 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada’s claim articulated in this contention is not material. DOE has also demonstrated that Nevada has failed to proffer adequate factual support or expert opinion. Accordingly, Nevada’s claim of noncompliance with this regulation also does not raise a genuine dispute of material fact or law. The contention’s arguments also raise no genuine dispute of material fact or law for the reasons set forth below.

First, Nevada incorrectly claims that infiltration, seepage, thermo-hydrologic and TSPA models are designed only for steady-state conditions. To the contrary:

- The Yucca Mountain infiltration model, as discussed in SAR Subsection 2.3.1, considers the high temporal variability of water flow near ground surface resulting from precipitation processes.
- The ambient seepage model was calibrated against field data collected from water-release tests that were performed within unsaturated zone of Yucca Mountain and involved transient water flow process. SAR Section 2.3.3.2.3.2.

- The thermal-hydrologic seepage model also considers transient water flow and heat transfer processes owing to temperature variations. SAR Section 2.3.3.5.
- The TSPA model (seepage abstraction model) is based on the above process models and therefore, also is not designed only for steady-state conditions. SAR Sections 2.3.3.4.4 and 2.3.3.5.4.

As another licensing board has recently ruled, a mischaracterization of the application does not establish a genuine issue of material fact. *Tenn. Valley Auth.* (Bellefonte Nuclear Power Plant Units 3 and 4), LBP-08-16, 68 NRC \_\_ (Sept. 12, 2008), slip op. at 39.

Nevada also erroneously claims that fracture seepage has been documented to be episodic. Petition p. 306. As indicated in SAR Section 2.3.2.2.2.5 and Section 6.1.6 of BSC, *Conceptual Model and Numerical Approaches for Unsaturated Zone Flow and Transport*, MDL-NBS-HS-000005 REV 01, LSN# DN2000416468 (2004), water flow in the deep unsaturated zone is largely at steady state under ambient conditions. Temporal variation in the surface infiltration rate drives the time-dependent or transient nature of water flow in the upper portion of the unsaturated zone. Studies show that PTn greatly attenuates episodic infiltration pulse (as a result of dominant matrix flow and relatively low water saturation in the PTn) so that water flow below the PTn is approximately at steady state under ambient conditions. BSC (2004) LSN# DN2000416468, at Section 6.1.6. This steady-state flow behavior is further supported by 14C data collected within bedded tuffs of the PTn unit, results of a water release test at Alcove 4, and results of line surveys of fracture minerals in the ESF and ECRB Cross-Drift. SAR Section 2.3.2.2.2.5. Consequently, fracture seepage is also at steady state under the ambient conditions. See SAR Sections 2.3.3.4.1.4 and 2.3.3.4.3.3.

Moreover, the NRC has explicitly recognized the appropriateness for postclosure models to utilize simplified assumptions, and therefore, that in and of itself, is not a basis for criticizing DOE's use of a single set of relative permeability and capillary pressure curves. As stated in the Yucca Mountain Review Plan:

In many regulatory applications, a conservative approach can be used to decrease the need to collect additional information or to justify a simplified modeling approach. Conservative estimates for the dose to the reasonably maximally exposed individual may be used to demonstrate that the proposed repository meets U.S. Nuclear Regulatory Commission regulations and provides adequate protection of public health and safety. Approaches designed to overestimate a specific aspect of repository performance (e.g., higher temperatures within the drifts) may be conservative with respect to temperature but could lead to nonconservative results with respect to dose. The total system performance assessment is a complex analysis with many parameters, and the U.S. Department of Energy may use conservative assumptions to simplify its approaches and data collection needs.

Thus, simplified assumptions, such as any that result from using a single set of relative permeability and capillary pressure curves, are appropriate provided they are conservative.

Indeed, DOE has shown that its use of a single set of relative permeability and capillary pressure curves to model water flow through fractures is adequate and justified because (1) water flow in the deep unsaturated zone are mainly at steady state under ambient conditions (as discussed above), and (2) effects of hysteretic behavior are not significant. The latter is demonstrated in the study by Liu et al., "Modeling Flow and Transport in Unsaturated Fractures Rock: An Evaluation of the Continuum Approach," *JOURNAL OF CONTAMINANT HYDROLOGY*, at 62-63, 173-188 (2003). This study provides a model analysis of infiltration-seepage tests conducted in the unsaturated zone of Yucca Mountain. The test site is located near the North Portal of the Exploratory Studies Facility (ESF). An alcove of the ESF, about 30 m

below the ground surface, was used for collecting seepage water originating from the infiltration plot located at the ground surface. Both infiltration-rate and seepage-rate data exhibit significant degrees of temporal variability. Liu et al. (2003), at Figures 1 and 3. However, the study successfully matched the observed data using a model without considering the hysteretic behavior, indicating that the effects of the hysteretic behavior are not significant for unsaturated flow in fractures within Yucca Mountain. *Id.* at Figure 4, p. 182.

Additionally, unsaturated zone flow is subject to both parameter and boundary condition uncertainty. The main boundary condition uncertainty is the uncertainty in the net infiltration rates at the ground surface. The results of sensitivity studies concerning hydrological parameter uncertainty (BSC, *Parameter Sensitivity Analysis for Unsaturated Zone Flow*, MDL-NBS-HS-000049 REV 00, at p. 7-3, LSN# DN2002170268 (2005)) show that parameter uncertainties have much less effect on unsaturated zone flow than infiltration uncertainty. SNL, *UZ Flow Models and Submodels*, MDL-NBS-HS-000006 REV03 AD01, at p. 6-131, LSN# DEN001572665 (2007). Therefore, hysteresis in hydrological parameters would also be expected to have a small effect in comparison with the effect of infiltration uncertainty. Infiltration uncertainty effects on unsaturated zone flow are computed and included in the TSPA. Accordingly, there is no legal or factual basis for Nevada's contention that DOE's "conditions at Yucca Mountain lie outside the range of applicability of DOE's models." Petition p. 306.

Nevada does not allege that DOE's modeling is not consistent with the reasonable expectation standard discussed in section V.A.3.C. If Nevada believes that quantification would show that DOE's modeling is not consistent with that standard, the burden is on Nevada to do so, as well as determine what effect, if any, acceptance of their contention would have on dose to the RMEI. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication

Facility), LBP-01-35, 54 NRC 403, 422 (2001). As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model.

*Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. As discussed in Section V.A.3 above, contentions expressing only generalized “uncertainties” in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from this deficiency. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the Yucca Mountain infiltration, seepage, thermo-hydrologic and TSPA model properties at the proposed repository site or to specifically state the radiological impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,

Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**55. NEV-SAFETY-55 - Data For The Chemistry Of Pore Waters In The Topopah Springs (Tsw) Formation**

Data for the chemical compositions (pH, alkalinity, nitrate) of pore waters in the Topopah Springs (Tsw) rock formation, as used in SAR Subsection 2.3.5.3.2 and related subsections, are inadequate, because the data are incomplete and/or lack sufficient reliability.

**RESPONSE**

This contention alleges that in SAR Subsection 2.3.5.3.2 and “related” (though unspecified) subsections, DOE relied on incomplete and/or insufficiently reliable data regarding the chemical composition (*e.g.*, pH, alkalinity, and nitrate) of the pore waters in the Topopah Spring (Tsw) rock formation. Specifically, according to the contention, 34 pore water samples is an inadequate number of samples, and these 34 samples are unreliable. Petition at 313.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations in paragraph 4 of this

contention. *See* Petition at 311-12. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . .,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7.), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Nevada asserts that DOE relied on incomplete and/or insufficiently reliable data regarding the chemical composition of the pore waters in the TSw rock formation. Petition at 311. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit

being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and as explained in the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Adrian H. Bath, Maurice E. Morgenstein, and Don L. Shettel, Jr.), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada is obligated to provide "a concise statement of the facts or expert opinions supporting the contention, along with appropriate citations to supporting scientific or factual materials." Petition at 312. Yet, other than citing the license application, Nevada references only one document, the "Engineered Barrier System: Physical and Chemical Environment," Sandia Nat'l Labs. (Aug. 31, 2007), (LSN# DN2002452948). Nevada cites this document, however, only to reference the source of the DOE conclusions that Nevada is challenging. *Id.* at 312-13. Furthermore, in some instances, Nevada provides an overly broad cite to an entire

section of this document. *See* Petition at 313 (e.g., §§ 6.6.1, 6.6.3 and 6.6.5). Vague references, such as these, are not permissible because a petitioner is required to identify specific portions of the documents on which it relies. *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 & 2), CLI-89-03, 29 N.R.C. at 240-41.

Although not referenced in the contention, three expert affidavits filed electronically with the Petition “adopt” this contention. *See* Petition Attachment Nos. 4, 10, & 17. But, these one-page affidavits contain no reasoning or substantive discussion whatsoever. An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *USEC, Inc.* (American Centrifuge Plant) CLI-06-10, 63 NRC 451, 472 (2006). Absent any tangible information or substance—let alone a “reasoned basis or explanation”—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel*, CLI-03-13, 58 NRC at 203. The inadequacy of these affidavits is underscored by the fact that the contention itself does not even mention them. Nevada’s failure to cite supporting scientific or factual materials in the contention cannot be salvaged by these paltry affidavits. *See USEC*, CLI-06-10, 63 NRC at 472.

Not having cited any scientific or factual materials or any expert opinions to support its factual assertions, all of the Nevada assertions in this contention are necessarily unsupported and thus inadmissible.

First, Nevada complains that DOE used too few water pore samples. Petition at 313 (“Thirty-four analyses is an insufficient number on which to understand the present-day variability and geochemical controls of pore water compositions . . .”). By way of background, as explained in detail in “Engineered Barrier System: Physical and Chemical Environment,” DOE compiled 125 pore-water analyses. LSN# DN2002452948 at 6-86. Thirty-five of these

analyses were excluded from further consideration because they either were incomplete or not representative of the current ambient conditions. *Id.* at 6-87. Screening the remaining ninety samples revealed that many had relatively poor charge balances and exhibited a consistent anion deficiency. SAR at 2.3.5-27. DOE concluded that this likely was due to microbial activity in the samples after collection, when the samples were wrapped tightly in plastic and sealed in core tubes, which in turn were wrapped in plastic. SAR at 2.3.5-28. DOE performed screening to evaluate the sample quality and the degree of modification by microbial process. *Id.* Fifty-six of the ninety samples were eliminated through this screening process. *Id.*

Thus, of the original 125 samples compiled, thirty-four were further examined for use in the near-field chemistry model. Although Nevada claims that using thirty-four samples is insufficient, Nevada does not provide any basis for that position. More importantly, Nevada cites no technical or scientific authority (or any authority at all) for its position. Thus, Nevada is merely stating counsel's opinion about what is not a sufficient number of pore water samples.

Second, Nevada asserts that because the screen for microbial activity revealed that fifty-six samples were affected, “[t]here must be doubt about the reliability of the chemical data for the selected 34 samples.” Petition at 313. This is pure conjecture and Nevada cites nothing to show that the thirty-four selected samples were unreliable.

Third, according to Nevada, the pH values of the thirty-four selected samples have additional uncertainties due to the screening criteria. Nevada’s position that there are “uncertainties” in the pH value is based on its view that DOE should not have assumed a fixed value of  $10^{-3}$  bars for  $P(\text{CO}_2)$  because doing so, according to Nevada, means that the “pH calculated using  $P(\text{CO}_2) = 10^{-3}$  bars is always too low, or the measured pH values are too high.” Petition at 313. The “Engineered Barrier System: Physical and Chemical Environment”

document states that “[p]ore waters were equilibrated at P(CO<sub>2</sub>) of 10<sup>-3</sup> bars *because that is the accepted value in the repository units under ambient conditions.*” LSN# DN2002452948 at 6-96 (emphasis added). What scientific reference or expert opinion does Nevada cite as the basis for Nevada’s disagreement with the use of this fixed value? None; Nevada states a wholly unsupported position.

Fourth, Nevada makes an equally unsupported statement when it speculates that the “data for nitrate in pore waters *probably* have also been biased to low values by microbial degradation during core storage.” Petition at 313 (emphasis added). From this assertion, Nevada further hypothesizes that the chloride/nitrite ratios “are likely to be too high.” *Id.* But once again, Nevada makes these assertions without citing any technical references, documents, or expert affidavits. Thus, these assertions are nothing more than attorney argument.

In summary, because the contention does not identify any documents or expert opinion to support its contention issues, the contention is inadmissible. A contention is “inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed above in Section V.A.3, contentions that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from that flaw. For as many times as Nevada asserts that there are “uncertainties” in the selected pore water samples, Nevada never once presents the essential element of its claim: how these uncertainties adversely affect DOE’s results such that

the TSPA is deemed unacceptable to support licensing of the Yucca Mountain repository. Merely claiming that uncertainties exist does not establish a genuine issue of material fact or law because, as discussed in the applicable Legal Standards section, Part 63 recognizes that uncertainties exist and cannot be eliminated. *See* Final Rule, Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, NV, 66 Fed. Reg. at 55,747-748. For that reason, 10 C.F.R. § 63.114(b) does not require that uncertainties be eliminated or even minimized, but that DOE “[a]ccount for uncertainties and variabilities in parameter values and provide for the technical basis for parameter ranges, probability distributions, or bounding values used in the performance assessment.”

In particular, with respect to Nevada’s position that thirty-four samples is too few to produce reliable data, Nevada never claims that this caused a material difference in the near field chemistry model, and Nevada certainly does not provide any expert or documentary support for such a claim. Indeed, DOE’s “Engineered Barrier System: Physical and Chemical Environment” report demonstrates that just the opposite is true. This document reports that:

[t]he repository horizon within the Topopah Spring Tuff . . . is relatively uniform in composition. Peterman and Cloke . . . analyzed twenty core samples, in duplicate, from the cross drift within the four lithologic units constituting the repository level. *All samples were compositionally similar with respect to major oxides and trace elements . . . and normative mineral compositions...*

LSN# DN2002452948 at 5-3 (emphasis added). The SAR also observed that the “chemical similarity of the host-rock units makes large variations in concentrations of non-conservative aqueous species unlikely (SNL 2007b, Section 5.2.1).” SAR at 2.3.5-37. Based on the homogeneity of the host-rock units, additional samples would be unnecessary. *See, e.g., id.* (explanation of assumption that the measured pore-water compositions adequately represent the

actual range of initial water compositions in the natural system). Nevada alleges no facts to show otherwise.

Similarly, although Nevada questions the screening criteria that were used to arrive at the thirty-four water pore samples and whether there are uncertainties in the thirty-four retained samples because DOE assumed a fixed  $P(\text{CO}_2)$ , Petition at 313, Nevada's arguments do not create a genuine dispute of material fact for a number of reasons. First, Nevada never alleges that the supposedly flawed criteria or resulting uncertainties had a material effect on the near field chemistry model. As the "Engineered Barrier System: Physical and Chemical Environment" report explains, "Pore waters were equilibrated at  $P(\text{CO}_2)$  of  $10^{-3}$  bars *because that is the accepted value in the repository units under ambient conditions.*" DN2002452948 at 6-96 (emphasis added). And, according to that same document, the cutoff value implemented,  $\text{pH}_{\text{calc}} = +8.35$ , was *conservative*. *Id.* at 6-100. Second, if any of the thirty-four samples were affected by microbial activity, they would be nitrate-poor and Ca-rich. *See* LSN# DN2002452948, Section 6.6, at 6-93. In turn, a lower nitrate concentration would *increase* localized corrosion in Alloy 22. *See* SAR at 2.3.6-36. Accordingly, even if some of the samples were affected by microbial activity, it was conservative to use them in the model. Third, the SAR shows that trace element data for the pore waters provided confidence in the screening criteria. SAR at 2.3.5-28; *see also* LSN# DN2002452948 at 6-105. Nevada does not dispute any of these facts and, therefore, the challenge to the screening criteria does not establish a genuine dispute of material fact.

Nor does Nevada's challenge to the chloride/nitrate ratios in the retained samples create a genuine dispute of material fact. Though Nevada claims that the chloride/nitrate ratios "are likely to be too high," Nevada does not argue that the allegedly correct, lower ratios would have

a material impact on the near field chemistry model, particularly in light of the Localized Corrosion Initiation model. *See* SAR Section 2.3.6.4.4.1.

Finally, the “Engineered Barrier Systems” report explains that after the thirty-four samples were selected, DOE used a mathematical technique—“principal component analysis” or “PCA”—to determine how many chemically distinct groups, or clusters, are present in the samples. LSN# DN2002452948 at 6-10. The PCA revealed that the water samples cluster into four groups. *Id.* All four groups were equally weighted in TSPA (occurring 25% of the time). Most of the waters exhibited properties that were less conducive to corrosion. By weighting each group equally even though most of the waters fall within the benign group, DOE took a conservative approach because as the SAR explained, “[t]his approach conservatively over-represents the potentially corrosive . . . waters . . . .” SAR at 2.3.5-29.

As discussed in Section V.A.3 above, contentions expressing only generalized “uncertainties” in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. Although Nevada claims that DOE should have considered additional uncertainties in determining the chemical composition of the water in the vicinity of the disposal drifts, Nevada fails to point out any impact that these additional uncertainties would have on the rates at which the disposal system components would degrade.

In summary, the contention fails to raise a genuine dispute of a material issue of fact or law and must be dismissed.

**56. NEV-SAFETY-56 - Geochemical Interactions And Evolution In The Unsaturated Zone, Including Thermo-Chemical Alteration Of Tsw Host Rock**

Screening of FEPs (Features/Events/Processes) 2.2.08.03.0B and 2.2.10.09.0A

“Geochemical interactions and evolution in the UZ” and “Thermo-chemical alteration of the TSw basal vitrophyre” from performance assessments in SAR Subsection 2.2.1.2 and related subsections and as specifically stated at SAR Table 2.2-1 at 2.2-143 and 2.2-145 is not justified.

**RESPONSE**

This contention alleges that DOE’s exclusion of FEPs related to the geochemical alteration of rocks in the unsaturated zone, including Thermo-Chemical Alterations of TSW host rock, “is not justified.” Petition at 315. Nevada’s basis for that assertion is the alleged “uncertainty and controversy” regarding the duration of this past period of hydrothermal heating and also over the mechanism of heating. Petition at 317.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

The basis of this contention is Nevada’s concern over possible uncertainties regarding past hydrothermal heating and alteration of the TSw unit, history upon which DOE relies for its screening justification for FEP 2.2.10.09.0A, “Thermo-chemical alteration of the Topopah Spring basal vitrophyre.” *See* Petition at 316; Features, Events, and Processes for the Total

System Performance Assessment: Analyses, LSN#DEN001584824, 6-1083 (Mar. 6, 2008). As discussed in the applicable Legal Standards section above, contentions expressing only generalized “uncertainties” in DOE models or analyses represent an improper challenge to Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from that deficiency, and accordingly must be rejected as outside the scope of the proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 315-316.

Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 316. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Nevada asserts that DOE did not comply with regulations regarding postclosure performance assessments and FEP screening. *See* Petition at 315-316. Essentially, it alleges that

possible uncertainties regarding past hydrothermal heating and alteration of the TSw unit undermine DOE's FEP screening bases. *Id.* at 317. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository.

Nor does Nevada even claim that geochemical interactions and evolution in the UZ, or thermo-chemical alteration of the TSw basal vitrophere would significantly affect radionuclide transport. A petitioner must allege not only that "more accurate input data could be used in applicant's model, but the use of it "could materially impact the computed outcome." *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339-340 (2006).

Nevada also neglects to establish how exclusion of the subject FEP could produce any alternative TSPA results. The simple conclusion presented in Paragraph 5 that "DOE's [exclusion] justification is questionable and may not be valid" does not suffice to present a litigable issue. Petition at 317. Therefore, this contention does not make the requisite showing that the issues raised are material to a finding that the NRC must make, and should be dismissed.

Moreover, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing geochemical alteration of rock is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. To the extent this contention relies upon expert opinion, this contention fails to meet those standards. Nevada’s Petition attaches several affidavits (by Maurice E. Morgenstein, Don L. Shettel, Jr., Adrian H. Bath, and Michael C. Thorne) that purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

This contention provides, as its bases, only conclusory statements and unsupported arguments of counsel. For the most part, Nevada provides a laundry list of “facts” to support its contention, but fails to provide any corresponding reference or supporting documentation. *See* Petition at 316-317. Nevada then provides one conclusory statement, that there is “uncertainty and controversy” regarding some of the supporting data for the exclusion of FEP 2.2.10.09.0A, “Thermo-Chemical Alteration of the Topopah Spring Basal Vitrophere.” *See* Petition at 317. For that statement, Nevada provides two references, but fails to provide any explanation for its statement or the supporting material. *See* Petition at 317. Nevada then concludes that, because of this unexplained “uncertainty and controversy,” DOE’s FEP exclusion justification is “questionable.” Petition at 317. In sum, this contention offers little more than “bare assertions and speculation.” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *Gen. Pub. Utils. Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

Moreover, Nevada simply cites to the two reference documents noted above in their entirety. Vague references to documents are not permissible. Rather, a petitioner has the obligation to identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). Therefore, the reference to these documents is not sufficient to satisfy Section 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This is exactly what is done in this contention and, therefore, it must be dismissed for failure to establish a genuine dispute of material fact.

This contention does not include any information to refute DOE's screening justification for the subject FEPs. For its challenge to FEP 2.2.08.03.0B, "Geochemical interactions and evolution in the UZ," Nevada fails to provide *any* information to controvert DOE's "low consequence" exclusion justification. *See* Petition at 316. Rather, it uses the subject of FEP 2.2.10.09.0A, "Thermo-chemical alteration of the Topopah Spring basal vitrophyre," as an illustration and – based on a string of unsupported "facts" and one mention of uncertainties – gingerly opines that DOE's exclusion justification is "*questionable* and *may* not be valid." *See* Petition at 316-317. Such assertions – if one can consider such innocuous terms to be "assertions" – do not directly challenge a position taken in the LA (*i.e.*, DOE's "low consequence" screening justification), and therefore do not give rise to a genuine dispute.

Indeed, the NRC has recognized that a substantial amount of uncertainty will exist in any model attempting to predict the future of complex systems. *See* 66 Fed. Reg. 55,732, 55,747 (Nov. 2, 2001) ("The first-of-a-kind nature of the repository and the evaluation over a very long time period result in significant uncertainty being included in the performance assessment.") As discussed in the applicable Legal Standards section above, contentions such as this that express only generalized "uncertainties" in DOE models or analyses, represent an improper challenge to Part 63, which recognizes that uncertainties exist and cannot be eliminated and must be dismissed.

To the extent that Nevada does challenge the exclusion of FEP 2.2.08.03.0B, "Geochemical Interactions and Evolution in the UZ," and FEP 2.2.10.09.0A, "Thermo-Chemical Alteration of the Topopah Spring Basal Vitrophyre," it fails to establish a genuine dispute with the LA. Nevada claims that geochemical alteration of rock in the UZ will occur, creating alteration products that could sorb or co-precipitate with radionuclides. *See* Petition at 316. This

is consistent with DOE's analysis in the subject FEPs. *See* LSN# DEN001584824, at 6-990 and 6-1083. Both FEPs concluded, however, that the resulting release of radionuclides would “not result in a significant adverse change in the magnitude or timing of either radionuclide exposure to the RMEI or radionuclide release to the accessible environment.” *Id.* at 6-993 and 6-1085. Accordingly, these FEPs were excluded from the performance assessment on the basis of low consequence, consistent with the FEP screening requirements of proposed 10 C.F.R. § 63.342(a). 70 Fed. Reg. 53,313, 53,319. Because this contention fails to establish that the result would produce a *significant* adverse change, it likewise fails to establish a genuine dispute.

Finally, 10 C.F.R. § 63.114(e) – which Nevada cites in its contention – requires DOE to provide the technical basis for inclusion or exclusion of a FEP if the dose to the RMEI or release to the accessible environment would be “*significantly* changed” by its omission. *See* 10 C.F.R. § 63.114(e) (emphasis added). Nevada has merely alleged that there exist questions regarding the exclusion justification of these FEPs. This speculation is a far cry from what is required to satisfy its burden to establish a genuine dispute of material fact. Indeed, Nevada does not even suggest, let alone demonstrate, that the inclusion of the subject FEPs would change the calculated dose to the RMEI in any way. Therefore, there is no genuine dispute of a material issue.

In the same vein, Paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material, and attempts to shift the burden to DOE to demonstrate that its contention is *not* material. This is contrary to the requirements of 10 C.F.R. § 2.309(f)(1)(vi). *See* Petition at 317-318; *see also* *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). For this

and the aforementioned reasons, this contention does not establish a genuine dispute of a material issue and therefore must be dismissed.

**57. NEV-SAFETY-57 - Data For Near-Field Chemistry Models**

SAR Subsection 2.3.5.3, and similar and related subsections, which state or assume that a limited number of pore water analyses are sufficient for the near-field chemistry model, is not justifiable and therefore fails to appropriately define the range of conditions in which corrosion can occur.

**RESPONSE**

In this contention, Nevada challenges the near-field chemistry model in SAR Subsection 2.3.5.3 and “similar and related” (through unspecified subsections), claiming that DOE relied on “only” 34 pore water analysis from three of the four members of the Topopah Spring Tuff (TSw), and objecting that DOE did not identify or sample fracture flow water. Petition at 319.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations in section (e) of this contention.

Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, (Oconee Nuclear Station, Units 1, 2 and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Here, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and as explained in the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits of Michael C. Thorne, Adrian H. Bath, Don. L. Shettel, Jr., and Maurice E. Morgenstein, which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada is obligated to provide "[a] concise statement of the facts or expert opinions supporting the contention, along with appropriate citations to supporting scientific or factual materials." Petition at 320. Yet other than the license application, Nevada cites three documents (i.e., the documents that contain the chemical analyses of pore waters) only for the purpose of providing background information. *Id.* at 321 (citing LSN# DN2000202392; LSN# DEN000702996; and LSN# DEN000687467, with corrections at LSN# DEN000374732).

Nevada argues that thirty-four water pore analyses from three of the four members of the Topopah Spring Tuff (TSw) is an adequate number of samples to represent the entire TSw for the near-chemistry model. Petition at 320. The SAR reflects that water samples were available from all of the host-rock units. SAR 2.3.5.3.3.2.1 at 2.3.5-37. In any event, however, Nevada fails to provide any explanation for its belief that DOE used an inadequate number of insufficiently characterized water samples. More importantly, Nevada cites no scientific or factual materials that demonstrate that there is any merit to Nevada's challenge. A contention is "inadmissible if the petitioner 'has offered no tangible information, no experts, no substantive affidavits', but instead only 'bare assertions and speculation.'" *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc. (Oyster Creek Nuclear Generating Station)*, CLI-00-06, 51 NRC 193, 208 (2000)).

The four boilerplate expert affidavits that "adopt" the contention are wholly inadequate support for Nevada's challenge to DOE's decision to use only thirty-four water pore samples from three of the four members of the TSw. See Petition Attachment Nos. 3, 4, 10, & 17. These one-page affidavits contain no reasoning or substantive discussion of the specific contention issues whatsoever. An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *USEC, Inc., (American Centrifuge Plant)* CLI-06-10, 63 NRC 452, 472 (2006). Absent any tangible information or substance—let alone a "reasoned basis or explanation"—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel*, CLI-03-13, 58 NRC at 203. The inadequacy of these affidavits is underscored by the fact that the contention itself does not even mention them. Nevada's failure to cite supporting scientific or factual materials in the contention cannot be salvaged by these affidavits. See *USEC*, CLI-06-10, 63 NRC at 472.

In this contention, Nevada also makes the equally unsupported assertion that DOE erred by not identifying or sampling “any natural fracture flow waters with which to validate [DOE’s] assumption that there is an equilibrium between fracture flow and matrix waters”. Petition at 320. As with the assertions regarding the number of water pore analysis, Nevada does not even explain why it believes it is necessary for DOE to identify or sample the natural fracture flow waters. If there is any scientific or factual basis for this, Nevada chose not to reference it in the contention. And as stated above, the four affidavits that “adopt” the contention simply do not save it from dismissal.

In summary, the contention fails to explain the basis for its challenges, much less identify any documents or expert opinion to support the contention. The contention therefore must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention urges that the range of conditions in which corrosion can occur is not appropriately defined in the SAR because, according to the contention, DOE included only thirty-four water pore analysis from three of the four members of the TSw and additionally, because DOE did not identify or sample the natural fracture flow waters. The contention must be dismissed because these assertions do not establish that a genuine dispute exists with DOE on a material issue of law or fact.

There is a glaring omission in this contention: It never once states that the results of the near-field chemistry model would be materially different if more water pore samples were used, if water pore samples from all four members of the TSw were used, or if natural fracture flow waters had been identified or sampled. In fact, there would be no material difference in the outcome for a number of reasons.

First, regarding the challenge to the inclusion of “only” thirty-four water pore samples, the SAR states:

Near-field chemistry model results are calculated assuming the repository is located in the Tptpl unit but are assumed to apply across the entire repository. This assumption is supported by the use of a range of thermal conductivity values that spans much of the range for the other host rock units, and by the compositional uniformity of the host rock units (Peterman and Cloke 2002). In addition, the four starting waters represent the observed range of matrix pore-water compositions, including analyses of samples from three of the four host-rock units (Ttpmn, Tptpl, and Ttpul).

SAR Subsection 2.3.5.3.3.2.1 at 2.3.5-37. Nevada’s contention fails to acknowledge and certainly does not refute this reasoning or these conclusions that use of the four starting waters is adequate. As other licensing boards have previously held, a contention that does not directly controvert a position taken by the applicant in the application is subject to dismissal. *See Tenn. Valley Auth.* (Bellefonte Nuclear Power Plant Units 3 and 4), LBP-08-16, 68 NRC, (slip op. at 18, 29, 39-40, 42) (Sept. 12, 2008); *Tex. Utils. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

In addition, the SAR reflects that “[m]easured pore-water compositions from pore-water samples are used to determine the four initial water compositions for the near-field chemistry model . . . [W]hile pore-water samples are not available from all possible *locations in the repository*, samples are available from *all of the host-rock units*.” SAR Subsection 2.3.5.3.3.2.1 at 2.35-37 (emphasis added). DOE used the statistical method of principal component analysis to group the thirty-four water analyses on the basis of similar chemistry. *Id.* at 2.3.5-29. The representative waters from the four groups came from only three of the four units. *Id.* at 2.3.5-37.

As to whether it is appropriate to use water pore analyses from only three of the members of the TSw as starting waters, the SAR states that:

**Measured Pore-Water Compositions Adequately Represent the Actual Range of Initial Water Compositions in the Natural System**—Measured pore-water compositions from pore-water samples are used to determine the four initial water compositions for the near-field chemistry model. The measured pore-water compositions are assumed to adequately represent the actual range of pore-water compositions in the natural system. There are two bases for this assumption. First, while pore-water samples are not available from all possible locations in the repository, samples are available from all of the host-rock units. Second, the chemical similarity of the host-rock units makes large variations in concentrations of non-conservative aqueous species unlikely (SNL 2007b, Section 5.2.1).

SAR Subsection 2.3.5.3.3.2.1 at 2.35-37. Therefore, including water pore analysis from all four of the members would have no material effect on the model. The contention does not address or dispute this section of the SAR.

As to whether DOE should have identified or sampled the natural fracture flow in order to validate the assumption that there is an equilibrium between the fracture flow and the matrix waters, Nevada cites no scholarly authority that indicates DOE should have done so. And, the SAR specifically justifies why it was unnecessary to do so. The SAR explains that “[u]sing multiple lines of evidence, fracture water chemistries are shown to be similar to the matrix pore waters, although no fracture water compositions have been measured directly.” SAR 2.3.5-30. Next, the SAR discusses the “multiple lines of evidence.” These lines of evidence include, first, that “flow and transport modeling of the TSw unit above the repository also suggests that equilibration of matrix and fracture waters is rapid relative to downward transport throughout much of the host rock mass.” *Id.* The second line of evidence is that “[t]he strontium isotopic composition of fracture-lining calcite from the TSw unit also supports rapid matrix-fracture

equilibration.” *Id.* The SAR cites yet another basis, namely that “[u]ranium-series isotopic data also indicate fracture-matrix water equilibrium.” *Id.* at 2.3.5-31. Finally, the SAR relied on “[u]ranium isotopic data from fracture minerals [that] also show[ed] evidence of extensive matrix-fracture interactions.” *Id.* All of these assertions are explained in detail in the SAR and are supported by several scientific references that are cited in the SAR, including, Engineered Barrier System: Physical and Chemical Environment, Aug. 2007. *See* SAR 2.3.5-30 to -31; LSN# DN2002452948 at 6.3.2.3.

DOE also corroborated the results of the near-field chemistry model (which incorporates strong fracture-matrix interaction) by comparing them to the thermal-hydrologic-chemical seepage (THC) model, *see* SAR Subsection 2.3.5.2.3 at 2.3.5-17 to -20, with an adjustment of the feldspar dissolution rate equation in the near-field chemistry model to be the same one used by the THC model, *see* SAR 2.3.5.3.3.5.3 at 2.3.5-58 to -62. The THC seepage model implements a reactive transport code incorporating dual-permeability flow and transport. *Id.* at 2.3.5-59. Time-concentration curves for sodium and potassium are nearly identical for the two approaches, indicating that the two modeling approaches predict closely similar degrees of water-rock interaction, and hence pore water residence times. SAR at 2.3.5-60 to -61; SAR Figure 2.3.5-23 at 2.3.5-205.

Nevada does not reference these conclusions, and it certainly does not present any scientific authority to contradict them. Because Nevada fails to address any of these SAR sections, the contention fails to establish a genuine dispute of material issue of fact or law and should be dismissed.

In addition, as discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or

results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from that flaw. Nevada has made no attempt to determine or estimate what effect, if any, acceptance of their contention would have on the results of the near field chemistry model or potential corrosion of the engineered barrier system. Nor has Nevada shown how the contention's resolution would make a difference in the outcome of the proceeding.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, the contention must be dismissed for failure to establish a genuine dispute of a material issue of fact or law.

**58. NEV-SAFETY-58 - Groundwater Samples In The Unsaturated Zone Sorption Tests**

SAR Subsection 2.3.8.3.1, and similar and related subsections, assume without validation that two groundwater compositions (from the saturated zone) are representative and useful for experimentation to describe radionuclide sorption in the unsaturated zone.

**RESPONSE**

This contention alleges that DOE used the two groundwater samples in SAR Subsection 2.3.8.3.1 erroneously and without justification. It states that DOE should not have “assume[d] without proof” that these samples are “representative of [UZ] waters” “for the purposes of determining the ranges of radionuclide sorption coefficients.” Petition at 323.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 324.

10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the

contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Moreover, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing determining sorption coefficients for modeling UZ transport is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than

absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Nevada concludes that “[SAR Subsection 2.3.8.3.1 and related subsections] do not comply with 10 C.F.R. § 63.21(c)(1)(ii), which requires the SAR to describe the hydrology of the site and its effect on the safety and performance of the repository.” Petition at 325. However, the remainder of Nevada’s contention merely asserts that DOE “assumes without proof that [two groundwater compositions] are representative and applicable to sorption and retardation in the [UZ],” *Id.* at 324, which bears no connection to the question of whether DOE complied with 10 C.F.R. § 63.21(c)(1)(ii). Accordingly, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository.

Moreover, Nevada fails to provide qualitative – let alone *quantitative* – results of this alleged deficiency. The vague and unsupported allegation that “[w]ithout any proof of the relevance of the groundwater samples to any groundwater present in the unsaturated zone, the DOE assumption is not justified,” Petition at 324, does not suffice to present a litigable issue. A petitioner must allege not only that “more accurate input data could be used in applicant’s model, but the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339-340 (2006).

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Maurice E. Morgenstein, Don L. Shettel, Jr., Adrian H. Bath, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

The crux of Nevada's argument is its statement that "[i]t is unreasonable and unjustified for DOE to say that these two groundwater samples are representative of all unsaturated zone waters." Petition at 324. However, here and elsewhere in its contention, Nevada fails to provide any support for that assertion. Without support, this amounts to little more than an unsubstantiated argument of counsel, and fails the requirement of 10 C.F.R. § 2.309(f)(1)(v). *See also Yankee Atomic Elec. Co.*, CLI-96-7, 43 NRC at 262 (in referencing 10 C.F.R. § 2.714,

the predecessor to 10 C.F.R. § 2.309, the Commission stated that petitioners must present “claims rooted in fact, documents, or expert opinion”).

Nevada cites to only one reference document, and then only for the limited principle that “radionuclide retardation coefficients for the various radionuclides of interest are functions not only of the solids (rock samples) used in the sorption experiments, but also of the chemistry of the water samples.” Petition at 324. Yet, neither the referenced document nor the contention identifies the “radionuclides of interest,” or otherwise supports a challenge to the groundwater samples used for sorption measurements in the LA. Accordingly, this reference does little to bolster Nevada’s contention, which remains rooted in bare assertions and speculation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada’s contention, regarding DOE’s use of two bounding groundwater samples for analyses of radionuclide sorption in the UZ, presents an issue that is not material and not adequately supported. For this reason, and because it imposes unjustified requirements upon DOE, mischaracterizes DOE’s analysis, and does not specify the ramifications of its alleged errors, this contention does not establish a genuine dispute of material fact.

First, this contention fails to raise a genuine dispute because it mischaracterizes DOE’s use of the groundwater samples at issue. Nevada claims that DOE’s position is that “these two groundwater samples are representative of all unsaturated zone waters.” Petition at 324. However, DOE explains, “[t]he intent of this approach was to examine the potential dependence of water chemistry on sorption, rather than to represent the exact geochemical conditions in the fracture, perched, or pore water.” SAR Section 2.3.8.3.1, at 2.3.8-19. Petitioner’s imprecise readings cannot form the basis for a litigable contention. *See Ga. Inst. of Tech.*

(Georgia Tech Research Reactor), LBP-95-6, 41 NRC 281, 300 (1995).

This contention also incorrectly states that DOE “assumes without proof” that the two groundwater samples are representative of all UZ compositions. Petition at 324. To the contrary, DOE’s use of the subject groundwater samples is rooted in extensive analysis. SAR Section 2.3.8.3.1 describes the measurement of sorption coefficients for use in the UZ transport calculations, and references Appendix A of SNL 2007. *See* SNL 2007, “Radionuclide Transport Models Under Ambient Conditions,” LSN# DN2002466365. A summary of composition of perched and pore waters in the UZ is given in Appendix A, Section A4 of SNL 2007. *Id.* Appendix A, Table A-2 gives ranges of concentrations of elements in perched and pore waters, together with J-13 and UE-25 p#1-c well water concentrations. *See id.* The J-13 and UE-25 p#1-c waters were used in sorption experiments as end-member compositions intended to conservatively represent the impact of water composition on sorption coefficients. *See* SAR Section 2.3.8.3.1 at 2.3.8-19.

These two waters adequately bracket the influence of water chemistry on potential radionuclide sorption coefficients because they adequately account for the most important and dominant impacts on sorption relevant to radionuclide transport away from the repository, that is, competition for sorption sites and solution complexation. *See* BSC 2004, Section 5.2.2.7.3 and 5.3.3.2.1, LSN# DN2992066045; SNL 2007, Appendix A, Table A-2, LSN# DN2002455365.

DOE also accounted for uncertainties in these parameters. Appendix A of SNL 2007 provides probability distributions for the sorption coefficient of each element of interest, on the three major rock types (devitrified, zeolitic, and vitric) found in the UZ. *See* SNL 2007, Appendix A, Section A1, LSN# DN2002455365. The influence of expected variations in water chemistry, radionuclide concentrations, and variations in rock surface properties within one of

the major rock types are incorporated into these probability distributions. *Id.* at Appendix A, Section A1. In addition, surface complexation modeling is used to further evaluate the impact of variations in water chemistry and surface area on sorption coefficients. *Id.* at Appendix A, Section A6. Thus, the sorption models used and the resulting probability distributions account for uncertainties in the input variables, including water chemistry.

Second, this contention also fails to raise a genuine dispute because it erroneously opposes DOE's use of two groundwater samples on the basis that it oversimplifies actual conditions. Nevada contends that it is "unreasonable and unjustified for DOE to say that these two groundwater samples are representative of all [UZ] waters." Petition at 324. However, the fact that DOE used only two samples is not an adequate basis for discarding the model. Indeed, the NRC has recognized the appropriateness of simplified assumptions in models used to estimate postclosure performance of the Yucca Mountain Repository, and therefore, simplifications in and of themselves, are not an adequate basis for criticizing the model. As stated in NUREG-1804, "Yucca Mountain Review Plan," pg. 2.2-2:

In many regulatory applications, a conservative approach can be used to decrease the need to collect additional information or to justify a simplified modeling approach. Conservative estimates for the dose to the reasonably maximally exposed individual may be used to demonstrate that the proposed repository meets U.S. Nuclear Regulatory Commission regulations and provides adequate protection of public health and safety. Approaches designed to overestimate a specific aspect of repository performance (e.g., higher temperatures within the drifts) may be conservative with respect to temperature but could lead to nonconservative results with respect to dose. The total system performance assessment is a complex analysis with many parameters, and the U.S. Department of Energy may use conservative assumptions to simplify its approaches and data collection needs.

The Commission has also noted this in the context of simplified dose calculations:

Mathematical models describing the various sequences of natural phenomena which relate releases of radioactive material to radiation dose vary in detail and complexity. This was frequently observed in the hearing. Through circumstances peculiar to his case, one applicant may be able to present to the Regulatory Staff adequate support for his proposal through the use of simple models and conservative parameter values, while another applicant cannot prove his case so easily. There is no regulatory necessity for performing the most realistic dose estimates that are technologically achievable if a less complex and less expensive analysis can be made to demonstrate compliance with licensing requirements. The use of the simpler procedure may, however, introduce a wider range of uncertainty in estimated doses than a more complicated analysis. Hence the proper choice of parameter values for a simple calculation might be more conservative than values appropriate for a more precise calculation.

*In the Matter of Rulemaking Hearing Numerical Guides for Design Objectives and Limiting Conditions for Operation to Meet the Criterion "As Low as Practicable" for radioactive material in Light-Water-Cooled Nuclear Power Reactor Effluents, CLI-75-5, 1 NRC 277, 339 (1975).* Nevada alleges only that "[w]ithout any proof of the relevance of the groundwater samples to any groundwater present in the [UZ], the DOE assumption is unjustified." Petition at 324. Nevada has not contended, much less shown, however, that the two groundwater samples used by DOE are not conservative or do not provide reliable results.

Third, Nevada fails to provide a genuine dispute because it neglects to establish that DOE has any obligation to give additional detail on its selection of these two bounding groundwater samples. Nevada cites no regulatory requirement or even guidance document that would have DOE provide more discussion of its groundwater analysis. An allegation that some aspect of a license application is "inadequate" or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some

material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, n.12 (1990).

Fourth, this contention does not raise a genuine dispute of a material issue because Nevada does not show that DOE violated applicable regulations or that the contention, if correct, would affect the NRC's findings in this proceeding. For example, although Nevada cites the requirements of 10 C.F.R. § 63.31(a)(2), Nevada does not establish or even allege that DOE's use of the subject groundwater samples will preclude a "reasonable expectation that the materials can be disposed of without unreasonable risk to the health and safety of the public." 10 C.F.R. § 63.31(a)(2). In fact, as shown above, DOE's development of the two groundwater samples and related uncertainty parameters, demonstrate that DOE has satisfied these requirements.

Similarly, the contention also fails to show that DOE violated the requirements of 10 C.F.R. § 63.305(c), which states that DOE must vary factors related to hydrology based upon "cautious, but *reasonable* assumptions" (emphasis added). DOE demonstrated regulatory compliance in SAR Section 2.3.8, which provides a detailed summary of the extensive work on radionuclide transport in UZ of Yucca Mountain. Specifically, SAR Subsection 2.3.8.3 details data collection from the Yucca Mountain site and surrounding area, and uncertainties and variabilities in parameter values, and SAR Subsection 2.3.8.3.1 describes laboratory sorption measurements for the UZ and uncertainty in parameter data. Nevada thus has an affirmative burden to show that DOE's assumptions were *unreasonable*, but made no attempt to do so.

Lastly, as discussed in the applicable Legal Standards section and section (d) above, this contention alleges potential errors, omissions, and alternative approaches -- without specifying the ramifications or results of such alleged deficiencies. Here, Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Accordingly,

Nevada has failed to raise a genuine dispute of material fact or law and, therefore, this contention is inadmissible. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises genuine dispute on a material issue of fact or law in this proceeding. Not only does Nevada fail to do so, but Paragraph 6 essentially attempts to shift this burden to DOE and should be rejected.

**59. NEV-SAFETY-59 - Groundwater Compositions Assumed**

SAR Subsection 2.3.8.3.1 and similar subsections, which state that only two natural water compositions bound the range of water compositions expected in the unsaturated zone for the purposes of sorption and radionuclide transport, is illogical and impossible for a multicomponent aqueous system and means that the sorption and radionuclide transport calculations cannot be relied upon.

**RESPONSE**

This contention alleges that “SAR Subsection 2.3.8.3.1 and similar subsections,” which identify DOE’s use of only two groundwater samples to bound the range of water compositions in the UZ, is “illogical and impossible for a multi component aqueous system.” Petition at 326. Nevada concludes that, because of the use of these two samples, “the sorption and radionuclide transport calculations cannot be relied upon.” *Id.*

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 326-27. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 327. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Moreover, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete

assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in modeling UZ transport is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Nevada asserts that DOE did not comply with regulations regarding evaluation of the hydrology at the site and appropriate parameters for the postclosure performance assessments. Petition at 326-27. Essentially, it alleges that DOE improperly used only two groundwater compositions to bound the range expected in the UZ. *Id.* at 326. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository.

Moreover, Nevada neglects to establish how consideration of additional or different groundwater compositions could produce any alternative TSPA results. The simple allegation that “the water compositions adopted do not provide an appropriate basis for the evaluation of parameters characterizing radionuclide sorption and transport in the [UZ], with significant implications for the fluxes of radionuclides released and doses to the [RMEI],” does not suffice to present a litigable issue. Petition at 328. Beyond its passing reference to “significant

implications,” Nevada fails to provide any quantitative support for this alleged deficiency. Petition at 328. A petitioner must allege not only that “more accurate input data could be used in applicant’s model, but the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339-340 (2006).

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below, (1) for the most part, the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition attaches several affidavits (by Maurice E. Morgenstein, Don L. Shettel, Jr., and Adrian H. Bath) that purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

The crux of Nevada’s argument is its statement that “the water compositions adopted [by DOE] do not provide an appropriate basis for the evaluation of parameters characterizing radionuclide sorption and transport in the [UZ].” Petition at 328. However, here and elsewhere

in its contention, Nevada fails to provide any factual support or expert opinion for that assertion. Without support, this amounts to little more than an unsubstantiated argument of counsel, and certainly fails the requirement of 10 C.F.R. § 2.309(f)(1)(v). *See also Yankee Atomic Elec. Co.*, CLI-96-7, 43 NRC at 262 (in referencing 10 C.F.R. § 2.714, the predecessor to 10 C.F.R. § 2.309, the Commission stated that petitioners must present “claims rooted in fact, documents, or expert opinions”).

In fact, entire passages from this contention, such as the example that follows, lack any reference or support whatsoever:

In analytical chemistry, when one is attempting to determine the concentration of one species or component (such as a cation or metal), a calibration line (or curve) is constructed first by measuring the concentration of (at least) two solutions with known concentrations of the species of interest and generally with one concentration that is lower and the other that is higher than that of the unknown solution, thereby bracketing, or “bounding,” the unknown solution. This technique assumes that all other variables (the matrix) in the two known solutions are equal and similar to that of the unknown solution. When extrapolating this type of technique to multiple variables (major cationic and anionic species or components) one might assume that two solutions are necessary for each variable. The DOE sorption experiments are more complex than this slightly simpler analogy, because the sorption of a number of individual radionuclides is being determined on the same rock type. However, DOE assumes that only two solutions in total are required, perhaps because otherwise the matrix of necessary experiments becomes incredibly large. In addition, the two natural water compositions chosen are not specific for transport and sorption in the UZ as they are groundwater compositions from the saturated zone.

Petition at 327-28. The same is true of the following unsupported statement by Nevada, which is entirely speculative: “DOE assumes that only two solutions in total are required, perhaps because otherwise the matrix of necessary experiments becomes incredibly large.” Petition at 328.

Licensing boards have found that “[m]ere assertions without appropriate explanation and support

do not satisfy the requirements of the contention rule.” *See Duke Energy Corp.* (McGuire Nuclear Station, Units 1 & 2; Catawba Nuclear Station, Units 1 & 2), LBP-03-17, 58 NRC 221, 229 (2003), *aff’d on other grounds*, CLI-03-17, 58 NRC 419 (2003). Accordingly, the Board should not accept Nevada’s hypothetical, unsupported assertions.

Nevada cites to only one reference document, which supports a limited statement in this contention that “[b]efore 1990, when sorption experiments began, there were no site-specific analyses of fracture or pore waters from the [UZ].” Petition at 328. However, Nevada fails to provide any explanation for this statement or how it contributes to its contention. This is inconsistent with a petitioner’s obligation to explain the significance of any factual information upon which it relies. *See Fansteel, Inc.* (Muskogee, Oklahoma Site), CLI-03-13, 58 NRC 195, 204-05 (2003).

Accordingly, for the aforementioned reasons, Nevada fails to adequately support its contention, in violation of 10 C.F.R. § 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada’s contention, regarding DOE’s use of two bounding groundwater samples for analyses of transport and sorption in the UZ, presents an issue that is not material. For this reason, and for the reasons set forth below, this contention does not establish a genuine dispute of material fact.

This contention does not raise a genuine dispute because it mischaracterizes some of DOE's relevant analyses and neglects to account for the remainder. This contention alleges, in part, that SAR Subsection 2.3.8.3.1 and similar subsections “state that only two natural water compositions are used to bound the range of water compositions expected in the unsaturated zone for the purposes of sorption and radionuclide transport.” Petition at 326. Nevada alleges

that, as a result, sorption and transport calculations used in the LA are unreliable. The contention further claims that “DOE assumes that it is possible to bound a multi-component aqueous system ... with only two natural water samples.” *Id.* This misstates the intended use of these two sample waters. As explained in SNL (2007) LSN# 2002466365, a supporting document to SAR Section 2.3.8.3.1, use of the two natural waters was “intended to bracket the impact of water composition on sorption coefficients” (*i.e.*, K<sub>d</sub> values). SNL 2007 *Radionuclide Transport Models Under Ambient Conditions*. MDL-NBS-HS-000008 REV 02 ADD 01, LSN# DN2002466365 at A-6. That is, natural water samples used for sorption experiments were not intended to bound the range of potential water compositions, but rather to bound the *impact* of all possible water compositions on potential K<sub>d</sub> values. Because these impacts are adequately addressed by using these two natural groundwaters, as explained below, radionuclide sorption and transport calculations used in the DOE's performance assessment (TSPA) are reliable.

Two of the most important processes by which major ions in solution can affect radionuclide sorption are (1) competition for sorption sites by similarly charged ions, which is essentially equivalent to ion exchange (Stumm and Morgan, 1996, “Aquatic Chemistry” 3rd Edition, Wiley & Sons, TIC: 246296, Section 9.8, at 586-93) and (2) complexation of radionuclides by oxyanions in solution (Langmuir 1997. “Aqueous Environmental Chemistry” Prentice Hall, TIC: 237107, at 509 and 521-31). As explained by Langmuir, the actinide cations (Th, U, Np, Pu, Am) are hard acids and so form their strongest solution complexes with ligands that are hard bases, the strongest of which are carbonate and hydroxide complexes. *See* Langmuir at 522, and Table A13.5 – A13.8.

Measuring sorption of radionuclides onto solids from an aqueous solution that is carbonate-rich (*e.g.*, UE-25 p#1) will therefore tend to result in lower measured sorption

coefficients (Kds) compared with waters containing less dissolved carbonate (*e.g.*, J-13) due to formation of stable solution species for those radionuclides that form strong carbonate complexes. Similarly, measuring sorption in an aqueous solution containing relatively high concentrations of divalent cations (*e.g.*, UE-25 p#1) compared with a more dilute water (*e.g.*, J-13) will account for relatively strong competition for sorption sites (ion exchange),

Compositions of pore waters tend towards those of perched and ground waters with increasing depth. BSC 2004, *Yucca Mountain Site Description*, LSN# DN2002066045 at F5-13 – F5-17. Specifically, pore waters from the Paintbrush Tuff Nonwelded Hydrogeologic Unit, *see id.* at F5-14, and those from the Tiva Canyon Welded and Topopah Spring Welded Hydrogeologic Units, *see id.* at F5-15, are richer in sulfate plus chloride and in divalent ions (Ca+Mg) than perched waters and ground waters; whereas deeper pore waters, such as those from below the top 200 feet of the Calico Hills Nonwelded Hydrogeologic Unit and above the Prow Pass Lithostratigraphic Unit, are compositionally similar to perched waters and groundwaters (which are compositionally similar to each other). *See id.* at F5-13, F5-17 and F5-16.

Thus, the use of J-13 (a relatively dilute groundwater) and UE 25p#1 (a Ca<sup>2+</sup>-Mg<sup>2+</sup> and carbonate-rich groundwater) bracket the influence of water chemistry on potential radionuclide sorption coefficients because these two waters account for the most important and dominant impacts on sorption relevant to radionuclide transport away from the repository, that is, competition for sorption sites and solution complexation.

Nevada also erroneously alleges that DOE did not undertake extensive analysis to evaluate parameters characterizing radionuclide sorption and transport in the UZ. In doing so, Nevada apparently neglects the analyses presented in the SAR and supporting documents. For

instance, a number of processes relevant to sorption are specifically addressed in FEPs that are part of the analysis and modeling report, “Radionuclide Transport Models Under Ambient Conditions” (SNL 2007; Table 6-2) LSN# DN2002466365, including FEP 2.2.08.01.0B, “Chemical Characteristics of Groundwater in the UZ”; FEP 2.2.08.06.0B, “Complexation in the UZ”; FEP 2.2.08.09.0B, “Sorption in the UZ”; and FEP 2.2.09.01.0B, “Microbial Activity in the UZ.” *See* LSN#DEN001584824 at Table 6-2.

In addition, the potential range of compositions entering the repository are addressed by the near-field chemistry process model in “Engineered Barrier System: Physical and Chemical Environment,” which predicts potential seepage water compositions at the drift wall. *See* SNL 2007 LSN# DN2002452948, Section 6.3.2. This model was designed specifically to investigate the effects of thermal-hydrologic-chemical processes in the host rock, including the effects of initial water chemistry, and mineral and gas compositions in the rock. *Id.* at Sections 6.3.2 and 6.6. The near-field chemistry process model incorporates the effects of water–rock interactions and thermal-hydrologic-chemical processes. Uncertainty in the initial water chemistry is incorporated by using four starting waters in the P&CE models, representing the four chemically distinct groups of TSw pore-water compositions. *See also* FEP 2.2.08.12.0A “Chemistry of Water Flowing into the Drift,” LSN#DEN001584824 at 6-1033.

Nevada's assertion that “DOE has given *no* consideration to the compositions of seepage waters that may develop over time as the thermal history of the repository evolves,” Petition at 328 (citations omitted, emphasis added), is not correct. To the contrary, DOE conducted extensive analyses and, as a result, excluded some FEPs from TSPA models based on their low consequence. The relevant excluded FEPs include FEP 2.2.08.03.0B, “Geochemical Interactions and Evolution in the UZ,” (LSN# DEN001584824, at 6-990), which examined thermo-chemical

effects on the seepage water entering the waste emplacement drifts by using the Drift-scale THC Seepage Model (SNL 2007, LSN# DN2002490523). It found that the evolutionary pathways of the PTn pore-water chemistries closely progress towards those of the TSw hydrogeologic unit. *See* LSN# DEN001584824 at 6-991. Therefore, it is not expected that mixing of PTn and TSw pore waters would generate water chemistries that are different from those defined by the compositional range of the TSw pore waters. *Id.* This FEP and the supporting documents explain that the resulting effects on sorption and transport from seepage waters will not significantly affect the magnitude or timing of the dose to the RMEI or release to the accessible environment. *See* LSN# DEN001584824, at 6-990 to -994. Similar conclusions apply to analyses conducted for excluded FEP 2.2.01.05.0A, “Radionuclide Transport in the Excavation Disturbed Zone,” (LSN# DEN001584824 at 6-884); FEP 2.2.08.03.0B, “Geochemical Interactions and Evolution in the UZ,” (LSN# DEN001584824 at 6-990); and FEP 2.2.10.06.0A, “Thermo-Chemical Alteration in the UZ (Solubility, Speciation, Phase Changes, Precipitation/Dissolution,” (LSN#DEN001584824 at 6-1069 to 1070) (finding “overall weak dependency of sorption [coefficients] on temperature”). Accordingly, Nevada’s allegedly missing information is, in fact, provided by DOE.

As discussed in the Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts that the Application fails to address an issue that the Application does address, is defective. As established here, Nevada’s contention suffers from this flaw. Nevada completely ignores the relevant portions of the Application and fails to explain how the alleged defects in the Application will significantly affect the performance assessments. In short, this contention is inadmissible because “the Petitioner’s assertion that the application[] [is] deficient is simply based upon a failure to read or perform any meaningful

analysis of the application[.]” *Dominion Nuclear Conn., Inc.*, LBP-04-15, 60 NRC at 95 (2004) *aff’d*, CLI-04-6, 60 NRC 631 (2004).

Second, this contention also erroneously opposes DOE’s analyses on the basis that they oversimplify actual conditions. Nevada contends that the two groundwater samples used by DOE do not provide an adequate basis for evaluation of transport and sorption in the UZ, because it is not possible “to ‘bound’ multi-component aqueous solution compositions expected in the unsaturated zone with only two natural groundwater compositions.” Petition at 328. Nevada states (without any explanation or specific reference) that “DOE assumes that only two solutions in total are required” and “[t]hus, the water compositions adopted do not provide an appropriate basis for the evaluation of parameters characterizing radionuclide sorption and transport in the [UZ].” Petition at 328. However, the fact that DOE used only two samples is not an adequate basis for discarding the model. Indeed, the NRC has recognized the appropriateness of simplified assumptions in models used to estimate postclosure performance of the Yucca Mountain Repository, and therefore, simplifications in and of themselves, are not an adequate basis for criticizing the model. As stated in NUREG-1804, “Yucca Mountain Review Plan,” pg. 2.2-2:

In many regulatory applications, a conservative approach can be used to decrease the need to collect additional information or to justify a simplified modeling approach. Conservative estimates for the dose to the reasonably maximally exposed individual may be used to demonstrate that the proposed repository meets U.S. Nuclear Regulatory Commission regulations and provides adequate protection of public health and safety. Approaches designed to overestimate a specific aspect of repository performance (e.g., higher temperatures within the drifts) may be conservative with respect to temperature but could lead to nonconservative results with respect to dose. The total system performance assessment is a complex analysis with many parameters, and the U.S. Department of Energy may use

conservative assumptions to simplify its approaches and data collection needs.

The Commission has also noted this in the context of simplified dose calculations:

Mathematical models describing the various sequences of natural phenomena which relate releases of radioactive material to radiation dose vary in detail and complexity. This was frequently observed in the hearing. Through circumstances peculiar to his case, one applicant may be able to present to the Regulatory Staff adequate support for his proposal through the use of simple models and conservative parameter values, while another applicant cannot prove his case so easily. There is no regulatory necessity for performing the most realistic dose estimates that are technologically achievable if a less complex and less expensive analysis can be made to demonstrate compliance with licensing requirements. The use of the simpler procedure may, however, introduce a wider range of uncertainty in estimated doses than a more complicated analysis. Hence the proper choice of parameter values for a simple calculation might be more conservative than values appropriate for a more precise calculation.

*In the Matter of Rulemaking Hearing Numerical Guides for Design Objectives and Limiting Conditions for Operation to Meet the Criterion "As Low as Practicable" for Radioactive Material in Light-Water-Cooled Nuclear Power Reactor Effluents*, CLI-75-5, 1 NRC 277, 339 (1975). Nevada has not contended that the two groundwater samples used by DOE are not conservative or do not provide reliable results.

Third, this contention fails to raise a genuine dispute because it neglects to specify the ramifications of its alleged errors. Nevada makes no attempt to show that, if its allegations were correct, the resulting dose estimate would exceed regulatory requirements or significantly change the performance assessments.

For example, although Nevada cites the requirements of 10 C.F.R. § 63.114(a), Nevada does not establish that DOE's use of the subject groundwater samples does not satisfy the requirement to "include data related to the geology, hydrology, and geochemistry ... of the

Yucca Mountain site.” 10 C.F.R. § 63.114(a). Likewise, although this contention alleges that DOE failed to comply with the requirements of 10 C.F.R. § 63.114(b), it does not otherwise show that DOE did not “[a]ccount for uncertainties and variabilities in parameter values and provide for the technical basis for parameter ranges, probability distributions, or bounding values used in the performance assessment.” 10 C.F.R. § 63.114(b). Nevada’s unsupported assertions are especially bare in light of the extensive analysis of uncertainties and variabilities in parameter values conducted by DOE in SAR Section 2.3.8.3, as explained above.

In addition, the contention fails to show that DOE violated the requirements of proposed 10 C.F.R. § 63.305(c), which states that DOE must vary factors related to geology and hydrology based upon “cautious, but *reasonable* assumptions” that could affect Yucca Mountain during the period of geologic stability. 70 Fed. Reg. at 53319 (emphasis added). As outlined above, DOE has demonstrated the reasonableness of its assumptions in SAR Section 2.3.8 and the aforementioned supporting FEPs. Thus, Nevada bears an affirmative burden to show that DOE’s assumptions were *unreasonable*, which it fails to do here.

As discussed in the applicable Legal Standards section and section (d) above, this contention alleges potential errors, omissions, and alternative approaches -- without specifying the ramifications or results of such alleged deficiencies. Here, Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Accordingly, Nevada has failed to raise a genuine dispute of material fact or law and, therefore, this contention is inadmissible. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is

Nevada's burden to show that its contention raises a genuine dispute on a material issue of fact or law in this proceeding, which it fails to do.

**60. NEV-SAFETY-60 - Empirical Site-Specific Data And The Near-Field Chemistry Model**

DOE's near-field chemistry model is not site specific and therefore not valid for Ti-7 and C-22 corrosion studies because the unsaturated zone hydrogeochemical characterization porewater data are not satisfactory for determining the environment in which in-drift geochemical reactions will occur.

**RESPONSE**

In this contention, Nevada challenges DOE's near-field chemistry model as not site-specific, and claims that the unsaturated zone hydrogeochemical characterization pore waters cannot be used to determine the environment in which in-drift geochemical reactions will occur, and that the model therefore is not valid for Ti-7 and C-22 corrosion studies. Petition at 332.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations in paragraph 4 of the

contention. Petition at 331-32. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding. . .,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7.), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate more than that DOE has not or cannot satisfy a specific performance objective

but, instead, must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Here, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and as explained in the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach affidavits of Adrian H. Bath, Don. L. Shettel, Jr., and Maurice E. Morgenstein, which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

The first issue raised in the contention is that "DOE treats unsaturated zone pore-waters as being geochemically equivalent to unsaturated zone fracture flow water." Petition at 332. Nevada disagrees with DOE's premises for treating these waters as equivalent, claiming that "unsaturated zone pore-waters cannot normally be equated with fracture flow waters." *Id.* Its disagreement, however, is based largely on equivocations such as, "DOE's observations *may* incorrectly distinguish matrix . . . from small and large fracture flow;" "it is *most doubtful* that

fracture flow water in fast path transport will come into equilibrium with the wall rock of the fractures in the welded tuffs;” and “it is *likely* that pore-water will be in a meta-stable equilibrium state with the matrix rock because of the long time of rock-water interaction . . . .” Petition at 333 (emphasis added). In fact, in arguing this first issue, Nevada cites no documents other than various SAR sections. And, no factual support or expert opinion is cited for these assertions. Such reliance on unsubstantiated statements do not satisfy the requirements of 10 C.F.R. § 2.309(f)(1)(v). *Fansteel*, 58 NRC at 203.

Apart from all the speculation, Nevada also makes numerous unsubstantiated assertions of fact regarding the properties and propensities of pore-water, matrix pore water, and fracture flow water with respect to the first issue raised in the contention. None of these assertions is supported by a reference to any scientific documents or expert opinions. For example, without any support at all, Nevada claims that there is “just not sufficient time” for “fracture flow water in fast path transport [to] come into equilibrium with the wall rock of the fractures in welded tuffs.” Petition at 333. Nevada also claims that “[i]n some instances, one might even expect that the matrix pore water is connate.” *Id.* As such, Nevada is suggesting that the existing TSw pore waters could represent the initial water released from the initial volcanic glass during devitrification. That statement is unsupported attorney argument, whereas the SAR notes, based on scholarly authority, that these waters are estimated to be 10,000 years, at the base of the TSw. SAR at 2.3.5-54 to -55.

The second issue that Nevada raises in this contention relates to the “[q]uality . . . of DOE unsaturated zone pore-water data and unjustifiable screening procedures.” Petition at 335-38. As with the first issue raised in the contention, this argument also relies on a series of statements that are not attributed to any scientific materials or expert opinions. For example, Nevada claims

that “[t]he quality of the DOE reported pore-water is below standard acceptable practices in hydrology and certainly below competent practices when these analysis are so important with respect to determining the lifetime of critical EBS materials such as C-22.” Petition at 337. But, Nevada cites absolutely no authority for this position.

Another example of Nevada’s disregard for the requirement to provide (in its own words) “appropriate citations to supporting scientific or factual materials,” Petition at 332, is Nevada’s statement that the “screening cut-offs *seem* to be arbitrary . . . .” Petition at 338 (emphasis added). Nevada cites no authority for its characterization of the screening cut-offs as “arbitrary.” Where, as here, the petitioner “” has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation,’” the contention must be dismissed. *Fansteel*, 58 NRC at 203.

Similarly, Nevada claims that “screening procedures used to obtain the 34 analyses are not without controversy.” The only citation that Nevada provides for the proposition that there was “controversy” over the screening procedures is the SAR at 2.3.5-28. But, the discussion at that SAR section says exactly the opposite, namely that the criteria “proved sufficient to screen out” waters affected by microbial activity.” *Id.* Accordingly, the SAR cite provides no basis for the contention's assertion that there was controversy over the screening procedures.

Nevada does cite to “Engineered Barrier System: Physical and Chemical Environment ANL-EBS-MD-000033 REV 06B” (08/31/2007), LSN# DN2002452948, in connection with the second issue raised in the contention. *See* Petition at 35. But Nevada cites this document only as the source for certain background facts, such as the number of pore-water samples obtained and DOE’s findings regarding these pore-water samples. *Id.* Nevada’s cite to “Thermal Testing Measurements Report, ANL-NBS-HS-000041 REV 00 (09/26/2002), LSN# DN2002296975,

(*see* Petition at 337) serves the same purpose; it is merely referenced as the source for background facts about the compositions of the unsaturated zone waters and the DST Borehole water samples. *Id.*

Finally, the affidavits of the three experts who merely “adopt” either paragraph 5 or paragraph 6 of this contention fall far short of the requirement to provide conclusions supported by reasoned bases or explanation. *See* Petition Attachment Nos. 4, 10, & 17. These one-page affidavits contain no reasoning or substantive discussion of the specific contention issues whatsoever. An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *USEC*, CLI-06-10, 63 NRC at 472. Absent any tangible information or substance—let alone a “reasoned basis or explanation”—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel*, CLI-03-13, 58 NRC at 203. The inadequacy of these affidavits is underscored by the fact that the contention itself does not even mention them. Nevada’s failure to cite supporting scientific or factual materials in the contention cannot be salvaged by these paltry affidavits. *See USEC*, CLI-06-10, 63 NRC at 472.

Not having cited any scientific or factual materials to support its assertions about the alleged inadequacies in data for near-field chemistry models, every one of Nevada’s challenges is necessarily based on nothing more than unsubstantiated attorney argument. Accordingly, the contention must be dismissed.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such

alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from that flaw.

As noted above, this contention raises two separate issues. The first relates to DOE’s treatment of unsaturated zone pore-water as geochemically equivalent to unsaturated zone fracture flow water, and in particular whether that conclusion is supported by DOE’s determination that properly concluded that there was an equilibrium. Petition at 332. In the second issue, Nevada challenges the quality of DOE’s unsaturated zone pore-water samples. *Id.* at 335.

**(1) Treatment of Unsaturated Zone Pore-Water as Geochemically Equivalent to Unsaturated Zone Fracture Flow Water**

Nevada questions two “concepts” that form the basis for DOE’s treatment of unsaturated zone pore-water as geochemically equivalent to the unsaturated zone fracture flow water. The first “concept” that Nevada challenges is DOE’s determination that “[e]quilibration of matrix and fracture waters is rapid relative to downward transport throughout much of the host rock.” SAR Subsection 2.3.5.3.2.2.1 at 2.3.5-30. In disputing this conclusion, Nevada claims that the conclusion is “based upon a DOE plug flow model with averaged rock properties, assuming ambient saturation” and that “does not consider different rock units or actual matrix and fracture saturations.” Petition at 332.

In fact, the plug flow model is based in part on the finite element heat and transfer code (FEHM) modeling results. In turn, the FEHM simulations utilized a more detailed representation of the process and “*included the four TSw repository host rock units, each with the hydraulic and capillary properties taken from the calibrated rock properties set developed by the unsaturated zone flow model . . .*” SAR at 2.3.5-30 (emphasis added). Thus, the contention raises no genuine dispute of material issue of fact or law because, as another Licensing Board has recently

ruled, a mischaracterization of the application does not establish a genuine issue of material fact. *Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (Sept. 12, 2008), slip op. at 39.

Nevada also claims that there are “no data presented to indicate that matrix as defined in FEHM equates to matrix as defined with respect to pore-water chemistry.” Petition at 333. But Nevada is again wrong. The basis can be found in the validation comparison with the THC seepage model, which uses the same dual continuum approach and matrix and fracture hydrologic property sets as the FEHM calculations used in developing the near field chemistry model, with the exception that the feldspar dissolution rate was modified in running the near-field chemistry model to equate to that in the THC model. *See* SAR 2.3.5.3.3.5.3 at 2.3.5-58 to -62; SAR Figure 2.3.5-23 at 2.3.5-205.

These and the other grounds that Nevada cites in challenging DOE’s conclusion about the fracture-matrix exchange are based on conclusory and theoretical assertions for which Nevada cites no factual or scientific support. Indeed, Nevada disproves some of its own assertions. For example, Nevada claims that “[t]he basic hydrogeochemical signal is therefore set upon infiltration and is only modified by dissolution and evaporation along the fracture flow transport pathways until it joins the mixing waters in the saturated zone.” Petition at 333. This unsupported statement is refuted by Nevada’s next assertion that “[i]f a portion of the downward transporting water diffuses into the matrix it can acquire a strong geochemical signal from the host rock matrix and this signal is certainly dependent on its residence time for rock-water interaction,” which suggests a mechanism by which fracture water *could be* modified by other processes.

The second “concept” that Nevada challenges is DOE’s conclusions regarding the similarity between the isotopic characteristics of fracture waters and matrix waters. Petition at 334. Based on an examination of the isotopic composition of fracture-lining minerals from the TSw unit and matrix pore waters, DOE concluded that they indicated rapid equilibration of matrix and fracture waters relative to downward transport. *See* SAR 2.3.5-30 to -31. The contention asserts--without any support--that the minerals cannot represent matrix pore waters because they are in the fracture continuum, and fracture and matrix waters cannot possibly have equilibrated. Petition at 334. That is merely a way of saying that Nevada disagrees with DOE. Yet, Nevada does not cite any particular problem with DOE’s quantitative modeling work and predictions showing that fracture-matrix compositional mixing occurs to a significant extent. SAR at 2.3.5-30 to -31. This argument therefore does not raise a genuine dispute on a material issue of fact or law regarding DOE’s conclusions regarding the isotopic characteristics of fracture waters and matrix waters.

## **(2) Quality and Screening of the Pore Waters**

This aspect of the contention raises a nearly-identical challenge as that presented in NEVADA-SAFETY-55. Nevada complains that too few samples were used and that some of the samples retained may have been microbially affected by bacterial action.

With respect to Nevada’s position that thirty-four samples are too few to produce reliable data, Nevada never claims that this caused a material difference in the outcome of the near field chemistry model, and Nevada does not provide any expert or documentary support for such a claim. Indeed, the “Engineered Barrier System: Physical and Chemical Environment” report demonstrates that just the opposite is true. This document reports that “[t]he repository horizon within the Topopah Spring Tuff . . . is relatively uniform in composition. Peterman and Cloke . .

. analyzed twenty core samples, in duplicate, from the cross drift within the four lithologic units constituting the repository level. *All samples were compositionally similar with respect to major oxides and trace elements . . . and normative mineral compositions . . .*” LSN# DN2002452948 at 5-3 (emphasis added). The SAR also observed that the “chemical similarity of the host-rock units makes large variations in concentrations of non-conservative aqueous species unlikely (SNL 2007b, Section 5.2.1).” SAR at 2.3.5-37. Based on the homogeneity of the host-rock units, additional samples would be unnecessary. *See, e.g., id.* (explanation of assumption that the measured pore-water compositions adequately represent the actual range of initial water compositions in the natural system).

As to Nevada’s claim that the water pore-samples were not adequate because only 50% had complete chemical analyses, Nevada notes that the SAR concluded that this most likely was due to microbial activity. Petition at 336. The contention then specifically points out that in the SAR, DOE explained that these missing values could be derived for these parameters when the samples are pre-equilibrated for use in the near field chemistry model. *Id.* (citing Subsection 2.3.5.3.2.2.1 at 2.3.5-27. Nevada does not dispute that the missing values could be derived in this manner.

In any event, if any of the thirty-four samples were affected by microbial activity, they would be nitrate-poor and Ca-rich. *See* Engineered Barrier System: Physical and Chemical Environment, LSN# DN2002452948, Section 6.6, at 6-93. In turn, however, a lower nitrate concentration would increase localized corrosion in Alloy 22. *See* SAR at 2.3.6-36. Accordingly, even if some of the samples were affected by microbial activity, it was conservative to retain them as samples, and so no genuine dispute of material issue of fact or law is raised by this complaint. *Id.*

Finally, Nevada challenges DOE's screening by incorrectly claiming that "DOE use[d] trace elements strontium and manganese to discriminate between the screened-in and screened-out (elevated values) pore-water." Petition at 338. The two screening criteria were charge balance and calculated pH upon equilibration. The strontium and manganese data were used specifically as confirmatory data, and actually illustrated that there are systematic differences between the screened-in and screened-out waters. LSN# DN2002452948, Section 6.6.4.

As discussed in Section V.A.3 above, contentions expressing only generalized "uncertainties" in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. Although Nevada claims that DOE should have considered additional uncertainties in determining the chemical composition of the water in the vicinity of the disposal drifts, Nevada fails to point out any impact that these additional uncertainties would have on the rates at which the disposal system components would degrade.

Nevada bears the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f), including showing that the contention raises a genuine dispute of an issue material to this proceeding. *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Because it has not done so, the contention should be dismissed.

**61. NEV-SAFETY-61 - Ambient Seepage Into Emplacement Drifts**

SAR Section 2.1 and Subsection 2.3.3.2, and similar and related subsections, which state or assume that postclosure ambient seepage of water into emplacement drifts will be reduced by capillary forces, is incorrect because the analysis only considers drift-wall rock properties (e.g., flow characteristics in the unsaturated zone, permeability, and capillary strength of fractured rock) and geometry of the emplacement drifts, and thus completely fails to consider engineered ground support items (e.g., the Bernold-type perforated stainless steel liners) that are deemed necessary for the safety of preclosure operations.

**RESPONSE**

Nevada asserts that SAR Section 2.1 and Subsection 2.3.3.2, and “similar and related subsections,” Petition at 341, which state or assume that postclosure ambient seepage of water into emplacement drifts will be reduced by capillary forces, is incorrect because DOE only considers drift-wall rock properties in analyzing ambient seepage into emplacement drifts, thereby failing to consider the effect of engineered ground support items, which allegedly increase drift seepage by reducing capillary strength.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada alleges that stainless steel liners in contact with the upper surface of the emplacement drifts will reduce the capillary strength of the drifts, thereby “facilitat[ing] seepage flow onto the liners” and increasing the possibility of drips contacting the engineered barrier system (EBS). Petition at 343.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.21(a)(3), 10 C.F.R. §63.21(c)(1)(ii), 10 C.F.R. §63.21(c)(3)(ii), 10 C.F.R. §63.21(c)(14), 10 C.F.R. § 63.102(h) (part of Subpart E), 10 C.F.R. §63.113, and 10 C.F.R. §63.115). Petition at 341-42. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would

make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing seepage of water into emplacement drifts is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or

cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

While Nevada alleges that the presence of perforated stainless steel liners against the upper surface of the emplacement drifts will reduce capillary strength and cause an increase in ambient drift seepage, Nevada has not alleged an increase in the mean dose above the regulatory limit. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada claims that the installation of the Bernold-type perforated steel liners against the upper wall of the emplacement drift will reduce the capillary strength of the drift, resulting in increased drift seepage. Nevada, however, does not provide the requisite supporting facts, expert opinion, or references in support of its contention. Accordingly, this contention must be dismissed.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. §

2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the LA and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach several affidavits (by Michael C. Thorne, Doug F. Hambley, Don L. Shettel, and Stephen K. Matthai), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

According to Nevada's contention, the LA's analyses of ambient seepage into emplacement drifts is somehow deficient because it omits consideration of the Bernold-type perforated stainless steel liners that will be installed against the upper surface of emplacement drifts. For the several reasons discussed below, the contention does not raise a genuine issue of material fact.

First, while Nevada claims that these liners will increase the possibility of seepage through the perforations onto the EBS (Petition at 343), Nevada does not even allege, much less demonstrate, how this alleged seepage will affect the waste package or other aspects of the EBS, and how, if at all, this would affect radiological dose results. Contentions that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or

results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Units Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Next, this contention ignores DOE’s extensive discussion of ambient drift seepage. As explained in SAR § 2.3.3.1, capillary strength is only one of several processes that define seepage barrier capability. Ambient drift seepage is influenced primarily by three processes: (1) the flow characteristics and magnitude of local percolation in the unsaturated zone above the emplacement drifts; (2) permeability and capillary strength of the fractured rock mass near the emplacement drifts; and (3) geometry of the emplacement drifts and drift-wall properties.” SAR § 2.3.3.1 at 2.3.3-5. The main features that influence these processes are “detailed flow patterns” (discussed in SAR § 2.3.3.2.1.2), the magnitude and variability of unsaturated flow in the unsaturated zone (discussed in SAR § 2.3.3.2.1.2), and capillarity and permeability of the host rock and other units.

This contention also ignores the LA discussion demonstrating that the stainless steel liners would not have a significant impact on TSPA results. For example, as explained in SAR § 2.3.6, “Waste Package and Drip Shield Corrosion”:

The alloys used to fabricate the waste packages and drip shields have excellent corrosion resistance over a wide range of aqueous solution compositions and temperatures. Based upon measurements of corrosion rates of the passive metals that comprise the waste package and drip shield, the waste packages and drip shields can remain intact with no penetrations due to general corrosion for durations of tens of thousands and even hundreds of thousands of years.  
SAR at § 2.3.6-6.

SAR section 2.3.6 goes on to discuss the modeling of waste package corrosion in the TSPA, including generalized corrosion, localized corrosion, stress corrosion cracking, early

failure due to manufacturing or handling-induced defects, and long-term thermal aging, and explains why the models are conservative (i.e., overestimate the likelihood of penetration of the waste package corrosion barrier). SAR Subsection 2.3.6.2.2, “Waste Package Degradation Processes.” Overall, this discussion in the LA shows that the waste packages are highly resistant to corrosion, and that the TSPA has taken into account numerous potential causes of corrosion and waste package failure, using failure rates that are higher than the most likely rates. As a result, even if the TSPA did not adequately account for the effects of stainless steel liners on seepage during the postclosure period, the effect on the TSPA results would likely be insignificant. Nevada does not dispute or even address the discussion in SAR § 2.3.6.

Nevada also fails to recognize DOE has considered the impact of the Bernold-type stainless steel liners on groundwater flow. FEP 2.1.06.04.0A, Flow Through Rock Reinforcement Materials in EBS, analyzes groundwater flow through ground support materials, and excludes it based on low consequence. FEP 2.1.06.04.0A, Flow Through Rock Reinforcement Materials in EBS, Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN# DEN001584824 at 6-512 (Mar. 6, 2008). FEPs excluded on the basis of low consequence are those whose omission would not result in significantly adverse changes in radiological exposures to the RMEI, or radionuclide releases to the accessible environment. This FEP demonstrates that Nevada’s claim that the liners have the effect of increasing seepage into emplacement drift is incorrect. Indeed, “Bernold-type sheets, which are bolted to the emplacement walls and roof . . . , may act to divert some seepage away from waste packages.” *Id.* at 6-513. In ignoring this statement and making unsupported claims to the contrary, Nevada fails to raise a genuine dispute.

Despite the fact that the liners may divert seepage away from waste packages, DOE has taken no credit for any prevention of seepage that the steel liner may provide. In doing so, DOE has accounted for any uncertainty that the presence of steel liners in the emplacement drifts may provide: “[g]roundwater flow into emplacement drifts (seepage) is modeled in the TSPA as being completely unhindered by any rock reinforcement models.” *Id.* Clearly, DOE has satisfied its obligation consistent with 10 C.F.R. Part 63. Significantly, Nevada has provided no analysis countering DOE’s exclusion of this FEP on the basis of low consequence and its conclusion that its treatment of steel liners is conservative. Consequently, Nevada fails to raise a genuine dispute of material fact or law. Indeed, rather than explain precisely how the engineered ground support items such as the Bernold-type perforated stainless steel liner allegedly lead to enhanced drift seepage, Nevada argues that this process can be analogized to that of an “old canvas tent in a rainstorm.” Petition at 343. Such an empty metaphor by no stretch constitutes the requisite analysis, required by regulation and precedent, to support this contention.

Finally, Nevada essentially admits that it does not know whether this contention raises a genuine dispute of a material issue: allegedly due to the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions” (Petition at 345), Nevada has not determined what effect the contention would have on the dose to the RMEI. Yet Nevada bears the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), including showing that the contention raises a genuine dispute of an issue material to this proceeding. *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Because it has not done so, the contention should be dismissed by conceding that it does not know how the presence of stainless steel liners will cause the dose to exceed regulatory limits, the contention essentially argues that DOE must

show that Nevada's contention does not raise a genuine dispute of material issue of fact. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and provides an additional basis for rejection.

For the reasons stated above, there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must be dismissed.

**62. NEV-SAFETY-62 - Thermal Seepage Into Emplacement Drifts**

SAR Section 2.1 and Subsection 2.3.3.1, and similar and related subsections, which state or assume that postclosure thermal seepage of water into emplacement drifts will be reduced by capillary forces, is incorrect because the analysis only considers drift-wall rock properties (e.g., flow characteristics in the unsaturated zone, permeability and porosity, capillary strength of fractured rock), temperature increases due to waste decay, and geometry of the emplacement drifts, and thus completely fails to consider engineered ground support items such as Bernold-type perforated stainless steel liners, which are deemed necessary for the safety of preclosure operations.

**RESPONSE**

Nevada argues that SAR Section 2.1 and Subsection 2.3.3.1, and “similar and related subsections,” which state or assume that thermal seepage into emplacement drifts will be reduced by capillary forces, are incorrect because DOE only considers drift-wall rock properties, temperature increases caused by waste decay, and geometry of the drifts, thereby failing to consider the effect of engineered ground support items, which allegedly increase drift seepage by reducing capillary strength.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada alleges that stainless steel liners in contact with the upper surface of the emplacement drifts will reduce the capillary strength of the drifts, thereby “facilitat[ing] seepage flow onto the liners” and increasing the possibility of drips contacting the engineered barrier system (EBS). Petition at 348.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. Part 63, including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.21(a)(3), 10 C.F.R. §63.21(c)(1)(ii), 10 C.F.R. §63.21(c)(3)(ii), 10 C.F.R. §63.21(c)(14), 10 C.F.R. §63.113, and 10 C.F.R. §63.115). Petition at 347. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing seepage of water into emplacement drifts is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the

licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

While Nevada alleges that the presence of perforated stainless steel liners against the upper surface of the emplacement drifts will reduce capillary strength and cause an increase in thermal drift seepage, Nevada has not alleged an increase in the mean dose above the regulatory limit. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada claims that the installation of the Bernold-type perforated steel liners against the upper wall of the emplacement drift will reduce the capillary strength of the drift, resulting in increased drift seepage. Nevada, however, does not provide the requisite supporting facts, expert opinion, or references in support of its contention. Accordingly, this contention must be dismissed.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the LA and DOE’s

supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach several affidavits (by Michael C. Thorne, Doug F. Hambley, Don L. Shettel, and Stephen K. Matthai), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

According to Nevada's contention, the LA's analyses of thermal seepage into emplacement drifts is somehow deficient because it omits consideration of the Bernold-type perforated stainless steel liners that will be installed against the upper surface of emplacement drifts. For the several reasons discussed below, the contention does not raise a genuine issue of material fact.

First, while Nevada claims that these liners will increase the possibility of seepage through the perforations onto the EBS (Petition at 348), they do not even allege, much less demonstrate, how this alleged seepage will affect the waste package or other aspects of the EBS, and how, if at all, this would affect radiological dose results. Contentions that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are,

therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Units Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Next, this contention ignores the LA's extensive discussion of the features and process that affect drift seepage during the early postclosure stage, while rock temperature near the emplacement drifts are above the boiling point of water. As explained in SAR § 2.3.3.1 and 2.3.3.3, seepage during this period is influenced by vaporization from thermal perturbation from radioactive waste decay heat. These effects, in conjunction with the features that define ambient seepage barrier capability, reduce drift seepage.

Ambient drift seepage is influenced primarily by three processes: (1) the flow characteristics and magnitude of local percolation in the unsaturated zone above the emplacement drifts; (2) permeability and capillary strength of the fractured rock mass near the emplacement drifts; and (3) geometry of the emplacement drifts and drift-wall properties." SAR § 2.3.3.1 at 2.3.3-5. The main features that influence these processes are "detailed flow patterns" (discussed in SAR § 2.3.3.2.1.2), the magnitude and variability of unsaturated flow in the unsaturated zone (discussed in SAR § 2.3.3.2.1.2), and capillarity and permeability of the host rock and other units.

Further, during the early postclosure period, in addition to the factors that reduce ambient seepage, heat from waste decay further impedes seepage, as "thermal perturbation causes additional diversion of water around repository drifts." SAR § 2.3.3.1 at 2.3.3-6. As SAR § 2.3.3.1 explains, the thermal-hydrologic seepage model demonstrates that water is prevented from entering the emplacement drifts as long as the fractured rock near the drift wall is above boiling temperature. During this time, seepage is limited not by capillary barrier behavior, but by the vaporization barrier that prevents water from penetrating the drift wall. Accordingly,

seepage “is not expected to occur as long as boiling temperatures and dryout conditions prevail in the rock above the repository.” *Id.*

This contention also ignores the LA’s discussion demonstrating that the stainless steel liners would not have a significant impact on TSPA results. For example, as explained in SAR § 2.3.6, “Waste Package and Drip Shield Corrosion”:

The alloys used to fabricate the waste packages and drip shields have excellent corrosion resistance over a wide range of aqueous solution compositions and temperatures. Based upon measurements of corrosion rates of the passive metals that comprise the waste package and drip shield, the waste packages and drip shields can remain intact with no penetrations due to general corrosion for durations of tens of thousands and even hundreds of thousands of years.

SAR at § 2.3.6-6. Therefore, the durability of waste packages and drip shields is very long compared to the few thousands years relevant for thermal seepage.

SAR section 2.3.6 goes on to discuss the modeling of waste package corrosion in the TSPA, including generalized corrosion, localized corrosion, stress corrosion cracking, early failure due to manufacturing or handling-induced defects, and long-term thermal aging, and explains why the models are conservative (i.e., overestimate the likelihood of penetration of the waste package corrosion barrier). SAR Subsection 2.3.6.2.2, “Waste Package Degradation Processes.” Overall, this discussion shows that the waste packages are highly resistant to corrosion, and that the TSPA has taken into account numerous potential causes of corrosion and waste package failure, using estimates of failure rates that are higher than the likely rates. As a result, even if the TSPA did not adequately account for the effects of stainless steel liners on seepage during the postclosure period, the effect on the TSPA results would likely be insignificant. Petitioner does not dispute or even address the discussion in SAR § 2.3.6.

In addition, FEP 2.1.06.04.0A analyzes groundwater flow through ground support materials, and excludes it based on low consequence. FEP 2.1.06.04.0A, Flow Through Rock Reinforcement Materials in EBS, Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824 at 6-512 (Mar. 6, 2008). FEPs excluded on the basis of low consequence are those whose omission would not result in significantly adverse changes in radiological exposures to the RMEI, or radionuclide releases to the accessible environment. This analysis demonstrates that Nevada's claim that the liners have the effect of increasing seepage into emplacement drift is incorrect. Indeed, "Bernold-type sheets, which are bolted to the emplacement walls and roof, may act to divert some seepage away from waste packages." *Id.* at 6-513. In ignoring this statement and making unsupported claims to the contrary, Nevada fails to support its position that it has a genuine dispute.

Despite the fact that the liners may divert seepage away from waste packages, DOE has taken no credit for any prevention of seepage that the steel liner may provide. In doing so, DOE has accounted for any uncertainty that the presence of steel liners in the emplacement drifts may provide: "[g]roundwater flow into emplacement drifts (seepage) is modeled in the TSPA as being completely unhindered by any rock reinforcement models." *Id.* at 6-512. Significantly, Nevada has provided no analysis countering DOE's exclusion of this FEP on the basis of low consequence and its conclusion that its treatment of steel liners is conservative. Consequently, Nevada fails to raise a genuine dispute of material fact or law. Indeed, rather than explain precisely how the engineered ground support items such as the Bernold-type perforated stainless steel liner allegedly lead to enhanced drift seepage, Nevada argues that this process can be analogized to that of an "old canvas tent in a rainstorm." Petition at 348. Such an empty

metaphor by no stretch constitutes the requisite analysis, required by regulation and precedent, to support this contention.

Moreover, paragraph 6 of the contention essentially admits that it does not know whether this contention raises a genuine dispute of a material issue: allegedly due to the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions” (Petition at 350), Nevada has not determined what effect the contention would have on the dose to the RMEI. Nevada asserts that because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” it has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 349. Yet Nevada bears the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), including showing that the contention raises a genuine dispute of an issue material to this proceeding. *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Instead, Nevada asserts that DOE must show that Nevada’s contention does not raise a genuine issue. Because it has not done so, the contention should be dismissed. Nevada’s position constitutes an improper attempt by Nevada to shift its burden to DOE, and as such, the contention should be rejected.

For the reasons stated above, there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must be dismissed.

**63. NEV-SAFETY-63 - Effect Of Rock Bolts On Ambient Seepage**

SAR Section 2.1 and Subsection 2.3.3.2 of the SAR, and similar and related subsections, which state or assume that postclosure ambient seepage of water into emplacement drifts will be reduced by capillary forces, is incorrect because the analysis only considers drift-wall rock properties (e.g., flow characteristics in the unsaturated zone, permeability and porosity, capillary strength of fractured rock) and geometry of the emplacement drifts, and thus fails to adequately consider an engineered ground support item, i.e., the hundreds of thousands of un-grouted super Swellex-type stainless steel rock bolts, which is deemed necessary for the safety of preclosure operations.

**RESPONSE**

Nevada asserts that SAR Section 2.1 and Subsection 2.3.3.2, and “similar and related subsections,” which state or assume that postclosure ambient seepage of water into emplacement drifts will be reduced by capillary forces, is incorrect because DOE only consider drift-wall rock properties in analyzing ambient seepage, thereby failing to consider the effect of engineered support items, specifically the un-grouted super Swellex-type stainless steel rock bolts.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada alleges that the stainless steel rock bolts “may reduce capillary barriers to ambient water flow diversion” around emplacement drifts, thereby increasing the possibility of water entering drifts and contacting the engineered barrier system (EBS). Petition at 351.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.21(a)(3), 10 C.F.R. §63.21(c)(1)(ii), 10 C.F.R. §63.21(c)(3)(ii), 10 C.F.R. §63.21(c)(14), 10 C.F.R. §63.113, and 10 C.F.R. §63.115). *See* Petition at 352. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing seepage of water into emplacement drifts is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the

licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

While Nevada alleges that the presence of the un-grouted super Swellex-type stainless steel rock bolts in emplacement drift rock walls has not been adequately considered, Nevada has not alleged an increase in the mean dose above the regulatory limit. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada claims that the installation of the super Swellex-type stainless steel rock bolts in the walls of the emplacement drift will reduce the capillary strength of the drift, “act as a channel or drain for ambient seepage to enter” the drift, and create a “larger capture volume for seepage waters,” all of which will allegedly result in increased seepage into the drift. Petition at 353. Nevada, however, does not provide the requisite supporting facts, expert opinion, or references in support of its contention. Accordingly, this contention must be dismissed.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the LA and DOE’s

supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach several affidavits (by Michael C. Thorne, Doug F. Hambley, Don L. Shettel, and Stephen K. Matthai), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

According to Nevada's contention, the LA's analysis of ambient seepage into emplacement drifts is somehow deficient because it omits consideration of the hundreds of thousands of stainless steel rock bolts in the walls of emplacement drifts. For the several reasons discussed below, the contention does not raise a genuine dispute issue of material fact.

First, while Nevada claims that because of presence of the rock bolts, "the rock wall [will] provide[] an opening that may act as a channel or drain for ambient seepage to enter the emplacement drift" and that the bolts will "facilitate liquid flow towards the emplacement drift," (Petition at 353) Nevada does not even allege, much less demonstrate, how any increase of ambient seepage into the emplacement drift will affect the waste package or other aspects of the EBS, and how, if at all, this would affect radiological dose results. Contentions that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such allege deficiencies – fail to raise a genuine dispute of material fact and are,

therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Units Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Next, this contention ignores DOE's extensive discussion of ambient drift seepage. As explained in SAR § 2.3.3.1, capillary strength is only one of several processes that define seepage barrier capability. Ambient drift seepage is influenced primarily by three processes: (1) the flow characteristics and magnitude of local percolation in the unsaturated zone above the emplacement drifts; (2) permeability and capillary strength of the fractured rock mass near the emplacement drifts; and (3) geometry of the emplacement drifts and drift-wall properties." SAR § 2.3.3.1 at 2.3.3-5. The main features that influence these processes are "detailed flow patterns" (discussed in SAR § 2.3.3.2.1.2), the magnitude and variability of unsaturated flow in the unsaturated zone (discussed in SAR § 2.3.3.2.1.2), and capillarity and permeability of the host rock and other units.

This contention also ignores the LA discussion demonstrating that the super Swellex rock bolts would not have a significant impact on TSPA results. For example, as explained in SAR § 2.3.6, "Waste Package and Drip Shield Corrosion":

The alloys used to fabricate the waste packages and drip shields have excellent corrosion resistance over a wide range of aqueous solution compositions and temperatures. Based upon measurements of corrosion rates of the passive metals that comprise the waste package and drip shield, the waste packages and drip shields can remain intact with no penetrations due to general corrosion for durations of tens of thousands and even hundreds of thousands of years.

SAR at § 2.3.6-6.

SAR section 2.3.6 goes on to discuss the modeling of waste package corrosion in the TSPA, including generalized corrosion, localized corrosion, stress corrosion cracking, early failure due to manufacturing or handling-induced defects, and long-term thermal aging, and

explains why the models are conservative (i.e., overestimate the likelihood of penetration of the waste package corrosion barrier). SAR Subsection 2.3.6.2.2, “Waste Package Degradation Processes.” Overall, this discussion in the LA shows that the waste packages are highly resistant to corrosion, and that the TSPA has taken into account numerous potential causes of corrosion and waste package failure, using failure rates that are higher than the most likely rates. As a result, even if the TSPA did not adequately account for the effects of certain rock bolts on seepage during the postclosure period, the effect on the TSPA results would likely be insignificant. Nevada does not dispute or even address the discussion in SAR § 2.3.6.

Furthermore, SAR § 2.3.3 states that the “seepage model for performance assessment is also used to simulate the potential effect of rock bolts in the drift ceiling on seepage. Several rock bolts scenarios are examined in a sensitivity analysis, including cases representing both grouted and ungrouted boreholes. It is shown that these features have a minor effect on seepage, and can be excluded in the TSPA drift seepage submodel.” SAR 2.3.3.2.3.4.1 at 2.3.3-35.

In addition, FEP 2.1.06.04.0A analyzes groundwater flow through ground support materials, and excludes it based on low consequence. FEP 2.1.06.04.0A, Flow Through Rock Reinforcement Materials in EBS, Features, Events, and Processes for the Total System Performance Assessment: Analyses, (LSN#DEN001584824 at 6-512) (Mar. 6, 2008). FEPs excluded on the basis of low consequence are those whose omission would not result in significantly adverse changes in radiological exposures to the RMEI, or radionuclide releases to the accessible environment. This FEP demonstrates that Nevada’s claim that the rock bolts will have the effect of increasing seepage into emplacement drift is incorrect:

Groundwater flow into emplacement drifts (seepage) is modeled in the TSPA as being completely unhindered by any rock reinforcement materials. The impact of rock bolts on seepage was investigated using the predictive model for performance

assessment . . . . These results indicate that the presence of rock bolts does not lead to significant seepage enhancement. This is understandable, considering that an open borehole without grout acts as a capillary barrier to unsaturated flow; that the cross-sectional area of the rock bolt borehole, onto which flow may be incident, is small; and that water that may have seeped into the borehole can imbibe back into the rock along its length.

*Id.* at 6-512.

Moreover, FEP 1.1.01.01.0B analyzes the effect of holes “drilled through the drift walls or crown for a variety of reasons,” including “rock bolt and ground support,” and states that sensitivity analyses were performed in which capillarity and permeability were examined. These features were found to have a minor effect on seepage, and this FEP was excluded on the basis of low consequence. FEP 1.1.01.01.0B, Influx Through Holes Drilled in Drift Wall or Crown, Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824, 6-24 (Mar. 6, 2008).

Despite the fact that DOE has examined the effect on repository performance of rock bolts in the emplacement drift and has excluded it on the basis of low consequence, Nevada ignores this analysis in making unsupported claims to the contrary. Clearly, DOE has satisfied its obligation consistent with 10 C.F.R. Part 63. Significantly, Nevada has provided no analysis countering DOE’s exclusion of this FEP on the basis of low consequence. Consequently, Nevada fails to raise a genuine dispute of material fact or law.

In fact, Paragraph 6 of the contention essentially admits that it does not know whether this contention raises a genuine dispute of a material issue: allegedly due to the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions” (Petition at 355), Nevada has not determined what effect the contention would have on the dose to the RMEI. Nevada asserts that because of the “burden and complexity of showing the dose effects of

acceptance of Nevada's contentions," it has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 355. Yet Nevada bears the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), including showing that the contention raises a genuine dispute of an issue material to this proceeding. *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001), arguing instead that DOE must show that Nevada's contention does not raise a genuine issue. Because it has not done so, the contention should be dismissed. Nevada's position constitutes an improper attempt by Nevada to shift its burden to DOE, and as such, the contention should be rejected.

For the reasons stated above, there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must be dismissed.

**64. NEV-SAFETY-64 - Effect Of Rock Bolts On Thermal Seepage**

SAR Section 2.1 and Subsection 2.3.3.2, and similar and related subsections, which state or assume that postclosure thermal seepage of water into emplacement drifts will be reduced by capillary forces, is incorrect because the analysis only considers drift-wall rock properties (e.g., flow characteristics in the unsaturated zone, permeability and porosity, capillary strength of fractured rock) and geometry of the emplacement drifts, and fails to adequately consider an engineered ground support item, i.e., the hundreds of thousands of ungrouted super Swellex-type stainless steel rock bolts, which is deemed necessary for the safety of preclosure operations.

**RESPONSE**

Nevada asserts that SAR Section 2.1 and Subsection 2.3.3.2, and similar and related subsections, which state or assume that postclosure thermal seepage of water into emplacement drifts will be reduced by capillary forces, is incorrect because DOE only considers drift-wall rock properties and geometry of the drifts, thereby failing to consider the effect of engineered support items, specifically the un-grouted super Swellex-type stainless steel rock bolts. Petition at 356.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada alleges that the stainless steel rock bolts “may reduce capillary barriers to ambient water flow diversion” around emplacement drifts, thereby increasing the possibility of water entering drifts and contacting the engineered barrier system (EBS). Petition at 356.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.21(a)(3), 10 C.F.R. §63.21(c)(1)(ii), 10 C.F.R. §63.21(c)(3)(ii), 10 C.F.R. §63.21(c)(14), 10 C.F.R. §63.102(h), 10 C.F.R. §63.113, and 10 C.F.R. §63.115). Petition at 357. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing seepage of water into emplacement drifts is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the

licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

While Nevada has alleged that DOE fails to consider the effect of the rock bolts on thermal seepage of water into emplacement drifts, Nevada has not alleged an increase in the mean dose above the regulatory limit. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada claims that the installation of the super Swellex-type stainless steel rock bolts in the walls of the emplacement drift will reduce the capillary strength of the drift, “act as a channel or drain for ambient seepage to enter” the drift, and create a “larger capture volume for seepage waters,” all of which will allegedly result in increased seepage into the drift. Petition at 358. Nevada, however, does not provide the requisite supporting facts, expert opinion, or references in support of its contention. Accordingly, this contention must be dismissed.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the LA and DOE’s

supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach several affidavits (by Michael C. Thorne, Doug F. Hambley, Don L. Shettel, and Stephen K. Matthai), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

According to Nevada's contention, the LA's analysis of thermal seepage into emplacement drifts is somehow deficient because it omits consideration of the hundreds of thousands of stainless steel rock bolts in the walls of emplacement drifts. For the several reasons discussed below, the contention does not raise a genuine dispute issue of material fact.

First, while Nevada claims that because of presence of the bolts, "the rock wall [will] provide[] an opening that may act as a channel or drain for ambient seepage to enter the emplacement drift" and that the bolts will "facilitate liquid flow towards the emplacement drift," (Petition at 358) Nevada does not even allege, much less demonstrate, how any increase of seepage into the emplacement drift will affect the waste package or other aspects of the EBS, and how, if at all, this would affect radiological dose results. Contentions that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such allege deficiencies – fail to raise a genuine dispute of material fact and are,

therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Units Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Next, this contention ignores the LA's extensive discussion of the features and process that affect drift seepage during the early postclosure stage, while rock temperature near the emplacement drifts are above the boiling point of water. As explained in SAR § 2.3.3.1 and 2.3.3.3, seepage during this period is influenced by vaporization from thermal perturbation from radioactive waste decay heat. These effects, in conjunction with the features that define ambient seepage barrier capability, result in reduced drift seepage.

Ambient drift seepage is influenced primarily by three processes: (1) the flow characteristics and magnitude of local percolation in the unsaturated zone above the emplacement drifts; (2) permeability and capillary strength of the fractured rock mass near the emplacement drifts; and (3) geometry of the emplacement drifts and drift-wall properties." SAR § 2.3.3.1 at 2.3.3-5. The main features that influence these processes are "detailed flow patterns" (discussed in SAR § 2.3.3.2.1.2), the magnitude and variability of unsaturated flow in the unsaturated zone (discussed in SAR § 2.3.3.2.1.2), and capillarity and permeability of the host rock and other units.

During the early postclosure period, in addition to the factors that reduce ambient seepage, heat from waste decay further impedes seepage, as "thermal perturbation causes additional diversion of water around repository drifts." SAR § 2.3.3.1 at 2.3.3-6. As SAR § 2.3.3.1 explains, the thermal-hydrologic seepage model demonstrates that water is prevented from entering the emplacement drifts as long as the fractured rock near the drift wall is above boiling temperature. During this time, seepage is limited not by capillary barrier behavior, but by the vaporization barrier that prevents water from penetrating the drift wall. Accordingly,

seepage “is not expected to occur as long as boiling temperatures and dryout conditions prevail in the rock above the repository.” *Id.* Therefore rock bolts can not facilitate liquid flow during the time period when the entire bolt is in a superheated environment.

This contention also ignores the LA discussion demonstrating that the super Swellex rock bolts would not have a significant impact on TSPA results. For example, as explained in SAR § 2.3.6, “Waste Package and Drip Shield Corrosion”:

The alloys used to fabricate the waste packages and drip shields have excellent corrosion resistance over a wide range of aqueous solution compositions and temperatures. Based upon measurements of corrosion rates of the passive metals that comprise the waste package and drip shield, the waste packages and drip shields can remain intact with no penetrations due to general corrosion for durations of tens of thousands and even hundreds of thousands of years.

SAR at § 2.3.6-6. Therefore, the durability of waste packages and drip shields is very long compared to the few thousand years relevant for thermal seepage.

SAR section 2.3.6 goes on to discuss the modeling of waste package corrosion in the TSPA, including generalized corrosion, localized corrosion, stress corrosion cracking, early failure due to manufacturing or handling-induced defects, and long-term thermal aging, and explains why the models are conservative (i.e., overestimate the likelihood of penetration of the waste package corrosion barrier). SAR Subsection 2.3.6.2.2, “Waste Package Degradation Processes.” Overall, this discussion in the LA shows that the waste packages are highly resistant to corrosion, and that the TSPA has taken into account numerous potential causes of corrosion and waste package failure, using failure rates that are higher than the most likely rates. As a result, even if the TSPA did not adequately account for the effects of certain rock bolts on seepage during the postclosure period, the effect on the TSPA results would likely be insignificant. Nevada does not dispute or even address the discussion in SAR § 2.3.6.

In addition, FEP 2.1.06.04.0A analyzes groundwater flow through ground support materials, and excludes it based on low consequence. FEP 2.1.06.04.0A, Flow Through Rock Reinforcement Materials in EBS, Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824 (Mar. 6, 2008) at 6-512. FEPs excluded on the basis of low consequence are those whose omission would not result in significantly adverse changes in radiological exposures to the RMEI, or radionuclide releases to the accessible environment. This FEP demonstrates that Nevada's claim that the rock bolts will have the effect of increasing seepage into emplacement drift is incorrect:

Groundwater flow into emplacement drifts (seepage) is modeled in the TSPA as being completely unhindered by any rock reinforcement materials.

*Id.* at 6-512

Moreover, FEP 1.1.01.01.0B analyzes the effect of holes “drilled through the drift walls or crown for a variety of reasons,” including “rock bolt and ground support,” and states that sensitivity analyses were performed in which capillarity and permeability were examined. These features were found to have a minor effect on seepage, and this FEP was excluded on the basis of low consequence. FEP 1.1.01.01.0B, Influx Through Holes Drilled in Drift Wall or Crown, Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#DEN001584824, 6-24 (Mar. 6, 2008).

Despite the fact that DOE has examined the effect on repository performance of rock bolts in the emplacement drift and has excluded it on the basis of low consequence, Nevada ignores this analysis in making unsupported claims to the contrary. Clearly, DOE has satisfied its obligation consistent with 10 C.F.R. Part 63. Significantly, Nevada has provided no analysis

countering DOE's exclusion of this FEP on the basis of low consequence. Consequently, Nevada fails to raise a genuine dispute of material fact or law.

In fact, paragraph 6 of this contention essentially admits that it does not know whether this contention raises a genuine dispute of a material issue: allegedly due to the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions" (Petition at 358), Nevada has not determined what effect the contention would have on dose. Petition at 358. Yet Nevada bears the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), including showing that the contention raises a genuine dispute of an issue material to this proceeding. *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Because it has not done so, the contention should be dismissed. Nevada's position constitutes an improper attempt by Nevada to shift its burden to DOE, and provides an additional basis for rejection.

For the reasons stated above, there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and this contention must be dismissed.

**65. NEV-SAFETY-65 - Structural Control Of Seepage In The Emplacement Drift**

SAR Subsection 2.3.2 and similar subsections, which describe unsaturated zone flow, fail to recognize that the Yucca Mountain fracture geometry controls the spatial distribution of seepage into the in-drift environment, which affects water delivery to the drip shield and waste package.

**RESPONSE**

Nevada asserts that SAR Section 2.3.2 and “similar subsections” are inadequate because DOE does not consider that fracture geometry controls spatial distribution of seepage into emplacement drifts, thereby failing to analyze the effect of seepage drip alignments that result in patterned corrosion of engineered barrier system (EBS) surfaces.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada alleges that water in the unsaturated zone flows in discrete fractures and faults, thereby causing drip seepage onto the EBS to occur in discrete patterns. Nevada claims that

DOE has failed to consider the implications of such patterned corrosion on the EBS and has failed to demonstrate that such information is being used to affect DOE's waste package and drip shield placement strategy.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.31(a)(3), 10 C.F.R. §63.21, 10 C.F.R. §63.21(c)(3)(ii), 10 C.F.R. §63.21(c)(14), 10 C.F.R. §63.102(h)(2), 10 C.F.R. §63.113, 10 C.F.R. §63.115, and 10 C.F.R. § 114(f). Petition at 361-62. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. §

63.31(a)(2). However, as discussed in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing unsaturated zone flow and its impact on drift seepage is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit

being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

While Nevada claims that the impacts of water flow through fractures and faults in the unsaturated zone on seepage has not been adequately considered, it has not alleged an increase in the mean dose above the regulatory limit. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the LA and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach several affidavits (by Adrian P. Butler, Maurice E. Morgenstein, and Stephan K. Matthäi) which purportedly provide expert opinions to support this contention. Petition, Attachments 6, 17 and 21. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada argues that the LA's discussion of unsaturated zone flow is inadequate because it does not consider the impact of fracture geometry on spatial distribution of seepage into emplacement drifts and onto the EBS, and fails to analyze patterned corrosion resulting from seepage drip alignment. This contention, however, ignores the analysis conducted by DOE to address the impact of fracture-fault spatial patterning on drift seepage, fails to recognize the LA analysis showing that the EBS will demonstrate corrosion resistance to a wide range of solutions and temperatures, and fails to show how drip alignments that provide "patterned wetting of the EBS surfaces" (Petition at 363) will affect repository performance.

Several sections of the SAR analyze the effects of fracture geometry in the unsaturated zone on the spatial distribution of drift seepage. SAR § 2.3.3.2.3.2 examines the Conceptual and Numerical Models of Seepage used in the LA, stating that "[s]mall-scale features and processes, including discrete-fracture flow behavior, surface roughness, and film flow, are captured in effective model-related parameters determined from site-specific data that reflect the seepage process on the appropriate scale." SAR § 2.3.3.2.3.2 at 2.3.3-31-32. SAR § 2.3.3.2.3.5 also demonstrates DOE's examination of the impacts of percolation flux and flow focusing on seepage drip alignment. As stated, the site-scale unsaturated zone flow model "calculates flow fields accounting for climate changes and related uncertainties, variability in net infiltration, the effect of different stratigraphic units, and the presence of faults." SAR § 2.3.3.2.3.5 at 2.3.3-38. In addition to this model, the flow focusing model is a "high-resolution fracture continuum numerical flow model" that captures intermediate-scale heterogeneity. *Id.* In doing so, this model represents fracture heterogeneity "as a stochastic heterogeneous continuum with variable

permeability.” *Id.* Based on these results, among other analyses in the SAR, a distribution of flow focusing factors is developed for use in simulation of emplacement drift seepage.

Furthermore, SAR § 2.3.3.4 explains the TSPA implementation of drift seepage, explaining that seepage calculations in the TSPA are performed “using a probabilistic approach that accounts for the spatial and temporal variability and the inherent uncertainty of seepage-relevant properties and processes.” SAR § 2.3.3.4 at 2.3.3-69. As discussed in that section, the TSPA accounts for fracture geometry in the unsaturated zone, and its effects on spatial distribution of seepage into emplacement drifts.

Additionally, FEP 2.2.07.04.0A analyzes the differentiation of flow that may result in preferential flow paths and explains that fractures and faults in the unsaturated zone may result in focusing. Accordingly, this contention fails to raise a genuine dispute of material fact or law and must be dismissed. FEP 2.2.07.04.0A, “Focusing of Unsaturated Flow (Fingers, Weeps),” Features, Events, and Processes for the Total System Performance Assessment: Analyses (Mar. 6, 2008) (LSN#DEN001584824 at 6-929):

Drift-scale models focus on the vicinity of emplacement drifts. These models typically have a more refined grid resolution on the order of a few centimeters to decimeters that allows for explicit representation of preferential flows. Seepage models . . . represent preferential flow of water into drifts (i.e., in “weeps”) on two different scales. First, intermediate-scale focusing of flow from the site scale to the drift scale is accounted for in the seepage abstraction by using appropriate flow-focusing factors . . . Second, small-scale preferential flow is explicitly simulated in the seepage process model . . . Thus, preferential flow is inherently imbedded in the seepage lookup tables for ambient seepage . . . Uncertainty in flow focusing is therefore propagated to TSPA models through the use of distributions of flow-focusing factors and lookup tables for seepage.” *Id.* at 6-930.

This analysis demonstrates again that the impact of fractures and faults in the unsaturated zone on water seepage into emplacement drifts is accounted for in the TSPA and that DOE has

accordingly satisfied its obligations consistent with 10 C.F.R. Part 63. Significantly, Nevada has provided no support or analysis countering DOE's considerations. Accordingly, Nevada's claim that "DOE gives no consideration to the potential implications of patterned corrosion on drip shield and waste package failure" (Petition at 363) fails to raise a genuine dispute of material fact or law and must be dismissed.

Moreover, while Nevada claims that focused drift seepage "may have very significant controls on the focusing of corrosion on . . . EBS materials" (Petition at 363), Nevada does not demonstrate how any patterned or focused seepage will affect the waste package or other aspects of the EBS, and how, if at all, this would affect radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co. (Turkey Point Plant, Unit Nos. 3 and 4)*, LBP-90-16, 31 NRC 509, 521 (1990).

Nevada also ignores the LA's discussion demonstrating that Nevada's claim that seepage drip alignments will cause patterned wetting of EBS surfaces, even if true, would not have a significant impact on TSPA results. For example, as explained in SAR § 2.3.6, "Waste Package and Drip Shield Corrosion":

The alloys used to fabricate the waste packages and drip shields have excellent corrosion resistance over a wide range of aqueous solution compositions and temperatures. Based upon measurements of corrosion rates of the passive metals that comprise the waste package and drip shield, the waste packages and drip shields can remain intact with no penetrations due to general corrosion for durations of tens of thousands and even hundreds of thousands of years.

SAR at 2.3.6-6.

SAR section 2.3.6 goes on to discuss the modeling of waste package corrosion in the TSPA, including generalized corrosion, localized corrosion, stress corrosion cracking, early failure due to manufacturing or handling-induced defects, and long-term thermal aging, and explains why the models are conservative (i.e., overestimate the likelihood of penetration of the waste package corrosion barrier). SAR Subsection 2.3.6.2.2, “Waste Package Degradation Processes.” Overall, this discussion shows that the waste packages are highly resistant to corrosion, and that the TSPA has taken into account numerous potential causes of corrosion and waste package failure, using conservatively high estimates of the likely failure rates. As a result, even if the TSPA did not adequately account for the effect of fracture-fault spatial patterning on seepage into emplacement drifts, the effect on the TSPA results would likely be insignificant. Nevada does not dispute or even address the discussion in SAR § 2.3.6.

Finally, in providing background into its allegation that DOE has failed to consider the effect of fracture geometry in the unsaturated zone on water seepage into emplacement drifts, Nevada claims that “[c]aves and old mine tunnels that are fed by fracture flow dripping commonly develop a stalactite, stalagmite and column pattern which follows the fault pattern of the host rock.” Petition at 362. Thus, Nevada relies upon caves and mines to make observations about hydrologic behavior in underground settings. Similarly, SAR § 2.3.2.5.1.6.1 demonstrates that DOE has conducted this analysis in observing the hydrologic behavior of “ancient man-made tunnels and natural caves [which] provide information about water seepage into mine openings in an unsaturated zone over thousands of years.” SAR § 2.3.2.5.1.6.1 at 2.3.2-90. This data was used to estimate groundwater flow paths and “provided insight into processes controlling fracture and matrix flow under unsaturated conditions.” *Id.*

For the reasons stated above, there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must be dismissed.

**66. NEV-SAFETY-66 - Attenuation Of Seepage Into Naturally Fractured Drift Walls**

SAR Subsection 2.3.3 and related subsections argue for a flow diversion around the repository drifts due to capillary forces, but in the presence of drift-wall fractures this is not a valid assumption which implies that more water will enter the emplacement drifts than is asserted by DOE.

**RESPONSE**

Nevada asserts that SAR Subsection 2.3.3 and “related subsections,” which state or assume that water flow will be diverted around emplacement drifts due to capillary forces is incorrect because the presence of drift-wall fractures, which may result in variations in fracture aperture, imbibing of fluids into fractures, and other mechanisms, may cause water to enter emplacement drifts rather than being diverted around them.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada alleges that drift-wall fractures and associated features and processes will reduce capillary forces that divert water around emplacement drifts, resulting in more water entering the drifts. Petition at 368. But Nevada is silent as to how any increase in the probability of water entering emplacement drifts would result in DOE failing to comply with 10 C.F.R. Part 63. Therefore, Nevada has not demonstrated why this proposed contention – even if true – would be material to the findings the NRC must make in this proceeding.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.31(a)(3), 10 C.F.R. §63.21, 10 C.F.R. §63.21(c)(9), 10 C.F.R. §63.113, C.F.R. §63.21(c)(15), 10 C.F.R. §63.114(e), and 10 C.F.R. §63.114(c)). Petition at 365-68. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the impact of drift-wall fractures and other features on unsaturated zone water flow and drift seepage is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are

immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

While Nevada alleges an omission in DOE’s analyses of fractures in the drift-wall and their effect on diversion of water flow around emplacement drifts, it has not alleged an increase in the mean dose above the regulatory limit. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada claims that because of drift-wall fractures, the occurrence of flow diversion around emplacement drifts due to capillary forces “is not a valid assumption.” Petition at 368. Nevada, however, does not provide the requisite supporting facts, expert opinion, or references in support of its contention. Accordingly, this contention must be dismissed.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the LA and DOE’s

supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach three affidavits (by Michael C. Thorne, Adrian P. Butler and Stephan K. Matthäi), which purportedly provide expert opinions to support this contention. Petition, Attachments 6 and 21. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada argues that DOE fails to analyze fractures in the drift-wall and "considerations of variations in fracture aperture, the imbibing of fluids into fractures, and mechanisms akin to gas-oil gravity drainage" and that "alternative conceptual models are readily justified that may result" in water entering emplacement drifts rather than being diverted around them. Petition at 368. This contention, however, ignores the factors that reduce or prevent seepage into emplacement drifts, fails to recognize that the TSPA accounts for fractures, matrix imbibition, and other FEPs relevant to the effect of fractures on water entering emplacement drifts, and fails to recognize that the SAR identifies that the EBS will demonstrate corrosion resistance to a wide range of solutions and temperatures. Accordingly, this contention fails to raise a genuine dispute of material fact or law and must be dismissed.

First, while Nevada claims that flow diversion around repository drifts is not a valid assumption because of drift-wall fractures, it does not sufficiently allege, much less demonstrate,

how water allegedly entering emplacement drifts will affect the waste package or other aspects of the EBS, and how, if at all, this would affect radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Nevada argues that SAR Subsection 2.3.3 does not comply with regulations requiring the “performance assessment to provide the technical basis for either inclusion of exclusion of specific FEPs, such as those relating to the behavior of water in fractures.” (Petition at 368). Nevada fails to recognize, however, the several FEPs analyzing water flow in fractures and that the TSPA accounts for such factors. For example, FEP 2.2.07.20.0A discusses seepage process models that “explicitly consider the impact of underground openings (including flow diversion and seepage),” which are accounted for in the TSPA. FEP 2.2.07.20.0A, “Flow Diversion Around Repository Drifts,” Features, Events, and Processes for the Total System Performance Assessment: Analyses, Mar. 6, 2008 (LSN#DEN001584824 at 6-973).

Additionally, FEP 1.2.02.01.0A states that “[f]low processes in fractures or other channels are important for seepage because the amount of seepage is controlled by the fracture diversion capacity in the drift vicinity . . . These flow processes are influenced by fracture characteristics such as orientation, aperture, asperity, length, connectivity, and fillings. All seepage process models that feed into the seepage abstraction explicitly simulate the flow processes in fractures using appropriate continuum properties.” FEP 1.2.02.01.0A, Fractures, Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN# DEN001584824 at 6-81-2 (Mar. 6, 2008).

FEP 2.2.07.18.0A analyzes film flow into the repository, a process which “could allow water to enter a waste emplacement drift at non-zero capillary pressure.” FEP 2.2.07.18.0A, Film Flow into the Repository, Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN# DEN001584824 at 6-969. The impact of “film flow on seepage is included in the prediction of seepage into waste emplacement drifts” and “[u]ncertainty due to the potential effects of film flow is incorporated into TSPA by sampling a probability distribution for the capillary-strength parameter.” *Id.* In addition, FEP 2.2.07.09.0A identifies that matrix imbibition in the unsaturated zone is accounted for in the TSPA. FEP 2.2.07.09.0A, Matrix Imbibition in the UZ, Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN# DEN001584824 at 6-948.

Accordingly, Nevada’s assertions that the presence of drift-wall fractures will reduce flow around emplacement drifts ignore the wide-range of FEPs that DOE accounts for in the TSPA. Nevada has not adequately challenged these analyses and thereby fails to raise a genuine dispute of material fact or law.

Furthermore, this contention makes assertions that mischaracterize the processes affecting water flow within the unsaturated zone and that ignore DOE’s analyses of these processes. Significantly, these assertions fail to recognize the LA’s extensive analysis of the capillary barrier effect and its impact on processes occurring at interfaces between materials of different capillary strength, such as fractures and drift openings.

Nevada states that where “gradual aperture variations in the fractures exist, the end-effect argument does not apply.” Petition 367. Nevada also claims that “water can imbibe into narrow aperture segments without overcoming an entry pressure threshold,” (Petition at 367) and implies

that this mechanism is not considered in the LA seepage models. These assertions fail to raise a genuine dispute of material fact or law.

First, increases in fracture aperture towards emplacement drifts are discussed in the LA, and are appropriately accounted for in seepage models, as described in SAR § 2.3.3.2.1.3: “An increase in fracture aperture causes an increase in fracture permeability and a decrease in capillary strength. The ambient seepage models use excavation-disturbed rock properties in the simulation of seepage.” SAR § 2.3.3.2.1.3 at 2.3.3-15. Furthermore, as explained in this section, the capillary barrier effect continues to apply at the interface between fractures and the emplacement drift. Accordingly, Nevada’s claim that the end-effect argument does not apply where gradual aperture variations in the fractures exist is incorrect. In addition, as described in SAR § 2.3.3.2.3.2, the seepage models assume that all percolating water in the unsaturated zone has imbibed into and thus flows within the fractures.

In making claims to the contrary, Nevada has ignored the analyses provided in the LA, and in doing so, fails to raise a genuine dispute of material fact or law.

Nevada further argues “that alternative conceptual models are readily justified that may result in water preferentially entering the emplacement drifts rather than being diverted around them.” (Petition at 368). Nevada’s unsupported assertion challenging the models DOE considered in analyzing water flow and diversion around drifts is simply not a sufficient basis for rejecting the model. Nevada fails to demonstrate that its claims, even if accepted, would have any material effect on water diversion around emplacement drifts. In particular, the contention does not allege or demonstrate that the use of a different method would result in more accurate modeling of flow diversion or capillarity.

Nor does Nevada allege that DOE's modeling is not consistent with the reasonable expectation standard discussed in section V.A.3.c. If Nevada believes that quantification would show that DOE's modeling is not consistent with that standard, the burden is on Nevada to do so, as well as determine what effect, if any, acceptance of their contention would have on dose to the RMEI. *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Furthermore, Nevada ignores the LA discussion demonstrating that water entering emplacement drifts would not have a significant impact on TSPA results. For example, as explained in SAR § 2.3.6, "Waste Package and Drip Shield Corrosion":

The alloys used to fabricate the waste packages and drip shields have excellent corrosion resistance over a wide range of aqueous solution compositions and temperatures. Based upon measurements of corrosion rates of the passive metals that comprise the waste package and drip shield, the waste packages and drip shields can remain intact with no penetrations due to general corrosion for durations of tens of thousands and even hundreds of thousands of years.

SAR section 2.3.6 goes on to discuss the modeling of waste package corrosion in the TSPA, including generalized corrosion, localized corrosion, stress corrosion cracking, early

failure due to manufacturing or handling-induced defects, and long-term thermal aging, and explains why the models are conservative (i.e., overestimate the likelihood of penetration of the waste package corrosion barrier). SAR Subsection 2.3.6.2.2, “Waste Package Degradation Processes.” Overall, this discussion shows that the waste packages are highly resistant to corrosion, and that the TSPA has taken into account numerous potential causes of corrosion and waste package failure, using conservatively high estimates of the likely failure rates. As a result, even if the TSPA did not adequately account for reduced flow diversion around emplacement drifts due to drift-wall fractures, the effect on TSPA results would likely be insignificant. Petitioner does not dispute or even address the discussion in SAR § 2.3.6.

In fact, Nevada essentially admits, in paragraph 6 of this contention, that it does not know whether this contention raises a genuine dispute of a material issue. Allegedly due to the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions” (Petition at 369), Nevada has not determined what effect the contention would have on dose. Yet Nevada bears the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), including showing that the contention raises a genuine dispute of an issue material to this proceeding. *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Because it has not done so, the contention should be dismissed. Nevada’s position constitutes an improper attempt by Nevada to shift its burden to DOE, and provides an additional basis for rejection.

For the reasons stated above, there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and this contention must be dismissed.

**67. NEV-SAFETY-67 - Evaluation Of Uncertainties In Estimated Chemical Properties, Especially pH Values, Of Evaporated Drift Brines**

The modeled compositional range for evaporated brines that might seep onto waste packages, and thus be the agent for corrosion, at the end of the thermal period should be broader than has been estimated and used in SAR Subsection 2.3.5.5 and related subsections.

**RESPONSE**

In this contention, Nevada challenges the uncertainties in the modeled compositional range for evaporated brines that might seep onto waste packages at the end of the thermal period. Nevada claims that the uncertainties are understated with respect to pH and thus the modeled composition range should be broader than DOE estimated.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and

therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp. (Oconee Nuclear Station Units 1, 2 and 3)*, CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation:” (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Here, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), and as discussed in the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Michael C. Thorne, Adrian H. Bath, Don L. Shettel, Jr., and Maurice E. Morgenstein), which purportedly provide expert opinions to support this contention. Petition, Attachments 3, 4, 10, and 17. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Without any doubt, Nevada knows that it is obligated to provide "a concise statement of the facts or expert opinions supporting the contention, *along with appropriate citations to supporting scientific or factual materials.*" Petition at 372. Yet other than the license application, Nevada cites only one other document—the "Engineered Barrier System: Physical and Chemical Environment," LSN# DN2002452948—and does so for the sole purpose of explaining the assumptions that DOE used in estimating the modeled pH. Nothing Nevada cites from this document supports Nevada's position that in the model, DOE should have accounted for uncertainties identified by Nevada.

Nevada notes that DOE estimated that the uncertainty in pH can be reduced to less than +/- 1 pH unit for brines that are below the salt saturation limit. Nevada claims that the model fails to assume that there are *other* controls on pH besides P(CO<sub>2</sub>), and that, therefore, DOE has not properly estimated the uncertainty in pH for brines that are below the salt saturation limit. *Id.* Nevada then reaches the conclusion that that there is a “probability that uncertainties have been underestimated” and therefore, “the in situ pH range *could* be even greater than [5 to 11.] *Id.* (emphasis added).

Nevada cites no scholarly authority to support its view that DOE’s model failed to take into account the relevant controls on pH or that DOE has not properly estimated the uncertainty in the model. In addition, Nevada’s conclusions that because there is a “probability that uncertainties have been underestimated,” the “in situ pH range could be even greater” than DOE estimated is pure speculation. “[I]f the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation,’” the contention must be dismissed. *Fansteel*, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). Nevada’s contention fails in exactly that respect and thus must be dismissed.

Nevada has supplied four boilerplate expert affidavits that “adopt” this contention. *See* Petition Attachment Nos. 3, 4, 10, & 17. But, these affidavits are wholly inadequate support for Nevada’s challenge to DOE’s assumption that pH is controlled by equilibration with P(CO<sub>2</sub>). These one-page affidavits contain no reasoning or substantive discussion of the specific contention issues whatsoever. An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006). Absent any tangible information or

substance—let alone a “reasoned basis or explanation”—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel, Inc.* (Muskogee, Oklahoma site), CLI-03-13, 58 NRC at 203. The inadequacy of these affidavits is underscored by the fact that the contention itself does not even mention them. Nevada’s failure to cite supporting scientific or factual materials in the contention cannot be salvaged by these paltry affidavits. *See USEC*, CLI-06-10, 63 NRC at 472.

In summary, the contention fails to explain the basis for its challenges, much less identify any documents or expert opinion to support the contention. The contention therefore must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from that flaw.

Nevada claims that there are more “uncertainties” in DOE’s modeled pH and thus that in situ pH could be higher than DOE estimated. The Commission, however, recognizes that “uncertainties” may exist in DOE’s postclosure model. *See* 66 Fed. Reg. at 55,747-748. Therefore, merely alleging that there may be more uncertainty than DOE accounted for in the TSPA is not alone grounds for denial of the Application. *Duke Energy Corp.*, LBP-03-17, 58 NRC at 236-38, *aff’d*, CLI-03-17, 58 NRC 419. For instance, in *Duke Energy*, the Board rejected as inadmissible the contention that Duke “failed to take adequate account of uncertainties and their effect on the results of its analysis.” *Id.* at 234. The underlying question is not whether uncertainties exist, but, more importantly, whether applicant “has satisfied

applicable NRC guidance with respect to such uncertainty analyses” or, in the alternative, “performed a qualitative analysis.” *Id.* at 236. In fact, 10 C.F.R. § 63.114(b) does not require that uncertainties be eliminated or even minimized, but that DOE “[a]ccount for uncertainties and variabilities in parameter values and provide for the technical basis for parameter ranges, probability distributions, or bounding values used in the performance assessment.” This is precisely what DOE has done with the pH model.

First, although Nevada seems to challenge DOE’s use of the modeled pH (Pitzer pH) because the Pitzer pH values do not correspond with pH measured in validating experiments, Petition at 373, the SAR specifically addresses this. The SAR explains that the Pitzer pH values (which are calculated using EQ3/6 and the Pitzer thermodynamic database account) are a more accurate representation of the hydrogen ion activity in high ionic strength multi-component brine systems. SAR at 2.3.5-129. Additionally, the SAR specifically points out that “there is significant experimental error in the process of measuring pH, especially in concentrated brines....” *Id.* Thus, the SAR cautions that “[b]ecause Pitzer pH and measured pH values are not equivalent, and because of likely measurement errors in the experimentally-determined pH, comparing them *significantly overestimates the uncertainty in predicted Pitzer pH values.*” *Id.* (emphasis added).

Nonetheless, DOE was able to bound the uncertainty in the Pitzer pH values. pH has a strong effect on the concentration of other ions in solution, and those other ions can be measured directly. SAR at 2.3.5-129. Here, total inorganic carbon concentrations ( $[C]_{\text{total}}$ ) is a pH-sensitive solution parameter that is relevant to the in-drift chemical environmental model. *Id.* DOE concluded that “examination of  $[C]_{\text{total}}$  uncertainty at neutral pH should provide a maximum, bounding uncertainty for all conditions.” *Id.* DOE also concluded that estimates of

uncertainty based on comparisons measured pH values “probably greatly overestimate the pH uncertainty, but provide an upper bound.” *Id.* at 2.3.5-129.

So, although the contention notes that the modeled pH is the “Pitzer pH,” and Pitzer pH does not correspond to the pH values measured in the validating experiments, that is irrelevant because, as even the contention notes, the uncertainties in Pitzer pH are estimated by proxy, using model/data comparisons for  $[C]_{\text{total}}$ . Petition at 373; SAR at 2.3.5-129 to -130. Corrosion test solutions, including those with solute concentrations or temperature unsuitable for direct pH measurement, were modeled using EQ3/6 and the resulting Pitzer pH values are used in the corrosion models. *See* SAR Tables 2.3.6-6 and -7, pp. 2.3.6-111-127. Nevada therefore has not created a genuine dispute of material issue of fact or law because Nevada does not cite any factual, scientific or expert materials that point out the ramifications of the allegedly incorrect use of the Pitzer pH. *Duke Energy Corp.*, LBP-03-17, 58 NRC at 236.

Second, Nevada is incorrect that “modeled pH is based on an assumption that it is controlled by equilibration with the partial pressure of  $\text{CO}_2$  in the atmosphere of the drifts” and “does not allow for the possibility that other chemical reactions might control pH.” Petition at 373. Nevada misstates DOE’s pH model. DOE’s seepage evaporation model evaluates the compositions of evaporated water in the emplacement drift using the Pitzer database to account for an extensive set of reactions between aqueous species and mineral precipitation/dissolution reactions, as well as the atmosphere in the drift. *See* SAR at 2.3.5.5.3.2. Thus, the predicted pH is a result of consideration of all these reactions, not just  $\text{P}(\text{CO}_2)$ . *See, e.g.*, Engineered Barrier System, LSN# DN2002452948 at Figure 6.6-17 (showing pore waters at the same  $\text{P}(\text{CO}_2)$  evolving to different pH values); *see also* Figures 6.13-5 to 6.13-8 at 6-233 to -234 (output of seepage evaporation model).

Thus, Nevada raises no genuine dispute of material issue of fact or law when it complains that DOE's model assumed no other controls on pH because Nevada has mischaracterized DOE's model. As another licensing board has recently ruled, a mischaracterization of the application does not establish a genuine issue of material fact. *Tenn. Valley Auth.* (Bellefonte Nuclear Power Plant Units 3 and 4), LBP-08-16, 68 NRC \_\_ (slip op. at 39) (Sept. 12, 2008).

Finally, Nevada never quantifies how much greater the in situ pH range would be if these unidentified, additional controls had been assumed in the model. In fact, the contention does not even state qualitatively that the modeled compositional range for the evaporated brines would be *materially* different if the uncertainties were not underestimated. Nevada's bare assertion that in situ pH range "could be even greater than [5 to 11]," Petition at 373, fail to create a genuine dispute of a material issue of law or fact. Such unsupported assertions, "without any specific source of evidence concerning the importance of the alleged omission," does not raise a valid basis for attacking the model. *Fla. Power and Light Co.*, (Turkey Point Plant Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 515 (1990). Nevada must demonstrate how the use of a model different from the TSPA would change the results, and then tie those changes to a regulatory requirement that was not met. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Unit 2), LBP-03-12, 58 NRC 75, 92-93 (2003), *aff'd*, CLI-03-14, 58 NRC 207 (2003). Nevada has not done so and therefore, no genuine dispute is raised in this contention.

Third, this contention does not create a genuine dispute of material issue of fact or law because it ignores the TSPA's intrinsic conservatisms and margins of safety. *Duke Energy Corp.*, LBP-03-17, 60 NRC at 236, *aff'd*, CLI-03-17, 58 NRC 419. The contention completely ignores the fact that the "[o]nce the compositional parameters are determined for water on the waste packages and in the invert, the TSPA *accounts* for uncertainty in the in-drift

precipitates/salts model (Section 2.3.5.5.3.3.), and then the uncertainty in chloride-nitrate associated with use of a single pore water to represent each of the compositionally distinct pore-water groups.” SAR at 2.35-139; *see also* SAR § 2.3.5.5.4.3. Likewise, it ignores the conservatism in the in-drift chemical model and analyses. *See* SAR at 2.3.5-144 to 5-145. The SAR explains that:

Seepage waters on the waste package surface are assumed to reach equilibrium with the relative humidity on the surface of the waste package. Under most conditions, the waste package surface is hotter than its surroundings, resulting in a lower relative humidity, and the prediction that seepage will evaporate and concentrate on the waste package surface. This prediction is conservative because evaporation will result in a higher predicted chloride concentration, resulting in a less benign water composition with respect to localized corrosion.

SAR at 2.3.5-144. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster*

(Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001).

Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**68. NEV-SAFETY-68 - In-Drift Condensation On Mineral Dust**

SAR Subsection 2.3.5.4.2 and related subsections, which describe DOE's model for condensation, ignore condensation on surfaces of common and ubiquitous rock dust (siliceous and feldspathic) that coat EBS materials resulting in a much larger volume of liquid and vapor on these surfaces than calculated by DOE.

**RESPONSE**

In this contention, Nevada claims that DOE ignored condensation on the surfaces of the rock dust that coat the EBS materials. Nevada argues that by ignoring this condensation, DOE has miscalculated the volume of liquid and vapor on these surfaces.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and

therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, (Oconee Nuclear Station, Units 1, 2, & 3), CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation:” (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

The contention claims that “[t]he condensation model has not addressed the presence of dust on the metal EBS surfaces.” Petition at 377. Nevada, however, fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit

being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), and as discussed in the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Michael C. Thorne and Maurice E. Morgenstein), which purportedly provide expert opinions to support this contention. Petition, Attachments 3 and 17. However, rather than providing information to support the assertions in this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

This contention alleges that DOE has ignored moisture condensation on rock dust particles that coat EBS materials, which would, according to Nevada, result in a much larger volume of liquid and vapor on these surfaces than calculated by DOE. Nevada does not provide a reasonable explanation of how a larger volume of "liquid and vapor" on these surfaces could be deleterious to the repository performance. In fact, Nevada's "statement of facts or expert opinions supporting the contention along with appropriate citations to support scientific or factual materials," Petition at 376-77, is devoid of a single reference to a source other than the SAR itself, which Nevada cites only to describe DOE's analyses. *Id.* Thus, numerous assertions

underpinning the contention are just unsubstantiated, attorney arguments: (a) dust has the propensity to form crevices that are favorable to localize corrosion, (b) the volume of liquids at or near the surface of C-22 and Ti-7 will be “greatly affected by the association of these surfaces with dust that is associated with condensation,” (c) DOE has underestimated the volume of liquids and this alleged underestimation “affects the validity of the in-drift condensation model,” (d) the local-scale thermal-hydrologic-geochemical variability is “much greater” due to the presence of dust, and (e) the liquid at the EBS metal surfaces is (allegedly) underrepresented, and therefore the hydrogeochemical conditions on the surface of the waste form and the timescale for corrosion will be affected. Petition at 377. Nevada cites no documents or expert opinions that vouch for these assertions and conclusions.

Furthermore, the affidavits of the two experts who merely “adopt” either paragraph 5 or paragraph 6 of this contention fall far short of the requirement to provide conclusions supported by reasoned bases or explanation. *See* Petition, Attachments 3 & 17. These one-page affidavits contain no reasoning or substantive discussion of the specific contention issues whatsoever. An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006). Absent any tangible information or substance—let alone a “reasoned basis or explanation”—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel Inc.*, (Muskogee, Oklahoma site), CLI-03-13, 58 NRC 195, 203 (2003). The inadequacy of these affidavits is underscored by the fact that the contention itself does not even mention them. Nevada’s failure to cite supporting scientific or factual materials in the contention cannot be salvaged by these affidavits. *See USEC Inc.*, CLI-06-10, 63 NRC at 472.

Accordingly, not having cited any scientific or factual materials to support its assertions about the alleged inadequacies in data for DOE’s in-drift and near-field chemistry models, every one of Nevada’s challenges is necessarily based on nothing more than unsubstantiated attorney argument. The Commission has held that a contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel Inc.*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). That is exactly what Nevada has done here and thus the contention should be dismissed.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention fails to raise a genuine dispute on a material issue of law or fact because Nevada has not alleged a claim that even if accepted would have a material impact on the “hydrochemical conditions on the surface of the waste form and drip shield and therefore the timescale over which they will corrode.” Petition at 377. As discussed in the Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency.

Nevada never actually states to what degree the hydrogeochemical conditions would be affected and never quantifies the difference in the timescale over which the waste form and drip shield will corrode in light of the information that Nevada claims DOE ignored. Nevada does not provide any quantitative information about the alleged consequences, or any qualitative information regarding the impact on the model. Instead, Nevada simply claims that there will be “greater variability” and that increased volume of liquid “affects” the model. Such bare

assertions, “without any specific source of evidence concerning the importance of the alleged omission,” do not raise a valid basis for attacking the model. *Fla. Power and Light Co.*, (Turkey Point Plant Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 515 (1990). Nevada must demonstrate how the use of a different model would change the results, and then tie those changes to a regulatory requirement that was not met. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Unit 2), LBP-03-12, 58 NRC 75, 92-93 (2003), *aff’d*, CLI-03-14, 58 NRC 207 (2003). Nevada has not done so and, therefore, no genuine dispute is raised in this contention.

Likewise, just claiming that there is more variability does not establish a genuine issue of material fact or law because, as discussed in the applicable Legal Standards section, Part 63 recognizes that uncertainties exist and cannot be eliminated. *See* Final Rule, Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, NV, 66 Fed. Reg. at 55,747-748. For that reason, 10 C.F.R. § 63.114(b) does not require that uncertainties be eliminated or even minimized, but that DOE “[a]ccount for uncertainties and variabilities in parameter values and provide for the technical basis for parameter ranges, probability distributions, or bounding values used in the performance assessment.”

Importantly, Nevada mischaracterizes the behavior of such brine and thus misstates the possible consequences of this alleged increased of volume of liquid. Brine forms from salts that are deposited with, and initially distributed throughout the thin dust layer. DOE develops bounding estimates for the *total* quantity of brine, based on the *total* amount of salts deposited. *See* Features, Events, and Processes for the Total System Performance Assessment: Analyses,” LSN#: DEN001584824, FEP 2.1.09.28.0A at 6-708. The volume of brine is sensitive to the quantities of salts present and to the relative humidity, but is not sensitive to any additional water that may be adsorbed or condensed on the dust particles. The reason is that if such

additional water were to come into direct contact with brine, then mixing would occur and the brine would be diluted, followed by evaporation to restore equilibrium with the relative humidity. After evaporation, the equilibrated brine volume would be unchanged from the initial volume.

Therefore, if additional adsorbed or condensed water comes into contact with deliquescent brine, the net effect is to physically spread the brine throughout the dust. This is exactly the thesis of DOE's position that capillary induction of brine by the dust layer reduces the amount of brine, and the amount of salts, that are available at the metal barrier surface to support corrosion processes. *See* "Features, Events, and Processes for the Total System Performance Assessment: Analyses," LSN#: DEN001584824, FEP 2.1.09.28.0A, at 6-708. This position recently received experimental support as reported by He et al., "Effect Of Capillary Retention By Dusts On The Corrosivity Of Deliquescence Brines" (2007), LSN#: NEV000004013.

Thus, although Nevada attempts to set up a conflict between its hypothetical increase in volume of liquid and DOE's position that capillary induction of brine by the dust layer reduces the amount of brine and salts that are available at the metal barrier surface to support corrosion processes, there is no such conflict. Accordingly, the contention fails to raise a genuine dispute of material issue of fact or law and must be dismissed.

In addition, under Nevada's unsupported hypotheticals in this contention, the additional water would dilute the brine without evaporation and conducting it to the metal barrier surface, so the brine would no longer be in equilibrium with the relative humidity. Nevada presents no scholarly authority to substantiate this conjecture. As noted above, if adsorbed or condensed

water is not in contact with brine or deliquescent salts in the “dust field” then that water does not contribute to brine-driven corrosion processes at the metal barrier surface.

Accordingly, Nevada raises no genuine dispute of material issue of fact regarding DOE’s conclusions that capillary induction of brine by the dust layer reduces the amount of brine and salts that are available at the metal barrier surface to support corrosion processes.

Similarly flawed is Nevada’s claim that “the condensation model has not addressed the presence of dust on the metal EBS surfaces,” Petition at 377, and would thus cause an increase in the volume of liquid. *Id.* Nevada does not create a genuine dispute of material issue of fact by alleging that the dust could create an increased volume of liquid. This is because the “volume of liquid” by itself is not a factor in corrosion processes modeled by DOE, and Nevada has failed to show how the volume of liquid is important to corrosion of Ti-7 or Alloy 22.

The contention confuses dust deliquescence analysis with the drift wall condensation model. To be sure, both are part of the performance assessment. But, the condensation model represents macroscopic quantities of water that can condense on solid surfaces. *See In-Drift Natural Convection and Condensation*, LSN#: DN2002451236, Section 8, pp. 54[a] to 56[a]. Dust deliquescence, on the other hand, involves small quantities of water dissolving small amounts of salts and forming small quantities of brine. *See Features, Events, & Processes*, LSN#: DEN001584824, FEP 2.1.09.28.0A, at 6-708. In any event, if macroscopic condensation occurs under the drip shield (where contact with the waste package is possible) in the presence of dust (which is essentially what Nevada argues would be complicated by the presence of dust), the resulting brines will be dilute and no more aggressive than those formed directly from

deliquescence.<sup>60</sup> *See* Features, Events, and Processes, LSN#: DEN001584824, FEP 2.1.08.14.0A, at 6-604 to -611, and FEP 2.1.09.28.0A, at 6-705.

Macroscopic condensation can occur in the presence of dust, but the amount of condensate that can be produced, *see* “In-Drift Natural Convection and Condensation” (Aug. 2007), LSN#: DN2002451236, Section 8, Figures A-1[a] to A-8[a], given in kg condensate per meter of drift per year, is far greater than estimates for one-time formation of brine from deliquescent salts in dust, given in microliters of brine per square centimeter, *see* “Analysis of Dust Deliquescence for FEP Screening” (Sept. 2007), LSN#: DN2002478854, Table 6.4-4, p. 6-67. Again, this means that the contention—even if true—does not create a genuine dispute of material issue of fact regarding the outcome of the model that DOE used.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada’s contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

---

<sup>60</sup> Moreover, the potential for significant localized corrosion of Alloy 22 from deliquescent brines has been analyzed by DOE and found to be insignificant. *See* “Analysis of Dust Deliquescence for FEP Screening,” LSN#: DN2002478854 Section 7.1, pp. 7-1 to -5.

**69. NEV-SAFETY-69 - Coupled Seepage And Dust Deliquescence**

SAR Subsection 2.3.5.2 and similar subsections, which focus on coupled processes, fail to consider seepage and dust deliquescence reactions as combined processes and therefore underestimate the degree and extent of localized C-22 corrosion.

**RESPONSE**

In this contention, Nevada challenges SAR Subsection 2.3.5.2 and “similar” (though unspecified) subsections for failing to take into account seepage and dust deliquescence reactions as combined, or coupled, processes. Nevada claims that by omitting analysis of these coupled processes, DOE has underestimated the degree and extent of localized C-22 corrosion.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 379-80. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges noncompliance with these regulatory provisions and

therefore raises a material issue.” *Id.* at 380. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . .” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp., (Oconee Nuclear Station, Units 1, 2 & 3) CLI-99-11, 49 NRC 328, 333-34 (1999).*

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

The contention argues that in SAR Subsections 2.3.5.2 as well as in other “similar subsections,” DOE did not consider the consequences of seepage coupled with salt brine production and related salt brine C-22 pit-corroded areas due to dust deliquescence. Petition at

379. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Here, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), and as explained below: (1) the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert

opinion. Nevada's Petition does attach three affidavits (by Michael C. Thorne, Maurice E. Morgenstein, and Stephan K. Matthäi), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" these otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada claims that DOE neglected to consider dust deliquescence and in-drift seepage as either sequentially occurring processes, or simultaneously occurring processes. Petition at 380. The essential element of the "sequentially occurring processes" argument is that hygroscopic salt reactions resulting from dust deliquescence "may be enhanced by thermo-hydro-chemically (THC)-modified brines from unsaturated zone seepage at later containment periods when thermal-hydrologic conditions are optimal for fracture flow seepage." *Id.* at 381. This assertion describe a completely speculative scenario. Despite a dearth of factual or scientific authority, Nevada boldly claims that DOE "neglect[ed] to consider" this sequential coupling. *Id.* The Board should not accept these hypothetical, unsupported assertions. *See USEC, Inc. (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006).*

Regarding the purported "simultaneous processes," Nevada's argument is layered with theoretical possibilities. For example, Nevada assumes that there could be a "scenario in which dust deliquescence occurs at the same time as unsaturated zone seepage." Petition at 381. DOE's assumption that there can be no such occurrence is supported by the SAR, *see, e.g.*, SAR 2.3.5.4.1.1.3, yet Nevada cites not even one expert opinion or scientific document to support its contrary view. Nevada's explanation for how this scenario could occur is based on yet another unsupported premise, namely that "the head of water available in large fractures would control

non-equilibrium seepage because a high hydraulic head would overcome both of the conceptual barriers [to seepage] (vaporization and capillary).” Petition at 382. Nevada is obligated to back up these assertions with a citation to scholarly authority. Nevada does not do so. Based on only attorney argument, Nevada simply announces, “Therefore, there is strong reason to consider coupled processes where both dust deliquescence and seepage occur together.” *Id.*

If a petitioner, like Nevada, “has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation,’” the contention must be dismissed. *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). The three boilerplate expert affidavits that “adopt” the contention do not change that outcome here. These affidavits are wholly inadequate support for Nevada’s argument that DOE should have considered these coupled processes. *See* Petition, Attachment Nos. 3, 17, & 21. These one-page affidavits contain no reasoning or substantive discussion of the specific contention issues whatsoever. An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *USEC*, CLI-06-10, 63 NRC at 472. Absent any tangible information or substance—let alone a “reasoned basis or explanation”—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel, Inc.* (Muskogee, Oklahoma site) CLI-03-13, 58 NRC 195, 203 (2003). The inadequacy of these affidavits is underscored by the fact that the contention itself does not even mention them. Nevada’s failure to cite supporting scientific or factual materials in the contention cannot be salvaged by these paltry affidavits. *See USEC*, CLI-06-10, 63 NRC at 472.

In summary, the contention fails to explain the basis for its challenges, much less identify any documents or expert opinion to support the contention. The contention therefore must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from that flaw.

First, with respect to the “sequentially coupled processes,” Nevada’s contention assumes that as a result of these processes, localized corrosion would be easier to initiate under seepage conditions if the C-22 barrier were to be weakened by corrosion processes during the deliquescent period. *See* Petition at 379 (claiming that DOE’s model “underestimates the degree and extent of localized C-22 corrosion”). Nevada provides no authority for this position, but even if true, it would not raise a genuine dispute of material issue of law or fact, as explained below.

DOE’s localized corrosion model (SAR Section 2.3.6.4) conservatively predicts the initiation of localized corrosion. Nevada ignores the demonstration of the conservatism of the model presented by DOE in SAR Subsection 2.3.6.4.4.1, “Abstracted Model for Localized Corrosion.” *See* SAR § 2.3.6.4.4.12 at 2.3.6-41 (noting that: “[i]f localized corrosion due to seepage brines occurs, the affected area is modeled as the wetted waste package surface underneath the breached portion of the drip shield ... [t]his treatment is *conservative*, because the model is based upon samples with tight crevices, and only the area between the waste package and the emplacement pallet will be tightly creviced”) (emphasis added).

In the test used to develop the inputs to the localized corrosion model, an electrochemical potential is applied to the test coupon such that localized corrosion is initiated. General Corrosion And Localized Corrosion Of Waste Package Outer Barrier,” ANL-EBS-MD-000005 rev 003, LSN#: DN2002460404, Section 6.4.4.1 at 6-62 to 6-63. The electrochemical potential is then reduced until the already initiated and propagating localized corrosion process spontaneously arrests. This condition, where localized corrosion cannot be sustained, is used as the threshold for localized corrosion initiation. See “General Corrosion And Localized Corrosion Of Waste Package Outer Barrier,” ANL-EBS-MD-000005 rev 003, LSN#: DN2002460404, Section 6.4.4.1 at 6-62 to 6-63. Thus, DOE’s localized corrosion model includes the inherent assumption that upon seepage conditions, the C-22 barrier is already in a damaged state due to prior, extremely severe localized corrosion processes—and that is essentially what Nevada argues DOE did not consider.

Nevada only alleges that DOE’s model is incomplete; it does not allege that the results are inconsistent with the reasonable expectation standard. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Second, as to Nevada’s “simultaneously occurring” seepage and deliquescent processes, Nevada’s argument depends on a scenario in which non-equilibrium seepage would contact the

waste package while the temperature of the waste package surface is in excess of 100°C.

Petition at 381-82. As noted above, Nevada provides no authority for the position that this is even possible, or much less likely. DOE discussed this possibility (indeed, improbability) at length in the SAR. DOE concluded that “seepage under thermal conditions is possible only when two conditions are met simultaneously.” SAR Subsection 2.3.3.3.1 at 2.3.3-63.

Under the scenario presented by Nevada, simultaneously occurring seepage and deliquescence processes require non-equilibrium seepage to contact the waste package. Even assuming that capillary and vapor barriers could be compromised (as postulated in the contention), non-equilibrium seepage would not contact the waste packages until after failure of the titanium drip shields has occurred. In TSPA, for the nominal scenario class, initial breaches of the drip shields will not occur until approximately 230,000 years postclosure. See “Total System Performance Assessment Model/Analysis For The License Application,” LSN#: DEN001579005, Section 6.3.5.1.3. The range of waste package temperatures at postclosure times after 50,000 years is modeled to be below 50°C (SAR at 2.3.5-215)(Figure 2.3.5-33). The presence of the drip shields precludes non-equilibrium seepage waters contacting the waste package, making the asserted simultaneous action of deliquescence and in-drift seepage not relevant to performance of the waste package.

Thus, even accepting Nevada’s hypothetical, Nevada’s bare assertion that the model “underestimates the degree and extent of localized C-22 corrosion” does not raise a valid basis for attacking the model. *Fla. Power and Light Co.*, (Turkey Point Plant Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 515 (1990). Nevada must demonstrate how the inclusion of the different characteristics would change the results, and then tie those changes to a regulatory requirement that was not met. See *Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power

Station, Unit 2), LBP-03-12, 58 NRC 75, 92-93 (2003), *aff'd*, CLI-03-14, 58 NRC 207 (2003). Nevada has not done so and in light of the discussion above, cannot do so. Therefore, no genuine dispute is raised in this contention.

Indeed, the regulations require evaluation of degradation processes in detail only “*if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that the coupled processes would increase those risks at all, let alone that the risks would be “significantly changed by their omission.” Accordingly, Nevada fails to raise a genuine dispute of material issue of fact or law.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. Petition at 383. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**70. NEV-SAFETY-70 - JHC Evolution Of Near-Field Pre-Seepage Unsaturated Zone Water**

SAR Subsections 2.2.1, 2.3.5.5, 2.3.5.3 and similar subsections, which relate to hydrogeochemical changes in vadose fracture and matrix as a consequence of water evaporation and tuff dissolution, and thermal-hydrologic-chemical coupled processes, fail to recognize the critical significance of mineralization reactions on unsaturated zone seepage water chemistry.

**RESPONSE**

In this contention, Nevada challenges SAR Subsections 2.2.1, 2.3.5.5, 2.3.5.3, and “similar” (though unspecified) subsections for excluding the evolution of seepage water chemistry. Nevada also claims in this contention that the near-field chemistry model, is “inappropriate and inadequate for estimating the chemical composition of seepage waters.” Petition at 388. Nevada concludes that all these omissions demonstrate that DOE did not recognize the critical significance of mineralization reactions on unsaturated zone seepage water chemistry.

**a. Statement of Issue of Law or Fact to be Controverted**

This contention does not comply with C.F.R. § 63.309(f)(1)(v). In Section 1, Nevada’s statement of the contention, Nevada makes the general argument that “DOE fail[ed] to recognize the critical significance of mineralization reactions on unsaturated zone seepage water chemistry.” Petition at 384. Nevada’s “brief summary of the contention,” however, raises new issues—such as whether DOE has taken inconsistent approaches with respect to evolving geochemical interactions and whether DOE has used the proper model to compute the aqueous chemistry of the seepage waters. *Id.* In section 5 of the contention, Nevada expands the contention to include even more issues, such as challenge to a FEP, whether DOE’s in-field chemistry model is “unrealistic” because of evaporation along the fracture pathways, and

whether the unsaturated zone water is inappropriately defined on the basis of four pore waters from 34 samples. *Id.* at 386-87. The Board’s Case Management Order that contentions be “narrow, single-issue contentions” that are “sufficiently specific as to define the relevant issues” and do not require the Parties or Board to exhaust extensive resources to clarify the issue. *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_\_\_ (slip op. at 6). Based on the numerous issues raised in this contention, this contention lacks the specificity required by 10 C.F.R. § 63.309(f)(1)(v) and, therefore, must be rejected.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 384-85, section 4. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” Petition at 385. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its

resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in

quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Here, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and as explained in the specific response below: (1) the contention does not reference any documents, other than the license application and one FEP; (2) the contention

contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach four affidavits (by Michael C. Thorne, Adrian H. Bath, Don L. Shettel, Jr., and Maurice E. Morgenstein), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

For example, Nevada makes assertions about the effect of geochemical interactions and thermal envelopes on the ground water chemistry; the chemical reactions that are possible in the DOE model; the singular importance of "average" feldspar dissolution in the characterization of DOE's water-rock interactions; the nature of the fault and fracture systems; the impact of the heat envelope; and various other deficiencies in DOE's in-drift model. After pages of these sweeping and unsupported assertions, Nevada claims that DOE failed to provide a "coherent statement on the evolution of seepage water chemistry," that DOE's near-field water chemistry model is inadequate, and that as a consequence, SAR Subsections 2.2.1, 2.3.5.5, 2.3.5.3 and "similar subsection," do not "recognize the critical significance of the mineralization reactions on unsaturated zone seepage water chemistry." Petition at 388-389. The Board should not accept a contention, like this one, based on hypothetical, unsupported assertions like these. *See USEC, Inc. (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006).*<sup>61</sup>

The four boilerplate expert affidavits that "adopt" the contention do not change that outcome here. *See* Petition, Attachment Nos. 3, 4, 10, & 18. These one-page affidavits contain

---

<sup>61</sup> Nevada's one-sentence argument that the "modern-day unsaturated zone water is inappropriately defined on the basis of four water types from 34 samples classified by DOE as "unjustified," is pure fiction. DOE has never classified the 34 samples as "unjustified," and Nevada's citation to SAR Subsection 2.3.5.52 certainly does not support Nevada's assertion.

no reasoning or substantive discussion of the specific contention issues whatsoever. An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *USEC*, CLI-06-10, 63 NRC at 472. Absent any tangible information or substance—let alone a “reasoned basis or explanation”—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel*, CLI-03-13, 58 NRC at 203. Nevada’s failure to cite supporting scientific or factual materials in the contention cannot be salvaged by these paltry affidavits. *See USEC*, CLI-06-10, 63 NRC at 472.

In summary, the contention fails to explain the basis for its challenges, much less identify any documents or expert opinion to support the contention. The contention therefore must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention challenges whether DOE considered the significance of mineralization reactions on unsaturated zone seepage water chemistry. The contention claims that DOE did not do so, and that this is demonstrated (a) by DOE’s alleged failure to take into account the evolution of seepage water chemistry, and (b) DOE’s use of an inadequate and inappropriate model to compute the aqueous chemistry of the seepage. For several reasons, the contention fails to raise a genuine dispute of material issue of fact or law.

Nevada is wrong that DOE failed to take into account the evolution of water seepage chemistry. In making this argument, Nevada is essentially challenging the exclusion of FEP 2.2.08.03.0B, “Geochemical Interactions and Evolution in the UZ.” Petition at 386. Relying only on the title of this FEP, Nevada suggests that this FEP excluded geochemical interactions from the chemical evolution of near-field unsaturated zone water. According to Nevada, the FEP was improperly excluded because these interactions “will lead to dissolution and precipitation of

minerals along the groundwater flow path and these reactions will be affected by changes in the thermal envelope.” Petition at 386. Instead of citing any scholarly authority for this proposition, Nevada attempts to bolster this argument by fashioning an inconsistency between the FEP and the near-field chemistry, claiming that unlike the FEP, the near-field chemistry model “does account for evolving geochemical interactions at least to some degree,” *i.e.*, the use of an “average” feldspar dissolution. *Id.*

But, Nevada misstates the FEP and, moreover, the FEP and the near-field chemistry model are fully consistent. “Features, Events, and Processes for the Total System Performance Assessment: Analyses” (March 2008). FEP 2.2.08.03.0B, LSN#: DEN001584824, at 6-992, specifically notes that the effects of geochemical interactions on groundwater evolution in the unsaturated zone are included in the TSPA. The description of the FEP indicates that it addresses a broad array of topics:

Groundwater chemistry and other characteristics, including temperature, pH, Eh, ionic strength, and major ionic concentrations, may change through time, as a result of the evolution of the disposal system or from mixing with other waters. Geochemical interactions may lead to dissolution and precipitation of minerals along the groundwater flow path, affecting groundwater flow, rock properties, and sorption of radionuclides. Effects on hydrologic flow properties of the rock, radionuclide solubilities, sorption processes, and colloidal transport are relevant. Kinetics of chemical reactions should be considered in the context of the time scale of concern.

The FEP then discusses the specific issues identified in the description. The FEP considers numerous geochemical aspects and evolution of the unsaturated zone. As FEP 2.2.08.03.0B demonstrates, only some aspects of geochemical interactions and evolutions were screened from consideration; others were included as described in the related FEP cited in FEP 2.2.08.03.0B. DOE also pointed out in this FEP that “[t]he effects of variations in potential seepage water

compositions on –in-drift chemistry are addressed in included FEP 2.2.08.12.0A (Chemistry of Water Flowing into the Drift)).” LSN#: DEN001584824 at 6-992.

Accordingly, Nevada’s argument regarding the outcome of this FEP rests on a mischaracterization of it and, thus, DOE’s model. As another licensing board has recently ruled, a mischaracterization of the application does not establish a genuine issue of material fact. *Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (slip op. at 39) (Sept. 12, 2008). Nevada’s related argument—that “by removing the changing effects of the proposed repository on geochemical interactions and the evolution of the unsaturated zone from consideration, DOE has excluded normal evaporative geochemical reactions in fracture and fault conduits leading to the emplacement drifts”—fails for the same reason. Petition at 386. Moreover, in the very next paragraph of the contention Nevada quotes from the SAR for the proposition that evolution of pore waters is calculated as the waters move downward through the rock from the top of the TSw to the repository level. Petition at 386 (quoting SAR 2.3.5.3. 2.10 at 2.3.5-46). Thus, contrary to the assertions in the contention, the evolution of the thermal field of the repository through time is accounted for in the near field chemistry model (SAR Section 2.3.5.3) in evaluating water chemistry as it passes through the unit to the emplacement drifts and the aqueous chemistry.

Second, if Nevada were correct that DOE failed to take into account the geochemical evolution, the contention fails to raise a genuine dispute of material issue of fact or law because Nevada has not asserted, much less demonstrated with reference to scholarly authority, that the failure to consider the evolving geochemical interactions would change the results of DOE’s model. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Unit 2), LBP-03-12, 58 NRC 75, 92-93 (2003), *aff’d*, CLI-03-14, 58 NRC 207 (2003). Nor has Nevada then tied

those changes to an unmet regulatory requirement. *Id.* Indeed, the regulations require evaluation of degradation processes in detail only “*if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that the evolution of the geochemical interactions would increase those risks at all, let alone that the risks would be “significantly changed by their omission.” Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990). Accordingly, Nevada fails to raise a genuine dispute of material issue of fact or law.

Regarding Nevada’s separate challenge to DOE’s near field model for estimating the chemical composition of seepage waters, Nevada claims the model is inappropriate and inadequate. Petition at 388. Nevada asserts several reasons for this view, none of which raises a genuine dispute of material issue of fact or law. First, Nevada claims that by relying on the “average feldspar dissolution” the model is too limited. *See* Petition at 387 (arguing that “[t]he only chemical reactions that are possible in this DOE model during the transit of water from ground-surface infiltration to seepage (95°C thermal isotherm) into the emplacement drifts are derived from water-rock interactions characterized solely by ‘average’ feldspar dissolution.”). Notably, this sweeping conclusion is not supported by reference to any scientific or factual material.

Moreover, there is no merit to the argument that “average” feldspar dissolution is the only basis for the characterization of the water-rock interactions. Although feldspar dissolution

is the most important reaction that occurs (because feldspar comprises 60% of the tuff by weight), reactions with silica polymorphs (~35% of the rock) and calcite, an important trace mineral, are also considered in the model. *See* SAR Section 2.3.5.3.3.2. at 2.3.5 -36 to -37. In addition, SAR Section 2.3.5.3.3.3 addresses the precipitation of other secondary minerals that occurs as the fluid composition changes. *See* SAR 2.3.5-47. Moreover, the near field chemistry model is validated by comparisons to the THC seepage model (SAR Section 2.3.5.3.3.5.3), which explicitly includes several minor primary and secondary minerals, including biotite, zeolites, and clays. *See* “In-Drift Precipitates/Salts Model,” (LSN# DN2002371917) (Tables 1-27-1-28). Moreover, the near field chemistry model is validated by comparisons to the THC seepage model, SAR§ 2.3.5.3.3.5.3, which explicitly includes several minor primary and secondary minerals, including biotite, zeolites, and clays. *See* “Drift-Scale THC Seepage Model,” (SNL 2007)(LSN# DN2002490523, Section 4.1.6. at 4-8). Thus, Nevada is wrong that “average” feldspar dissolution is the only basis for the water-rock characterization and this argument, therefore, does not raise a genuine dispute of material issue of fact or law.

Second, Nevada challenges the near field chemistry model as “unrealistic” because “evaporation will occur along the fracture pathways between surface infiltration and the 95°C isotherm.” Petition at 387. Nevada claims that the model is particularly unrealistic for “fault and fracture systems that are presently breathing as a consequence of the normal unperturbed geothermal gradient. Once the proposed repository is closed, the heat envelope will extend further in fracture and fault conduits and will cause a breathing flux. . . .” *Id.* Nevada provides no authority for the notion that there is natural convection circulation in faults, driven by the geothermal gradient, or for the occurrence of such circulation under repository thermal loading.

In any event, however, simply claiming that the model is “unrealistic,” does not raise a genuine dispute of material issue of fact or law because Nevada does not take issue with whether the results are inconsistent with the reasonable expectation standard. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC at 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

For this same reason, Nevada’s argument that the DOE model is arbitrary, and that a modified in-drift model would be a more appropriate model also fails to state a genuine dispute of material issue of law or fact.

Third, the contention posits that “it is likely that” extensive evaporation will occur in the fractures above the drifts because of repository heat generation, potentially resulting in precipitation of soluble salts, which could later be remobilized. Petition at 387. Nevada provides no modeling, experimental, or observational basis for the assertion that repository heat generation could result in the high degrees of evaporation and low relative humidities required for precipitation of soluble salts. Accordingly Nevada fails to raise a genuine dispute of material issue of law or fact regarding whether DOE’s near field water chemistry model is flawed because of extensive evaporation that it alleges will occur in the fractures about the drifts. In any event, DOE considered mineral precipitation in the dryout zone around the drift, but screened it from performance assessment in excluded FEP 2.2.08.04.0A, Re-Dissolution of Precipitates Directs

More Corrosive Fluids to Waste Packages, LSN#: DEN001584824, at 6-995 to 6-998. Nevada fails to acknowledge that fact and certainly does not attempt to counter the analysis in excluded FEP 2.2.08.04.0A.

Finally, the contention concludes with more unsubstantiated arguments about errors in DOE's model relating to nitrate concentrations that may be reduced by bacterial action in the zone above the repository and a one-sentence argument regarding the opal and calcite in fractures found in trench 14. Petition at 388. But just like the other arguments in the contention, Nevada cites no scientific or factual support. As to the nitrate argument, the potential affects of microbial activity on nitrate concentrations is addressed in the response to contention NEV-SAFETY-076. Regarding the opal and calcite argument, Nevada fails to provide any supporting materials for this assertion and in any event fails to explain how it relates to the contention. Moreover, there is no basis in science to compare subsurface, host rock processes to Trench 14. Mineral precipitation in Trench 14 occurs within a few meters of the surface in soils and in a near-surface fracture zone, and has been established as pedogenic in origin. *See* Quade, J. and Cerling, T.E. 1990, "Stable Isotopic Evidence for a Pedogenic Origin of Carbonates in Trench 14 Near Yucca Mountain, Nevada," at 250, 1549-1552. Washington, D.C.: American Association for the Advancement of Science. Pedogenic processes are not expressed in the deep UZ where the hydrologic and chemical conditions are significantly different.

Thus, the contention fails to raise a genuine dispute of material issue of fact or law. Indeed, Nevada essentially admits in paragraph 6 of its contention that it does not know whether this contention is material. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions, Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at

389-90. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**71. NEV-SAFETY-71 - Microbially Induced Water Chemistry Changes In The Incubator Zone**

SAR Subsection 2.3.5 and similar subsections, which deal with the near-field chemistry model, fail to recognize the potential role of microbial communities in determining unsaturated zone water chemistry in the near-field environment.

**RESPONSE**

In this contention, Nevada claims that SAR subsection 2.3.5 and “similar,” although unspecified, subsections dealing with the near-field chemistry model fail to take into account the potential role of microbial communities in determining the chemistry of the unsaturated zone water in the near-field environment.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and

therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there

is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

The contention claims that DOE should have “considered the role of microbial communities in determining the unsaturated water chemistry.” *See* Petition at 391, 393. Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), and as discussed below: (1) other than the license application and DOE's supporting documents, the contention cites only one reference; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Adrian B. Bath and Maurice E. Morgenstein), which purportedly provide expert opinions to support this contention. Petition, Attachments 3, 4, & 17. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada's ultimate conclusion in this contention is that "[i]t is likely that the nitrate/chloride ratios used by DOE to describe corrosion inhibition are wrong." Petition at 393. This is mere speculation about what is "likely" to be.<sup>62</sup> Notably, other than citing the SAR for background, the only document that Nevada cites in the contention does not state that DOE's model of corrosion inhibition is wrong. *See* Petition at 393 (citing LSN#: NEV000004014). The cited document—"A Perspective on the Use of Anion Ratios to Predict Corrosion in Yucca Mountain"—asserts that without consideration of microbial alterations to the waters reaching the storage containers, predictions about corrosion cannot be based on anion ratios. LSN#:

---

<sup>62</sup> Although Nevada makes the broad claim that the bacterial and fungal activity "has the potential to change the hydrogeochemistry of the unsaturated zone fluids," Petition at 393, Nevada discusses only one alleged change.

NEV000004014 at 704. This document does *not* state that the author reviewed the TSPA and based on that review, the nitrate/chloride ratios used by DOE are wrong.

Furthermore, the affidavits of the three experts who merely “adopt” this contention fall far short of the requirement to provide conclusions supported by reasoned bases or explanation. *See* Petition Attachment Nos. 3, 4, & 17. These one-page affidavits contain no reasoning or substantive discussion of the specific contention issues whatsoever. An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451 at 472 (2006). Absent any tangible information or substance—let alone a “reasoned basis or explanation”—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel*, CLI-03-13, 58 NRC at 203. The inadequacy of these affidavits is underscored by the fact that the contention itself does not even mention them. Nevada’s failure to cite scientific or factual materials in support of the conclusion this contention asserts cannot be salvaged by these paltry affidavits. *See USEC*, CLI-06-10, 63 NRC at 472.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention fails to raise a genuine dispute of material fact or law because (1) DOE considered the very issue that this contention asserts was omitted from DOE’s analysis, (2) the contention fails to address, much less dispute, numerous aspects of the SAR, showing that DOE’s analysis was conservative, and (3) the contention does not specify the ramifications of this alleged omission. As discussed in the Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency.

First, there is simply no merit to Nevada's claim that DOE did not evaluate the role of bacteria or fungi in changing the chemical properties of unsaturated zone fluids that have a role in drip shield and waste package degradation. In at least five instances, DOE identified microbial activity and corrosion as a feature, event, or process that should be screened. See "Features, Events, and Processes for the Total System Performance Assessment: Analyses," ("Features, Events, and Processes") (March 2008) LSN#: DEN001584824 at 6-422, 6-716, 6-424, 6-1042, 6-743 (respectively). These include FEP 2.1.03.05.0A ("Microbially Influenced Corrosion (MIC) of Waste Packages), FEP 2.1.10.01.0A ("Microbial Activity in EBS"), FEP 2.1.03.05.0B ("Microbially Influenced Corrosion (MIC) of Drip Shields"), FEP 2.2.09.01.0B ("Microbial Activity in the UZ"), and FEP 2.1.11.08.0A ("Thermal Effects on Chemistry and Microbial Activity in the EBS).

In FEP 2.1.10.01.0A, DOE recognized that "biological activity is important to consider because of the potential impact on the aqueous chemical conditions within the waste and the EBS." LSN#: DEN001584824 at 6-716. DOE concluded that, based on several authorities, "due to severe environmental constraints, microbial activity in the repository is expected to be low, and its impact on drift chemistry will be insignificant." *Id.* at 6-717. One of the authorities on which DOE relied in considering whether to include the FEP was the "Evaluation of Potential Impact of Microbial Activity on Drift Chemistry," LSN#: DN2002308488. In this report, DOE observed the importance of chloride/nitrate ratio as a "parameter in the control of the longevity of the waste package and drip shield as engineered barriers." LSN DN2002308488 at 6-22.

Significantly, in the "Evaluation of the Impact of Microbial Activities on Drift Chemistry," DOE concluded that:

In principle, microorganisms could consume nitrate through denitrification, either heterotrophically or autotrophically, under

anaerobic conditions (Korom 1992 [DIAS 172324], pp. 1657 to 1668). *This, however, will be unlikely in the repository because the overall environment will be oxic, which, together with low organic-carbon concentrations, will prevent significant anaerobic microbial reactions, including denitrification, as shown by the field observation that a significant amount of NO<sub>3</sub> is currently present in groundwaters.* Even if some anaerobic microenvironments may exist in rock matrix, their impact on nitrate concentration has already been captured by the current water analysis.

LSN#: DN2002308488 at 6-22 (emphasis added). Based on the analysis in this report, DOE concluded that “thermal effects and water availability [in the repository] will limit microbial activity during, and for a period after, the thermal pulse, and that nutrient limitations will limit activity throughout. Because of the multiple and overlapping limitations on microbial growth, there will be no significant effects resulting from bio-reduction of multivalent contaminants, metals, or sulfate, nor will there be any significant potential to form organic complexants.”

LSN#: DEN001584824 at 6-717.<sup>63</sup>

DOE also considered “Microbial Activity in the UZ,” in FEP 2.2.09.01.0B. There, DOE examined the degree to which microbial activity in the UZ may affect radionuclide mobility in the rock and soil through colloidal processes. *See* LSN# DEN001584824 at 6-1042. DOE’s analysis led to the conclusion that “[t]he justifications for excluding the effects of microbial-produced complexing agents, biotransformation, and biocolloid transport in the EBS also apply in the unsaturated zone given that they are based on information obtained primarily from unsaturated zone and saturated zone rocks and saturated zone waters.” *Id.* Thus, after consideration of this FEP, DOE determined that it could be excluded. *Id.*

---

<sup>63</sup> DOE reached a similar conclusion regarding FEP 2.10.03.05.0B. In this FEP, DOE determined that even assuming that (contrary to excluded FEP 2.1.10.01.0A) microbial activity did occur on the drip shield, the MIC will not compromise the ability of the drip shields to perform and thus “will not significantly change radionuclide releases to the accessible environment or radiological exposures to the RMEI.” LSN#: DEN001584824 at 6-424.

Although DOE excluded these FEPs, the discussion in them as well as the analysis in the “Evaluation of the Impact of Microbial Activities on Drift Chemistry”—none of which Nevada acknowledges, much less attempts to address—demonstrates that, contrary to Nevada’s claim, DOE did evaluate the role of bacteria in changing the chemical properties of unsaturated zone fluids. Therefore, Nevada does not raise a genuine dispute of a material issue of fact or law.

The mere fact of these FEPs demonstrates that Nevada’s claim does not raise a genuine dispute of material fact. But the deficiency in Nevada’s contention is even more apparent given that DOE actually included FEP 2.1.03.05.0A (“Microbially Influenced Corrosion (MIC) of Waste Packages”) in the TSPA. The analysis of this FEP is reflected in the SAR at page 2.3.6-107 and in SAR §§ 2.3.6 and 2.3.6.3.3.2. The SAR also explains that, “some *excluded* FEPs are described in Section 2.3.6 particularly where an FEP is included for the waste package, but the corresponding FEP is excluded for the drip shield.” SAR at 2.3.6-10 & § 2.3.6.2.3. In the SAR, DOE explained that “[t]he effect of microbial influenced corrosion [on the waste package] is included as a multiplier to the general corrosion rates.” SAR at 2.3.6-11. As to the drip shields, DOE reported that “[m]icrobially influenced corrosion was also evaluated and found to have no significant effect on either general or localized corrosion process of titanium alloys under the exposure conditions of the repository.” SAR at 2.3.6-16 (citing “General Corrosion and Localized Corrosion of the Drip Shield” (Aug. 2007), LSN# DN2002467884).

Nevada does not discuss or even acknowledge these FEPs, SAR sections, or the sources cited in the FEPs and SAR sections. Thus, Nevada clearly fails to raise a genuine dispute of a material issue of fact as to whether DOE took into account the potential role of microbial communities in determining the chemistry of the unsaturated zone water in the near-field environment. Additionally because Nevada does not address any of this authority, there is no

genuine dispute of material fact that by the exclusion of microbially-induced changes to water chemistry does *not* result in a condition or circumstance that fails to comply with the regulations cited by Nevada.

Second, Nevada fails to address the numerous conservative aspects of DOE's analysis discussed in the SAR. These include DOE's conclusions that:

Because the data were obtained in a nutrient-rich environment, the effects of microbial activity on corrosion rates in these tests are expected to be greater than they will be in the repository environment, which is expected to be limited by the factors discussed in Section 2.3.6.3.3.2. Therefore, the effects of data uncertainty are adequately and conservatively represented in the microbially influenced corrosion model.

SAR at 2.3.6-22. The SAR also concluded that:

Overall, the corrosion rates from the electrochemical tests in microbial environments are so low that a temperature dependency for microbially influenced corrosion cannot be established. Since microbes are less likely to thrive at elevated temperatures, the use of a multiplier developed at room temperature is conservative and appropriate for all temperatures.

*Id.*

Furthermore, at SAR pages 2.3.6-26 to 6-27, DOE explained that

Environmental factors that affect levels of bacterial growth include temperature and radiation. These factors, however, are closely related to relative humidity; as temperature and radiation decrease in the repository, relative humidity is predicted to increase. At the same time, while there are some types of microorganisms that can survive the elevated temperatures ( $\geq 120^{\circ}\text{C}$ ) and high-radiation doses, if there is no available water, then microbial activity is completely prevented. Thus, because water availability is the primary limiting factor and this factor is coupled to other less critical limiting factors, water availability (as expressed by relative humidity) was used as the primary indicator of microbial activity (SNL 2007c, Section 6.4.5; BSC 2004b, Sections 6.4 and 7.1).

This relative humidity threshold range is based on the viability of microbes in repository conditions. The low value is set at the

minimum value at which microbes can be active (75%), and the high value is the relative humidity at which most microbes can thrive (90%) (SNL 2007c, Section 6.4.5). This treatment is appropriate and conservative because the other factors, such as limited nutrient supplies, will limit microbial activity (SNL 2007c, Section 6.4.5).

Nevada does not dispute that DOE was conservative, as demonstrated above. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Third, even assuming Nevada was correct that DOE ignored the information relating to microbial activity, which DOE clearly did not, the contention still fails to establish a genuine dispute of material issue of fact or law. This is because the contention makes only generalized statements regarding the consequences of DOE's alleged failure. Nevada merely states that "it is likely" that DOE nitrate/chloride ratios are "wrong." Nevada never provides any quantitative information about the consequences, much less any qualitative information, regarding the implications of the allegedly incorrect ratio. Nevada's bare assertions, "without any specific source of evidence concerning the importance of the alleged omission," do not raise a valid basis for attacking the model. *Fla. Power and Light Co.*, (Turkey Point Plant Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 515 (1990). Nevada must demonstrate how the use of a different model would change the results, and then tie those changes to a regulatory requirement that was not met. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Unit 2), LBP-03-

12, 58 NRC 75, 92-93 (2003), *aff'd*, CLI-03-14, 58 NRC 207 (2003). Nevada has not done so and therefore, no genuine dispute is raised in this contention.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, the contention fails to raise a genuine dispute of a material issue of fact or law and must be dismissed.

**72. NEV-SAFETY-72 - Characterization Of Dust Sources**

SAR Subsections 2.3.5, 2.3.5.1 and similar subsections, which describe the in-drift physical and chemical environment, fail to consider dust as an important physical factor in the in-drift environment and have poorly characterized the genesis of dust in that environment.

**RESPONSE**

In this contention, Nevada claims that SAR subsections 2.3.5, 2.3.5.1, and “similar,” although unspecified, subsections that describe the in-drift physical and chemical environment do not take dust into account as an “important physical factor” as part of that environment and, moreover, that DOE has “poorly” characterized the genesis of the dust in the environment.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and

therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there

is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

The contention claims that DOE did not sufficiently characterize dust in the emplacement drifts, which in turn causes DOE to “inappropriately and inaccurately characterize the EBS environment.” *See* Petition at 398-399. Here, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), and as discussed in the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Don L. Shettel, Jr. and Maurice E. Morgenstein), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" these otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

As Nevada concedes, DOE considered the impact of dust deliquescence to influence the localized corrosion of the waste package and drip shields. *See* Petition at 396 & 397; *see also* "Features, Events, and Processes for the Total System Performance Assessment: Analyses," (March 6, 2008) (LSN#: DEN001584824, at 6-705, 6-711). In this contention, Nevada's essential claim is that dust has implications for assessing modes and rates of corrosion of the drip shield and the waste package beyond those analyzed in these FEPs. In particular, Nevada asserts that the characteristics of the dust environment are "important properties," and the "role of dust" is "critical with respect to the behavior of C-22 and T-7." Petition at 397. This assertion fails to explain whether Nevada believes that the characteristics are important to deliquescence or to

some other unspecified process, or both. Moreover, having made these assertions, Nevada was obligated to back them up with a citation to scholarly authority. Nevada does not do so.

Similarly, Nevada claims that DOE omitted certain sources of dust from its consideration. Petition at 397. Nevada later lists four categories of direct dust that it claims DOE should have considered. Petition at 396. According to Nevada certain characteristics of these sources of direct dust must be examined in the TSPA. But, importantly, Nevada fails to provide any explanation, or authority for, its view that these characteristics are “important” or “critical” to the analysis.

For example, Nevada states that the trace elements in the geochemical composition of the four deposits have not been examined. Petition at 398. But, Nevada does not explain why they need to be examined and cites no authority that shares its view. Likewise, Nevada claims that “relative volume and hence the importance” of the four different dust deposits is unknown. *Id.* Nevada never even explains, though, how some unspecified, different volume of these dust materials would undermine the conclusions in the TSPA. In yet another example, Nevada maintains that calcium chloride dust concentrations from evaporative salt production must be examined. *Id.* As to why, however, Nevada is completely silent. Nevada also speculates about “potential concentrations of deleterious trace elements in decomposed EBS.” *Id.* Nevada cites no authority for the proposition that these materials will produce any significant amount of dust. Then, with no elaboration at all, Nevada simply concludes that the overall consideration of dust accumulation in the drift environment has been inadequate. Even this conclusion is unsupported, however.

If a petitioner, like Nevada, “has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation,’” the contention must

be dismissed. *Fansteel, Inc.* (Muskogee, Oklahoma site), CLI-03-13, 58 NRC 195, 203 (2003) (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). The two boilerplate expert affidavits that “adopt” the contention do not change that outcome here. These one-page affidavits contain no reasoning or substantive discussion of the specific contention issues whatsoever. An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451 at 472 (2006). Absent any tangible information or substance—let alone a “reasoned basis or explanation”—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel*, CLI-03-13, 58 NRC at 203. The inadequacy of these affidavits is underscored by the fact that the contention itself does not even mention them. Nevada’s failure to cite supporting scientific or factual materials in the contention cannot be salvaged by these paltry affidavits. *USEC*, CLI-06-10, 63 NRC at 472.

In summary, the contention fails to explain the basis for its challenges, much less identify any documents or expert opinion to support the contention. The contention therefore must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the Section V.A.3 above, contentions, like this one, that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from that flaw.

Nevada “contend[s] that the role of dust in the waste emplacement drift environment is critical with respect to the behavior of C-22 and T-7 [sic] as components of waste packages and

drip shields.” Petition at 397. Claiming that SAR 2.3.5 and 2.3.5.1 fail to consider dust as an important physical factor in the in-drift environment, Nevada mounts a challenge to DOE’s determination that FEPs 2.1.09.28.0A and 2.1.09.28.0B were of low consequence and thus could be excluded. *See Features, Events, and Processes for the Total System Performance Assessment: Analyses (“Features, Events, & Processes”)*, (March 6, 2008) LSN# DEN001584824 at 6-705, 6-711. Of course, these two FEPS—and the “Analysis of Dust Deliquescence for FEP Screening,” on which these FEPs are based—demonstrate that DOE recognized that dust could be an important factor, but that after an extensive analysis, determine that dust deliquescence was of low consequence. *See Analysis of Dust Deliquescence for FEP Screening (“Analysis of Dust Deliquescence”)*, ANL-EBS-MD-000074 REV 01 AD 01, LSN# DN2002478854.

To create a genuine dispute of material issue of fact or law regarding the propriety of the conclusions in these FEPs, Nevada needed to produce scholarly authority that explains why, how, and to what extent DOE is incorrect in its screening of these two FEPs and in its extensive analysis in *Analysis of Dust Deliquescence* on which these FEPs are based. Nevada did not do so.

As to Nevada’s challenge to the categories of dust considered in the screening process, in these FEPs, DOE explained that the screening justifications were developed “considering a wide range of the dust and brine compositions.” *Features, Events & Processes*, LSN#: DEN001584824 at 6-706 & 6-712. Nevada does not address that fact in the contention. Nevada also ignores the *Analysis of Dust Deliquescence*, which describes in greater detail the wide range of dust that DOE considered. *See Analysis of Dust Deliquescence*, LSN#: DN2002478854 at 6-4, 6-17, & 6-20. In this report, DOE explains that tunnel dust samples were collected and that these tunnel dust samples “consist mostly of crushed rhyolite, generated by excavation and other

support activities underground.” *Id.* at 6-4. The report also explains that DOE considered “atmospheric dusts” using “measured rain-out data collected by the National Atmospheric Deposition Program at Nevada sampling site, which reflects contributions of both atmospheric aerosols and windblown dust in the Yucca Mountain area.” *Id.* DOE evaluated the composition of these atmospheric aerosols, noting that they “have a number of natural sources, such as windblown surface soils/dust, sea spray, volcanic emissions, biosphere emissions, and the condensation of atmospheric gases.” *Id.* at 6-17.

In fact, in the 2008 addendum, DOE explicitly stated that the report “assumes the main source of dust that is of concern to the waste package corrosion performance comes from the atmospheric dust brought in during the preclosure ventilation period.” *Analysis of Dust Deliquescence*, at 5-1 (LSN# DN2002478854). This same addendum notes that “dust generated by the comminution of the host rock (so called rock flower) during excavation, repository operation or closure, or seismic events is also considered.” *Id.*

Similarly, in excluded FEP 1.20.03.02.0E, DOE considered rock dust generated by comminution of host rock fragments due to a drift collapse. While acknowledging that this dust is compositionally distinct from the dust deposited during the ventilation period, DOE concluded that the screening justifications for FEP 2.1.09.28.0A was equally applicable to the rock dust due to drift collapse. *Id.* at 6-124. DOE reached a similar conclusion with respect to cement dust due to the degradation of ground support material. *See* FEP 2.1.06.01.0A, LSN#: DN2002478854 at 6-504. In excluded FEP 2.1.06.01.0A, DOE concluded that while the effects of the added component of cement dust on deliquescent brine compositions are uncertain, “other aspects of the exclusion argument presented in FEP 2.1.06.01.0A . . . remain valid.” Thus, contrary to the assertions in the contention, DOE did take into consideration the possible

importance of dust as a physical factor in the in-drift environment; it just concluded that it was of low consequence. Nevada does not attempt to controvert DOE's conclusions in these FEPs, and thus fails to raise a genuine dispute of material issue of fact or law in this contention.

DOE also recognized that organic material likely could be present in repository dust. This would include material that originates with repository construction operations, such as machinery exhaust or abrasion of solid organic materials used in equipment. *See* Analysis of Dust Deliquescence, LSN#: DN2002478854 at 6-20. It also could include "atmospheric particles brought into the repository during the ventilation period." *Id.* Ultimately, DOE determined that it could not model the effects of these organic compounds, but concluded that "it is reasonable to expect that the addition of organic components would have only a modest effect on the deliquescence behavior." *Id.* at 6-21.

The record thus reveals that DOE considered an extensive range of categories of dust, if not all of those that Nevada lists on page 378 of the Petition, and still concluded that these FEPs were of low consequence. LSN# DN2002478854 at 6-123. Nevada does not address any of these documents in the contention. As already noted, Nevada offers only suppositions about the ways in which the characteristics of these other kinds of dust could have relevance to the corrosion of the C-22 and Ti-7. Petition at 398. The Board should not accept such hypothetical, unsupported assertions. *See USEC, CLI-06-10, 63 NRC at 472 (2006)* (holding that conclusory statements cannot provide "sufficient" support for a contention). This is particularly true where, as here, the contention allege errors, omissions, uncertainties or alternative approaches, without specifying the ramifications or results of such alleged deficiencies, fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. Nevada provides no quantitative or even qualitative information regarding whether, and the extent to which, the additional categories and

characteristics of dust would impact the waste package or drip shields in a way that is different from the conclusions in the FEP and the Analysis of Dust Deliquescence for FEP Screening. Thus, Nevada's bare assertion that the model is inadequate does not raise a valid basis for attacking the model. *Fla. Power and Light Co.*, (Turkey Point Plant Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 515 (1990).

For example, in Analysis of Dust Deliquescence, DOE conducted an analysis to estimate the volume of brine that may form on the waste package by deliquescence. LSN#: DN2002478854 at 6-56. DOE examined the volume of dust that would be brought in by ventilation and the compositions of the salts in the dust. *Id.* DOE concluded that volume of brine would be 1.8 uL/cm<sup>2</sup>—and if integrated over the footprint area of the waste, it would give a fraction of a liter. *Id.* at 6-67. Nevada was required to demonstrate how the inclusion of the different characteristics would change these results, and then tie those changes to a regulatory requirement that was not met. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Unit 2), LBP-03-12, 58 NRC 75, 92-93 (2003), *aff'd*, CLI-03-14, 58 NRC 207 (2003). Nevada has not done so and, therefore, no genuine dispute is raised in this contention.

The regulations require DOE's evaluation of degradation processes in detail only “*if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that these additional potential characteristics of dust would increase those risks at all, or even that they would be “significantly changed by their omission.” Accordingly, Nevada fails to raise a genuine dispute of material issue of fact or law.

In summary, the contention fails to raise a genuine dispute of a material issue of fact or law and must be dismissed.

**73. NEV-SAFETY-73 - In-Drift Organic Contribution By Ventilation Or Unsaturated Zone Water**

SAR Subsection 2.3.5.5 and similar subsections, which describe the in-drift chemical environment models, fail to include organic components in the composition of unsaturated zone water, or ventilation dust in the in-drift environment, and therefore omit these components from all of their experimental and model-based estimates of corrosion and other factors influencing repository performance.

**RESPONSE**

In this contention, Nevada claims that SAR subsections 2.3.5.5 and “similar” (although unspecified) subsections that fail to take into account organic components that are in either the composition of the unsaturated zone or the ventilation dust in the in-drift environment. Nevada argues that organic components thus have been omitted from DOE’s experiments and model-based estimates of corrosion and “other factors affecting repository performance.”

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, &3), CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic

setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

The contention claims that DOE’s “geochemical-hydrogeochemical characterization of the in-drift environment is *incomplete*” because of DOE’s “lack of attention to natural organic compounds.” Petition at 400 (emphasis added). Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the

licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), and as discussed in the specific response below: (1) the contention does not reference any documents, other than the license application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach two affidavits (by Maurice E. Morgenstein and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” these otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada asserts that organic compounds involve a “variety of important reactions” (including corrosion, the complexation of transition metals, the formation of colloids, and the distribution of complexes) and have a role in the formation of carbonates that “is also of potential importance in the near field.” Nevada also claims that organic compounds have the ability to

enhance bacterial metabolism and promote radionuclide transport. *See* Petition at 402. Nevada is obligated to substantiate these technical assertions with citations to scholarly authority. Nevada’s Petition concedes this much. *See id.* at 401 (heading 5 stating, “A concise statement of the facts or expert opinions supporting the contention, *along* with appropriate citation to supporting scientific or factual materials”). Here, however, in the entire contention, Nevada cites only the SAR, and even then, cites it only two times. *See id.* at 400 & 402. Thus, instead of meeting its obligation to cite scientific or factual materials, Nevada relies only on attorney argument. This is insufficient under the applicable regulations, as described in section V.A.3 above. A contention is “inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel, Inc.* (Muskogee, Oklahoma site) CLI-03-13, 58 NRC 195, 203 (2003) (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). Indeed, even Nevada’s ultimate conclusion—that DOE’s characterization of the in-drift and near filed environment is “incomplete and inadequate,” *id.*, -is unsupported.

The two boilerplate expert affidavits that “adopt” the contention do not change the conclusion that the contention must be dismissed. These affidavits are wholly inadequate support for Nevada’s challenge. *See* Petition Attachment Nos. 17& 18. These one-page affidavits contain no reasoning or substantive discussion of the specific contention issues whatsoever. An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006). Absent any tangible information or substance—let alone a “reasoned basis or explanation”—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel*, CLI-03-13, 58 NRC at 203. The inadequacy of these affidavits is

underscored by the fact that the contention itself does not even mention them. Nevada's failure to cite supporting scientific or factual materials in the contention cannot be salvaged by these paltry affidavits. *See USEC, CLI-06-10, 63 NRC at 472.*

In summary, the contention fails to identify any documents or expert opinion to support the contention. The contention therefore must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the Section V.A.3 above, contentions, like this one, that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from that flaw

Nevada's complaint is that SAR Subsection 2.3.5.5 and other, unspecified, but so-called "similar subsections" fail to include organic components when specifying the composition of the unsaturated zone or the ventilation dust to the in-drift environment. Petition at 402. Nevada argues—though without any supporting references—that organic compounds have a role in corrosion, the formation of colloids, the distribution of colloids, and the formation of carbonates, and have the ability to enhance bacterial metabolism and promote radionuclide transport. *Id.* Twelve FEPs address the issues that Nevada raises regarding organic compounds. Some of these FEPs were included in the TSPA and some were excluded for low consequence. Nevada ignores all of them in this contention.

First, FEPs included in the TSPA are FEP 2.208.06.0A (Complexation in the SZ), FEP 2.208.06.0B (Complexation in the UZ), and FEP 2.2.08.10.0A (Colloidal Transport in the SZ). *See Features, Events, and Processes for the Total System Performance Assessment: Analyses* ("Features, Events, & Processes"), LSN#: DEN001584824 at 6-314, 6-1002, 6-1005, 6-1015

(March 6, 2008). FEP 2.208.06.0A relates to “[c]omplexing agents such as carbonate, fluoride, and humic and fulvic acids present in natural ground waters,” which could affect radionuclide transport in the saturated zone. LSN#: DEN001584824 at 6-1002. Similarly, FEP 2.208.06.0B relates to “[c]omplexing agents such as humic and fulvic acids present in natural ground waters,” which could affect radionuclide transport in the unsaturated zone. *Id.* at 6-1005. These FEPs observe that the “potential effects of organic complexing agents on sorption were investigated in Summary and Synthesis Report on Radionuclide Retardation for the Yucca Mountain Site Characterization Project, Section IVB.” LSN#: DEN001584824 at 6-1003 & 6-1006. *See also* Summary and Synthesis Report on Radionuclide Retardation for the Yucca Mountain Site Characterization Project, Section IVB., LSN#: DEN000855121. The Summary and Synthesis report concluded that tests showed very little effect of the organic materials for sorption of plutonium and neptunium on tuff materials. *See* LSN#: DEN001584824 at 6-1003 & 6-1006. Further detailed analysis of these FEPs is in SAR Subsections 2.3.9.3.2.2 and 2.3.8.2.2.2, respectively. Thus, contrary to Nevada’s assertion, organic components in connection with complexation and radionuclide transport are specifically addressed in the SAR.

Even these included FEPs reflect that the organic aspects of those FEPs are a negligible contributor to the included processes. For example, FEP 2.2.08.06.0A states that “[i]n the saturated zone, inorganic complexing agents, such as carbonates, are dominant, whereas organic complexing agents are not found in significant amounts (see excluded FEP 2.2.09.01.0A (Microbial Activity in the SZ)).” *See also* FEP 2.2.09.01.0A at pages 6-1039 (stating that “[i]n the saturated zone, heterotrophic microbial activity, which uses organic carbon as the sole energy source, is expected to be limited because geochemical analyses of groundwater samples taken

from saturated zone wells within the Yucca Mountain vicinity indicate that there is little organic carbon in these waters”).

Second, Nevada similarly fails to acknowledge or address the screening analysis for nine other relevant FEPs that were considered but excluded for low consequence. *See* FEP 1.1.02.00.0A, Chemical Effects of Excavation and Construction in EBS, LSN#: DEN001584824 at 6-26 (concluding that emplaced waste is expected to contain only trace amounts of organic/cellulosic materials that will not affect the degradation of FEP 2.1.02.10.0A, Complexation in EBS, LSN#: DEN001584824 at 6-344 (concluding that the emplaced waste is expected to contain only trace amounts of organic/cellulosic materials that will not affect the degradation of the waste forms or the dissolved and colloid concentrations of elements with radioactive isotopes); FEP 2.1.09.13.0A, Complexation in EBS, LSN#: DEN001584824 at 6-664 (concluding that because microbial activity in the repository will be low, there will be a low presence of organic compounds and thus the impact of organic materials in natural groundwater on radionuclide transport will be negligible); FEP 2.1.09.19.08.0A, Formation of Microbial Colloids in EBS, LSN#: DEN001584824 at 6-673 (concluding that organic compounds will not affect generation of inorganic colloids); FEP 2.1.10.01.0A, Microbial Activity in the EBS, LSN#: DEN001584824 at 6-716 to 6-717 (concluding that there will be no significant potential to form organic complexants); FEP 2.1.12.04.0A, Gas Generation (CO<sub>2</sub>, CH<sub>4</sub>, H<sub>2</sub>S) from Microbial Degradation, LSN#: DEN001584824 at 6-765 (concluding that gases produced from microbial activity were of low consequence); FEPs 2.2.09.01.0A & 0B, Microbial Activity in the SZ and in the UZ, LSN#: DEN001584824 at 6-1038 & 1042 (concluding that organic carbon is expected to be limited in the saturated zone and any increase in HCO<sub>3</sub> due to it is small in comparison to the range of uncertainty in carbonate/bicarbonate concentrations for radionuclide

*Kd* values and further concluding that same conclusions apply to the unsaturated zone); FEP 2.11.01.0A, Gas Effects in the SZ, LSN#: DEN001584824 at 6-1103 (concluding that gas generation effects, including microbial degradation of organic material, was of low consequence).

In addition, excluded FEP 2.1.10.01.0A, FEP 2.2.09.01.0A, and FEPs 2.2.09.01.0B rely on an extensive analysis in “Evaluation of Potential Impacts of Microbial Activity on Drift Chemistry,” LSN#: DN2002308488. This report concluded that the small quantities of organic substances expected in the repository “will have an insignificant effect on the bulk chemical environment in the drifts.” LSN#DN2002308488 at 6-37. It also examined the potential microbial effects on radionuclides, such as those associated with microbial degradation of organic carbon in the invert. *Id.*, Section 6.5.4. The report concluded that not only would the effects likely be immaterial, they might actually help the immobilization of radionuclides. *Id.* at 6-43.

As to organic compounds in ventilation dust (Petition at 400 & 402), DOE recognized that organic material likely could be present in repository dust. This would include material that originates with repository construction operations, such as machinery exhaust or abrasion of solid organic materials used in equipment. *See* “Analysis of Dust Deliquescence for FEP Screening,” LSN#: DN2002478854 at 6-20. It also could include “atmospheric particles brought into the repository during the ventilation period.” *Id.* Ultimately, DOE determined that it could not model the effects of these organic compounds, but concluded that “it is reasonable to expect that the addition of organic components would have *only a modest effect on the deliquescence behavior*” and, thus, corrosion. *Id.* at 6-21. (emphasis added).

The record thus reveals that DOE extensively considered the role of organic compounds in the repository operations, including the unsaturated zone and the in-drift environment. Nevada fails to present any factual material that disputes even one aspect of the FEPs or the extensive reports cited therein. Rather, Nevada relies on conclusory and hypothetical assertions without presenting any factual or scientific support for them. Petition at 402. Such assertions can not be the basis for a contention. *See USEC, Inc. (American Centrifuge Plant), CLI-06-10, 63 NRC at 472* (holding that conclusory statements cannot provide “sufficient” support for a contention). Having failed to address, much less refute, DOE’s conclusions in these FEPs, Nevada fails to raise a genuine dispute of material issue of fact or law in this contention.

Moreover, as discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches, without specifying the ramifications or results of such alleged deficiencies, fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. Nevada provides no quantitative or even qualitative information regarding whether and to what extent DOE’s conclusions in the TSPA and the FEPs regarding organic compounds would be affected by the alleged omissions. Nevada’s bare assertion that the model is inadequate does not raise a valid basis for attacking the model. *Fla. Power and Light Co., (Turkey Point Plant Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 515 (1990)*. The regulations require evaluation of degradation processes in detail only “*if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Even if organic compounds do play the roles that Nevada asserts, Nevada has not shown how there would be an increase in those regulatory-defined risks, let alone that they would be “significantly changed by

their omission.” Accordingly, Nevada fails to raise a genuine dispute of material issue of fact or law.

In summary, the contention fails to raise a genuine dispute of a material issue of fact or law and must be dismissed.

**74. NEV-SAFETY-74 - Impact Of Microbial Activity**

SAR Subsection 2.3.6.3.3.2, and similar subsections, which predict limited microbial activity in the repository, and therefore, limited impact on drift chemistry and the waste package, ignore the archaea, resulting in an underestimation of the potential for microbial activity and microbially influenced corrosion.

**RESPONSE**

In this contention, Nevada alleges that LA Section 2.3.6.3.3.2, “and similar subsections,” ignore the potential effect of archaea, a domain of microorganisms, “resulting in an underestimation of the potential for microbial activity and microbially influenced corrosion.” Petition at 405. For the reasons discussed below, this contention is inadmissible.

**a. Statement of Issue of Law or Fact to be Controverted**

As discussed below, this contention fails to state, with requisite specificity, an issue of law or fact justifying its admissibility in this proceeding.

**b. Brief Explanation of Basis**

For the many reasons discussed below, this contention lacks adequate factual or legal bases, and must be dismissed pursuant to 10 C.F.R. § 2.309(f)(1)(ii).

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere

assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

As a general matter, with respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage, LLC (Independent Spent Fuel Storage Installation) LBP-98-7*, 47 NRC 142, 181 (1998), *aff'd on other grounds*, CLI-98-13, 48 NRC 26 (1998). Such is the case here. Specifically, in attempting to provide the alleged facts or expert opinion that support its contention, *see* Petition at 406, Nevada describes the LA's discussion of microbially influenced corrosion at LA Section 2.3.6.3.3.2, noting that DOE's conclusions are based on data presented in “Evaluation of Potential Impacts of Microbial Activity on Drift Chemistry” (ANL-EBS-MD-000038) Rev. 01 (Nov. 18, 2004), (LSN# DN2002308488), referenced in the LA. Nevada also notes that much of the information about microorganisms specific to Yucca Mountain is taken from “Comparison of the Microbial Community Composition at Yucca Mountain and Laboratory Test Nuclear Repository Environments” (Oct. 9, 2002), (LSN# DEN000027985). Petition at 406.

Nevada then alleges that “[m]any of the limitations for microbial activity in the repository are based on the assumption that the microbial population is limited to eubacteria.” Petition at 407. In support of this proposition, Nevada notes that “Evaluation of Potential Impacts of Microbial Activity on Drift Chemistry” indicates that “[t]he maximum temperature at which known microorganisms can exist in an active state is 110°C.” Petition at 407. Next, Nevada asserts that “archaeal strain 121 grows at 121°C,” and notes that one scientist has

suggested that archaea can “exist in a wide variety of terrestrial, freshwater, and marine habitats, sometimes in very high abundance.” Petition at 407 (quoting “Oceans of Archaea,” DeLong, E. (2003), ASM NEWS, Vol. 69, No. 10 at 503-511). In this regard, Nevada also ignores the fact that the description of the conceptual model documented in “Evaluation of Potential Impacts of Microbial Activity on Drift Chemistry,” does not rely on the distinction among the three polygenetic domains of microbes (eukaryotes, bacteria and archaea). Instead, the model categorizes microorganisms into two general groups- heterotrophic and autotrophic microbes- based on their metabolic functionalities. Archaea are included in these two groups. See “Evaluation of Potential Impacts of Microbial Activity on Drift Chemistry,” ANL-EBS-MD-000038, Rev. 1, (LSN#: DN2002308488), Figure 6.1-1 at 6-5. Therefore, the License Application does not “ignore” any possible effect of archaea. The contention misses the key point of the LA model that the extent of each individual microbial reaction will be limited by environmental constraints, not by the types of microbes present. See *id.* at 7-3 (noting that “[m]icrobial activity, including [microbially influenced corrosion] is expected to be minimal in the Yucca Mountain repository”).

Without support or reference to relevant scholarship or expert opinion, however, Nevada jumps to the unsupported conclusion that bacteria and archaea have developed alternative mechanisms for carbon fixation that have varying sensitivities to oxygen, and that archaea can use a variety of energy sources to fix carbon, including oxidation of ammonia or hydrogen sulfide using either oxygen or metal ions as electron acceptors. Petition at 407. Again, without support or reference to relevant scholarship, Nevada further concludes that “[t]he wide range of distinctive metabolic pathways used by the archaea mean that they can have distinctive effects on corrosion processes and water chemistry that could substantially enhance the degradation rates of

engineered barrier components and also modify radionuclide release and transport mechanisms.”  
Petition at 408.

Importantly, Nevada does not allege that the existence of such archaea would have any material effect on DOE’s analysis relating to the effects of microbial activity on corrosion. Such conclusory assertions are inadequate to support admission of Nevada’s contention. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006).

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any relevant documents, other than the license application and DOE’s supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach two affidavits (by Brenda J. Little and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Even if this claim is construed to have been submitted by an expert, such support would not be sufficient to justify its admission. As the Commission has stated, “an expert opinion that merely states a conclusion (*e.g.*, the application is ‘deficient,’ ‘inadequate,’ or ‘wrong’) without providing a reasoned basis or explanation for that conclusion is inadequate because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion” of the

alleged basis for the contention. *USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006) (quoting *Private Fuel Storage, L.L.C.* (Independent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998), *aff'd on other grounds*, CLI-98-13, 48 NRC 26 (1998)).

This contention, therefore, is inadmissible

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada seemingly attempts to demonstrate a genuine dispute with DOE by repeating the unsupported assertions, discussed above, that DOE inappropriately ignored the potential effects of archaea and consequently underestimated the potential for microbially influenced corrosion. Petition at 408. As fully detailed above, however, Nevada does not assert that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). An allegation that some aspect of a license application is “inadequate” or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990).

Nevada also alleges, without foundation or reference to any purported expert opinion or supporting documentation, that SAR Section 2.3.6.3.3.2 violates 10 C.F.R. §§ 63.114(a), (b) and (f). Petition at 408. Indeed, Nevada’s “Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References” identifies no material facts, expert opinion, or supporting references regarding these sections of the LA. Nevada simply takes no steps to explain or support its naked assertions and blatant speculation. By so doing, Nevada has underscored another basis for rejection of its contention, as it is fundamental that a contention

“will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel, Inc.* (Muskogee, Oklahoma, Site), CLI-03-13, 58 NRC 195, 203 (2003) (*quoting GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

Accordingly, there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi).

For all of the reasons discussed above, this contention must be rejected in its entirety.

**75. NEV-SAFETY-75 - Microbially Influenced Corrosion Model**

The model described in SAR Subsection 2.3.6.3.3.2 and DOE reference “General Corrosion and Localized Corrosion of Waste Package Outer Barrier, ANL-EBS-MD-000003 Rev. 03” (07/25/2007), LSN# DN2002460404, to calculate an enhancement factor for microbially influenced corrosion as a multiplier to a general corrosion rate is not a standard or recommended practice and cannot be used to estimate localized corrosion resulting from the presence and activities of microorganisms.

**RESPONSE**

In this contention, Nevada alleges that the model described in SAR Section 2.3.6.3.3.2 is “not a standard or recommended” practice and is thus inappropriate for use in estimating the localized corrosion resulting from the presence and activities of microorganisms. Petition at 409. For the reasons discussed below, this contention is inadmissible.

**a. Statement of Issue of Law or Fact to be Controverted**

As discussed below, this contention fails to state, with requisite support, an issue of law or fact justifying its admission in this proceeding.

**b. Brief Explanation of Basis**

For the reasons discussed below, this contention lacks adequate factual basis, and must be rejected by the Board.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide

complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has

failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references to justify admission of its proffered contention. Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any relevant documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Brenda J. Little and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

In its statement of supporting facts, expert opinion, and references in support of this contention, Nevada observes that the model developed to estimate the alteration of corrosion rates of Alloy 22 due to microbially influenced corrosion was based, in part, on experiments that

were reported on in “Corrosion of Candidate Container Materials by Yucca Mountain Bacteria” (Feb. 5, 1999), LSN#: DEN000045571 (hereafter, “the 1999 experiments”). Petition at 410. Nevada generally describes the conduct of some of the 1999 experiments and alleges various purported deficiencies with them. As described more fully below, however, Nevada completely fails to demonstrate that the alleged deficiencies provide an adequate basis for supporting the contention, as they are unsupported by expert opinion or scientific and factual materials.

Nevada first comments that the researchers who conducted the 1999 experiments and who later published their results in “Corrosion of Candidate Container Materials by Yucca Mountain Bacteria” did not “cite a standard.” Petition at 410-411. Nevada notes that the “current ASTM standard for conducting polarization resistance measurements is ASTM Standard G59-97 (2003), “Standard Test Method for Conducting Potentiodynamic Polarization Resistance Measurements” and that ASTM G59-97 (2003) “specifies the bias due to solution resistance (i.e., low conductivity media) that results in an overestimation of polarization resistance and an underestimation of corrosion rates,” and that this standard provides that “[c]urrent interruption methods can compensate for solution resistance.” *Id.* at 411.

Apart from these general observations, however, Nevada notes that in the 1999 experiments there was “no indication ... that solution resistance was resolved.” *Id.* Nevada does not otherwise comment on the effect of these purported deficiencies. Nor does it comment on the effect, if any, that a lack of a citation to a standard with respect to the validity of the experiments has on the content of the LA or underlying model used by DOE. Most importantly, Nevada does not allege *any material effect* on the experiments or the model that is the subject of this contention as a consequence of there not being an indication in the text of “Corrosion of

Candidate Container Materials by Yucca Mountain Bacteria” that the “solution resistance was resolved.” *Id.*

Nevada next alleges, again without support or reference to relevant scholarship, that with respect to the 1999 experiments, “the method ... used to evaluate the electrochemical impact of microorganisms on electrode surfaces is not a standard practice.” Petition at 411. Nevada does not further explain this wholly-conclusory assertion, and, in particular, does not explain the resulting effect, if any, of using a purported “nonstandard practice” in the 1999 experiments. Nevada next describes the experiments, noting, for example, that “[m]icrobial cell densities were established before aseptically combining and spreading a defined number ... of all isolates on specimens which were air dried before they were exposed to growth media in corrosion cells.” *Id.* at 412. Nevada then comments that “[i]t is not clear whether the authors air-dried the coupons before or after spreading the cells on the surface” but asserts, without support or reference to any relevant scholarship, that “[i]n any case, spreading cells on a surface before exposure to growth media cannot have the same electrochemical impact as allowing a biofilm with living cells to form.” *Id.* Yet again, apart from its general commentary, Nevada does not allege any negative material impact or result on the experiments or the model that is the subject of this contention as a consequence of the circumstances described above. In particular, Nevada does not allege that the asserted different “electrochemical impact” noted above made any material difference in the outcome of the 1999 experiments.

Continuing along this same line of discourse, Nevada next observes that the text of “Corrosion of Candidate Container Materials by Yucca Mountain Bacteria” describing the 1999 experiments does not “describe any procedure for separating cells from culture medium and specifically eliminating yeast extract from the medium in which electrochemical measurements

were made.” Petition at 412. Nevada notes that an earlier (1994) experiment involving sulfate reducing bacteria suggested that “yeast extract caused interferences on electrochemical measurements in their experiments.” *Id.* (citing Webster, B.J. and Newman, R.C., “Producing Rapid Sulfate-Reducing Bacteria (SRB)-Influenced Corrosion in the Laboratory” (1994) at 33, Microbiologically Influenced Corrosion Testing, ASTM STP 1232. While Nevada acknowledges that the 1994 experiment used a different growth medium than the one used in the 1999 experiments, it does not further explain the relevance, if any, of the 1994 experiment to the 1999 experiments. Nevada simply asserts, again without support or reference to relevant scholarship, that the 1999 experiments did not include “essential control experiments – evaluating the impact of the R2 (containing yeast extract), glucose or protease peptone on the electrochemical measurements.” Petition at 412.

Nevada then alleges, again without citation, that during the 1999 experiments, “no attempt was made to verify that the uninoculated media were sterile” and that “[t]he coupons were not checked for contamination.” Petition at 413. It is impossible to discern from where Nevada draws support for these assertions. As noted above, the Petition does not cite a source for these unsupported assertions.

In this regard, and illustrative of this generic deficiency that runs through this contention rendering it inadmissible, the document that Nevada cited previously in its comments about the 1999 experiments, “Corrosion of Candidate Container Materials by Yucca Mountain Bacteria” is an 18 page paper presented at the April 1999 National Association of Corrosion Engineers Conference and Exhibition. That paper, however, does not indicate in any way whether or not Nevada’s statements above are correct. Nevada nevertheless concludes that “*If* the controls were contaminated, the corrosion rates for the controls would not represent corrosion rates in the

absence of bacteria.” Petition at 413 (emphasis added). Importantly, Nevada does not assert that the controls for the 1999 experiments *were* contaminated, but only speculates about the possibility of contamination. And yet again, Nevada does not allege, much less demonstrate, any negative material effect on the 1999 experiments or the model that is the subject of this contention as a consequence of these asserted deficiencies.

Lastly, Nevada notes that one of the documents referenced in SAR Section 2.3.6.3.3.2 describes additional experiments in which welded Alloy 22 coupons were exposed to a certain type of well water (100X J-13), plus 0.1% glucose with and without microorganisms from Yucca Mountain. Petition at 413 (citing “General Corrosion and Localized Corrosion of Waste Package Outer Barrier, ANL-EBS-MD-000003 Rev. 03” (LSN# DN2002460404 at 6-111, -112)). Nevada observes that “the results of the electrochemical tests are described in this referenced document as ‘conservative’ because of the addition of 0.1% glucose as an additional nutrient that would not be in the Yucca Mountain repository” but asserts that “it is well established that glucose can inhibit the growth of some microorganisms.” Petition at 413 (citing Marchand, E.A. and Silverman, J. (2003), “The Role of Enhanced Heterotrophic Bacterial Growth on Iron Oxidation by *Acdithiobacillus ferrooxidans*,” GEOMICROBIOLOGY JOURNAL, Vol. 20 (3)). Nevada does not attempt to explain the relevance of this information to the material content of SAR Section 2.3.6.3.3.2, and thereby does not demonstrate that this information was relied upon by DOE in any material way. Most importantly, Nevada does not allege, much less demonstrate, any negative material effect on the 1999 experiments or the model that is the subject of this contention as a consequence of its observations and speculation, cited above.

In summary, Nevada has failed to reference any expert opinion and/or scientific or factual materials in support of this contention. Instead, the contention appears to largely consist of

assertions of counsel. The various claims voicing perceived inadequacies or alleged inconsistencies or errors in the LA or materials referenced therein are conclusory in nature or not directly relevant to the issue raised in this contention; *i.e.*, that the model used by DOE to estimate the localized corrosion resulting from the presence and activities of microorganisms is not a “standard or recommended practice.” Petition at 409. As such, Nevada does not provide a reasoned basis that adequately supports its contention.

Even if the claims above were construed to have been submitted by an expert, they would not be sufficient to support the proffered contention. It is well established that with respect to factual information or expert opinion offered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26. Conclusory statements, such as these that are rife throughout this contention, do not provide sufficient support for admissibility under NRC rules of practice. *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006). In addition, “an expert opinion that merely states a conclusion ... without providing a *reasoned basis or explanation* for that conclusion is inadequate because it deprives the Board of the ability to make the necessary, reflective assessment of the opinion as it is alleged to provide a basis for the contention.” *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (emphasis added).

As a result of these major deficiencies, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(1)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

In its attempt to establish a genuine dispute on a material issue of law or fact, Nevada merely states that this contention “challenges SAR Subsection 2.3.6.3.3.2 and DN2002460404 Section 6.4.4 that describe a model for predicting the rate of microbially influenced corrosion as a multiplier to the general corrosion,” and that the model and multiplier “are based on flawed electrochemical experiments that do not represent any condition of microorganisms on a surface in the repository.” Petition at 413-14. Nevada concludes that “the potential for microbially influenced corrosion is underestimated.” Petition at 414. Nevada’s assertion is wholly conclusory and unsupported by any expert opinion or any facts that provide a reasoned basis for the contention, as fully described in paragraph d. above. Moreover, an unsupported allegation that some aspect of a license application is “inadequate” or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990). Additionally, Nevada’s assertion in this regard ignores the discussion in “Evaluation of Potential Impacts of Microbial Activity On Drift Chemistry”, ANL-EBS-MD-000038, Rev. 1 (LSN#: DN2002308488), which describes the environmental constraints on microbial activity in the repository, and notes that the microbial activity “is expected to be low” in the repository, and that “its impacts on drift chemistry can be negligible.” *See* “Evaluation of Potential the Impacts of Microbial Activity On Drift Chemistry” (LSN#: DN2002308488) at 7-2.

With respect to Nevada’s unsupported assertion challenging the microbially influenced corrosion model, it simply is not a sufficient basis for rejecting the model. Even if Nevada’s claims were somehow accepted by the Board, the contention provides no basis for demonstrating

that the claims would have any material effect on corrosion, or the content of the LA. In particular, the contention does not allege, even qualitatively, that the use of a different method would result in more accurate modeling of the corrosion. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Furthermore, Nevada ignores the demonstration of the conservatism of the model presented by DOE in SAR Section 2.3.6.3.3.2. *See* SAR § 2.3.6.3.3.2 at 2.3.6-26 (noting that “the linear polarization resistance results . . . are not necessarily indicative of actual corrosion rates, and therefore the results may overstate the effect of microbes on corrosion”; and “all current from the electrochemical tests was conservatively considered to be entirely due to metal oxidation”).

Accordingly, Nevada has failed to demonstrate that there is a genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

For the many reasons discussed above, this contention must be rejected in its entirety.

## **76. NEV-SAFETY-76 - Microbial Denitrification**

DOE underestimates some important modes of corrosion that depend on nitrate concentrations in SAR Subsection 2.3.6.4, and similar subsections, because of the conclusion in SAR Subsection 2.3.6.3.3.2, at 2.3.6-25, that oxic conditions will prevail in the repository over the growth-permissive high humidity and cooler period, and because of the erroneous assumption that microbial denitrification of nitrate is a strictly anaerobic process.

### **RESPONSE**

In this contention, Nevada generally alleges that DOE underestimates “some important” modes of corrosion “that depend on nitrate concentrations because DOE inappropriately concludes” that oxic conditions will prevail in the repository over the growth-permissive high humidity and cooler period, and because of the erroneous assumption that the microbial denitrification of nitrate is a strictly anaerobic process. Petition at 415. Nevada also challenges the Localized Corrosion Initiation Model described in SAR Section 2.3.6.4.3.1.1 and all similar and related sections, as well as all models that use the corrosion inhibition of the nitrate ion to predict that there will be no localized corrosion susceptibility for Alloy 22. For the reasons set forth below, this contention is inadmissible.

#### **a. Statement of Issue of Law or Fact to be Controverted**

Nevada states in subsection 1 of its contention that DOE underestimates some important modes of corrosion that depend on nitrate concentrations in SAR Subsection 2.3.6.4, but then states in subsection 6 of its contention that “[t]his contention challenges SAR Subsections 2.3.6.4.3.1.1 (at 2.3.6-34), based on DN2002308488, Section 6, and all similar and related sections, that do not account for the possibility of anaerobic respiration and that inaccurately define denitrification as a strictly anaerobic process.” Petition at 419. Nevada also challenges

“... all models that use the corrosion inhibition of the nitrate ion to predict that there will be no localized corrosion susceptibility for Alloy 22.” Petition at 419. Nevada further alleges in subsection 6 that SAR Section 2.3.6.4.3.1.1 does not meet the requirements of 10 C.F.R. § 63.114(b) and (c). It is not clear what Nevada really wants to challenge in this contention. Furthermore, it is not clear what “all models that use the corrosion inhibition of the nitrate ion ...” means. The vagueness and inadequately-pled structure of this contention warrants its dismissal.

**b. Brief Explanation of Basis**

For the reasons explained in subsections e and f of this Answer, Nevada has not satisfied the requirements of 10 C.F.R. § 2.309(f)(1)(ii) by providing sufficient bases in law or fact for this contention.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations.

In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due

to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

As more fully described below, Nevada asserts a number of purported deficiencies associated with DOE's evaluation of the chemical environment of the repository that purport to be bases for this contention.

First, Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because: (1) for the most part, the contention does not reference any relevant supporting documents and as more fully described below, the supporting documents that Nevada does reference in support of its contention are mischaracterized; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach three affidavits (by Brenda J. Little, Maurice E. Morgenstein, and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada asserts that DOE underestimated the effect of certain corrosion processes because:

- (1) DOE has improperly evaluated the overall chemical environment in the repository as "oxic" and therefore has improperly concluded that significant anaerobic activity is "unlikely" (Petition at 416);
- (2) DOE has not recognized that oxygen gradients will form due to respiring aerobic microorganisms (*Id.*);
- (3) DOE has inappropriately claimed that there will be no biofilm in formation in the repository (*Id.* at 417); and

- (4) DOE has inappropriately failed to consider the effects of aerobic denitrification (*Id.* at 418).

As described below, these purported bases are insufficient to support admission of this contention.

In support of the four general propositions summarized above, Nevada cites to several documents, including a document referenced in the LA, “Evaluation of Potential Inputs of Microbial Activity on Drift Chemistry” ANL-EBS-MD-000038, Rev. 1 (Nov. 11, 2004) LSN#: DN2002308488 (hereafter, “Evaluation”), that DOE, in part, relied upon in predicting and evaluating the conditions that will prevail in the repository during the post-closure period. As discussed below, Nevada mischaracterizes the text and selectively quotes from this supporting document.

Nevada first posits a scenario that will allow oxygen gradients to form in biofilms due to respiring aerobic microorganisms, and challenges DOE’s findings that such biofilms will not form in the repository. In this regard, Nevada first asserts that the “overall chemical environment in the repository is described in SAR Subsection 2.3.6.3.3.2 as oxic, and therefore significant anaerobic activity is described as *unlikely*.” Petition at 416 (emphasis added). This assertion mischaracterizes the information presented in Section 2.3.6.3.3.2. Nowhere in the text in this section is this claim made. Rather, Section 2.3.6.3.3.2 notes that “[a]n oxic environment will prevail in the repository over the growth-permissive high-humidity and cooler period hundreds of years after peak temperatures are reached, and, therefore, prevent the generation and accumulation of reduced inorganic species that are the prerequisite for autotrophic metabolism.” SAR § 2.3.6.3.3.2 at 2.3.6-25.

Nevada also notes that there is recognition in Evaluation that: (a) metal corrosion will consume oxygen; (b) some bacteria can survive intense radiation and will grow when conditions

are favorable; (c) bacteria create their own environments by forming biofilms; and (d) there is possibility of limited microbial activity. Nevada, however, then claims, without scholarly support, that there is “no recognition that oxygen gradients will form due to respiring aerobic microorganisms.” Petition at 416.

Nevada then asserts that DOE has overlooked the possibility that “oxygen gradients will form [in biofilms] due to respiring aerobic microorganisms.” *Id.* In support of this proposition, Nevada cites to “Lewandowski, Z. and Beyenal (2007), “Fundamentals of Biofilm Research” (CRC Press Taylor & Francis Group) which, assertedly, notes that the authors “measured oxygen profiles from the bulk medium through biofilms and demonstrated a distinct decrease in oxygen concentration at the biofilm/water interface.” *Id.*

Nevada further alleges, without support or reference to relevant scholarship, that “oxygen gradients exist in many oxygenated media, for example open oceans.” *Id.* at 417. Yet, Nevada acknowledges that Evaluation demonstrates “that a combination of low relative humidity and high temperature will inhibit biofilm formation.” *Id.* (citing Evaluation at 6-32).

In continuation of its quest for admission of this contention, Nevada questions the applicability of one of the references that Evaluation relied on in making this demonstration. In particular, Nevada questions the evaluation of biofilm formation by “scanning electron microscopy” (SEM) as discussed in Else, T.A., Pantle, C.R., and Amy, P.S. (2003), “Boundaries for Biofilm Formation: Humidity and Temperature,” *Applied and Environmental Microbiology*, Vol. 69(8) (hereafter, “Else”), referenced in Evaluation. *Id.* In this regard, Nevada asserts that “because of biofilm dehydration, SEM cannot be used to quantify biofilm area coverage and thickness. *See* Petition at 417 (quoting Little, B.J., Wagner, P.A., Ray, R.I., Pope, R., and Scheetz, R. (1991), “Biofilms: An ESEM Evaluation of Artifacts Introduced During SEM

Preparation,” J. INDUSTRIAL MICROBIOLOGY AND BIOTECHNOLOGY, Vol. 8, No. 4 at 213-221).

Nevada acknowledges that the experiments discussed in Evaluation “demonstrate a relationship between relative humidity, temperature and biofilm formation.” *Id.* But Nevada mischaracterizes the description of these experiments; rather than merely demonstrating a “relationship between relative humidity, temperature, and biofilm formation” (*Id.*), Evaluation actually states that “increased temperature ... or decreased humidity ... impeded biofilm formation on N-316 stainless steel, C22 nickel alloy, and titanium coupon in surfaces.” *See Evaluation* at 6-33.

Nevada next asserts, without support or reference to relevant scholarship, or even any further explanation, that because “the microorganisms were not acclimated to the environmental conditions of the experiments ... [t]herefore, it is *not clear* that the Else ... experiments can be related to Yucca Mountain or that they can be used to substantiate the claim that there will be no biofilm formation in the repository.” Petition at 417 (emphasis added). This unsupported claim completely ignores the documentary evidence to the contrary. The complete description of the experiments presented in Evaluation notes that the experiments involved actual samples from Yucca Mountain. *See Evaluation* at 6-32 (noting that the experiments used “...[m]ined Yucca Mountain tuff ... collected near the North Portal entrance”). More importantly, Nevada ignores the fact that the results of the Else experiments are “consistent with a report that under unsaturated conditions of soil and vadose rock, extensive biofilm development has not been observed ....” *Id.* at 6-33. Furthermore, Nevada ignores the statement in Evaluation that “[t]his [result] is also consistent with a full-scale test conducted by AECL, in which a simulated waste container was buried for 2.5 years surrounded by a compacted buffer material. The test showed

that, together, decreased relative humidity (95 to 96 percent), elevated temperature (60° C to 90° C), high radiation doses, and limited nutrient supplies prevented biofilm formation (Stroes-Gascoyne 1996)....” *Id.*

Nevada’s assertions with respect to the research underlying the experiments related to the measurement of biofilms, discussed above, are important for what they *do not* contain. Nevada does not assert that the experiments evaluating biofilm formation and the resulting scholarship have rendered DOE’s analysis flawed in any material way. Nor does Nevada assert that the LA’s demonstration “that a combination of low relative humidity and high temperature will inhibit biofilm formation” is false or deficient in any way. Nevada has merely opined that “it is not clear” that the experiments can be related to Yucca Mountain and that “it is not clear” that the experiments can be used to substantiate the claim that there will be no biofilm formation in the repository. Petition at 417. Nevada has not asserted, much less demonstrated, that it is certain, or even likely, that the LA’s discussion of biofilms is deficient. Such assertions, devoid of supporting fact or expert opinion, are mere speculation and cannot form the basis for an admissible contention.

Nevada then attempts to assert that DOE failed to consider the effects of denitrification. Nevada first notes that Evaluation addresses the microbial aspects of the reduction-oxidation potential in drifts and states that “[nitrate (NO<sub>3</sub><sup>-</sup>)] is an inhibitor for metal corrosion as opposed to chloride (Cl<sup>-</sup>) ... and that [t]he ratio of NO<sub>3</sub><sup>-</sup>/Cl<sup>-</sup> is an important parameter in the control of the longevity of the waste package and drip shield as engineered barriers.” Petition at 418 (internal citation omitted). Nevada next notes that Evaluation provides that “[i]n principle, microorganisms could consume nitrate through denitrification, either heterotrophically or autotrophically, under anaerobic conditions....” *Id.* (internal citation omitted).

Importantly, Nevada fails to include the very next sentence in Evaluation, which provides that “this [consumption of nitrate through denitrification], however, will be unlikely in the repository because the overall environment will be oxic, which, together with low organic-carbon concentrations, will prevent significant anaerobic microbial reactions, including denitrification, as shown by the field observation that a significant amount of NO<sub>3</sub> is currently present in groundwaters. Even if some anaerobic microenvironments may exist in rock matrix, their impact on nitrate concentration has already been captured by the current water analysis.” Evaluation at 6-22. Thus, Evaluation, rather than supporting the proposition that microorganisms will consume nitrate through denitrification, indicates that this process will be unlikely to occur.

Nevada then asserts that researchers have reported that “denitrification can occur in fully aerobic conditions with a wide range of bacteria.” Petition at 418 (quoting Robertson, L.A., van Niel, E.W., Torremans, R.A.M., and Kuenen, J.G. (1988), “Simultaneous Nitrification and Denitrification in Aerobic Chemostat Cultures of *Thiosphaera pantotropha*,” APPLIED AND ENVIRONMENTAL MICROBIOLOGY, Vol. 54, No. 11 at 2812-2818), and that “Robertson and Kuenen ... identified a denitrifying mixotroph capable of simultaneously ‘utilizing nitrate and oxygen as terminal electron acceptors in respiration.’” *Id.* (quoting Robertson, L.A. and Kuenen, J.G (1984), “Aerobic Denitrification: A Controversy Revived,” ARCH MICROBIOL, Vol. 139 at 351-354). Nevada fails to demonstrate, or even assert, the relevance of the previous statements to Yucca Mountain or the LA, and does not allege, much less demonstrate, any negative material effect on DOE’s evaluation of corrosion generally, or any of DOE’s corrosion models in particular.

Moreover, none of Nevada's claims discussed above challenge the *accuracy* of the SAR. Nevada does not further explain these assertions or their relevance, and does not show how these statements relate to *any* section of the LA or how they assertedly render *any* portion of the LA deficient. Furthermore, these statements are not referenced or discussed in any other section of the contention. In this respect, an allegation that some aspect of a license application is inadequate or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material aspect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4, LBP-90-16, 31 NRC 509, 521 n. 12 (1990)). Relatedly, Nevada does not allege that the circumstances and purported deficiencies asserted above are in conflict with any regulation, SAR provision, or any other requirement. A contention that does not *directly controvert a position taken by the applicant in the application* is subject to dismissal. *See Tex. Utils. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992) (emphasis in original).

In summary, Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. Even if these claims were construed to have been submitted by an expert, they would not be sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, "the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention." *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff'd on other grounds*, CLI-98-13, 48 NRC 26. Conclusory statements cannot provide "sufficient" support for a contention. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006). In addition, "an expert opinion that merely states a conclusion ... without providing *a reasoned basis or explanation* for that conclusion is inadequate because it deprives the Board

of the ability to make the necessary, reflective assessment of the opinion as it is alleged to provide a basis for the contention.” *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (emphasis added).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Notably, Nevada fails to meet its 10 C.F.R. § 2.309(f)(1)(i),(ii) and (v) pleading requirements for the alleged deficiencies relating to SAR Section 2.3.6.4.3.1.1, which discusses the development of the Localized Corrosion Initiation Model, and are asserted for the first time in paragraph 6 of the contention. For this reason alone, these assertions cannot provide adequate support for the admission of this contention.

Additionally, with respect to Nevada’s assertion challenging DOE models that use the corrosion inhibition of the nitrate ion to predict that there will be no localized corrosion susceptibility for Alloy 22, Nevada’s claim is not a sufficient basis for rejecting the model. Even if Nevada’s claim were to be accepted, the contention provides no basis for believing that it would have any material effect on corrosion. In particular, the contention does not allege that use of a different method would result in a more accurate modeling of corrosion. *Cleveland Elec. Illuminating Co. (Perry Nuclear Power Plant, Units 1 and 2)*, LBP-85-35, 22 NRC 514, 534-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Since the contention does not allege that DOE’s results are inconsistent with the reasonable expectation standard not conservative, it does not establish a genuine dispute on a material issue of fact.

Accordingly, Nevada has failed to demonstrate that there is a genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**77. NEV-SAFETY-77 - Corrosion From Rock Bolt Seepage**

SAR Subsection 1.3.4.4 and similar subsections, which discuss the ground support system in the emplacement drifts, fail to mention or consider the fact that the Super Swellex™ are hollow and would act as a conduit for seepage into the emplacement drifts and the neglect of this process means that the TSPA-LA assumptions relating to isolation of the wastes within the waste package are unfounded.

**RESPONSE**

This contention states that the discussion of the ground control system in SAR section 1.3.4 does not address the effect of the rock bolts on seepage and that, consequently, the TSPA assumptions regarding the isolation of wastes in the waste package are “unfounded” and “understated.” Petition at 421.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies 10 C.F.R. §§ 63.31(a)(2) and (3), 63.21(c)(9)

and (c)(15), and 63.114(a) in the contention. *See* Petition at 421-22. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as stated in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate

that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

Nevada argues that this contention raises a material issue because the Application does not consider the potential effect of Super Swellex™ bolts on in-drift seepage prior to the installation of drip shields, the potential for corrosion of the waste packages and the impact that could have on the TSPA assumptions that relate to the isolation of wastes within the waste package. Petition at 423. The method the DOE used in addressing waste package corrosion in the TSPA is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

In this contention, Nevada does not assert that any seepage due to the Super Swellex™ bolts prior to the installation of drip shields would have a significant effect on the waste packages or on the TSPA results. Nevada simply states that the TSPA assumptions related to the isolation of wastes within the waste package are “unfounded” and that the potential for corrosion of the waste package is “understated” because DOE did not consider the alleged effect of using Super Swellex™ rock bolts. Petition at 421. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

In paragraph 5, Nevada states that the Application does not mention potential issues due to seepage prior to the installation of the drip shields (Petition at 422) and that the Super Swellex™ rock bolts can directly transfer water to the drifts (id. at 423). From this, Nevada concludes that “the potential for corrosion of the waste packages is understated” and the “assessment of the ability of the EBS system to isolate the waste” is inaccurate. *Id.*

Nevada does not cite any basis for asserting that the rock bolt would increase the amount of seepage, or that such seepage would cause significant corrosion of the waste packages. Moreover, the Application shows that such seepage would not have a significant effect. First, Nevada does not reference or dispute any of the following statements from SAR section 2.3.3, which specifically address the effect of rock bolts on seepage:

The seepage model for performance assessment is also used to simulate the potential effect of rock bolts in the drift ceiling on seepage (BSC 2004a, Section 6.5). Several rock bolts scenarios are examined in a sensitivity analysis, including cases representing both grouted and ungrouted boreholes. It is shown that these features have a minor effect on seepage, and can be excluded in the TSPA drift seepage submodel (Section 2.2, Table 2.2-5, for excluded FEPs 1.1.01.01.0B, Influx through holes drilled in drift wall or crown; and 2.1.06.04.0A, Flow through rock reinforcement materials in EBS).

SAR at page 2.3.3-35. This shows that Nevada is wrong in asserting that the License Application does not consider the effect of the rock bolts on seepage, and that DOE's analysis concluded that the effect would be insignificant. Nevada has not claimed that the effect would be significant, nor has it provided a reasoned basis for disputing DOE's conclusion.

Second, SAR Subsection 2.3.3.2.2.3.1 (SAR at 2.3.3-26) explains that during the period of forced ventilation the dry air pushed through the emplacement tunnels has a large capacity for

taking up moisture from the surrounding rocks, and is much larger than the rates of percolation arriving at the emplacement drifts. The relevant SAR Section states:

The evaporation potential of the dry drift air in response to forced ventilation has a strong impact on seepage under natural ambient conditions (Table 2.3.3-1, FEP 1.1.02.02.0A, Preclosure ventilation). Seepage can only occur when the amount of percolating water is large enough to overcome evaporation. This has evidently not been the case in any of the ventilated openings in the rock units below the PTn unit at Yucca Mountain, as no unambiguous evidence of dripping from natural percolation water has ever been observed (SNL 2007a, Section 7.1.1[a]). The significant evaporation potential of the dry drift atmosphere is evident not only from theoretical considerations, but also from (1) temporal observations of wet spots observed at the drift crown during liquid-release tests conducted in the ECRB Cross-Drift (BSC 2004f, Section 6.10.2.2); and (2) the fact that a damp-looking feature observed along a the vertical end wall immediately after the dry excavation of Niche 1 (also referred to as Niche 3566) dried up within a few hours (BSC 2004f, Section 6.2.1.2; Wang et al. 1999) before a bulkhead could be installed to increase the relative humidity in the opening.

SAR Subsection 2.3.3.2.2.3.1 (SAR at 2.3.3-26) Thus, the License Application indicates that seepage would be expected to simply evaporate and be removed by the forced ventilation. For this reason, seepage during the preclosure period while forced ventilation is in operation in the emplacement drifts is not included in the TSPA. See SAR Section 2.3.3.2.4.2.4 (SAR at 2.3.3-57 to 2.3.3-58). Nevada does not reference or dispute this discussion or provide any basis for asserting that the amount of any moisture transferred via the rock bolts would be large enough to overcome evaporation.

Finally, even if Nevada had shown that there would be enough seepage to overcome the evaporative effect of the forced ventilation and drip onto the emplaced waste packages, it also would need to show that such seepage could have a significant effect. SAR section 2.3.6 “Waste Package and Drip Shield Corrosion” states that:

The alloys used to fabricate the waste packages and drip shields have excellent corrosion resistance over a wide range of aqueous solution compositions and temperatures. Based upon measurements of corrosion rates of the passive metals that comprise the waste package and drip shield, the waste packages and drip shields can remain intact with no penetrations due to general corrosion for durations of tens of thousands and even hundreds of thousands of years.

SAR at 2.3.6-6. SAR section 2.3.6 goes on to discuss the modeling of waste package corrosion in the TSPA, including generalized corrosion, localized corrosion, stress corrosion cracking, early failure due to manufacturing or handling-induced defects, and long-term thermal aging, and explains why the models are conservative (i.e., overestimate the likelihood of penetration of the waste package corrosion barrier). SAR Subsection 2.3.6.2.2, “Waste Package Degradation Processes.” Overall, this discussion shows that the waste packages are highly resistant to corrosion, and that the TSPA has taken into account numerous potential causes of corrosion and waste package failure, using conservatively high estimates of the likely failure rates. As a result, even if seepage were to occur during the preclosure period, the effect on the TSPA results would likely be insignificant. This contention does not dispute or even address the discussion in SAR Subsection 2.3.6, or provide any basis for concluding that any seepage during the preclosure period could have a significant effect on the TSPA results.

In sum, nowhere in this contention does Petitioner show—either quantitatively or qualitatively—how DOE’s alleged failure to address enhanced seepage caused by Super Swellex™ rock bolts calls into question DOE’s TSPA results as they related to the isolation of wastes within the waste package. Nevada also does not dispute those portions of the SAR that address the effects of rock bolts on seepage and indicate that the seepage caused by rock bolts will not have significant impact on the isolation of wastes in the waste package. Accordingly, this contention does not demonstrate that this contention raises a material issue of law or fact.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in the specific response below: (1) the contention does not reference any documents, other than the License Application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach three affidavits (by Michael C. Thorne, Doug F. Hambley and Don L. Shettel, Jr.) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

In this particular contention, Nevada fails to provide any basis for concluding that any alleged increase in seepage caused by Super Swellex™ rock bolts would have a significant effect on the TSPA results. In fact, Nevada does not even assert that the bolts would have a significant effect on the TSPA results. Nevada simply states, without any support whatsoever, that the TSPA assumptions related to the isolation of wastes within the waste package are "unfounded" and that the potential for corrosion of the waste package is "understated" because DOE did not consider the effect of using Super Swellex™ rock bolts in the LA. Petition at 421. This hardly puts DOE's TSPA results in dispute, let alone in a material way. Moreover, Nevada has not provided a reasoned explanation of its basis for contending that there would be a significant

effect. Consequently, Nevada has failed to demonstrate that there is a genuine dispute on a material issue of fact or law, and for this reason, as well, this contention should be dismissed.

**78. NEV-SAFETY-78 - Static Corrosion Tests On Alloy 22**

SAR Subsection 2.3.6.3 and similar subsections, which describe long-term weight loss measurements of the outer corrosion resistant material, alloy C-22, of the waste canister at the long-term test corrosion facility, fail to adequately represent the corrosion environment that is expected in a mined geologic repository situated in the unsaturated zone.

**RESPONSE**

In this contention, Nevada alleges that DOE's long-term weight loss measurements of the Alloy C-22 outer corrosion resistant material fail to adequately represent the corrosion environment that is expected to exist in the repository.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and

therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. In particular, this contention does not reference any expert opinion or documentary materials, other than the license application and DOE's description of the corrosion tests related to the long-term weight loss measurements of the Alloy C-22. Instead, this contention appears to consist entirely of assertions of counsel. *See* Petition at 426-27. Therefore, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention mainly contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach four affidavits (by Don L. Shettel, Jr., Adrian H. Bath, Maurice E. Morgenstein, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Even if the claims are construed to have been submitted by an expert, they would not be sufficient to support a contention. For example, Nevada merely asserts, without support or

reference to any relevant scholarship, that DOE's experiments were not conducted in the precise environment that Nevada believes will be the environment that the waste containers will experience at Yucca Mountain. Petition at 427. Nevada next asserts, without support or reference to any relevant scholarship, that the outer canister will be subjected to changing temperatures, high humidity, and "dripping seepage water ..." of "*possibly* varying chemical conditions" where the resultant "aqueous solutions *may* dry out" leaving behind "salt deposits that *may* interact with dust on the canister surface," and where rockfall and drip shield material "*may* also be in contact" with the outer canister. *Id.* (emphasis added). Nevada then concludes that the "actual physico-chemical surface environment" posited above differs from DOE's test conditions, thus rendering the test results "unrealistic, non-site specific, and non-conservative." *Id.* Nevada fails to demonstrate why "different" equates to "unrealistic."

The scenarios postulated by Nevada leading up to its conclusion depend on multiple independent events of causation, and Nevada merely asserts their theoretical possibility and provides no support for the proposition that such a scenario is even likely. The Board should not accept such hypothetical, unsupported assertions. With respect to factual information or expert opinion proffered in support of a contention, "the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention." *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff'd on other grounds*, CLI-98-13, 48 NRC 26. Nevada's unsupported conclusion, that DOE's test results are "unrealistic, non-site specific, and non-conservative" should likewise not be accepted by the Board. Conclusory statements cannot provide "sufficient" support for a contention. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006).

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada attempts to demonstrate “a genuine dispute with DOE” by merely asserting, without foundation or reference to any relevant scholarship, that: (1) DOE’s corrosion tests described in SAR Section 2.3.6.3 “are not an appropriate basis to assess the degradation of the EBS,” and thus violate 10 C.F.R. § 63.114(f); and (2) the complexity of the TSPA Model does not allow Nevada to determine whether the dose rate standard would be violated by the issues raised by this contention. Petition at 427-28.

With regard to Nevada’s first assertion, Nevada ignores DOE’s exhaustive description of its corrosion experiments and the development of the general corrosion model in SAR sections 2.3.6.3 and related subordinate sections of the SAR, as well as the documents referenced in these SAR sections. *See* SAR § 2.3.6.3 at 2.3.6–18--2.3.6–27. Nevada merely disagrees with aspects of the testing, and as noted above, has not set forth sufficient expert opinion or documentary evidence to support a contention. Nevada’s mere allegation of inadequacy of DOE’s experiments is also insufficient to support this contention. An allegation that some aspect of a license application is “inadequate” or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co. (Turkey Point Plant, Unit Nos. 3 and 4)*, LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990).

With respect to Nevada’s second assertion regarding the inadequacy of the TSPA Model, Nevada’s assertions similarly are not adequate to support a contention. Paragraph 6 of the

contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada's contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

For all of the reasons set forth above, this contention should be dismissed in its entirety.

**79. NEV-SAFETY-79 - Static General Corrosion Test Solutions**

SAR Subsection 2.3.6.3 and similar subsections, which describes static long-term general corrosion tests on the waste package outer material, alloy C22, fail to address the need for and use of realistic, site-specific aqueous test solutions that are appropriate for waste packages situated in a humid, thermally perturbed, unsaturated environment.

**RESPONSE**

In this contention, Nevada alleges that DOE's static long-term general corrosion tests on the alloy C-22 waste package outer material fail to address the need for and use of realistic, site-specific aqueous test solutions that are appropriate for waste packages situated in a humid, thermally perturbed, unsaturated environment.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere

assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” Petition at 430. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. Section V.A.3, above, discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach four affidavits (by Don L. Shettel, Jr., Adrian H. Bath, Maurice E. Morgenstein, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Even if Nevada's claims are construed to have been submitted by an expert, they would not be sufficient to support the contention. In its "Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position," Nevada makes a single assertion related to the adequacy of the water used by DOE in its corrosion tests on alloy C-22, declaring, without foundation or reference to any relevant scholarship, that the J-13 well water used in the static long-term

corrosion tests on alloy C-22 “is a groundwater ... and is therefore a non-conservative, unrealistic, and non-site specific choice on which to base a series of test solutions.” Petition at 430-431. Nevada notes, again without foundation or reference to any relevant scholarship, that “[m]ore environmentally realistic choices for long-term general corrosion aqueous test solutions would have included fracture water ..., pore waters ... and thermally evolved seepage evaporation waters.....” *Id.* Nevada does not further explain these bare assertions and provides no other statements that could arguably provide a reasoned basis to conclude that these assertions provide adequate support for the contention.

The Board should not accept such hypothetical, unsupported assertions. With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26. Nevada’s unsupported conclusion, that the selection of the J-13 well water for use in the static long-term corrosion tests was “a non-conservative, unrealistic, and non-site specific choice on which to base a series of test solutions,” does not provide adequate support for this contention. Conclusory statements cannot provide “sufficient” support for a contention. *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006).

In summary, this contention sets forth no documentary evidence or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada first attempts to demonstrate a genuine dispute with DOE by repeating the bare allegation noted above, asserting, again without foundation or reference to any relevant scholarship, that the use of J-13 well water was a “non-conservative, unrealistic, and non-site specific,” and that this use of the J-13 well water was, assertedly, “not an appropriate basis to assess the degradation of the EBS” and is thus violative of 10 C.F.R. § 63.114(f). Petition at 431.

This assertion is bare speculation and does not adequately support a finding of a genuine dispute. Nevada merely disagrees with an aspect of the testing, and as noted above, has not set forth any expert opinion or documentary evidence to support a contention in this regard. An allegation that some aspect of a license application is “inadequate” or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, n.12 (1990).

Secondly, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada’s contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute

exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

For all of the reasons set forth above, this contention should be dismissed in its entirety.

**80. NEV-SAFETY-80 - Localized Corrosion, Chloride Bearing Mineral Deposits And Hot Wall Effects**

SAR Subsection 2.3.6.1.1 and similar subsections state that titanium is extremely resistant to localized corrosion due to its very passive film, and as a result, DOE has concluded that localized corrosion of titanium will not occur in repository environments and is excluded from the TSPA; DOE is incorrect because the most likely failure mode of titanium in this application is localized corrosion under insulating mineral deposits from seepage water, which has not been properly considered by DOE, that could lead to early failure of the drip shield due to penetration of the water diversion surface.

**RESPONSE**

In this contention, Nevada alleges that in SAR Subsection 2.3.6.1.1 and similar subsections, DOE has inappropriately concluded that localized corrosion of titanium will not occur in repository environments and is excluded from the TSPA. Nevada also asserts that DOE has not properly considered the localized corrosion of titanium under insulating mineral deposits from seepage water, which Nevada asserts could lead to the early failure of the drip shield due to penetration of the water diversion surface.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R.

§ 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the

licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. Section V.A.3, above, discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention mainly contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach three affidavits (by James A. McMaster, Robert A. Cottis, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Even if Nevada's claims were construed to have been submitted by an expert, they would not be sufficient to support a contention. Nevada quotes from the text of SAR Subsection 2.3.6.2.3, and concludes that, "DOE has stated that it is *ignoring* localized corrosion of the titanium." Petition at 435 (emphasis added). To the contrary, the SAR Subsection quoted by Nevada provides that "[g]iven the exposure conditions expected in the repository, localized corrosion of titanium alloys is not considered possible and is, therefore, excluded from TSPA..." SAR Subsection 2.3.6.2.3 at 2.3.6-16. Rather than ignore the possibility of localized titanium corrosion, DOE has exhaustively studied the possibility of such corrosion and excluded it as part of its evaluation of the features, events, and processes (FEPs) required by 10 C.F.R. § 63.114(e). In this regard, Nevada ignores the relevant screening justification for FEP 2.1.03.03.0B, "Localized Corrosion of Drip Shields" found in "Features, Events, and Processes for the Total System Performance Assessment: Analyses." See "Features, Events, and Processes for the Total System Performance Assessment: Analyses" (March 28, 2008) (LSN# DEN001584824 at 6-405 to -413), (describing DOE's screening justification for exclusion of "Localized Corrosion of Drip Shields" due to "low probability").

Nevada next asserts, without foundation or reference to any relevant scholarship, that a number of what it perceives as relevant failures of titanium tubing "have been reported in National Association of Corrosion Engineers (NACE) publications and conferences" and that the "conditions associated with the failure[s] observed by NACE are likely to occur under conditions present at Yucca Mountain." Petition at 435. However, Nevada fails to cite any such NACE publications; its assertions in this regard are bare speculation and conclusory.

Nevada then claims, without foundation or reference to any relevant scholarship, that “DOE has not adequately assessed localized corrosion, because it has failed to use tests that generate, or at least simulate, the chemistry, pH and temperature conditions that are expected to occur in the emplacement drifts” and that “DOE has not adequately considered the significant risk of localized corrosion of the Grade 7 Drip Shield” which would “result in high concentrations of chlorides, fluorides or other species, and low pH, and would be exacerbated by the hot wall effect of the heat from the canister.” *Id.* at 436. Nevada concludes, again without foundation or reference to any relevant scholarship, that “[l]ocalized corrosion in the form of under deposit corrosion ... *could* lead to premature failure by local penetration of many drip shields, followed by localized seepage on to many of the waste packages.” *Id.* (emphasis added).

Nevada does not further explain these assertions and provides no other statements that could arguably provide a reasoned basis to conclude that these assertions provide adequate support for a contention. Importantly, Nevada only asserts that the end result of these various independent events is only that localized corrosion *could* lead to premature failure by local penetration of many drip shields. Most importantly, none of these assertions is supported by reference to any scholarly research or expert opinion. The Board should not accept such hypothetical, unsupported assertions. Such conclusory statements cannot provide “sufficient” support for a contention. *See USEC, Inc. (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006).*

In summary, this contention sets forth no documentary evidence or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada attempts to demonstrate a genuine dispute with DOE by reference to the speculative claims discussed above, and asserting, again without foundation or reference to any relevant scholarship that, consequently, “DOE has not adequately considered the significant risk of localized corrosion of the Grade 7 Drip Shield under conditions where seepage from above evaporates on the surface.” Petition at 436. Nevada next asserts that SAR Subsection 2.3.6 and similar subsections do not comply with 10 C.F.R. § 63.114(f) and 10 C.F.R. § 63.114(g), which require the provision of the technical basis for either inclusion or exclusion of degradation, deterioration, or alteration processes of engineered barriers in the performance assessment, and the provision of the technical basis for models used in the performance assessment, respectively.

With respect to Nevada’s assertion regarding 10 C.F.R. § 63.114(f), its allegation is false. As discussed above, DOE’s exclusion of FEP 2.1.03.03.0B is documented in “Features, Events and Processes for the Total System Performance Assessment: Analyses,” (LSN# DEN001584824). Further, Nevada ignores the related discussion at SAR Subsection 2.3.6.2.1, Summary of Features, Events and Processes Included in Waste Package and Drip Shield Corrosion Models. *See* SAR Subsection 2.3.6.2.1 at 2.3.6-10.

With respect to Nevada’s assertion that “SAR Subsection 2.3.6 and *similar subsections*” do not comply with 10 C.F.R. § 63.114(g)’s provisions regarding DOE’s obligation to provide the technical basis of models, it is difficult to discern what Nevada is alleging, given the lack of specificity regarding the purportedly deficient portion of the SAR. Nevada sets forth no expert testimony or supporting references with respect to the local corrosion model, nor does its “Statement of the Contention Itself” or its “Brief Summary of the Basis for the Contention” refer to such model. In any event, it appears that Nevada has ignored the various sections of the LA

that discuss the technical basis of the local corrosion model. *See* SAR Subsection 2.3.6.8.2.3, “Localized Corrosion Model”; and SAR Subsection 2.3.6.8.2.4, “Localized Corrosion Model Adequacy” at 2.3.6-77-78. Thus, this assertion fails to show a genuine dispute with DOE related to the provisions of 10 C.F.R. § 63.114(g).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada’s contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**81. NEV-SAFETY-81 - Hydrogen Uptake Resulting From General Corrosion**

SAR Subsection 2.3.6.8.1 and related subsections describe general corrosion of the drip shield, provide calculations of weight loss due to general corrosion, and consider the effect of thinning in terms of mechanical weakening of the structure, but DOE fails to consider the effects of localized embrittlement due to hydride formation resulting from general corrosion, and consequently DOE incorrectly assumes that the drip shield will not fail by brittle fracture resulting from rockfall or similar event.

**RESPONSE**

In this contention, Nevada alleges that in SAR Subsection 2.3.6.8.1 and related subsections, the DOE inappropriately failed to consider the effects of localized embrittlement due to hydride formation resulting from general corrosion, and that, consequently, DOE incorrectly assumes that the drip shield will not fail by brittle fracture resulting from rockfall or a similar event.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide

complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative

analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. In particular, this contention does not reference any expert opinion and refers to one supporting document, which appears to present only background information. Instead, the contention consists essentially of the unsupported assertions of counsel. *See* Petition at 440. Therefore, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by James A. McMaster and Robert A. Cottis), which purportedly provide expert opinions to support this contention. Petition, Attachments 14 and 18. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention.

That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Even if Nevada's claims were construed to have been submitted by an expert, they would not be sufficient to support a contention. In its "Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position," Nevada states a series of random assertions that do not provide support for its contention. Nevada first asserts, without foundation or reference to relevant scholarship, that "[t]itanium general corrosion is typically accompanied by absorption of a small percentage" of hydrogen and that "a titanium or titanium alloy component *exposed to sulfuric acid strong enough* to cause corrosion will take up hydrogen as it corrodes." Petition at 440 (emphasis added). Notably, Nevada does not allege that the conditions in the repository would allow the titanium to be exposed to sulfuric acid, of any strength.

Next, Nevada asserts, without foundation or reference to relevant scholarship, that the "effects of the hydrogen *can sometimes* destroy the function of a part long before the significant corrosion allowance is consumed" and that "hydrogen uptake *can* lead to hydride formation and embrittlement, residual stresses, and cracking long before the part is consumed." Petition at 440 (emphasis added). Nevada's assertions are important for what they do not contain – Nevada does not assert that the hypothetical circumstances are certain to occur, or even that they are probable, or likely, or even significantly plausible. Rather, Nevada only asserts that its claim above *can sometimes* occur. In short, Nevada's claims are conclusory and mere speculation without basis.

Finally, Nevada concludes, again without foundation or reference to relevant scholarship, that "DOE fails to demonstrate that the hydrogen absorbed during general corrosion (of the corrosion allowance) will not result in hydride formation, with its consequent effects on

component integrity.” Petition at 440. Again, this declaration is unsupported by citation to any supporting reference, and is therefore mere speculation without basis.

Nevada cites to a single document in the contention, noting simply that the “absorption of hydrogen accompanying corrosion is described on page 4-1 in ANL-EBS-MD-000006 Revision 02, Hydrogen-Induced Cracking of the Drip Shield, September 2004 ....” Petition at 440.

Nevada does not further refer to this document, or otherwise link it to any of its assertions above. Nevada does not state how, or even if, this document supports Nevada’s assertions related to hydrogen absorption.

The Board should not accept Nevada’s hypothetical, unsupported assertions. With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26. Nevada’s unsupported conclusion, that “DOE fails to demonstrate that the hydrogen absorbed during general corrosion ... will not result in hydride formation, with its consequent effects on component integrity” is unsupported as well. Conclusory statements cannot provide sufficient support for a contention. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006).

In summary, this contention sets forth no documentary evidence or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada attempts to demonstrate a genuine dispute with DOE by alleging, again without foundation or reference to relevant scholarship, that DOE’s asserted “neglect of the effects ... by

hydrogen absorption . . . increases *the potential* for brittle failure due to rockfall or other impact loads,” thus “substantially degrading the drip shield’s performance and hence increasing the predicted dose to the RMEI.” Petition at 440-41 (emphasis added). Consequently, Nevada alleges that the SAR does not comply with 10 C.F.R. § 63.102(h), which requires the performance assessment to address how the natural barriers and the engineered barrier system work in combination to enhance the resiliency of the geologic repository, and 10 C.F.R. § 63.113, which requires the geologic repository to be designed with proper consideration to the engineered barrier system working in combination with the natural barrier to limit radiological exposures. *Id.* at 441. Nevada’s allegations in this regard are not supported by any facts and it has offered no reasoned basis for their validity. Nevada fails to allege, much less demonstrate, that its asserted deficiencies are anything more than a potential circumstance. Most importantly, Nevada fails to even allege that resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). As noted above, such contentions are immaterial and inadmissible. An allegation that some aspect of a license application is inadequate or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990).

Nevada also alleges that because of DOE’s asserted “failure to address [the] hydrogen-mediated embrittlement process,” DOE has failed to comply with the provisions of 10 C.F.R. § 63.114(f) with respect to the evaluation of degradation, deterioration, or alteration processes of engineered barriers. Petition at 441. Notably, Nevada has failed to provide any expert opinion

or facts from supporting references in this regard. Thus, Nevada's assertion is mere speculation, unsubstantiated and conclusory. Conclusory statements cannot provide sufficient support for a contention. *See USEC, CLI-06-10, 63 NRC at 472.* In summary, a contention "will be ruled inadmissible if the petitioner 'has offered no tangible information, no experts, no substantive affidavits', but instead only 'bare assertions and speculation.'" *Fansteel, CLI-03-13, 58 NRC at 203 (quoting GPU Nuclear, Inc. (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).*

Nevada next asserts, again without foundation or reference to relevant scholarship, or even to any purported facts or purported expert opinion asserted in paragraph 5 of the contention, that the complexity of the TSPA Model does not allow it to determine whether the dose rate standard would be violated by the issues raised by this contention.

With respect to this allegation regarding the inadequacy of the TSPA Model, Nevada's assertions similarly are not adequate to support a contention. As discussed in Section IV.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency. This assertion essentially admits that Nevada does not know whether this contention is material. Nevada asserts that, because of the "burden and complexity of showing the dose effects" of acceptance of Nevada's contentions, it has not attempted to determine what effect, if any, acceptance of its contention would have on doses. *See* Petition at 442. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001).* Therefore, it is Nevada's burden to

show that its contention raises an issue that is material to this proceeding. In contrast, Nevada's assertion essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

To the extent that Nevada is asserting that DOE has failed to consider the effects of localized embrittlement due to hydride formation resulting from general corrosion, this assertion is incorrect. In this respect, Nevada ignores the related discussion in "Features, Events, and Processes for the Total System Performance Assessment: Analyses" (March 28, 2008) LSN# DEN001584824, (ANL-WIS-MD-000027) REV 000. This discussion summarizes an analysis performed that assumed that the cathodic reaction rate supporting the passive dissolution of titanium in an aggressive solution was due entirely to the hydrogen evolution reaction. *See* "Features, Events, and Processes for the Total System Performance Assessment: Analyses" (March 28, 2008) LSN# DEN001584824, (ANL-WIS-MD-000027) REV 000 at 6-418. In that analysis, embrittlement of the drip shield did not result until a period of 58,000 years; however, because this was well in excess of 10,000 years after permanent closure, it was not required to be included in the DOE's TSPA.

For these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

For all of the reasons set forth above, this contention should be dismissed in its entirety.

## **82. NEV-SAFETY-82 - Corrosion Of Thermally Oxidized Titanium**

SAR Subsection 2.3.6.8.3 and similar subsections state that the drip shield will be fully stress-relief-annealed before emplacement and describe the process to be conducted in fuel-air atmosphere at 1150°F which will result in significant surface oxide thickness compared to normal oxide films formed in air; however, DOE has failed to evaluate the effects of thermally oxidized titanium (simulating air stress relieved material that is specified as a manufacturing step intended to eliminate residual stresses assumed to eliminate stress corrosion cracking (SCC) and other hydrogen cracking issues) under the relevant repository corrosion conditions, including effects on general corrosion rates and under-deposit corrosion from seepage water evaporating on hot wall surfaces, which affect the validity of the corrosion analysis used to predict drip shield performance in the LA and could lead to early drip shield failures due to unanticipated decreased corrosion performance.

### **RESPONSE**

In this contention, Nevada alleges that DOE failed to evaluate the effects of thermally oxidized titanium under the relevant repository corrosion conditions. Nevada alleges that this failure affects the “validity of the corrosion analysis used to predict drip shield performance in the LA and could lead to early drip shield failures due to unanticipated decreased corrosion performance.” Petition at 443. For the reasons explained below, this contention is inadmissible.

#### **a. Statement of Issue of Law or Fact to be Controverted**

As explained below, Nevada’s conclusory, unsupported, generalized statements and allegations fail to present a dispute on a genuine issue of fact or law, as required under 10 C.F.R. § 2.309(f)(1)(i) to be admissible in this proceeding

**b. Brief Explanation of Basis**

As explained below, Nevada’s reliance on SAR Subsection 2.3.6.8.3, and the undefined, unidentified “similar subsections,” does not provide an adequate basis in law or fact for the proffered contention. Moreover, as demonstrated below, this contention is rife with mere speculation, as well as unsubstantiated and conclusory allegations. Conclusory statements simply do not provide sufficient support for an admissible contention. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006). A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations.

In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due

to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. In particular, this contention does not reference any expert opinion

or documentary materials, other than the LA. Instead, this contention consists entirely of the unsupported assertions of Nevada's counsel. *See* Petition at 445. Therefore, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach three affidavits (by James A. McMaster, Michael C. Thorne and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Even if Nevada's claims were construed to have been submitted by an expert, they would not be sufficient to support admission of this contention in this proceeding. The Statement of Alleged Facts or Expert Opinion and Supporting References is but three sentences long. *See* Petition at 445. In it, Nevada asserts, without foundation or reference to relevant scholarship or expert opinion, that although thermally thickened titanium oxide films have been shown to be beneficial to corrosion resistance of titanium under some conditions involving normal industrial exposures of a few years, "none of the tests described in the LA and supporting materials have

attempted to simulate thermally thickened oxide under the long-term conditions involved in the repository.” *Id.* at 445.

Nevada next asserts, again without foundation or reference to relevant scholarship or expert opinion, that “[t]he performance of this thicker oxide layer and the specific effect on the material compositions and combinations of material compositions ... in the drip shield is *uncertain*.” *Id.* (emphasis added). Lastly, Nevada alleges, once again without foundation or reference to any relevant scholarship or expert opinion, that “[o]xide growth is generally accepted to slow over time, but the effects of a pre-existing thermally enhanced oxide layer two orders of magnitude thicker than the air-formed oxide tested by DOE are unknown.” Petition at 445. In sum, Nevada’s assertions do no more than acknowledge that thermally thickened titanium oxide films have been shown to be beneficial to corrosion resistance and vaguely assert that: (1) the performance of the thick oxide layer and its specific effect on the material compositions and combinations of material compositions ... in the drip shield is *uncertain*; and (2) the effects of a pre-existing thermally enhanced oxide layer two orders of magnitude thicker than the air-formed oxide tested by DOE are *unknown*.

Such unsupported, vague speculation, devoid of any documentary reference, cannot support admission of this contention. A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). This contention is a textbook example of inadmissibility for these reasons.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As a threshold matter, the Commission has stated that a petitioner must “read the pertinent portions of the license application, . . . state the applicant’s position and the petitioner’s opposing view,” and explain why it disagrees with the applicant. Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. at 33,170. This Nevada has not done, counter to one of the key underlying principals of the NRC hearing process. Thus, the contention is also inadmissible pursuant to 10 C.F.R. § 2.309(f)(1)(vi), as demonstrated in the following paragraphs.

In a first step, Nevada seemingly attempts to demonstrate a genuine dispute with DOE by challenging, “the validity of DOE long-term corrosion test results reported in SAR Subsection 2.3.6, and similar subsections,” because, assertedly, “the condition of materials tested for corrosion do not duplicate the conditions of material to be placed in the repository.” Petition at 445. In this regard, Nevada claims that DOE “failed to test the thermally oxidized surface condition resulting from stress relief of the titanium material, as described in SAR Subsection 2.3.6.8.3, and similar subsections.” Petition at 446.

As noted above, however, this assertion is wholly conclusory, and completely fails to demonstrate that the purported inadequacy in the application is material in nature or effect. It is axiomatic that an allegation—such as that proffered here by Nevada— that some aspect of a license application is inadequate or unacceptable, does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co. (Turkey Point Plant, Unit Nos. 3 and 4)*, LBP-90-16, 31 NRC 509, 521 n.12 (1990)(emphasis added). On this point, Nevada does not allege that the circumstances asserted above -- that the conditions of materials tested for corrosion do not

duplicate the conditions of materials to be placed in the repository, and that DOE failed to test the thermally oxidized surface condition -- are in conflict with any regulation or any other requirement.

Rather, Nevada simply concludes that because of the purported failure asserted above, and “[s]ince this is the condition of the drip shield material as it is proposed for placement, there is no demonstration of fitness for purpose which impacts the predicted dose to the RMEI.” Petition at 446. Yet Nevada fails to identify the source of any purported requirement that DOE demonstrate the fitness of the drip shield material and otherwise does not explain how, or even whether, Nevada’s allegation relates to the predicted dose to the RMEI. Importantly, Nevada fails to even allege that resultant dose rates will evidence an increase in the mean dose *above regulatory limits*.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Nevada next alleges that, because of the perceived deficiency discussed above, “*these various subsections* do not comply with 10 C.F.R. § 63.114(f), which requires *any* performance

assessment used to demonstrate compliance with Section 63.113 to provide the technical basis for either inclusion or exclusion of degradation, deterioration, or alteration processes of engineered barriers in the performance assessment, including those processes that would adversely affect the performance of natural barriers.” Petition at 446 (emphasis added). In so doing, Nevada fails to identify which portion(s) of the LA relates to the alleged deficiency, and fails to identify the performance assessment that it believes to be deficient. As such, Nevada yet again fails to “provide sufficient information to show . . . a genuine dispute . . . with the applicant . . . on a material issue of law or fact,” as required by 10 C.F.R. § 2.309(f)(1)(vi), and provided yet another reason for the Board to reject this contention.

Nevada also notes that “[d]egradation, deterioration, or alteration processes of engineered barriers must be evaluated in detail if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.” Petition at 446. Nevada fails to allege a specific deficiency with respect to this claim, and, as noted above, does not claim that there will be any increase in radiological dose rates as a result of the alleged deficiencies let alone a significant change. Thus, the claim above cannot support any genuine material dispute of law or fact.

Along this same line, Nevada next asserts that the same “various subsections” noted above also do not comply with 10 C.F.R. § 63.114(g), which “requires any performance assessment used to demonstrate compliance with Section 63.113 to provide the technical basis for models used in the performance assessment . . . .” *See* Petition at 446. Nevada does not identify the “various subsections,” further explain this assertion or otherwise discuss the

perceived deficiency. Mere, unfocused speculation does not demonstrate a genuine dispute of a material fact.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada's contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For all of these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact and the contention must therefore be dismissed in its entirety.

**83. NEV-SAFETY-83 - Adequacy of Methods of General And Localized Corrosion Testing of The Drip Shield**

SAR Subsection 2.3.6 at 2.1-104 and 105 describe corrosion tests as long-term immersion exposures of open, creviced, and stressed specimens all together in closed tanks under two temperature conditions; however, the tests are not adequately representative of corrosive conditions in the proposed repository that will affect repository performance and specifically do not address the effects of  $Ti^{++}$  ion concentrations and aeration in the test solution that could change corrosion behavior and lead to erroneous conclusions that fail to predict corrosion performance of the actual drip shields.

**RESPONSE**

In this contention, Nevada alleges that DOE's conduct of corrosion tests involving long-term immersion exposures of open, creviced, and stressed specimens all together in closed tanks under two temperature conditions is not "adequately representative of corrosive conditions in the proposed repository that will affect repository performance." Petition at 448. In particular, Nevada alleges that the tests "do not address the effects of  $Ti^{++}$  ion concentrations and aeration in the test solution that could change corrosion behavior and lead to erroneous conclusions that fail to predict corrosion performance of the actual drip shields." *Id.* For the reasons discussed below, this contention is inadmissible.

**a. Statement of Issue of Law or Fact to be Controverted**

As discussed below, this contention fails to state, with requisite specificity, an issue of law or fact justifying its admissibility in this proceeding.

**b. Brief Explanation of Basis**

For the many reasons discussed below, this contention lacks adequate factual or legal bases, and must be dismissed for that reason.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R.

§ 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the

licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references to justify admission of its proffered contention. In particular, this contention does not reference any expert opinion or documentary materials, other than the license application. Instead, this contention appears to consist entirely of arguments of counsel. *See* Petition at 450-52.

Therefore, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach three affidavits (by James A. McMaster, Michael C. Thorne and Robert A. Cottis), which purportedly provide expert opinions

to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada alleges a series of unsupported random facts and mere assertions that do not provide adequate support for its contention. First, Nevada asserts that with respect to the “Long Term Corrosion Test Facility Tests ... described in SAR Subsection 2.3.6 ... “[t]he reader is led to believe that the specimens were immersed in the original solution for the exposure times described in the report.” Petition at 450. Nevada next asserts that the “effects of titanium ions in solution were interpreted by early researchers to lead to a reduction of corrosion rates over time, a contention refuted in subsequent tests where solution replenishment was addressed” and that a “lack of description of replenishment of solutions or of tests of alternate aeration conditions leads one to believe this important practice in titanium corrosion testing was not considered in the DOE tests described.” *Id.* Nevada then alleges that “[i]n repository conditions, dripping solutions are constantly replenished” and that the “[f]ailure to replenish solutions in ‘beaker’ corrosion tests of titanium ... was the source of many erroneous results in the early years before the corrosion inhibiting effect of  $Ti^{++}$  ion in the test solution from specimen corrosion was discovered to be critically important ... [and that] [a]lthough the corrosion rates of Grade 16 or Grade 7 are low, leading to low levels of  $Ti^{++}$ , the effect is uncertain without data as to the  $Ti^{++}$  levels in the test solution prior to replenishment.” *Id.*

According to Nevada, “DOE did not check or did not report titanium ion concentration in the test solutions, something that might have been a useful guide to very low corrosion rates” and “that the failure to test alternate aeration conditions fails to simulate many conditions that

may be encountered, or to demonstrate that the method employed by DOE does produce fully aerated conditions (oxygen levels substantially in equilibrium with air), something that is also of critical importance in corrosion tests of titanium.” *Id.* at 450-51. Nevada then makes a number of general assertions and observations relating to weight loss tests and related issues and concerns. *Id.* It does not, however, tie any of these assertions and general observations to DOE or to the LA, except to allege that the “effects of changes in pH, species concentration increases, and hot wall effects that are probable under repository exposure conditions are not adequately addressed in the LA.” *Id.* at 451.

None of Nevada’s assertions and speculation is supported by a reference to expert opinion, relevant scholarship, or documentary material. In fact, Nevada does not even explain how this unfocused collection of statements is relevant to any specific portion of the LA. As such, the statements do not provide adequate support for admission of this contention. It is axiomatic that a contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel, Inc.* (Muskogee, Oklahoma, Site) CLI-03-13, 58 NRC 195, 203 (2003) (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). This is another textbook example of an inadmissible contention as defined by 10 C.F.R. § 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada unsuccessfully attempts to demonstrate a genuine dispute with DOE by challenging “the sufficiency of conditions tested and validity of the titanium corrosion data from the Long Term Corrosion Test Facility Tests described in SAR Subsection 2.3.6. and similar subsections.” Petition at 452. Nevada is unsuccessful in this attempt because it fails to specify

the portion of SAR Section 2.3.6 about which it seeks to assert some deficiency. SAR § 2.3.6 is 192 pages long, and Nevada fails to specify either the subordinate subsection or the page of this 192-page SAR section it seeks to challenge.

This pleading deficiency is further evident in Nevada's attempt to set forth alleged facts or expert opinion in paragraph 5 of its contention. *See* Petition at 450 (referring only to "SAR Subsection 2.3.6"). Curiously, the "Statement of the Contention Itself" in paragraph 1 refers to corrosion tests described in "SAR Subsection 2.3.6. at 2.1 – 104 and 105." Petition at 448 (emphasis added). All of the pages in SAR § 2.3.6. fall between 2.3.6.-1 and 2.3.6.-192. Page 2.3.6-104 is "intentionally left blank," and page 2.3.6-105 contains Table 2.3.6, which is unrelated to the long-term immersion exposure test that Nevada purports to challenge. SAR at 2.3.6-104 to-05. Thus, it is entirely unclear which portion of the SAR it is that Nevada seeks to challenge.

Such vague references to documents are not permissible and do not warrant admission of a contention. A petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). For this reason alone, this contention is inadmissible. A contention "will be ruled inadmissible if the petitioner 'has offered no tangible information, no experts, no substantive affidavits', but instead only 'bare assertions and speculation.'" *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *Gen. Pub. Utils. Nuclear, Inc.*, CLI-00-06, 51 NRC at 208).

Nevada also asserts, again without reference to any section of the SAR or any other authoritative reference, that the titanium corrosion data "are used by DOE to support its assumed performance of the drip shield in the TSPA model and thus the predicted dose to the RMEI." Petition at 452. Nevada then claims, without expert support or reference to relevant scholarship,

or even further explanation, that DOE's tests "are not valid for use in this context." *Id.*

Proceeding in this unsupported fashion, Nevada concludes, with the same lack of specificity noted above, that "[t]hus, SAR Subsection 2.3.6 and similar subsections do not comply with 10 C.F.R. § 63.114(g), which requires that any performance assessment used to demonstrate compliance with Section 63.113 must provide the technical basis for models used in the performance assessment ..." and that "... the comparisons made with empirical observations do not provide a legitimate technical basis for the models used." *Id.* at 452-53. Such argument amounts to mere speculation.

Nevada next asserts, without support and, again, with same lack of specificity noted above, that "SAR Subsection 2.3.6 and similar subsections" also do not comply with 10 C.F.R. § 63.114(g), which "requires any performance assessment used to demonstrate compliance with Section 63.113 must provide the technical basis for models used in the performance assessment..." *See* Petition at 452. Nevada does not further explain this assertion or otherwise explain the perceived deficiency. Mere, unfocused speculation does not demonstrate a genuine dispute of a material fact.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In

contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For this reason and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

For all of the reasons set forth above, this contention should be dismissed in its entirety.

**84. NEV-SAFETY-84 - Use Of Differential Weight Loss To Estimate Very Low Corrosion Rates**

SAR Subsection 2.3.6.8.1 and similar subsections state that general corrosion may occur, but DOE describes immersion corrosion testing methods and differential weight loss measurements to predict both general and localized corrosion where corrosion rates are very low and the data are to be extrapolated for thousands of years. The test methods are not sufficient to measure general and localized corrosion to an accuracy level sufficient for extrapolation to predict drip shield performance.

**RESPONSE**

This contention alleges that SAR section 2.3.6.8.1 and other similar subsections state that general corrosion may occur, but DOE describes immersion corrosion testing methods and differential weight loss measurements to predict both general and localized corrosion where corrosion rates are very low and the data are to be extrapolated for thousands of years. The test methods are not sufficient to measure general and localized corrosion to the accuracy level sufficient for extrapolation to predict drip shield performance.

**a. Statement of Issue of Law or Fact to be Controverted**

In this contention, at paragraph 1, “A statement of the contention itself,” Petitioner alleges that “*SAR section 2.3.6.8.1 and similar sections* state that general corrosion may occur, but DOE describes immersion corrosion testing methods and differentiated weight loss measurements to predict both *general and localized corrosion* where corrosion rates are very low and the data are to be extrapolated for thousands of years.” Petition at 454 (emphasis added). Petitioner further asserts that “use of weight loss measurement for localized ... corrosion is inaccurate for general corrosion and fails to estimate the severity of *localized corrosion* ....”

Petition at 454 (emphasis added). SAR section 2.3.6.8.1, however, discusses only *general corrosion*. Localized corrosion is discussed in SAR section 2.3.6.8.2.

It is impossible to discern what precisely the focus of this contention is and which section of the LA Nevada seeks to challenge. 10 C.F.R. § 2.309(f)(1)(i) requires “a specific statement of the issue of law or fact to be raised or controverted.” The June 20, 2008 Case Management Order further notes that “this [§ 2.309(f)(1)(i)] statement shall set forth petitioner’s contention in precisely the form it wishes the contention to be considered.” *U.S. Dep’t of Energy*, (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board) LBP-08-10, 67 NRC \_\_\_ (slip op. at 6) (June 20, 2006). Nevada’s inability to clearly delineate which SAR section it is challenging, coupled with its vague and imprecise references to “similar subsections” (Petition at 454, 456) make it clear that Nevada has not met the pleading specificity requirements of 10 C.F.R. § 2.309(f)(1)(i) and its related obligations of the June 20, 2008 Case Management Order. Accordingly, this contention should be dismissed.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies various regulations in support of the contention. *See* Petition at 455. Nevada concludes this general description of various

sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Specifically, although Petitioner asserts that the erroneous data cannot be used to assess drip shield degradation upon which dose to the RMEI is predicated, it fails to establish that the error is relevant to DOE’s compliance with any Part 63 requirement. Petition at 457. Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. See 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance

objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing general and localized corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by James A. McMaster, Maurice E. Morgenstein, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

For example, without foundation or reference to any relevant scholarship, Nevada asserts the following in this contention: (1) "[l]ocalized corrosion ... tends to cause minimal weight loss even with severe penetration rates" (Petition at 456); (2) "[u]sing weight loss as a means for assessing this type of corrosion is not valid compared to examining surfaces for attack and judging failure based on such evidence" (Petition at 456); (3) "[i]mmersion testing with numerous specimens in a single container, without describing solution replenishment procedures, *leaves open the possibility* that all test results are compromised due to the presence of titanium

ions in the solution” (Petition at 457) (emphasis added); and (4) “[t]esting on limited air aeration compared to a more positive way to assure oxygen equilibrium with the test solution ... as well as failure to test using nitrogen or pure oxygen aeration to better quantify the limits of aeration effects, *leaves open the possibility* that all test results are compromised due to the effects of different levels of aeration.” Petition 457 (emphasis added).

With the exception of providing its own unsupported example weight loss for localized corrosion, Nevada does not further explain these assertions and provides no other statements that could arguably provide a reasoned basis to conclude that these assertions provide adequate support for a contention. Most importantly, none of these assertions is supported by reference to any scholarly research or buttressed by expert opinion. The Board should not accept such hypothetical, unsupported assertions. Such conclusory statements cannot provide “sufficient” support for a contention. *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006).

In summary, this contention sets forth no documentary evidence or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(1)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention asserts that DOE’s use of differential weight loss based on immersion corrosion testing methods to predict both long term general and localized corrosion, as well as its failure to evaluate the effects of  $Ti^{++}$  ion concentration in the solution and various aeration effects “*leaves open the possibility* that all test results are compromised.” Petition at 457 (emphasis added). For several reasons, this contention does not establish a genuine dispute of material fact.

First, regarding Nevada's assertion pertaining to the requirements of 10 C.F.R. § 63.114(g) with respect to the technical basis of models, it is entirely unclear as to what deficiency Nevada is alleging. *See* Petition at 457. Nevada sets forth no expert testimony or supporting references with respect to any model, nor does its "Statement of the Contention Itself" or its "Brief Summary of the Basis for the Contention" refer to any such model. In this respect, this assertion fails to provide sufficient information to show a genuine dispute with DOE related to the provisions of 10 C.F.R. § 63.114(g).

Next, this contention contains only unsupported speculation. For example, Nevada maintains that "[m]easuring weight loss on specimens with extremely low corrosion rates is *problematic*." (Petition at 456) (emphasis added). With respect to its example regarding drip shield corrosion, Petitioner asserts that "[w]ith the *relatively* rapid penetration rates due to localized corrosion, the time until penetration *can be much less* than the time for loss due to general corrosion of 1mm of surface." Petition at 456 (emphasis added). Similarly, Nevada alleges that DOE's use of differential weight loss based on immersion corrosion testing methods for general and localized corrosion, and its failure to evaluate the effects of  $Ti^{++}$  ion concentration in the solution and various aeration effects, "*leaves open the possibility* that all test results are compromised." Petition at 457 (emphasis added).

The Board should not accept such unsupported and speculative assertions. Even if these claims were construed to have been submitted by an expert, it would not be sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, "the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention." *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff'd on other grounds*, CLI-98-13, 48 NRC 26.

Furthermore, Nevada's unsupported conclusion that DOE's extrapolation of this "questionable data ... affects the basis upon which the dose to the RMEI is predicted" should likewise not be accepted by the Board. Petition at 457. As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency. Petitioner provides no quantitative or even qualitative information regarding the extent to which DOE's corrosion data used to predict drip shield performance effect its evaluation of dose to the RMEI. Thus, Petitioner fails to demonstrate a genuine dispute.

In addition, Petitioner mischaracterizes the LA and a supporting reference. Petitioner maintains, without citing to a specific paragraph or page, that "[i]n the testing reported in SAR subsection 2.3.6.8.1 and similar subsections, and as described in ... "General Corrosion and Localized Corrosion in the Drip Shield" (4/27/2006), LSN#: DN2002228104 it was noted that cleaning procedures to remove surface deposits on the test coupon material sometimes resulted in weight gain due to inadequate cleaning." Petition at 456. Neither SAR section 2.3.6.8.1 nor LSN#: DN2002228104 discusses inadequate cleaning procedures.

Lastly, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 458. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed

Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. See Section V.A.3 of the Answer for a more detailed discussion of this position.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be dismissed.

**85. NEV-SAFETY-85 - Declining Corrosion Rate Over Time**

SAR Subsection 2.3.6 states that the model implementation for corrosion is considered conservative because the general corrosion rate of metals and alloys is known to decrease with time, but the referenced tests are invalid and therefore this assumption is not applicable.

In this contention, Nevada alleges that “SAR Subsection 2.3.6 states that the model implementation for corrosion is considered conservative because the general corrosion rate of metals and alloys is known to decrease with time, but the referenced tests are invalid and therefore this assumption is not applicable.” Petition at 459. For the reasons discussed below, this contention is inadmissible.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

As explained below, Nevada’s one-sentence statement set forth in subsection 2 of its contention is not sufficiently specific and unsupported by fact or expert opinion to meet the bases requirements of 10 C.F.R. § 2.309(f)(1)(ii).

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations.

Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references to justify admission of its proffered contention. In particular, this contention does not reference any expert opinion or relevant documentary materials in support of its position, other than the license application. Therefore, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any relevant documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by James A. McMaster and Robert A. Cottis), which purportedly provide expert opinions to support this contention. Petition, Attachments 14 and 18. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Even if the claims are construed to have been submitted by an expert, they still would not be sufficient to support admission of this contention. Nevada references one document in its proffered contention, citing to Millaway, E.E. (1965), "Titanium: Its Corrosion Behavior and Passivation," *Material and Protection* (1965), for the proposition that corrosion rates have been understood to decrease over time. *See* Petition at 461. As discussed more fully below, Nevada asserts that the opposite is true. Thus, Nevada presents *no* expert opinion and offers *no* supporting scientific or factual material in support of its contention. Therefore, this contention's "Statement of the Facts or Expert Opinions Supporting the Contention and Supporting References" consists entirely of assertions of counsel and, as such, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Nevada first asserts, without support or reference to relevant scholarship -- and even without citation to any specific portion of the LA or to any of the documents that are referenced in the LA -- that "DOE appears to have ignored possible corrosion inhibiting effects of titanium corrosion product ion (Ti<sup>++</sup>) in solution and of various aeration conditions in its long-term immersion corrosion tests by failing to periodically refresh the test solutions" and, consequently, that the immersion test results are "highly questionable." Petition at 461. Nevada's claim is indefinite and nonspecific, lacks the required specificity required to support a contention, and is mere speculation.

Next, Nevada acknowledges that in the past, it was understood that corrosion rates decreased over time. *See* Petition at 461 (noting that "in early testing in the 1950's it was thought that corrosion rates fell over time" (internal citation omitted)). But, Nevada then asserts, without support or reference to any relevant scholarship, that "... subsequent research demonstrated the inhibiting effect of the titanium ion, the effects of titanium ion (Ti<sup>++</sup>) in

solution, and of variable aeration on corrosion test results, which have been demonstrated in numerous tests made by laboratories engaged in testing of titanium for corrosion applications.” Petition at 461. Nevada next asserts, again without support or reference to any relevant scholarship, that “[a]eration effects have also been shown to be significant in the results of corrosion tests with titanium.” *Id.* Lastly, Nevada acknowledges that DOE examined the effects of aeration, but asserts, once again without support or reference to any relevant scholarship, that DOE did not “... compare aeration using oxygen, air and nitrogen, for example, to better define valid bounds for its data, nor does the aeration method described, air passing over the surface, provide assurance that the aeration conditions were really known or consistent throughout DOE’s testing.” Petition at 461. These assertions are mere speculation.

None of the above assertions are supported by any reference to relevant scholarship and Nevada does not assert the relevance of any of them to any specific portion of the LA. Importantly, Nevada does not even allege, much less demonstrate, that any of the possible circumstances or claims described above has any material effect on DOE’s corrosion testing or on the validity of any of DOE’s corrosion models. These indefinite claims amount to mere unfocused speculation, unsupported by any documentary reference or expert opinion. As such, they cannot provide adequate support for a contention. A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

The Board should not accept such hypothetical, conclusory and unsupported assertions. Even if these claims were construed to have been submitted by an expert, they would not be

sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26.

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada attempts to demonstrate a genuine dispute with DOE by challenging “DOE’s assumption in SAR Subsection 2.3.6 that corrosion rates decrease over time.” Petition at 461. Nevada specifically alleges that “[b]y ignoring the effects of build-up of titanium ions in their experimental configuration and by inadequately simulating aeration, DOE test results are questionable ... and DOE inappropriately presents the unproven assumption that the rates will decline over time as making the results even more conservative.” *Id.* at 461-62. Nevada’s assertion is unclear. In terms of the modeling of the general corrosion rate of titanium in the TSPA, although it has been experimentally demonstrated that the corrosion rate for titanium does decline over time, the TSPA conservatively models it as being constant. *See* SAR § 2.3.6.8.1.1 at 2.3.6-71 (noting that “[t]he general corrosion rate of the drip shield is modeled to be constant with time. This treatment results in earlier drip shield failures than expected because the general corrosion rate of metals and alloys tends to decrease with time....”).

Nevada’s attempts to demonstrate a factual dispute fail for a variety of reasons. First, Nevada fails to specify the portion of SAR Section 2.3.6 about which it seeks to assert some

deficiency. SAR Section 2.3.6 is 192 pages long, and Nevada fails to specify either the subordinate subsection or the page of this 192 page SAR section it seeks to challenge. This pleading deficiency is also demonstrated in Nevada's Statement of the Contention Itself in subsection 1 of its contention. *See* Petition at 459 (referring only to "SAR Subsection 2.3.6"). Such vague references to documents are not permissible. A petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-0 3, 29 NRC 234, 240-41 (1989). For this reason alone, this contention is inadmissible.

Second, as noted above, Nevada's assertions are wholly conclusory and unsupported by any expert opinion or any facts that provide a reasoned basis for the contention. An allegation that some aspect of a license application is inadequate or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 n.12 (1990). Relatedly, Nevada does not allege that the circumstances asserted above – that DOE's test results are questionable and DOE inappropriately presents an unproven assumption that the rates will decline over time – are in conflict with any regulation or any other requirement.

Nevada concludes, with the same lack of specificity noted above, that "[t]hus, SAR Subsection 2.3.6 does not comply with 10 C.F.R. § 63.114(f), which requires that any performance assessment used to demonstrate compliance with Section 63.113 must provide the technical basis for either inclusion or exclusion of degradation, deterioration, or alteration processes of engineered barriers in the performance assessment...." *See* Petition at 462. Nevada next asserts, without support or amplifying information, that SAR Subsection 2.3.6 does not

comply with 10 C.F.R. § 63.114(g), which “requires any performance assessment used to demonstrate compliance with Section 63.113 to provide the technical basis for models used in the performance assessment ....” *See* Petition at 462.

These claims amount to mere speculation. Nevada provides no support for these two purported deficiencies and does not further explain either assertion or otherwise explain the perceived deficiency. Mere, unfocused speculation does not demonstrate a genuine dispute of a material fact. A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact and the contention must therefore be dismissed.

For all of the reasons set forth above, this contention should be dismissed in its entirety.

**86. NEV-SAFETY-86 - Role Of Rock Dust On Canister Surfaces In Localized Corrosion**

SAR Subsection 2.3.6.4.4.1 and related subsections, which describe DOE's model for localized corrosion, are grossly incomplete because common and ubiquitous rock dust (siliceous and feldspathic) can form crevices on C-22 and Ti-7 surfaces that are favorable environments for localized corrosion.

**RESPONSE**

In this contention, Nevada alleges that "SAR Subsection 2.3.6.4.4.1 and related subsections, which describe DOE's model for localized corrosion, are grossly incomplete because common and ubiquitous rock dust (siliceous and feldspathic) can form crevices on C-22 and Ti-7 surfaces that are favorable environments for localized corrosion." Petition at 464.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere

assertion that “[t]his contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references to justify admission of its proffered contention. In particular, this contention does not reference any expert opinion or adequate documentary materials in support of its position. Therefore, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any relevant supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Maurice E. Morgenstein and Robert A. Cottis), which purportedly provide expert opinions to support this contention. Petition, Attachments 17 and 18. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Even if the claims are construed to have been submitted by an expert, they still would not be sufficient to support admission of this contention.

In an attempt to present support for its proffered contention, Nevada alleges a series of unsupported and seemingly random facts and assertions that do not provide adequate support for its contention. Nevada first asserts, without support or reference to relevant scholarship, that “[g]eochemically benign dust can form loosely spaced crevices that are favorable physical environments for localized corrosion initiation with acid brines and vapors produced by hygroscopic salt dust and/or unsaturated zone seepage.” Petition at 465-66. Next, Nevada observes that SAR Subsection 2.3.6.4.4.1 notes that:

Brines produced from dust deposits onto the Alloy 22 waste package outer barrier will not generate a favorable environment for localized corrosion initiation and growth. If brine exists at elevated temperatures (>120°C), it will be benign, rather than corrosive and initiation of localized corrosion and subsequent penetration of the waste package outer barrier are not expected.

Petition at 466.

Nevada next declares, and without reference to any portion of the SAR or to any other relevant documentary source, that “[t]he operating DOE premise is that acid vapors will evolve into the tunnel atmosphere and therefore will not have time to react with critical EBS materials such as the C-22 outer canister barrier.” Petition at 466. Nevada next notes that “... SAR Subsection 2.3.6.4.3.1.3 ... suggests that crevices may form on the waste package below ‘mineral scales, corrosion products and rocks.’” Petition at 466 (quoting SAR Subsection 2.3.6.4.3.1.3 at 2.3.6-38). Nevada then asserts that it “has laboratory evidence ... that supports these statements in SAR Subsection 2.3.6.4.3.1.3, which contradict SAR Subsection 2.3.6.4.4.1.” Petition at 466 (citing “Experiments Devised to Studying Temperature and Geometry Effects of Corrosion of C-22 Alloy” (04/23/2008), LSN# NEV000005235). Yet, even with this

opportunity, Nevada provides no specific evidence, supported by scholarly opinion in associated affidavits.

Nevada also fails to explain the relevance of its allegation of inconsistency between the text of SAR Subsection 2.3.6.4.4.1 and the text of SAR Subsection 2.3.6.4.3.1.3 quoted above. In any case, its assertion mischaracterizes the text quoted from SAR Subsection 2.3.6.4.4.1 above, which merely indicates that brine from dust deposits on Alloy 22 will not provide a favorable environment for localized corrosion. In fact, the next two sentences following the text that Nevada quotes provide that “[t]he quantity of brine at elevated temperatures is small, which hinders corrosion initiation and extent” and that “... the overall consequence of dust deliquescence on the localized corrosion of the waste package outer barrier will be insignificant.” SAR § 2.3.6.4.4.1 at 2.3.6-41. This text then notes that “[t]herefore, localized corrosion of Alloy 22 due to dust deliquescence is excluded from TSPA. *Id.* (citing Section 2.2, Table 2.2-5; FEP 2.1.09.28.0A).

The text from SAR 2.3.6.4.3.1.3, which merely provides that “crevices may form on the waste package below mineral scales, corrosion products and rocks,” is not at odds with the former statement. The former statement addresses the possibility of a favorable environment for localized corrosion; the latter statement notes only that crevices may form on the waste package. In any event, Nevada does not further explain the purported discrepancy or its relationship to its contention.

Nevada then declares that “... nowhere within the SAR does DOE actually state that dust can form crevices.” Petition at 466. It is unclear what to make of this assertion, and Nevada does not explain it. However, the text that Nevada failed to quote from SAR § 2.3.6.4.4.1, noted above, describes the exclusion of localized corrosion of Alloy 22 due to dust deliquescence from

the TSPA, and refers to FEP 2.1.09.28.0A. FEP 2.1.09.28.0A's screening justification provides, in pertinent part, that "[t]his evaluation shows that dust deliquescence-induced localized (primarily crevice) corrosion of the waste package outer corrosion barrier (Alloy 22) is of low consequence with respect to repository performance ...." See "Features, Events, and Processes for the Total System Performance Assessment: Analyses" (March 2008) LSN DEN001584824 at 6-705. Thus, it is clear that not only did DOE consider the possibility of dust deliquescence-induced localized crevice corrosion, but that evaluation, in part, led to the exclusion of "Localized Corrosion on Waste Package Outer Surface Due to Deliquescence" from the TSPA.

Nevada next asserts, without support or reference to any relevant scholarship, that "thermally evolving seepage water may also be trapped under dust, dust combined with rock fall debris, or rock fall debris forming crevices that are therefore fed by low pH brines" and that these "environments are likely to enhance C-22 corrosion, but are not considered in DOE's corrosion models." Petition at 466. Nevada's assertions related to a purported failure by DOE to consider possible corrosion due to seepage water is misplaced. FEP 2.1.09.28.0A, discussed above, excludes localized corrosion from salt-containing dust, which can accumulate on the waste package. *Id.* A second included FEP, FEP: 2.1.03.03.0A, "Localized Corrosion of Waste Packages" accounts for the other forms of localized corrosion of waste packages. In this regard, FEP: 2.1.03.03.0A notes that "[t]he two main routes through which an aqueous solution could come into contact with the waste package surface are dust deliquescence and seepage. The possibility of localized corrosion of the [waste package outer barrier] due to brines produced by dust deliquescence is discussed in excluded FEP 2.1.09.28.0A (Localized Corrosion on Waste Package Outer Surface due to Deliquescence). Localized corrosion initiation due to seepage water contact is discussed [in FEP 2.1.03.03.0A ]." (LSN# DEN00158424, at 6-400.)

Thus, DOE has considered both dust deliquescence-induced localized crevice corrosion and localized corrosion of the waste packages due to seepage water. Nevada's assertions above are incorrect, unfounded and amount to bare speculation. As such, they cannot provide adequate support for a contention. A contention "will be ruled inadmissible if the petitioner 'has offered no tangible information, no experts, no substantive affidavits', but instead only 'bare assertions and speculation.'" *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada attempts to demonstrate a genuine dispute in subsection 6 of its contention by challenging "SAR Subsection 2.3.6.4.4.1 and related subsections, which describe DOE's model for localized corrosion, because they are grossly incomplete because common and ubiquitous rock dust (siliceous and feldspathic) can form crevices on C-22 and Ti-7 surfaces that are favorable environments for localized corrosion." Petition at 467. As noted above, DOE considered the localized corrosion of waste packages with respect to both dust deliquescence and seepage, "[t]he two main routes through which an aqueous solution could come into contact with the waste package surface are dust deliquescence and seepage." See LSN#: DEN001584824 at 6-400.

In any event, Nevada's assertions are not sufficient to sustain its admission. Even if Nevada's claims were somehow to be accepted by the Board, the contention provides no basis for demonstrating that the claims would have any material effect on corrosion, or the content of

the LA. In particular, the contention does not allege, even qualitatively, that the use of a different method would result in more accurate modeling of the corrosion, or would be inconsistent with the reasonable expectation standard. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model.

*Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Thus, notwithstanding whether Nevada's contention is correct or not, the contention does not demonstrate that DOE's results are inconsistent with the reasonable expectation standard. In this regard, Nevada ignores the demonstration of the conservatism of the model presented by DOE in SAR Section 2.3.6.4.4.1, "Abstracted Model for Localized Corrosion." See SAR § 2.3.6.4.4.12 at 2.3.6-41 (noting that: "[i]f localized corrosion due to seepage brines occurs, the affected area is modeled as the wetted waste package surface underneath the breached portion of the drip shield . . . . This treatment is *conservative*, because the model is based upon samples with tight crevices, and only the area between the waste package and the emplacement pallet will be tightly creviced.") (emphasis added).

Nevada next alleges that, "SAR Subsection 2.3.5.6 does not comply with 10 C.F.R. § 63.114(f), which requires that any performance assessment used to demonstrate compliance with Section 63.113 must evaluate in detail degradation, deterioration, or alteration processes of engineered barriers, if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission." Petition at 467.

With respect to Nevada's next assertion regarding the inadequacy of the TSPA Model, this too is not adequate to support admission of the proffered contention. As discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

For all of the reasons set forth above, this contention should be dismissed in its entirety.

**87. NEV-SAFETY-87 - Intergranular Scc Corrosion During Dry-Wet Cycle**

SAR Subsection 2.3.6.5 and similar subsections, which describe stress corrosion cracking (SCC) of the waste package outer barrier, fail to consider SCC initiation as a consequence of dry-wet drip cycling inter-granular corrosion thereby underestimating the environmental causes for C-22 stress corrosion cracking.

**RESPONSE**

In this contention, Nevada alleges that in SAR Subsection 2.3.6.5 and similar subsections, DOE has not considered stress corrosion cracking (SCC) initiation as a consequence of dry-wet drip cycling inter-granular corrosion, thereby underestimating the environmental causes for C-22 stress corrosion cracking. In short, Nevada contends that DOE has not sufficiently studied a *possible* cause of corrosion. In addition to its pleading deficiencies, Nevada fails to provide a reasoned basis to substantiate that conclusion. Moreover, even if Nevada could show that DOE underestimated the causes for C-22 SCC, Nevada fails to demonstrate that the waste package will be compromised as a result or that the alleged deficiency would have any impact on DOE's ability to limit radiological exposures and releases. Consequently, this contention fails to raise a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R.

§ 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Additionally, although Nevada has alleged an error on DOE’s part, Nevada has failed to establish that the error is material to DOE’s compliance with any Part 63 requirement. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a

contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. Nevada has merely hypothesized a scenario involving cyclic water infiltration and dryout in the waste containment drifts (Petition at 471) that, at most, indicates that there is a possibility, given a series of events, that corrosion of the C-22 surfaces of the waste package could result. Nevada's assertions are important for what they do not contain – Nevada does not assert that the hypothetical scenarios that it alleges are certain to occur, or even that they are probable, or likely, or even significantly plausible. Nevada's claims are mere speculation, and should be ruled inadmissible as detailed below.

Although not referenced in this contention, three affidavits attached to Nevada's Petition to Intervene as a Full Party states that the affiant "adopt[s]" the discussion in paragraphs 5 and 6 of this contention. *See* Petition at Attachments 3, 17, and 18. As discussed in more detail in Section V.A.3 of this Answer, such an affidavit is not sufficient to satisfy the requirements of Section 2.309(f)(1)(v) to provide conclusions supported by reasoned bases or explanation. Indeed, because the contention itself does not even refer to the affidavits, it is unclear which statements are facts or opinions belonging to the technical experts as opposed to legal argument that cannot be ascribed to those experts.

Moreover, none of Nevada's proffered experts (Drs. Morgenstein, Thorne, and Cottis) is identified as an author of the scientific study to which Nevada cites in support of its contention. *See* Petition at 471 (citing Y. Z. Jia., *et al.*, "Experiments Devised to Studying Temperature and Geometry Effect of Corrosion of C-22 Alloy" (April 23, 2008) (hereinafter, "Jia Report") (LSN# NEV000005235). Nor is there any evidence that any of Nevada's experts had any involvement in the reported experiments. Thus, there is no basis for concluding that the proffered experts have any personal knowledge to explain the alleged significance of the Jia Report or its reported experiments.

Even if this claim were construed to have been submitted by an expert, it would not be sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, "the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention." *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff'd on other grounds*, CLI-98-13, 48 NRC 26. Here, Nevada's only cited reference undercuts, rather than supports, Nevada's claims.

Nevada states that it has conducted experiments based on its hypothesis of cyclic dripping and dryout. Petition at 471. Conspicuously, the Jia Report it cites, on its face, was not designed to test cyclic water infiltration cycles. To the contrary, the "experiments were devised to study temperature effect and geometry effect of corrosion of C-22 alloy in UZ pore water." Jia Report, NEV000005235 at 1. Although the reported experiment involved dry-wet cycling, there is no evidence that the study's conceptual model accurately approximates the proposed repository environment or was even intended to do so. Indeed, nowhere does the Jia Report even discuss the reasons for selecting the particular dry-wet cycling parameters.

Nevada ascribes three supposed conclusions to the Jia Report that it says are relevant to this contention, but none of Nevada's descriptions are supported by the Jia Report.

First, Nevada says that there were "no differences between corrosion reactions in the vapor and salt submersion portions of the test samples." Petition at 471. The Jia Report makes no such explicit conclusion.

Second, Nevada states that reported experiments showed that a "significant amount of SCC was observed at the bottom of the re-nucleating inter-granular corrosion tunnels. Petition at 471. The Jia Report makes no such finding. In fact, it does not even mention "re-nucleating inter-granular corrosion tunnels."

Third, Nevada states that "SCC may be more active at lower temperatures." To the contrary, the Jia Report reported that the "corrosion rate of C22 alloy increases with the temperature increasing." Jia Report at 1.

Most significantly, Nevada's core assertion – that dry-wet cycling increases SCC corrosion contention – reflect nothing more than its wishful reading of the Jia Report. The Jia Report states that "Prof. Roger W. Staehle considered those [corrosion cracks] were SCC cracks, and he suggested the metallographic faces should be etched in order to show the bases for the initiation of the SCC." Jia Report at 7. "But," the Report concludes, "the results of etching metallographic faces [sic] not success." *Id.* at 8. Moreover, whatever corrosion the experiment found, the Jia Report makes clear that the study's author's do not know what caused the supposed SCC, and they concluded that "[f]urther study should be emphasized on why the SCC happens in the process of dry-wet cycling experiment." *Id.* Thus, the experiments on which Nevada relies merely confirm that this contention amounts to no more than hypothesis and speculation.

Nevada concludes that “DOE has not adequately investigated corrosion of C-22 in the drift environment.” Petition at 472. The scenarios postulated by Nevada leading up to this conclusion depend on multiple independent events of causation, and Nevada merely asserts their theoretical possibility and does not demonstrate – and does not even assert – that the causation described, much less the asserted result of corrosion of the C-22 material, is either certain or even likely. The Board should not accept such hypothetical, unsupported assertions. *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (holding that conclusory statements cannot provide “sufficient” support for a contention).

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(1)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada first attempts to demonstrate a genuine dispute with DOE by repeating the assertions, discussed above, that DOE failed to consider whether cyclic water infiltration and dryout in the waste containment drifts *possibly* could result in corrosion of the C-22 surfaces of the waste package. As explained above, these assertions do not give rise to a material deficiency. Nevada has not stated what radiological impact its postulated dryout testing would have on the corrosion modeling. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co. (Turkey Point Plant, Unit Nos. 3 and 4)*, LBP-90-16, 31 NRC 509, 521 (1990).

Even if Nevada had accurately described the results reported in the Jia Report (and it has not, as discussed above), Nevada fails to explain what significance those findings would have or how they in any way undercut DOE's corrosion analysis. Also, even if the Jia experiments showed that SCC of C-22 may occur in drift environment, Nevada has not shown that DOE failed to account for that corrosion or that it would materially change DOE's analysis. Indeed, DOE already "conservatively assumed that, regardless of the environment, the waste package will undergo stress corrosion cracking if stress conditions are met." SAR at 2.3.6-45-46.

Moreover, the regulations require evaluation of degradation processes in detail only "if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be *significantly changed by their omission.*" 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that SCC in fact would increase those risks at all, let alone that they would be "significantly changed by their omission." Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. Nevada asserts, without foundation or reference to relevant scholarship, that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 472-73. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, Nevada essentially argues that DOE must show that Nevada's

contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For this reason and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**88. NEV-SAFETY-88 - Thermodynamics of Complex Deliquescent Salt Reactions During C-22 Corrosion**

SAR Subsections 2.3.6.4.4.1, 2.3.5.5.4.2.1 and 2.3.5.5.4.3 and similar subsections, which describe hygroscopic dust and seepage environments, fail to consider the formation of a variety of complex hygroscopic natural salts such as tachyhydrite ( $\text{CaMg}_2\text{Cl}_6 \cdot 12\text{H}_2\text{O}$ ) and carnallite ( $\text{KMgCl}_3 \cdot 6\text{H}_2\text{O}$ ) that could substantially influence modes and rates of corrosion.

**RESPONSE**

This contention alleges that SAR sections 2.3.6.4.4.1, 2.3.5.5.4.2.1, and 2.3.5.5.4.3 fail to recognize the formation of a variety of complex hygroscopic natural salts, which could influence modes and rates of corrosion.

**a. Statement of Issue of Law or Fact to be Controverted**

In this contention at paragraph 1, “A statement of the contention itself,” Nevada states that, “*SAR Subsections 2.3.6.4.4.1, 2.3.5.5.4.2.1, and 2.3.5.5.4.3*, and similar subsections, which describe hygroscopic dust and seepage environments, fail to consider the formation of a variety of complex hygroscopic natural salts ... that could substantially influence modes and rates of corrosion.” Petition at 474 (emphasis added). However, Nevada raises for the first time at paragraph 5, (regarding the pleading requirement to show support for the contention) SAR subsections 2.3.5.3.3.5.2, 2.3.5.5.3, and 2.3.5.3.2, including the discussions of salts contained in these subsections. Petition at 476-77. Moreover, Nevada’s assertions at paragraph 6 only mention SAR subsections 2.3.6.4.4.1, 2.3.5.5.4.2.1, and 2.3.5.5.4.3 – all of which comprise “the statement of the contention itself” in paragraph 1 of the Petition. Petition at 477.

It is impossible to discern what precisely the focus of this contention is and which section of the LA it is that Nevada seeks to challenge. 10 CFR § 2.309(f)(1)(i) requires that “a specific

statement of the issue of law or fact to be raised or controverted.” The June 20, 2008 Case Management Order further notes that “this [§ 2.309(f)(1)(i)] statement shall set forth petitioner’s contention in precisely the form it wishes the contention to be considered.” *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 6). Nevada’s conflicting statements regarding the specific SAR sections that it wishes to challenge make it clear that Nevada has not met the pleading specificity requirements of 10 CFR § 2.309(f)(1)(i) and its related obligations of the June 20, 2008 Case Management Order. Accordingly, this contention should be dismissed.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Petitioner generically claims noncompliance with a litany of regulatory provisions in 10 C.F.R. Part 63, including §§ 63.31, 63.21, 63.102, 63.113, 63.114, and 63.115. Petition at 474-75. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Specifically, although Nevada alleges an omission in the analysis of the waste emplacement drifts, Petitioner fails to establish that the omission is relevant to DOE’s compliance with any Part 63 requirement. Additionally, while Nevada claims that “it is imperative to have some real basis for understanding the types and amounts of authigenic salts present,” it has not alleged an increase in the mean dose *above regulatory limits*. Petition at 477.

Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. See 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Petition at 479, Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is

Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Don L. Shettel, Jr., Maurice E. Morgenstein, Michael C. Thorne, and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Although Nevada makes copious technical assertions regarding the alleged need to consider complex salts, it does not provide any scholarly support. Therefore, this contention does not comply with 10 C.F.R. 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention states that “the potential for corrosion of C22 from salt deliquescence ... has been poorly studied from the prospective of the environmental conditions that are expected to exist in the waste emplacement drifts.” Petition at 474. For several reasons, this contention does not establish a genuine dispute of material fact.

First, the basis for this contention, that in-drift water compositions are based on calculations using only a few simple salts, is incorrect. In its contention, Nevada states that “[t]he seepage evaporation analysis and results (SAR Subsection 2.3.5.5.3.2) discusses the following salts: halite (NaCl), calcite or aragonite (CaCO<sub>3</sub>), and sylvite (KCl). The remaining discussion is confined to the composition of brines but not the relationship(s) between the brines and the authigenic salts.” Petition at 447. This assertion mischaracterizes the seepage evaporation abstraction model (*See* SAR 2.3.5.5.4), which implements the in-drift precipitates/salts model (SAR 2.3.5.5.3.1) and includes a Pitzer thermodynamic database (SAR 2.3.5.5.2). The Pitzer database comprises over 200 minerals including many complex salts (listed in “In-Drift Precipitates/Salts Model,” LSN#: DN2002371917, Tables 1-27 and 1-28) and includes all of the salts listed in part 5 of the contention. *See* Petition at 476-77.

Nevada further states in part 5 that “SAR Subsection 2.3.5.3.3.5.2 discusses ambient pore-water compositional trends and mineral assemblages without considering complex salts and considers only calcite as a simple salt.” Petition at 476. This statement, referring to the near-field chemistry model (*See* SAR 2.3.5.3.3.5.2) is also incorrect. The minerals permitted to

precipitate in the EQ3/6 simulations for the near-field chemistry model include the same complex salts discussed above for the seepage evaporation abstraction model, which encompass the salts that Nevada asserts were not considered. *See Engineered Barrier System: Physical and Chemical Environment*,” LSN#: DN2002452948, Table 6.2-3. Thus, Nevada fails to raise a genuine dispute.

Second, this contention is based on speculation and conjecture. By way of example, Petitioner asserts the following: (1) SAR subsections “fail to consider the formation of a variety of complex hygroscopic natural salts ... that *could* substantially influence modes and rates of corrosion” (Petition at 474) (emphasis added); and (2) “[s]eepage evaporation on C-22 surfaces has been discussed in terms of brine production ... but not in terms of common complex deliquescent salts that are likely to form” Petition at 476 (emphasis added). The Board should not accept such causal, hypothetical, and unsupported assertions. Even if these claims were construed to have been submitted by an expert, it would not be sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26.

Third, the contention alleges without support that because DOE did not consider corrosive effect of the formation of complex salts, “the environmental picture ... is inadequate, incomplete, and misleading.” Petition at 476. As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers

from this deficiency. Petitioner provides no quantitative or even qualitative information regarding whether and the extent to which complex salts could influence the modes and rates of corrosion in the waste emplacement drifts. Thus, Petitioner fails to demonstrate a genuine dispute.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected.

**89. NEV-SAFETY-89 - Inhibition Of C-22 Corrosion By High Nitrate To Chloride Ratio**

SAR Subsections 2.3.5.3.2.2.1 (unsaturated zone pore water chemistry), 2.3.6.4.4.1 (abstracted model for localized corrosion), 2.3.6.4.2 (data and data uncertainty), and similar subsections, which discuss the nitrate-to-chloride ratio with respect to C-22 corrosion inhibition, fail to describe any experimental conditions that represent the waste emplacement drift environment, and fail to consider low pH evaporative conditions that do represent that environment; consequently, the corrosion models utilized for C-22 are inappropriate.

**RESPONSE**

In this contention, Nevada alleges that “SAR Subsections 2.3.5.3.2.2.1 (unsaturated zone pore water chemistry), 2.3.6.4.4.1 (abstracted model for localized corrosion), 2.3.6.4.2 (data and data uncertainty), and similar subsections, which discuss the nitrate-to-chloride ratio with respect to C-22 corrosion inhibition, fail to describe any experimental conditions that represent the waste emplacement drift environment, and fail to consider low pH evaporative conditions that do represent that environment; consequently, the corrosion models utilized for C-22 are inappropriate.” Petition at 480.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R.

§ 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the

licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Nevada essentially admits that it does not know whether this contention is material. In an attempt to escape its burden of proof, it claims that, because of the “burden and complexity of showing the dose effects” of acceptance of Nevada’s contention, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. *See* Petition at 485-86. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, Nevada would here have DOE demonstrate that Nevada’s contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references to justify admission of its proffered contention. In particular, this contention does not reference any expert opinion or any documentary materials in support of its position, other than the license

application. Therefore, it does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any relevant supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach three affidavits (by Maurice E. Morgenstein, Robert A. Cottis, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, these affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Even if the claims are construed to have been submitted by an expert, they still would not be sufficient to support admission of this contention.

In an attempt to present support for its proffered contention, Nevada alleges a series of unsupported and seemingly random facts and assertions that do not provide adequate support for its contention. Nevada first asserts without support or reference to relevant scholarship, that "Nitrate/chloride ratios as characterized by DOE in their 34 pore-water samples *may not be* representative of seepage waters ..." for a number of reasons. Petition at 482 (emphasis added).

Nevada also asserts without foundation or reference to relevant scholarship, that “[t]he nitrate/chloride ratio *may not be* representative of seepage waters because:

- 1) “Nitrate *can be* separated from chloride due to differences in vapor pressure” ;
- 2) “Nitrate salts *can be* separated from chloride salts during gravity flow evaporation on the surface of C-22 due to their differences in solubility” ;
- 3) “Nitrates *can be, in part,* removed from pre-seepage waters by bacterial action in the incubator zone above the proposed repository emplacement drifts” ; and
- 4) “Nitrate and chloride concentrations determined in the 34 pore-water samples have not been adequately correlated to nitrate and chloride concentrations in fracture flow unsaturated zone water, which is the type of water that will seep into the emplacement drifts.”

Petition at 482 (emphasis added).

Importantly, with respect to this assertion, Nevada only posits that the “[n]itrate/chloride ratios as characterized by DOE *may not be* representative ...” Petition at 482 (emphasis added).

In fact, Nevada merely asserts that such a circumstance is only a hypothetical possibility, and fails to allege that such a circumstance is probable, or likely, or even significantly plausible.

These assertions are mere speculation, and can provide no adequate basis to support a contention.

Similarly, Nevada next makes a series of seemingly random assertions, which are wholly unsupported by any foundation or reference to any relevant scholarship. Most importantly, Nevada fails to identify any particular portion of the LA, or any of the LA’s supporting documents, in making these assertions. For example, Nevada asserts, with no intervening explanatory or amplifying information, and without citation to the LA or the LA’s supporting references:

1. “The nitrate/chloride ratio may not determine oxygen repair at the C-22 passivating film

oxide-coating surface under environmental brine conditions where the pH is very low”;

2. “All of the DOE experimentation concerning the effect of the nitrate/chloride ratio on the passivating film layer, which protects the metal surface from corrosion, have been in bath experiments that do not have low pH characteristics (in contrast to the concentrated brines that form on evaporation in the relevant conditions) and that do not approximate the conditions that will prevail in the waste emplacement drifts” ;

3. “Most of DOE’s bath aqueous compositions have both Cl<sup>-</sup> and NO<sub>3</sub><sup>-</sup> in solution, and as long as there is more repair function than corrosion function, the passive film layer will remain intact. If the chloride aqueous values increase in concentration, or the nitrate aqueous values drop in concentration (to some extent SO<sub>4</sub><sup>2-</sup> -- to SO<sub>3</sub><sup>2-</sup> conversion would also have a similar effect) the rate of repair of the passivating film will be affected” ;

4. “There are no experimental data obtained or discussed by DOE to show that C-22 is offered corrosion protection by high nitrate concentrations in very low pH brine environments, especially at elevated repository temperatures” ;

5. “The passivating film cannot even repair itself under low pH nitric acid conditions without the presence of chloride, although the rate of corrosion for nitric acid is much less than for hydrochloric acid”;

6. “When the two acids are mixed, as in the DOE immersion experiments, the apparent lower rate of corrosion with the increasing presence of nitric acid is not due to inhibition as much as it is due to a mixing ratio of about 1:200 for the nitrate: chloride corrosion rate ratio” ;

7. “A bath environment, as utilized by DOE, maintains several characteristics that are inappropriate to the waste emplacement drift environment”:

a) “the nitrate/chloride ratio used for experimentation remains constant for

that experiment and is based upon the simulated pore-water composition chosen” ;

- b) “there is no dry out” ;
- c) “the reacting liquid temperature is relatively low”; and
- d) “concentrations of corrosive species are low” ;

8. “It is totally unrealistic to assume that the canister will be submerged in the emplacement drifts and therefore laboratory bath experiments only approximate non-brine ponding conditions that do not represent the emplacement drift environment” ;

9. “In summary, SAR Subsections 2.3.5.3.2.2.1 (vadose pore water chemistry), 2.3.6.4.4.1 (abstracted model for localized corrosion), and 2.3.6.4.2 (data and data uncertainty) relate to a combined model of nitrate/chloride corrosion inhibition that, although well supported by immersion experiments, does not apply to waste emplacement drift conditions”; and

10. “Experiments and models relevant to evaluating SCC and localized corrosion of C-22 must address”:

- a) “Hydro geochemistry, based upon a valid mode of transport and seepage introduction into the waste emplacement drift environment from an aqueous source” ;
- b) “Salt dust geochemistry based upon salt source compositions, brine chemistry, dust deposit morphology, and dust delivery to the EBS metal surfaces” ;
- c) “The dynamics of temperature, humidity and atmospheric pressure” ; and
- d) “Mode of contact with the C-22 surface that is consistent with the geologic thermal-physical conditions that exist in the waste emplacement drift environment.”

Petition at 482-84.

Nevada's next conclusion, made, as with all of the other allegations above, without support or reference to any relevant scholarship, and without citation to the LA or the LA's supporting references, is that "DOE has not provided an adequate link between the characteristics of the environment in the waste emplacement drifts and their laboratory analysis/model support for proposed reactions in that environment." Petition at 484. Nevada further alleges that "[d]uring salt-cap-crevice corrosion starting with simulated, unconcentrated unsaturated zone water that then undergoes evaporative concentration, massive pitting and channeling occurs in C-22 when the pH is low, even when the nitrate/chloride ratio is greater than 1" and that "[i]n reality, when nitrate is present,  $\text{NO}_3^-$  reacts to  $\text{NO}_2^-$ , and the corrosion potential is raised into the passive zone as long as the pH is high enough so that the chemistry at the passive layer favors layer stability." Petition at 484. Nevada observes that "[t]his is a condition that is easy to maintain under the DOE bath experimentation protocol" but that it "... however, is not representative of the waste emplacement drift environment, and consequently, the DOE nitrate/chloride ratio inhibition philosophy does not apply in the conditions of practical relevance." Petition at 484.

To the extent that Nevada asserts that DOE's corrosion testing has not adequately represented the various environment scenarios postulated above, Nevada's assertions fail to provide any support for its contention. The goal of the DOE testing program was to produce data that are reasonably bounding for modeling of corrosion in anticipated repository environments, and this goal does not require testing in every conceivable postulated environment. The corrosion models used in performance assessment implement several conservatisms to ensure that corrosion rates are not underestimated include:

- General corrosion rates for C-22 used in TSPA are weighted towards the highest rates from the most aggressive exposure conditions. *See* SAR § 2.4.2.3.2.1.5 at 2.4-147.
- General corrosion rates for Ti-7 on the outer surfaces of the drip shields are modeled using only the fastest corrosion rates from the most aggressive environments. *See* SAR § 2.3.6.8.1.2.1 at 2.3.6-73.
- For interpreting polarization tests, the condition where localized corrosion cannot be sustained is conservatively used as the threshold for localized corrosion initiation. *See* SAR § 2.3.6.4.2.2 at 2.3.6-33.
- Stress corrosion cracking is modeled to occur whenever a stress threshold is reached independent of the chemical environment; this is very conservative in view of the fact that only aggressive environments support stress corrosion cracking. *See* SAR § 2.3.6.5.1 at 2.3.6-46.

Additionally, Nevada alleges, incorrectly, that the DOE model predicts that nitrate will continue to protect C-22 from corrosion under very low-pH conditions. Rather, the model does not give inappropriate credit to the influence of nitrate to chloride ratio on the propensity for localized corrosion initiation. As noted in SAR Figure 2.3.6-27, as the pH decreases, the model predicts a higher probability of localized corrosion initiation even with significant nitrate concentration. *See* Figure 2.3.6-27 at 2.3.6-171. Additionally, as discussed in SAR Section 2.3.6.4.4.1, for pH less than 1.9, the model predicts localized corrosion initiation for all chemical compositions, independent of the levels of chloride and nitrate. *See* SAR § 2.3.6.4.4.1 at 2.3.6-41.

As noted above, Nevada sets forth no supporting documents in its Statement of Alleged Facts or Expert Opinion in support of any of the above assertions and offers no expert opinion.

Consequently, the many and varied statements, allegations and conclusions set forth in subsection 5 of Nevada's contention, described above, are merely unsupported assertions of counsel. As such, they cannot provide adequate support for a contention. A contention "will be ruled inadmissible if the petitioner 'has offered no tangible information, no experts, no substantive affidavits', but instead only 'bare assertions and speculation.'" *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(1)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada attempts to demonstrate a genuine dispute in subsection 6 of its contention by merely noting that "SAR Subsections 2.3.5.3.2.2.1, ... 2.3.6.4.4.1, ... 2.3.6.4.2 and similar subsections, which discuss the nitrate to chloride ratio with respect to C-22 corrosion inhibition, fail to describe any experimental conditions that represent the waste emplacement drift environment, and fail to consider low pH evaporative conditions that do represent that environment." Petition at 484. As with the assertions offered in subsection 5 of the contention, this observation is unsupported by any fact or expert opinion, and is conclusory and mere speculation. Next, Nevada alleges that "the corrosion models for C-22 are inappropriate ...." As with the claims above, this assertion is conclusory and unsupported by fact or expert opinion, and amounts to mere speculation. Unsubstantiated conclusory statements cannot provide sufficient support for a contention. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006).

Additionally, these bare assertions challenging the (unspecified) corrosion models, even if they were somehow to be accepted by the Board, provide no basis for demonstrating that the claims would have any material effect on corrosion, or the content of the LA. In particular, the contention does not allege, even qualitatively, that the use of a different method would result in more accurate modeling of the corrosion, or is inconsistent with the reasonable expectation standard. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 534-44, 550 (1985). Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Nevada ignores the demonstration of the conservatism of the model presented by DOE in SAR Section 2.3.6.4.4.1, “Abstracted Model for Localized Corrosion.” See SAR § 2.3.6.4.4.1. at 2.3.6-40 (noting that the description of the set of rules used to implement the model provides: “[i]f the nitrate-to-chloride ion ratio in the environment exceeds 1.0, then evaluate Ecrev and Ecorr at a nitrate-to-chloride ion ratio of 1.0. This treatment is *conservative* because, at a given temperature and chloride-ion concentration, Ecrev increases markedly with nitrate-ion concentration, while Ecorr is less sensitive than Ecrev to nitrate-ion concentration at lower pH values where crevice corrosion is more likely to initiate ) (emphasis added). Additionally, the description of the “Abstracted Model for Localized Corrosion” provides that “[e]ach of the above chemical limits [the nitrate-to-chloride ion ratio, the molality of chloride ion, the molality of chloride ion and the pH in the environment] has been determined to result in a *conservative* application of the localized corrosion model ...” See SAR§ 2.3.6.4.4.1 at 2.3.6-40 to-41 (emphasis added).

Nevada next alleges that since the corrosion models for C-22 are, assertedly, inappropriate, and that consequently “these subsections” (presumably, SAR 2.3.5.3.2.2.1, 2.3.6.4.4.1, and 2.3.6.4.2 and the nonspecific “similar subsections” noted above) do not comply with 10 C.F.R. § 63.114(f), which “requires that any performance assessment used to demonstrate compliance with Section 63.113 must evaluate in detail degradation, deterioration, or alteration processes of engineered barriers, if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.” Petition at 485. Importantly, as discussed in paragraph d., above, Nevada fails to even allege that resultant dose rates will evidence an increase in the mean dose *above regulatory limits*.

For these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

For all of the reasons set forth above, this contention should be dismissed.

**90. NEV-SAFETY-90 - Effects Of Rock Bolt On C-22 And Ti-7 Corrosion Reactions**

SAR Subsections 1.3.4.4, 2.3.6, and similar subsections, which describe the use, design, and corrosion of Super Swellex-type stainless steel rock bolts in the ground support system and the corrosion of C-22, fail to consider that debris from rock bolt corrosion will accumulate on the drip shield and on the C-22 canister and will be deleterious to both EBS-barrier components.

**RESPONSE**

In this contention, Nevada alleges that in SAR Subsections 1.3.4.4, 2.3.6 and similar subsections, which describe the use, design and corrosion of Super Swellex-type stainless steel rock bolts in the ground support system and the corrosion of C-22, DOE failed to account for the supposed deleterious effects of debris from rock bolt corrosion accumulating on the drip shield and C-22 canister surfaces. In short, Nevada contends that DOE has not sufficiently studied a *possible* cause of corrosion on drip shields and waste canisters.

In addition to its pleading deficiencies discussed herein, Nevada fails to provide a reasoned basis to substantiate its conclusions. Moreover, even if Nevada could show that DOE underestimated the possible causes of corrosion, Nevada fails to demonstrate that the drip shields or waste packages will be compromised as a result or that the alleged deficiency would have any impact on DOE's ability to limit radiological exposures and releases. Consequently, this contention fails to raise a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Additionally, although Nevada has alleged an error on DOE’s part, Nevada has failed to establish that the error is material to DOE’s compliance with any Part 63 requirement.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or

cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. Nevada has merely hypothesized a scenario in which debris from corrosion of rock bolts in the waste containment drifts may accumulate on the drip shield and on the C-22 canister (Petition at 489-90) that, at most, indicates that there is a possibility, given a series of events, that corrosion of the drips shields and C-22 surfaces of the waste package could result. Nevada’s assertions are significant for what they do not contain – Nevada does not assert that the hypothetical scenarios are certain to occur, or even that they are probable, or likely, or even significantly plausible. Nevada does not refer to any experiments or scholarly study of this issue and evidently has not conducted its own analysis to substantiate its hypothesis.

Although not referenced in this contention, four affidavits attached to Nevada’s Petition to Intervene as a Full Party states that the affiant “adopt[s]” the discussion in paragraphs 5 and 6

of this contention. *See* Petition at Attachments 3, 9, 17, and 18. As discussed in more detail in Section V.A.3 of this Answer, such affidavits are not sufficient to satisfy the requirements of Section 2.309(f)(1)(v) to provide conclusions supported by reasoned bases or explanation. Indeed, because the contention itself does not even refer to the affidavits, it is unclear which statements are facts or opinions belonging to the technical experts as opposed to legal argument that cannot be ascribed to those experts.

Even if this contention were construed to have been sponsored by an expert, Nevada still fails to properly support its assertions. “[T]he Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26. As detailed below, Nevada’s claims are mere speculation and should be ruled inadmissible.

Nevada premises this contention on its speculation that red rust deposits observed during a drift scale heater test were derived from the degradation of the Super Swellex-type stainless steel rock bolts, which form part of the ground support system for the emplacement drifts. Petition at 489. It then asserts that such rust deposits are evidence “suggesting that the claim to a 100-year lifetime for the rock bolts is likely to be an overestimate, or at least cannot be relied upon for safety assessment purposes without additional evidence.” *Id.* The ground support system, however, is “classified as non-ITS because it is not relied on to prevent or mitigate a Category 1 or Category 2 event sequence, and it is not ITWI because the total system performance assessment (TSPA) does not take credit for ground support during the postclosure performance period.” SAR at 1.3.4-8.

Furthermore, Nevada points to no study or analysis to dispute DOE's conclusion that the "stainless steel rock bolts and perforated stainless steel sheets are expected to fulfill their functions during the preclosure period without excessive corrosion." SAR at 1.3.4-11 (citing BSC 2003c. Longevity of Emplacement Drift Ground Support Materials for LA. 800-K0C-TEG0-01200-000-00A. Las Vegas, Nevada: Bechtel SAIC Company. ACC: ENG.20030922.0004 [hereinafter, "Longevity Study"]). Indeed, the Longevity Study took a "conservative approach" in estimating corrosion rates. Longevity Study at 36. Nevada does not attempt to address that study and thus has not substantiated its claim that DOE underestimated rock bolt corrosion.

Although it has not quantified the amount rock bolt corrosion debris that may accumulate, Nevada alleges that such debris will have some "deleterious" effect on the alloy surfaces of the drip shields and waste canisters. Petition at 489. Nevada suggests two manners in which the corrosion debris, in theory, could enhance corrosion of the waste package alloys. Both theories, however, lack any substantial support.

First, Nevada suggests that the "physical debris field" from rock bolt corrosion could contribute to the creation of crevices, which Nevada alleges promote stress corrosion cracking (SCC). Petition at 489. Nevada elaborates that dust and debris fields can trap vapors, "some of which are acidic and can promote chloride brine corrosion of both Ti-7 and C-22." *Id.* at 489-90. But Nevada provides no relevant support such as scholarly references or studies to substantiate those claims. Moreover, it does not attempt to quantify the vapors that allegedly *could* be formed or how they would affect corrosion rates of the relevant alloys. Nor does Nevada appear to consider whether the addition of some unspecified quantity of rock bolt debris would have any material effect on DOE's corrosion model, which was designed to be

conservative in its approach (SAR at 2.3.6-37 to -38), and which Nevada concedes already considered rock fall and salt deposits (alternative sources of vapor-trapping debris) as sources for promoting SCC. *See* Petition at 489 (citing SAR Section 2.3.6.4.3.1.3). Nevada also speculates that the spatial location of rock bolts provide “relatively ideal conditions for C-22 and Ti-7 corrosion” (Petition at 490), but it offers zero explanation or support for that statement.

Second, Nevada asserts, again without support or reference, that rock bolt corrosion debris has “potential concentrations” of trace elements (lead and sulfur), which Nevada contends are known to cause corrosion failure in C-22. Petition at 490. Conspicuously, Nevada does not say what concentrations levels are required to cause corrosion, or whether the unspecified levels would have any material effect in this particular environment. Nevada hedges, contending that “very small amounts of lead are sufficient, because these are sequestered at the C-22 surface and accumulate to substantial concentrations in short periods of time.” *Id.* Not surprisingly, Nevada offers no support for that all-important factor. In any event, Nevada concedes that the supposed corrosion debris presents an “unknown and untested mixture of ions.” *Id.* Thus, Nevada’s conclusion that “this mixture may cause both SCC and localized corrosion of C-22 and Ti-7” (*id.*) is demonstrably nothing more than hypothesis and speculation.

Nevada concludes that “DOE has not studied the mobilization of trace elements from the corrosion of” the rock bolts or the “deleterious affects of these corrosion products on the lifetime of C-22 or Ti-7.” Petition at 491. The scenarios postulated by Nevada leading up to this conclusion depend on multiple independent events of causation, and Nevada merely asserts their theoretical possibility and does not demonstrate – and does not even assert – that the causation described, much less the asserted result of corrosion of the drip shields and waste packages, is either certain or even likely. The Board should not accept such hypothetical, unsupported

assertions. *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006) (holding that conclusory statements cannot provide “sufficient” support for a contention).

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(1)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada first attempts to demonstrate a genuine dispute with DOE by repeating the assertions, discussed above, that DOE failed to consider whether accumulation of debris from rock bolt corrosion in the waste containment drifts *possibly* could result in corrosion of the surfaces of the Ti-7 drip shields and C-22 waste packages. As explained above, these assertions do not give rise to a material deficiency. Nevada has not stated what radiological impact the supposed accumulated debris would have on the corrosion modeling. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co. (Turkey Point Plant, Unit Nos. 3 and 4)*, LBP-90-16, 31 NRC 509, 521 (1990).

Even if Nevada had substantiated its claim that corrosion from rock bolts could contribute to SCC in the drip shields and waste packages, Nevada fails to demonstrate any significance for DOE’s corrosion analysis. Nevada has not shown that DOE failed to account for that corrosion source or that it would materially change DOE’s analysis. In fact, Nevada’s postulated source of crevice corrosion is not material because DOE’s models for both the drip shield and waste package localized corrosion are based on crevice data, *i.e.*, the entire waste

package or drip shield surface already is assumed to be a crevice. *See, e.g.*, SAR at 2.3.6-31 (stating that once localized corrosion initiates, “it is presumed that there is a crevice tight enough for initiation on all waste package surfaces”); SAR at 2.3.6-38 (explaining that crevice repassivation potential model for initiation of localized corrosion conservatively assumes the entire waste package surface will be subjected to crevice-like conditions). Furthermore, DOE already “conservatively assumed that, regardless of the environment, the waste package will undergo stress corrosion cracking if stress conditions are met.” SAR at 2.3.6-45-46. Accordingly, there would be no need to evaluate the likelihood of crevice corrosion initiation caused by falling debris from deteriorating rock bolts because the entire surface already is modeled to assume significantly more severe crevices have formed than Nevada postulates.

Moreover, the regulations require evaluation of degradation processes in detail only “*if* the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be *significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that possible presence of rock bolt corrosion debris would increase those risks at all, let alone that they would be “significantly changed by their omission.”

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. Nevada asserts, without foundation or reference to relevant scholarship, that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Petition at 492, Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. *Id.* at 491-92. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed

Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, Nevada essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For this reason and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**91. NEV-SAFETY-91 - Representativeness Of C-22 And Ti-7 Corrosion Testing Methods**

SAR Subsection 2.3.6.1.2 and similar subsections, which deal with corrosion test environments and in-drift chemical environments, fail to utilize testing methods and hydrogeochemical compositions that capture the conditions and chemistries to which C-22 and Ti-7 are expected to be exposed in the emplacement drifts of the proposed repository.

**RESPONSE**

In this contention, Nevada alleges that “SAR Subsection 2.3.6.1.2 and similar subsections, which deal with corrosion test environments and in-drift chemical environments, fail to utilize testing methods and hydrogeochemical compositions that capture the conditions and chemistries to which C-22 and Ti-7 are expected to be exposed in the emplacement drifts of the proposed repository.” Petition at 493.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations.

Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references to justify admission of its proffered contention. In particular, this contention does not reference any expert opinion or adequate documentary materials in support of its position. Therefore, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference adequate documentary materials; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Maurice E. Morgenstein and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

In an attempt to present support for its proffered contention, Nevada alleges a series of unsupported assertions that do not provide adequate support for its contention. Nevada first asserts, without support or reference to any relevant scholarship, that "DOE's corrosion program

for Ti-7 and C-22 has ignored key physical and chemical characteristics of the environment in the waste emplacement drifts” and lists a number of aspects of the program that “remain unmodeled and un-treated with respect to corrosion in the DOE License Application.” Petition at 494-95.

Nevada further alleges, again without support or reference to any relevant scholarship, that “much of the DOE corrosion program as portrayed in SAR Subsection 2.3.6 and similar subsections is based on experimental strategy that is not related to the dynamic properties of the waste emplacement drift environment.” Petition at 495. In this regard, Nevada does not meet the pleading specificity requirements. SAR Section 2.3.6 is 192 pages in length; Nevada fails to identify the portion of SAR Section 2.3.6 that is allegedly deficient, and does not further identify the assertedly “similar” deficient subsections of the SAR. A petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). For this reason alone, this contention is inadmissible.

Nevada next asserts, without support or reference to any relevant scholarship, that in order to “adequately determine the lifetime of the C-22 layer around packages and thereby assess the performance of the EBS ... [t]he experimental apparatus should ... adequately model or mimic the repository environment.” Petition at 495. Nevada also asserts that “[i]n doing so, *one may argue* for validity by using a well-corroborated theory based upon sound calibrated laboratory models that are shown to be valid representations of the environment of interest” and that “this has not been achieved by DOE.” Petition at 495 (emphasis added). Nevada offers no support or reference to relevant scholarship in making it this assertion. Nevada then alleges, without support or reference to scholarly research, that “[s]pecifically, it is not possible to

exclude the [key physical and chemical characteristics omitted from the LA] ... from consideration and to focus solely on bath experimentation, as there is no correlation between the laboratory bath environment and conditions under which C-22 and Ti-7 are proposed for use.”

Petition at 495.

Nevada further asserts that:

1. “To justify claims about the correspondence between the Yucca Mountain environment and the laboratory models, DOE would have to show that the bath model environment provides the same environmental-chemical-thermal-spatial conditions as would arise due to the omitted un-modeled environmental parameters” ;
2. With respect to DOE’s existing experiments, “... there is little evidence to show that bounding unsaturated zone water compositions have been captured within the DOE laboratory testing program or will be captured in the future, as there is no compelling evidence to show that porewater is similar to fracture flow water” ;
3. “SAR Subsections 2.3.5 and 2.3.6 demonstrate that the corrosion modeling undertaken by DOE has been based upon unsupported claims that their laboratory models are valid representations of the waste emplacement drift environment” ;
4. “It is suggested, for example, that the nitrate/chloride ratio will provide adequate protection to the passivating film on C-22 because experimentation in simulated water bath conditions provide compelling evidence to this effect, ... [y]et, it is known that this ratio does not exert the control that DOE claims under the conditions of low pH that commonly occur during unsaturated zone dripping and evaporation” ;
5. “By not addressing the wide range of expected environmental conditions, the DOE model for corrosion behavior is unsupported and unjustified, and cannot be used to underpin arguments relating to drip shield and waste package lifetime [and consequently] ... no credence can be placed in DOE estimates of radionuclide releases from the EBS or assessed radiation doses to the RMEI.”

Petition at 495-96.

Nevada's wide-ranging and diverse allegations noted above have one thing in common: they are all made with utterly no support from any documentary supporting references or expert opinion. In fact, all of these many and varied assertions contained in Nevada's Statement of Alleged Facts or Expert Opinion described above amount to merely unsupported assertions of counsel. Nevada makes one additional assertion, alleging that "DOE recognizes that its existing work is inappropriate and/or inadequate as it has proposed a long-term corrosion testing program ...." which considers many of the items that are listed above that are totally absent from the discussion in SAR Subsection 2.3.6." Petition at 496 (citing "Long-Term Corrosion Testing Plan" (Aug. 1, 2008) (LSN# DEN001600862). Nevada fails to meet the pleading specificity requirements related to this assertion; the cited document is 100 pages long, and Nevada fails to specify the section or page of the document upon which it purports to rely. Such vague references to documents are not permissible; a petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). For this reason alone, this contention is inadmissible.

To the extent that Nevada asserts that DOE's corrosion testing has not adequately represented the various environment scenarios postulated above, Nevada's assertions fail to provide any support for its contention. The goal of the DOE testing program was to produce data that are reasonably bounding for modeling of corrosion in anticipated repository environments, and this goal does not require testing in every conceivable postulated environment. The corrosion models used in performance assessment implement several conservatisms to ensure that corrosion rates are not underestimated, including:

- General corrosion rates for C-22 used in TSPA are weighted towards the highest rates from the most aggressive exposure conditions. *See* SAR § 2.4.2.3.2.1.5 at 2.4-147.
- General corrosion rates for Ti-7 on the outer surfaces of the drip shields are modeled using only the fastest corrosion rates from the most aggressive environments. *See* SAR § 2.3.6.8.1.2.1 at 2.3.6-73.
- For interpreting polarization tests, the condition where localized corrosion cannot be sustained is conservatively used as the threshold for localized corrosion initiation. *See* SAR § 2.3.6.4.2.2 at 2.3.6-33.
- Stress corrosion cracking is modeled to occur whenever a stress threshold is reached independent of the chemical environment; this is very conservative in view of the fact that only aggressive environments support stress corrosion cracking. *See* SAR § 2.3.6.5.1 at 2.3.6-46.

Additionally, Nevada alleges, incorrectly, that the DOE model predicts that nitrate will continue to protect C-22 from corrosion under very low-pH conditions. Rather, the model does not give inappropriate credit to the influence of nitrate to chloride ratio on the propensity for localized corrosion initiation. As noted in SAR Figure 2.3.6-27, as the pH decreases, the model predicts a higher probability of localized corrosion initiation even with significant nitrate concentration. *See* Figure 2.3.6-27 at 2.3.6-171. Additionally, as discussed in SAR Section 2.3.6.4.4.1, for pH less than 1.9, the model predicts localized corrosion initiation for all chemical compositions, independent of the levels of chloride and nitrate. *See* SAR § 2.3.6.4.4.1 at 2.3.6 - 41.

The speculative, conclusory and unsupported assertions above do not provide adequate support for the admission of this contention. A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). Even if these claims were construed to have been submitted by an expert, they would not be

sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26.

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

In an attempt to demonstrate a genuine dispute in subsection 6 of the contention, Nevada merely concludes that “SAR Subsection 2.3.6.1.2 and similar subsections, which deal with corrosion test environments and in-drift chemical environments, fail to utilize testing methods and hydrogeochemical compositions that capture the conditions and chemistries to which C-22 and Ti-7 are expected to be exposed in the emplacement drifts of the proposed repository.” Petition at 497. As in subsection 5, Nevada fails to identify any supporting references or expert opinion relating to this conclusory assertion and thus fails to offer any support to demonstrate a genuine dispute. An allegation that some aspect of a license application is inadequate or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 n.12 (1990).

Nevada next alleges that SAR Subsection 2.3.6.1.2 and similar subsections “do not comply with 10 C.F.R. § 63.114(f), which requires that any performance assessment used to

demonstrate compliance with Section 63.113 must provide the technical basis for either inclusion or exclusion of degradation, deterioration, or alteration processes of engineered barriers in the performance assessment” and that “ ... degradation, deterioration, or alteration processes of engineered barriers must be evaluated in detail if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.” Petition at 497.

For these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**92. NEV-SAFETY-92 - Impacts Of Fluoride Due To Breach Of HLW Containers**

SAR Subsection 2.3.5 and similar subsections, which deal with the in-drift physical and chemical environment, fail to take account of releases of chemicals by early degraded EBS components in overall calculations of radionuclide containment.

**RESPONSE**

In this contention, Nevada claims that in connection with the overall calculations of radionuclide containment, SAR subsections 2.3.5 and “similar” (although unspecified) subsections fail to take into account chemicals released by early degraded EBS components.

**a. Statement of Issue of Law or Fact to be Controverted**

This contention does not provide a sufficiently specific statement of the issue. In section 5 of the contention, Nevada discusses whether, assuming a breach of a HLW container, DOE’s calculation of overall corrosion and radionuclide release within the emplacement drift takes into account the fluoride concentrations that would result from the breach. Nevada argues that it does not sufficiently take the breach into account because the effects of the breach were not coupled with analysis of the “geochemical behavior of all or most other EBS components.” Petition at 500. Then, however, Nevada states that “[t]he fluoride issue is only one of many geochemical issues where the failure of one EBS component needs to be coupled to the geochemical behavior of all or most other EBS components in the in-drift environment.” *Id.* Nevada does not identify any other “geochemical issues” that it is raising in this contention. Nevada repeats this broad assertion in section 6 of the contention by referring to “coupled processes” generically, but then, again, only discusses the “fluoride issue.”

The Commission requires that a contention “explain, with specificity, particular safety or legal reasons requiring rejection of the contested [application].” *Dominion Nuclear*

*Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC 349, 359-60 (2001). As written, the contention fails to give DOE sufficient notice of the issues of law or fact that Nevada seeks to dispute. Based on the information Nevada has provided, this contention lacks the specificity required by 10 C.F.R. § 63.309(f)(1)(v) and, therefore, must be rejected.

**b. Brief Explanation of Basis**

For the reasons discussed below, DOE does not believe that a sufficient basis has been provided for this contention.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 498, section 4. Nevada concludes this general description of various sections in 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . .,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2 & 3), CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied,” because specific

citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

The contention claims that flouride concentrations *can* evolve from a single breached HLW glass waste package, and, in turn, *can* result in an increase in flouride ion concentrations in the emplacement drift. Petition at 498. Nevada concludes that this “potentially” increases the corrosion of the Ti-7 drip shield and other waste containers. *Id.* Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section IV.A.3, above, discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to

be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), and as discussed in the specific response below: (1) the contention does not reference any documents, other than the license application; (2) the contention mainly contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach three affidavits (by Michael C. Thorne, Maurice E. Morgenstein, and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, as further discussed below, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" these otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada's contention is filled with speculation, unsubstantiated assertions, and a lack of specificity about the basis for the contention. Nevada claims that increased flouride concentrations "can" become aggressive towards Ti-7 drip shields and the C-22 outer layer of the remaining canisters, and this "can" affect the dissolution of the in-package waste forms. This is mere speculation about what possibly "can" happen, which is unsubstantiated by citation to a single scientific or factual source. The contention also fails to explain how elevated flouride concentrations in late phase brine formation could become more aggressive than already contemplated in DOE's model. Nor does it explain how more aggressive flouride concentrations would affect the dissolution of the in-package waste form.

Nevada rolls these assertions into an argument that the increased flouride concentrations must be "coupled to" the geochemical behavior of other, unspecified EBS components. According to Nevada, because DOE did not take into account these couplings, the geochemical

“complexity” of the entire in-drift and near-field environment is underestimated and insufficiently examined by DOE because there is a “potential for enhanced rates of release of radionuclides to the accessible environment.” Petition at 500. The contention lacks any description of the other EBS components that it claims must be coupled to the increased flouride concentration and hypothesizes about a “potential” result. And, again, Nevada cites no scientific authority for these broad conclusions.

Even more vague is Nevada’s passing comment that “[t]he flouride issue is only one of many geochemical issues” that requires coupling. *Id.* Nevada does not even hint at what other “geochemical issues” it seeks to raise in this contention. Nevada cites no scientific references or expert opinions for this overbroad assertion.

Nevada is required to substantiate all these assertions with expert opinion or citations to scholarly authority. Nevada’s Petition concedes this much. *See* Petition at 499 (heading 5 stating, “A concise statement of the facts or expert opinions supporting the contention, *along* with appropriate citation to supporting scientific or factual materials”). Here, however, in the entire contention, Nevada cites only the SAR and then only for background purposes. Thus, instead of meeting the requirement to cite scientific or factual materials, Nevada relies only on attorney argument. A contention is “inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

The three boilerplate expert affidavits that “adopt” the contention do not change the conclusion that the contention must be dismissed. These one-page affidavits are wholly inadequate support for Nevada’s challenge. *See* Petition Attachment Nos. 3, 17, & 18. They

contain no reasoning or substantive discussion of the specific contention issues. An expert affidavit, no less than any other purported factual basis for a contention, must be grounded in fact and reasoned explanation. *USEC, CLI-06-10, 63 NRC at 472*. Absent any tangible information or substance—let alone a “reasoned basis or explanation”—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel, CLI-03-13, 58 NRC at 203*. The inadequacy of these affidavits is underscored by the fact that the contention itself does not mention them. Nevada’s failure to cite supporting scientific or factual materials in the contention cannot be cured by these inadequate affidavits. *See USEC, CLI-06-10, 63 NRC at 472*.

In summary, the contention fails to identify any documents or expert opinion to support the contention. The contention therefore must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the Section IV.A.3, above, contentions that allege errors, omissions, uncertainties or alternative approaches--without specifying the ramifications or results of such alleged deficiencies--fail to raise a genuine dispute on a material issue of fact or law and are, therefore, inadmissible. Nevada provides no quantitative or even qualitative information regarding whether and to what extent DOE’s conclusions in the TSPA would change if DOE had coupled the processes. Indeed, the regulations require evaluation of degradation processes in detail only “*if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Here, Nevada fails to allege—let alone provide scientific or factual support for an allegation—that the coupling the processes would cause the RMEI to be “significantly changed.”

Additionally, the contention describes a scenario involving flouride that would be

encompassed by DOE's conservative model. Dissolved fluoride inside of a breached co-disposal package would not lead to higher radionuclide releases than presently predicted in the TSPA. This is because the fluoride effects on radionuclide solubilities are taken into account in the existing radionuclide solubility model in SAR Section 2.3.7.10.3. The SAR explains that:

Uncertainty associated with the effects of  $F^-$  concentration is captured by the uncertainty term  $\epsilon_2$ . The source of fluoride for commercial SNF waste packages is groundwater, but in codisposal waste packages, HLW glass releases fluoride as it dissolves. *To evaluate the effects of fluoride content on solubilities, calculations for a range of pH values at a single  $fCO_2$  were made at higher fluoride contents for each type of waste and water influx condition.* Maximum fluoride levels are calculated by concentrating fluoride-containing seepage fluids; the highest fluoride level is 10 mM. In general, increased fluoride concentration is associated with increased radionuclide solubility, as shown in Figure 2.3.7-34 for thorium. For each element, the largest difference between the base-case solubility and the solubility associated with increased fluoride concentration was used to establish the uncertainty distribution for  $\epsilon_2$ . This difference is the maximum and least likely value of the triangular distribution of  $\epsilon_2$  that has a minimum and most probable value of zero (SNL 2007h, Section 6.5.3.4.3). This was done because only the relatively high fluoride concentrations significantly increase actinide solubility levels. In the TSPA, the sampled values for the  $\epsilon_2$  term for each actinide should be perfectly correlated, since the uncertainty represented is epistemic uncertainty in the fluoride concentrations in seepage waters.

SAR at 2.3.7-55 (emphasis added).

*See also* "Dissolved Concentration Limits on Radioactive Elements," (July 2005), LSN#: DN2002463266 at 6-58 & 8-2 to 8-3. In addition, DOE's model for inside-out general corrosion of C-22 implicitly includes the effect of fluoride since the model was calibrated using corrosion measurements conducted in solutions that contained high levels of fluoride. *See* SAR at 2.3.6-105 (Table 2.3.6.1).

Nevada's claim does not dispute this analysis. A contention that does not directly controvert a position taken by the applicant in the application does not raise a genuine dispute of material issue of law or fact and thus is subject to dismissal. *See Tex. Utils. Elec. Co.*, LBP-92-37, 36 N.R.C. at 384. Thus, the contention must be dismissed. Moreover, Nevada does not explain why the conservatism in this model is not sufficient to address the fluoride issue described in the contention. Nevada provides no quantitative or even qualitative information regarding whether and the extent to which possible elevated levels of fluoride would materially change DOE's corrosion analysis, let alone what impact it would have on the overall safety case for the repository.

A more fundamental problem with the contention is that it is premised on an assumption that dissolved fluoride issuing from a breached codisposal package would alter the ambient chemistry of the in-drift environment to the point where the drip shield and/or adjacent waste packages are breached. Nevada does not explain how this would occur and Nevada provides no authority for that proposition. In fact, the maximum fluoride level predicted to leave the waste package is 47.5 ppm (= 2.5 mM), *see* SAR Section 2.3.7.5.3.1 at 2.3.7-33, which is substantially lower than the fluoride-rich solutions used to develop the C-22 and dripshield corrosion models, *see* SAR 2.3.6.-105 (Table 2.3.6-1). Consequently, any impact of breach fluoride on adjacent packages would fall within the existing range of predicted corrosion behavior.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Petition at 501, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that

its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**93. NEV-SAFETY-93 - Natural Lead Reactions On C-22**

SAR Subsection 2.3.6 and similar subsections, which deal with waste package and drip shield corrosion, fail to account for deleterious effects of natural lead remobilized and/or newly mineralized as coronadite  $[Pb(Mn_{4+}Mn_{2+})_8O_{16}]$  and/or lead carbonates in unsaturated zone fracture system seepage onto C-22 surfaces.

**RESPONSE**

In this contention, Nevada alleges that in SAR 2.3.6 and “similar subsections,” DOE “fail[s] to account for the deleterious effects of natural lead remobilized and/or newly mineralized as coronadite ... and/or lead carbonates in unsaturated zone fracture system seepage onto C-22 surfaces.” Petition at 502. For the reasons discussed below, this contention is inadmissible.

**a. Statement of Issue of Law or Fact to be Controverted**

As discussed below, this contention fails to state, with requisite specificity, an issue of law or fact justifying its admissibility in this proceeding.

**b. Brief Explanation of Basis**

For the many reasons discussed below, this contention lacks adequate factual or legal bases, and must be dismissed for that reason.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations.

Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” Petition at 508. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be

met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation:” (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit

being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any relevant supporting documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Don L. Shettel, Jr., Maurice E. Morgenstein and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Further, Nevada cites to a single document in the contention as the supporting scientific or factual material-- "Effects of Lead, Mercury, and Reduced Sulfur Species on the Corrosion of Alloy 22 in Concentrated Groundwaters as a Function of pH and Temperature," Scientific Basis

for Nuclear Waste Management XXV, Symposium held 11/26-29/2001, Boston, Massachusetts, (2002), LSN# NEV000002753 (hereafter, "LSN# NEV000002753"). Petition at 504. Yet, this document is cited simply to support the proposition that "[i]f coronadite were to enter or form in the emplacement drifts and were to be deposited on the surface of C-22 outer container barrier, there is reasonable evidence that the lead would react with C-22 to cause corrosion." *Id.* This document consists of a series of slides discussing corrosion testing of C-22. However, the materials make clear that the corrosion at issue therein occurred only under the most aggressive (accelerated) conditions, and the state has made no showing that such conditions would be found at Yucca Mountain. *See* LSN#: NEV000002753 at 9. Moreover, even so, the research concluded that these unrealistically aggressive conditions merely "enhanced" corrosion. *Id.* at 9. As discussed below, with regard to the other assertions in the contention hypotheses, the contention is devoid of any scientific support.

In this regard, Nevada has merely hypothesized a scenario involving coronadite, a manganese lead oxide, and lead carbonate that, at most, indicates that there is a mere possibility, given a series of events, that corrosion of the C-22 surfaces of the waste package could result. Nevada's assertions are important for what they do not contain – Nevada does not assert that the hypothetical scenarios that it alleges are certain to occur, or even that they are probable, or likely, or even significantly plausible at Yucca Mountain. Nevada's claims are mere speculation, and as such should be ruled inadmissible as detailed below.

With respect to the assertion that corrosion could potentially result from coronadite, Nevada admits that coronadite "has been well characterized in the DOE program." Petition at 504. Nevada also acknowledges that "in the present day Yucca Mountain most of the lead-loaded manganese oxides are located below the repository." *Id.* But Nevada asserts, without

support or reference to relevant scholarship, only that “it is *possible* that the elevated repository temperatures in the near field and with the normally high degree of oxidation in the transporting fluids, new mineralization of similar manganese oxides will occur.” *Id.* (emphasis added). Nevada then asserts that it is possible that these newly-formed manganese oxides could be transported to the emplacement drifts, asserting that “the appearance of lead-manganese oxides at Yucca Mountain also *suggests the potential* of lead-bearing colloid transport to and from the near field.” *Id.* (emphasis added). Next, Nevada hypothesizes that “*If coronadite were to enter or form in the emplacement drifts and were to be deposited on the surface of C-22 outer container barrier*” then “there is reasonable evidence that the lead would react with the C-22 to cause corrosion.” *Id.* (emphasis added).

With respect to the lead carbonate, Nevada asserts, again without support or reference to relevant scholarship, that “[l]ead-containing carbonate is also present in fractures and faults in Yucca Mountain” and that “trace lead concentrations *have the potential* to cause deleterious reactions in C-22 *if the dust is deposited on the C-22 surface.*” *Id.* at 504-05 (emphasis added). It concludes that “[t]he potential for these deleterious reactions to occur should have been investigated by DOE.” *Id.* at 505.

The scenarios postulated by Nevada leading up to this conclusion depend on multiple independent events of causation, and Nevada merely asserts their theoretical possibility and does not demonstrate – nor does it even assert – that the causation described, much less the asserted result of corrosion of the C-22 material, is either certain or likely at Yucca Mountain. The Board should not accept such hypothetical, unsupported assertions. Even if this claim were construed to have been submitted by an expert, it would not be sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, “the Board

is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage, LLC* (Independent Spent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998), *aff’d on other grounds*, CLI-98-13, 48 NRC 26. Nevada’s unsupported conclusion, that “the potential for these deleterious reactions should have been investigated by DOE,” should likewise not be accepted by the Board. Conclusory statements cannot provide “sufficient” support for a contention. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006).

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada first attempts to demonstrate a genuine dispute with DOE by repeating the assertions, discussed above, that DOE failed to consider the potential effects of coronadite and lead carbonates that could possibly result in corrosion of the C-22 surfaces of the waste package. As noted above, the contention is replete with nonspecific, vague, and indefinite assertions that do not give rise to a material deficiency. For instance, Nevada acknowledges that most of the type of materials containing lead at Yucca Mountain that it asserts could possibly cause corrosion exist below the repository. Petition at 504. Because the mechanism by which possibly corrosive material will come into contact with a waste package is via seepage, such materials below the repository would not appear in seepage above the repository.

Nevada also acknowledges that there is only a trace amount of such materials above the repository horizon. *Id.* at 504. To avoid the obvious conclusion that Yucca Mountain does not contain sufficient amounts of such material above the repository to cause concern, Nevada

hypothesizes that new material could be created in the future. However, this too is sheer speculation. Indeed, the contention is silent as to the probability that such new mineralization would occur or over what time frames.

Moreover, Nevada's mere assertion that DOE's SAR erred, does not, in and of itself, support a finding that there is a genuine dispute on a material issue of law or fact. An allegation that some aspect of a license application is "inadequate" or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada's contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For this reason and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

For all of the reasons set forth above, this contention should be dismissed in its entirety.

**94. NEV-SAFETY-94 - Significance Of Mineral Crusts In C-22 Corrosion**

SAR Subsections 2.3.6.4, 2.6.3.5 and similar subsections, which deal with localized and SCC waste package corrosion, fail to give adequate consideration to the role of mineral precipitates in forming crevices and facilitating corrosion on C-22 surfaces.

**RESPONSE**

In this contention, Nevada alleges that “SAR Subsections 2.3.6.4, 2.6.3.5 (*sic*) and similar subsections, which deal with localized and SCC waste package corrosion, fail to give adequate consideration to the role of mineral precipitates in forming crevices and facilitating corrosion on C-22 surfaces.” Petition at 507.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and

therefore raises a material issue.” Petition at 508. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada's contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references to justify admission of its proffered contention. In particular, this contention references no expert opinion and no documentary materials, other than the LA, in support of its position. Therefore, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. §

2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any supporting documentary materials; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach three affidavits (by Maurice E. Morgenstein, Robert A. Cottis, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Even if the claims are construed to have been submitted by an expert, they still would not be sufficient to support admission of this contention. In an attempt to present support for its proffered contention, Nevada alleges a series of statements and unsupported assertions that do not provide adequate support for its contention. Nevada first asserts, without support or reference to any relevant scholarship, that as seepage water evaporates, mineral precipitates will begin to form, resulting first in the formation of "calcite, gypsum (selenite) and opal ... followed by chloride and nitrate salts" and that "[s]ome of the chloride and nitrate salts are hygroscopic." Petition at 508. Nevada next asserts, again without support or reference to any relevant scholarship, that "[s]alt scales and frothy caps ... will be dominated by calcite and gypsum with minor concentrations of opal," and that the "chlorides and nitrate salts will generally form in the 'pockets,' where brines have accumulated during the later stages of evaporation." Petition at 508-09. Nevada next asserts, again without support or reference to any relevant scholarship, that "[s]ome of the chloride and nitrate brines will become trapped against the C-22 surface." Petition at 509.

Nevada acknowledges that the SAR discusses the issue of scale or salt precipitation “as a crevice former” (*see* Petition at 509, citing SAR Subsection 2.3.6.4.3.1.3), but disputes the adequacy of DOE’s analysis. In this regard, Nevada asserts that:

1. “DOE provides no direct experimental evidence of the behavior of these crevices with respect to C-22 corrosion, and all DOE experimentation with respect to crevice and localized corrosion is based upon immersion studies” ;
2. “Consequently, the crevice repassivation potential that DOE utilizes is not justified or appropriate for use in radiological impact assessment as none of the experimentation offered to support the DOE model is based on the conditions expected to prevail on waste package surfaces”;
3. “The salt-based scale or evaporite deposits formed on the C-22 surface will initiate during the formation of brines [and this] evaporation can go to complete dryout and can be rewetted upon initiation of new seepage” ; and
4. “It is unlikely that these salt deposits will form only under continuous wet conditions. Thus, their structure and the compositions of included brines will be very variable and heterogeneous.”  
Petition at 509.

These four assertions indicate that Nevada has ignored the SAR discussion that summarizes the waste package outer barrier localized corrosion initiation model. *See* SAR § 2.3.6.4.1 at 2.3.6-31. This summary notes that “ ... mineral deposits could potentially form on the [waste package] surface due to evaporative concentration of solutions contacting the waste package” and that [c]orrosion rates may be enhanced where creviced geometries form on the waste package surface.” *Id.* The discussion also provides that [t]he data used to develop the critical potential model were obtained from samples with extremely tight crevices” and that the

“... results are conservative in that these crevices are more severe than those that may potentially occur where the waste package contacts the emplacement pallet or *in areas where mineral deposits form due to evaporative concentration*. *Id.* (emphasis added). This approach is “conservative because the initiation thresholds for crevice corrosion of Alloy 22 in terms of water chemistry and temperature are lower than for pitting corrosion.” *Id.* (internal citation omitted).

Nevada’s next assertion, made, as with all of the other allegations above, without support or reference to any relevant scholarship or expert opinion, is that “DOE’s [corrosion] model “is unrealistic” because it “treats corrosion propagation as occurring at a rate that does not depend on the conditions of chemical exposure” and because “... in some of the conditions that are likely to occur the corrosion will likely stifle; whereas, in other conditions such as salt crusting, pitting can lead to channeling that can then lead to SCC with very rapid failure.” Petition at 509. Nevada further alleges, again without support or reference to any relevant scholarship or expert opinion that, in this regard, DOE’s “... use of a constant [corrosion] rate is inappropriate and has the potential to underestimate the degree of penetration of the waste package,” and thus “the localized corrosion propagation model ... is not applicable to the environment in the waste emplacement drifts nor does it provide an appropriate conceptual model for the corrosion behavior of C-22.” Petition at 509-10.

Further, Nevada asserts, once again without support or reference to any relevant scholarship or expert opinion, that “DOE also utilized a time-dependent propagation rate model in which the rate slows with time . . . [and that ] this model is not supported by any experimentation relevant to the environments likely to be encountered in the waste emplacement drifts, and is extremely unlikely to accurately describe C-22 corrosion under a salt cap.” Petition

at 510. In this regard, Nevada ignores the provisions of SAR section 6.3.4.1 which provides that “[o]nce localized corrosion initiates, the rate of propagation is conservatively modeled at a constant rate.” See SAR §6.34.1 at 2.3.6-31. Lastly, Nevada alleges, without support or reference to any relevant scholarship or expert opinion, that “[t]he localized corrosion propagation rates ... in SAR Subsection 2.3.6.4.3.2.1 are not based upon corrosion rates obtained from relevant environment-specific experimentation...” but [r]ather ... are apparently based upon a DOE literature review of experiments that ... are not directly applicable to estimating the actual corrosion rates that would occur under a salt cap on a waste package surface.” Petition at 510.

Nevada’s wide-ranging and diverse allegations noted above have one thing in common; they all are made with utterly no support from any documentary supporting reference or expert opinion. In fact, the many and varied assertions contained in Nevada’s Statement of Alleged Facts or Expert Opinion set forth in subsection 5 of Nevada’s contention amount to merely unsupported assertions of counsel. As such, they cannot provide adequate support for a contention. A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

Even if these claims were construed to have been submitted by an expert, they would not be sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.”

*Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff'd on other grounds*, CLI-98-13, 48 NRC 26.

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

In an attempt to demonstrate a genuine dispute in paragraph 6 of the contention, Nevada first asserts that “SAR Subsection 2.3.6 and other similar subsections fail to provide adequate consideration of the role of mineral precipitates in forming crevices and the accompanying corrosion on C-22 surfaces.” Petition at 510. SAR Section 2.3.6 is 192 pages in length; Nevada fails to identify the portion of SAR Section 2.3.6 that is allegedly deficient and does not further identify the assertedly “similar” deficient subsections of the SAR. A petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). For this reason alone, this contention is inadmissible.

Next, Nevada merely repeats its unsupported, conclusory and speculative claims from its “Statement of Alleged Facts or Expert Opinion” in paragraph 5 of the contention, concluding that “[t]here are strong scientific arguments that this mode of corrosion will be extremely significant, but its extent and significance cannot be assessed on the basis of the information provided and models developed by DOE.” Petition at 510-11. As in subsection 5, Nevada fails to identify any supporting references or expert opinion relating to these purportedly “strong scientific arguments,” and thus fails to offer any support to demonstrate a genuine dispute. An allegation that some aspect of a license application is inadequate or unacceptable does not give

rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 n.12 (1990).

Nevada next alleges that SAR Subsection 2.3.6 and similar subsections “do not comply with 10 C.F.R. § 63.114(f), which requires that any performance assessment used to demonstrate compliance with Section 63.113 must provide the technical basis for either inclusion or exclusion of degradation, deterioration, or alteration processes of engineered barriers in the performance assessment ...” and that “degradation, deterioration, or alteration processes of engineered barriers must be evaluated in detail if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.” Petition at 511.

For these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**95. NEV-SAFETY-95 - Peak Thermal Period Seepage And Corrosion**

SAR Subsections 2.3.3, 2.3.5 and 2.3.6 and similar subsections dealing with water seepage and corrosion, fail to account for corrosion of C-22 and Ti-7 during the thermal period.

**RESPONSE**

Nevada argues that SAR Subsections 2.3.3, 2.3.5, and 2.3.6 and “similar subsections,” which state or assume that thermal seepage into emplacement drifts will not occur during the thermal period, are incorrect and thereby fail to consider the capacity of water seepage to cause C-22 and Ti-7 corrosion.

**a. Statement of Issue of Law or Fact to be Controverted**

Paragraph 1 of this contention states that “SAR Subsections 2.3.3, 2.3.5., and 2.3.6, and similar subsections dealing with water seepage and corrosion” fail to consider corrosion of C-22 and Ti-7 during the thermal period. Petition at 513. Nevada, however, raises for the first time in paragraph 5, SAR Subsections 2.3.2.1, 2.3.2.2.2.4., and 2.3.2.4.1.2.4.4, in the context of discussing the possible formation of “perched water zones.” Petition at 514.

It is impossible to discern what precisely the focus of this contention is and which section of the LA it is that Nevada seeks to challenge. 10 CFR § 2.309(f)(1)(i) requires that “a specific statement of the issue of law or fact to be raised or controverted.” The June 20, 2008 Case Management Order further notes that “this [§ 2.309(f)(1)(i)] statement shall set forth petitioner’s contention in precisely the form it wishes the contention to be considered.” *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 6). Nevada’s inconsistent statements regarding the specific SAR sections that it wishes to challenge make it clear that Nevada has not met the pleading specificity requirements of 10 CFR § 2.309(f)(1)(i) and its related obligations of the June 20, 2008 Case Management Order. Accordingly, this contention should be dismissed.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada alleges that seepage into the emplacement drifts is possible during the thermal period and that such seepage has “the capacity to cause C-22 and Ti-17 corrosion.” Petition at 513. In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.31(a)(3), 10 C.F.R. §63.21, 10 C.F.R. §63.21(c)(3)(ii), 10 C.F.R. §63.21(c)(14), 10 C.F.R. §63.102(h), 10 C.F.R. §63.113, and 10 C.F.R. §63.115. *See* Petition at 513-14. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would

make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3. *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the impact of thermal seepage on corrosion of the engineered barrier system (EBS) is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as

mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Nevada claims that “[s]eepage into the emplacement drifts is possible during the thermal period and brines and deliquescent salts formed during this seepage have the capacity to cause C-22 and Ti-7 corrosion.” Petition at 513. Nevada, however, does not provide the requisite supporting facts, expert opinion, or references in support of its contention. Accordingly, this contention must be dismissed.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the LA and DOE’s

supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach several affidavits (by Maurice E. Morgenstein, Stephan K. Matthai, and Don L. Shettel), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada argues that the SAR fails to analyze that drift seepage into emplacement drifts during the thermal period has the capacity to cause C-22 and Ti-7 corrosion. As fully explained below, this contention, however, ignores the features and processes that reduce or prevent drift seepage during the thermal period, fails to recognize that the SAR identifies that the EBS will demonstrate corrosion resistance to a wide range of solutions and temperatures, and fails to allege how thermal seepage will have deleterious effects on the EBS. Accordingly, this contention fails to raise a genuine dispute of material fact or law and must be dismissed.

First, while Nevada claims that "[b]reakdown of [capillary] barriers could lead to non-equilibrium seepage events that are not limited by a wall rock temperature of 100 (degrees) C" (Petition at 514), Nevada does not show how this alleged seepage will affect the waste package or other aspects of the EBS, and how, if at all, this would affect radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a

genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Next, this contention ignores DOE's extensive discussion of thermal drift seepage. As explained in SAR §§ 2.3.3.1 and 2.3.3.3, thermal features, events, and processes prevent or significantly reduce drift seepage during the first few hundred years after closure when temperatures are high enough to cause boiling conditions. The heat from waste decay impedes seepage by "thermal perturbation caus[ing] additional diversion of water around repository drifts." SAR § 2.3.3.1 at 2.3.3-6. Thus, the "[p]artial or complete diversion of water around the emplacement drifts due to capillary diversion, in combination with vaporization during the thermal period, reduces or prevents seepage into the emplacement drifts." SAR § 2.3.3.2.1.1 at 2.3.3-10. Accordingly, seepage "is not expected to occur as long as boiling temperatures and dryout conditions prevail in the rock above the repository." SAR § 2.3.3.1 at 2.3.3-6. Seepage would only be possible during this period if "both the vaporization barrier in the boiling zone and the capillary barrier at the drift ceiling would be breached. Results from the thermal-hydrological seepage model demonstrate that this scenario is not expected." SAR 2.3.3.3.1 at 2.3.3-58.

Nevada argues, however, "that it is possible to generate seepage into the containment drifts during the thermal period in conceptual models and for a range of realistic parameter values that have not been addressed by DOE." Petition at 515. Nevada's unsupported assertion challenging the thermal-hydrologic seepage model and claiming that DOE has only considered conditions in which non-equilibrium seepage does not occur is simply not a sufficient basis for rejecting the model. Nevada fails to demonstrate that its claims, even if accepted, would have any material effect on seepage into emplacement drifts during the thermal period. In particular,

the contention does not allege or demonstrate that the use of a different method would result in more accurate modeling of thermal drift seepage, or is inconsistent with the reasonable expectation standard. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Nevada further alleges that “[s]eepage into the emplacement drifts is possible during the thermal period and brines and deliquescent salts formed during this seepage have the capacity to cause C-22 and Ti-7 corrosion” (Petition at 516) and that DOE “ignores all corrosive reactions on EBS materials during the thermal period.” Petition 515.

To the extent Nevada alleges that DOE has failed to address corrosion of the waste package and drip shield as a result of deliquescence, Nevada fails to recognize that DOE has considered such occurrences and excluded them from the TSPA on the basis of low consequence and low probability, respectively. FEP 2.1.09.28.0A, *Localized Corrosion on Waste Package Outer Surface Due to Deliquescence*, states that “[d]uring [the thermal period] and for as long as the drip shields perform their function, the only aqueous phase that could potentially contact the waste package outer surface is brine that originates by deliquescence of soluble salts in dust residing on the waste package. The potential for brines formed by dust deliquescence to initiate and sustain localized corrosion that results in failure of the waste package outer corrosion barrier has been evaluated” and has been screened as low consequence. FEP 2.1.09.28.0A, “Localized

Corrosion on Waste Package Outer Surface Due to Deliquescence”, Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#: DEN001584824 at 6-705 (Mar. 6, 2008).

FEPs excluded on the basis of low consequence are those whose omission would not result in significantly adverse changes in radiological exposures to the RMEI, or radionuclide releases to the accessible environment. *Id.* at 6-1. FEP 2.1.09.28.0B, “Localized Corrosion on Drip Shield Surface Due to Deliquescence,” has been excluded due to low probability. *Id.* at 6-711. FEPs excluded on the basis of low probability are those having less than one chance in 10,000 of occurring within 10,000 years of disposal. *Id.* at 6-1. Clearly, DOE has satisfied its obligation consistent with 10 C.F.R. Part 63 to examine the effect of deliquescence on EBS corrosion. Significantly, Nevada has provided no analysis countering DOE’s exclusion of these FEPs on the basis of low consequence and low probability. Consequently, Nevada fails to raise a genuine dispute of material fact or law.

The possibility of seepage redissolving salts precipitated in the near-field host rock during the thermal period is considered by FEP 2.2.08.04.0A, and is excluded on the basis of low consequence. FEPs 2.2.08.04.0A, Re-Dissolution of Precipitates Directs More Corrosive Fluids to Waste Packages, Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#: DEN001584824, 6-995 (Mar. 6, 2008). As stated in this FEP, the process of “redissolution of mineral precipitates is examined in the drift-scale thermal-hydrologic-chemical (THC) seepage model,” which is used to evaluate the significance of THC processes on the chemistry of seepage waters. *Id.* Additionally, DOE has conducted a sensitivity study that integrates the features of the seepage model with the drift-scale THC model to evaluate potential changes in seepage composition. The results of these studies shows that

precipitates that may form in the host rock during the thermal period consist primarily of “silica and calcite, but also including halite, anhydrite, and minor amounts of sulfate, carbonate, and nitrate salts.” *Id.* These precipitates redissolve when moisture returns to the dryout zone, with “small amounts of concentrated brine” forming when rewetting first occurs approximately 1,000 years after repository closure. *Id.* Furthermore, when seepage does occur, seepage composition is dilute because “large local percolation flux is required to produce seepage, and the small amounts of brine that can be produced are insufficient to impact seepage chemistry.” *Id.* In addition, in order for the transient changes in the composition of seepage that occurs immediately after rewetting to be significant, the drip shield must fail during, or prior to, rewetting.. *Id.* at 6-996.

As shown above, DOE has analyzed the potential effect of seepage on corrosion of EBS materials, finding that in the unlikely event of a transient pulse of early seepage containing redissolved salts, the solution will be dilute, and corrosion to the waste package will be impeded by the drip shield.

Furthermore, Nevada ignores further discussion demonstrating that seepage during the thermal period would not have a significant impact on TSPA results. For example, as explained in SAR § 2.3.6, “Waste Package and Drip Shield Corrosion”:

The alloys used to fabricate the waste packages and drip shields have excellent corrosion resistance over a wide range of aqueous solution compositions and temperatures. Based upon measurements of corrosion rates of the passive metals that comprise the waste package and drip shield, the waste packages and drip shields can remain intact with no penetrations due to general corrosion for durations of tens of thousands and even hundreds of thousands of years.

SAR at § 2.3.6-6.

SAR section 2.3.6 goes on to discuss the modeling of waste package corrosion in the TSPA, including generalized corrosion, localized corrosion, stress corrosion cracking, early failure due to manufacturing or handling-induced defects, and long-term thermal aging, and explains why the models are conservative (i.e., overestimate the likelihood of penetration of the waste package corrosion barrier). SAR Subsection 2.3.6.2.2, “Waste Package Degradation Processes.” Overall, this discussion shows that the waste packages are highly resistant to corrosion, and that the TSPA has taken into account numerous potential causes of corrosion and waste package failure, using conservatively high estimates of the likely failure rates. As a result, even if the TSPA did not account for all of the possible effects of corrosion of C-22 and Ti-7 from seepage into emplacement drifts during the thermal period, the effect on TSPA results would likely be insignificant. Petitioner does not dispute or even address the discussion in SAR § 2.3.6.

In fact, paragraph 6 of this contention essentially admits that Nevada does not know whether this contention raises a genuine dispute of a material issue: allegedly due to the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Petition at 517, Nevada has not indicated whether it has attempted to determine what effect the contention would have on the doses. Petition at 358. Yet Nevada bears the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), including showing that the contention raises a genuine dispute of an issue material to this proceeding. *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Because it has not done so, the contention should be dismissed. Nevada’s position constitutes an improper attempt by Nevada to shift its burden to DOE, and provides an additional basis for rejection.

For the reasons stated above, there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and this contention must be dismissed.

**96. NEV-SAFETY-96 - Salt Production and C-22 Corrosion Due To Heatpipe Conditions**

SAR Subsections 2.3.2.2.2.6, and 2.3.6 and similar subsections, which describe unsaturated zone heat-pipe thermal processes and corrosion, give a description of those processes that is inadequate for safety assessment, because it fails to recognize that convection cells can produce extensive deposits of evaporites that can result in a “pressure cooker” effect, can affect water delivery to the drip shield and waste package, and can provide large quantities of deliquescent salts to the in-drift environment affecting the lifetime calculations for C-22 and Ti-7.

**RESPONSE**

Nevada argues that SAR Subsections 2.3.2.2.2.6 and 2.3.6 “and similar subsections” which describe the “heat-pipe” process, in which Nevada alleges that convection cells can produce extensive deposits of evaporates that can result in a “pressure cooker” effect, are inadequate because they fail to address various factors affecting water delivery to the EBS during heat-pipe conditions and fail to address the effect of deliquescent salts on C-22 and Ti-7.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada argues that convection cells formed during heat-pipe conditions can produce evaporites that may affect water delivery to the EBS and “can provide large quantities of deliquescent salts to the in-drift environment affecting the lifetime calculations of C-22 and Ti-7.” Petition at 520-21. But Nevada is silent as to how any purported effect of heat-pipe conditions on C-22 and Ti-7 would result in DOE failing to comply with 10 C.F.R. Part 63. Therefore, Nevada has not demonstrated why this proposed contention – even if true – would be material to the findings the NRC must make in this proceeding.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations that apply to this contention (including 10 C.F.R. §63.21(a)(2), 10 C.F.R. §63.31(a)(3), 10 C.F.R. §63.21, 10 C.F.R. §63.21(c)(3)(ii), 10 C.F.R. §63.21(c)(14), 10 C.F.R. §63.102(h), 10 C.F.R. §63.113, 10 C.F.R. §63.115, and 10 C.F.R. §63.114(f). *See* Petition at 518-19. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would

make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3. *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the impact of the heat-pipe effect on EBS components is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as

mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Nevada alleges that heat-pipe conditions can affect the hydrogeology and hydrogeochemistry of emplacement drift conditions, consequently affecting the corrosion resistance of C-22 and Ti-7. Nevada, however, does not provide the requisite supporting facts, expert opinion, or references in support of its contention. Accordingly, this contention must be dismissed.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the LA and DOE’s

supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach two affidavits (by Maurice E. Morgenstein and Stephan K. Matthai), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada argues that DOE inadequately analyzes the effect of heat-pipe conditions, failing to recognize that "convection cells formed during . . . heat-pipe conditions can produce extensive deposits of evaporites that can affect water delivery to the drip shield and waste package and can provide large quantities of deliquescent salts to the in-drift environment affecting the lifetime calculations of C-22 and Ti-7." Petition at 520-21.

As more fully discussed below, this contention, however, fails to recognize that the TSPA accounts for heat-pipe conditions, as discussed in the LA, and fails to recognize that the SAR explains that the EBS will demonstrate corrosion resistance to a wide range of solutions and temperatures. Accordingly, this contention fails to raise a genuine dispute of material fact or law and must be dismissed.

First, while Nevada makes vague assertions that the hydrogeochemistry of unsaturated zone water "affected by heat-pipe conditions has the potential to be very different" from DOE's

assessment, can “greatly affect the stability and corrosion resistance of C-22 and Ti-7,” and is of “major potential importance in determining the lifetime of EBS components” (Petition at 520), Nevada does not demonstrate how, if at all, this would affect radiological dose results. Petition at 520-21. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Nevada argues that the heat-pipe processes that create hydrogeochemical conditions that will accelerate corrosion of C-22 and Ti-7 are not discussed in the LA. Nevada, however, fails to recognize that the TSPA accounts for heat-pipe conditions and its effect on corrosion of the EBS. FEP 2.2.10.10.0A states that:

The coupled processes causing heat-pipe behavior are simulated with the TH seepage model described in *Drift-Scale Coupled Process Models*. . . Using this model, the impact of heat-pipe behavior on seepage is assessed for several simulation cases in which percolation fluxes and rock properties are varied. Thus, the TH-seepage modeling results include the effect of heat pipes and the resulting uncertainties in the conditions under which seepage occurs and in the volume of seepage. The TH seepage model results are used to develop an appropriate thermal-seepage methodology in the seepage abstraction . . . The effect of heat pipes on predicted in-drift thermal-hydrological conditions is taken into account in the drift-scale submodels of *Multiscale Thermohydrologic Model*.

FEP 2.2.10.10.0A, “Two-Phase Buoyant Flow/Heat Pipes,” Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#: DEN001584824 at 6-1086 (Mar. 6, 2008).

These factors are addressed in the SAR in, for example, § 2.3.3.1, § 2.3.3.3.1, and §2.3.3.3.3.2, which discuss the thermal-hydrologic processes and associated models.

Accordingly, Nevada's assertions that DOE has failed to adequately consider heat-pipe conditions and their effect on corrosion of EBS components is incorrect. As stated above, DOE has analyzed these factors and their effect on repository performance. Nevada's bare assertions to the contrary fail to adequately challenge these analyses, thereby failing to raise a genuine dispute of material fact or law. Accordingly, this contention must be dismissed.

Nevada next alleges that the "eventual failure of salt plugs as a consequence of overburden weight" can create conditions beyond those considered by DOE. Petition at 520.

Next, Nevada claims that the effects of deliquescent salts on the in-drift environment "are of major potential importance in determining the lifetime of EBS components and are not addressed in the license application." Petition at 521. In doing so, Nevada fails to recognize, however, that localized corrosion of EBS components due to deliquescence has been considered and is excluded from the TSPA.

FEP 2.1.09.28.0A, "Localized Corrosion on Waste Package Outer Surface Due to Deliquescence," states that "for as long as the drip shields perform their function, the only aqueous phase that could potentially contact the waste package outer surface is brine that originates by deliquescence of soluble salts in dust residing on the waste package. The potential for brines formed by dust deliquescence to initiate and sustain localized corrosion that results in failure of the waste package outer corrosion barrier has been evaluated" and has been screened on the basis of low consequence. FEPs 2.1.09.28.0A, Localized Corrosion on Waste Package Outer Surface Due to Deliquescence, Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#: DEN001584824 at 6-705 (Mar. 6, 2008). FEPs excluded on the basis of low consequence are those whose omission would not result in significantly adverse changes in radiological exposures to the RMEI, or radionuclide releases to

the accessible environment. FEP 2.1.09.28.0B, “Localized Corrosion on Drip Shield Surface Due to Deliquescence,” has been excluded due to low probability. *Id.* at 6-711. FEPs excluded on the basis of low probability are those having less than one chance in 10,000 of occurring within 10,000 years of disposal.

Clearly, DOE has satisfied its obligation consistent with 10 C.F.R. Part 63 to examine the effect of deliquescent salts on corrosion of EBS components. Significantly, Nevada has provided no analysis countering DOE’s exclusion of these FEPs on the basis of low consequence and low probability. Consequently, Nevada’s claim that heat-pipe conditions will affect water delivery and provide deliquescent salts to emplacement drifts fails to raise a genuine dispute of material fact or law.

Nevada also ignores the LA’s discussion demonstrating that the conditions alleged by Nevada, even if true, would not have a significant impact on TSPA results. For example, as explained in SAR § 2.3.6, “Waste Package and Drip Shield Corrosion”:

The alloys used to fabricate the waste packages and drip shields have excellent corrosion resistance over a wide range of aqueous solution compositions and temperatures. Based upon measurements of corrosion rates of the passive metals that comprise the waste package and drip shield, the waste packages and drip shields can remain intact with no penetrations due to general corrosion for durations of tens of thousands and even hundreds of thousands of years.

SAR at § 2.3.6-6.

SAR section 2.3.6 goes on to discuss the modeling of waste package corrosion in the TSPA, including generalized corrosion, localized corrosion, stress corrosion cracking, early failure due to manufacturing or handling-induced defects, and long-term thermal aging, and explains why the models are conservative (i.e., overestimate the likelihood of penetration of the

waste package corrosion barrier). SAR Subsection 2.3.6.2.2, “Waste Package Degradation Processes.” Overall, this discussion shows that the waste packages are highly resistant to corrosion, and that the TSPA has taken into account numerous potential causes of corrosion and waste package failure, using conservatively high estimates of the likely failure rates. As a result, even if the TSPA did not adequately account for the heat-pipe condition’s impact on the EBS, the effect on the TSPA results would likely be insignificant. Nevada does not dispute or even address the discussion in SAR § 2.3.6.

In fact, paragraph 6 of this contention essentially admits that Nevada does not know whether this contention raises a genuine dispute of a material issue. Allegedly due to the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions” (Petition at 522), Nevada has not attempted to determine what effect the contention would have on the doses. Yet Nevada bears the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), including showing that the contention raises a genuine dispute of an issue material to this proceeding. *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Because it has not done so, the contention should be dismissed. Nevada’s position constitutes an improper attempt by Nevada to shift its burden to DOE, and provides an additional basis for rejection. *See* Section V.A.3 of the Answer for a more detailed discussion of this position.

For the reasons stated above, there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and this contention must be dismissed.

**97. NEV-SAFETY-97 - Crevice Corrosion On C-22 Due To Drip Shield Corrosion Debris**

SAR Subsection 2.3.6 and similar subsections, which describe the DOE model for drip shield corrosion, fail to recognize that the degradation of the drip shield will cause a debris field that collects on the surface of the waste canisters and that this debris field can accelerate C-22 corrosion resulting in degraded performance of the EBS.

**RESPONSE**

This contention alleges that SAR subsection 2.3.6 and similar subsections fail to recognize that the degradation of the drip shield will cause a debris field that collects on the surface of the waste canisters. According to Nevada, this debris field can accelerate C-22 corrosion, resulting in degraded performance of the EBS.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada generically claims noncompliance with a litany of regulatory provisions in 10 C.F.R. Part 63, including §§ 63.31, 63.21, 63.102, 63.113, 63.114, and 63.115. Petition at 523-24. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the

mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” Petition at 524. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Specifically, although Nevada alleges an error in DOE’s analysis regarding the EBS, and claims that “coupled drip shield and waste canister degradation ... would have significant deleterious effects on the overall performance of the disposal system,” Petitioner has not alleged an increase in the mean dose *above regulatory limits*. Petition at 526.

Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. See 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere,

and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing corrosion of the drip shield is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Maurice E. Morgenstein, Robert A. Cottis, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Although Nevada makes copious technical assertions regarding the alleged need to consider the debris field formed by drip shield failure, it does not provide *any* scholarly support. Therefore, this contention does not comply with 10 C.F.R. 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention urges that, based on various FEPs that have been inappropriately excluded from consideration, DOE has overestimated the performance of the drip shield and underestimated the resulting corrosion from the debris field, resulting in “deleterious effects on the overall performance of the disposal system.” Petition at 523. For several reasons, this contention does not establish a genuine dispute of material fact.

First, this contention is premised on the unsupported assertion that DOE has inappropriately excluded four FEPs (regarding drip shield corrosion) from consideration. Nevada maintains, without foundation or explanation, that “[a]ll of these [FEP] exclusions and the associated credit taken for the drip shield performance are based upon experimentation that either utilizes immersion in J-13 saturated water zone, or immersion in waters of simulated composition such as BSW-12 (basic saturated water) or contain a variety of salts.” Petition at 525.

Nevada ignores the extensive screening justification for each of the FEPs that it cites. As the screening justification explains, each FEP was excluded based on either low consequence or low probability. *See* FEP 2.1.03.02.0B, “Stress Corrosion Cracking (SCC) of Drip Shields,” Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#: DEN001584824, 6-396 (Mar. 6, 2008) (justifying DOE’s screening due to “low consequence”); FEP 2.1.03.03.0B, “Localized Corrosion of Drip Shields,” Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#: DEN001584824, 6-405 (Mar. 6, 2008), as amended “Scientific Analysis/Calculation Administrative Change Notice for Features, Events, and Processes for the Total System Performance Assessment: Analyses (C),” LSN#: DEN001585821, p.2 (Apr. 3, 2008) (justifying DOE’s screening due to “low consequence”);

FEP 2.1.06.07.0A, “Chemical Effects of EBS Component Interfaces,” Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#: DEN001584824, 6-538 (Mar. 6, 2008) (justifying DOE’s screening due to “low consequence”); FEP 2.1.09.28.0B, “Localized Corrosion on Drip Shield Surfaces Due to Deliquescence,” Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#: DEN001584824, 6-711 (Mar. 6, 2008) (justifying DOE’s screening due to “low probability”). With regard to its contention, Nevada does not even allege, much less specify, why, how, and to what extent DOE’s screening justifications are somehow incorrect. Moreover, Nevada fails to demonstrate that the magnitude or timing of either the radiological exposure to the RMEI, or the radionuclide releases to the accessible environment would be significantly changed by the omission of these FEPS. *See* 10 C.F.R. § 63.114(e). Thus, Nevada fails to raise a genuine dispute.

Second, this contention is with speculation and conjecture. Nevada asserts, again without foundation or citation to relevant scholarship, that “dripping conditions on the ‘drip shield’ will result in ... environmental conditions that are not taken into account in the DOE analysis” (*e.g.*, “Drip Shield corrosion will take place under rock and rock bolt dust deposits that act as crevice formers.”). Petition at 525-26. In addition, Nevada alleges the following: (1) “[a]s it is *anticipated* that the degradation of the drip shield will be more rapid and extensive than assumed by DOE, consideration needs to be given to the debris field formed by this drip shield failure:” (2) “[o]nce the drip shield fails, percolation will reach the C-22 surface;” and (3) “[t]he debris field that forms from the degradation of the drip shield will contribute to the corrosion of the waste canister.” Petition at 526 (emphasis added).

The scenarios postulated by Nevada leading up to this conclusion depend on multiple independent events of causation, and Nevada merely asserts their theoretical possibility and does

not demonstrate – nor does it even assert – that the causation described, much less the asserted result of corrosion of the waste canister, is either certain or likely at Yucca Mountain. The Board should not accept such hypothetical, unsupported assertions. Even if this claim were construed to have been submitted by an expert, it would not be sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26.

Third, Nevada asserts that DOE underestimated the rate of corrosion caused by debris fields that would “have significant deleterious effects on the overall performance of the disposal system.” Petition at 526. As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this infirmity. Petitioner provides no quantitative or even qualitative information regarding whether and the extent to which this corrosion would impact the disposal system. Thus, Petitioner fails to demonstrate a genuine dispute.

With respect to Nevada’s assertion regarding 10 C.F.R. § 63.114(f), its allegation is false. As discussed in detail above, DOE’s exclusion of FEP 2.1.03.02.0B, 2.1.03.03.0B, 2.1.06.07.0A, and 2.1.09.28.0B is well documented in “Features, Events and Processes for the Total System Performance Assessment: Analyses,” (March 6, 2008) (LSN# DEN001584824). Since Nevada has made no attempt to contravene DOE’s analysis, it has failed to raise a genuine dispute.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 527. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada’s contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

**98. NEV-SAFETY-98 - Rate Of Drip Shield Interconnection Corrosion**

SAR Subsections 1.3.4, Figures 1.3.4-14 and 1.3.4-15, and similar subsections which describe the drip shield, fail to recognize that the connector plate and plate sections, due to the interlocking design, form crevices that have the potential to provide a locus for SCC driven by the concentrations of chloride and fluoride in unsaturated zone waters.

**RESPONSE**

This contention asserts that DOE did not adequately consider that there will be crevices at the intersections between drip shield plates, and that the crevices are likely to intercept drips and provide environments in which Stress Corrosion Cracking (SCC) would occur.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention seeks to raise an issue that is outside the scope of this proceeding, because it argues for the application of a stricter standard than NRC regulations require. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff'd*, CLI-01-17, 54 NRC 3 (2001). Petitioner alleges that DOE failed to comply with 10 C.F.R. § 63.114(f), because it failed to consider the possible impact of SCC caused by the interception of drips at the intersections between drip shield plates. Nevertheless, 10 C.F.R. § 63.114(f) only requires the inclusion of a degradation, deterioration, or alteration process, such

as SCC “*if* the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be *significantly* changed by their omission.” (emphasis added). As discussed below, DOE excluded SCC of the drip shields from its TSPA based on DOE’s conclusion that SCC would not have a significant effect. Petitioner does not allege that the omission of SCC would have the requisite *significant* impact.

In effect, Petitioner appears to argue that 10 C.F.R. § 63.114(f) requires DOE to demonstrate through a performance assessment, such as its TSPA analysis, that inclusion of SCC as described in this contention, would not significantly change the results of the TSPA analysis. Petition at 531. Moreover, Petitioner appears to argue that such a confirmatory performance assessment must include every identified feature, event or process (FEP) to verify that including the combination of all such low probability and low consequence FEPs would not significantly change the TSPA results. Acceptance of this argument would be tantamount to requiring DOE to include in its TSPA every known FEP, regardless of its likelihood of occurrence or potential consequences. This obviously asks the Board to impose a stricter requirement than what 10 C.F.R. § 63.114 requires, which Petitioner is not permitted to do. *See Fla. Power & Light Co., supra.*

Similarly, Petitioner also claims that no one but DOE is capable of performing the modeling referenced in this contention. Petition at 530-1. By urging the admissibility of this contention while conceding that it does not know whether the alleged deficiency would impact the TSPA results or cause the dose to exceed the regulatory limits, Petitioner essentially argues that DOE must show that the contention does not raise a genuine dispute of a material issue of

fact. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and provides an additional basis for rejection.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention does not identify any legal requirement that directly addresses the consideration of drip shield SCC. Although Petitioner points out that 10 C.F.R. § 63.114(f) provides that “[d]egradation, deterioration, or alteration processes of engineered barriers must be evaluated in detail *if* the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be *significantly* changed by their omission,” Petition at 529 (emphasis added), Petitioner does not argue that the omission of drip shield SCC would have a *significant* impact on radiological exposures or radionuclide releases.

Specifically, Petitioner implies that there would be a change in the TSPA results by its assertion that “[t]his omission means that the rate and degree of degradation of the EBS is underestimated, with *implications* for radionuclide releases and assessed doses to the reasonably maximally exposed individual.” Petition at 530 (emphasis added). But this falls far short of demonstrating that the omission is material because, as stated above, Nevada does not argue that the “implications” are significant. Nor has Nevada provided the basis for such an argument, as described below.

As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this flaw. Nevada has made no attempt to determine or estimate what effect, if any, acceptance of their contention would have

on its TSPA results. In fact, Nevada actually admits that it has no idea whether this contention raises a material issue because it is allegedly beyond its “practical ability” to determine what effect the contention would have. Petition at 531. Yet Nevada bears the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), including showing that the contention raises an issue that is material to this proceeding. *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Because it has not done so, the contention should be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

The legal standards that require adequate factual support or expert opinion in order for a contention to be admitted are discussed in Section V.A.3 of this Answer. This contention fails to meet those standards because it presents only unsupported arguments of counsel. It should also be noted that, although not referenced in the body of this contention, attachments to three of the affidavits included with Nevada’s Petition reference this contention, albeit broadly.

Nevertheless, these references do not somehow save this contention from being dismissed for failure to provide an adequate statement of alleged facts or expert opinion. As discussed in Section V.A.3 above, the referenced expert affidavit(s) fall far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Ultimately, Petitioner cites two figures in SAR Section 1.3.4 in alleging that there will be crevices at the intersections between drip shield plates and that the crevices are likely to intercept drips and provide environments in which SCC would occur. Petition at 529. Based on nothing more than these figures, Petitioner then argues that:

- 1) DOE has excluded SCC on the basis of immersion experiments, but has not experimented with crevices in drip-dryout conditions using fracture flow unsaturated zone water;
- 2) The omission of drip shield SCC means the rate and degree of degradation of the EBS is underestimated; and
- 3) That this asserted underestimation has implications for radionuclide releases and assessed doses to the RMEI.

*Id.* at 529-30. These arguments lack any basis in fact whatsoever.

With respect to Petitioner's first claim involving exclusion of SCC based on immersion experiments, Petitioner is simply wrong. The DOE does not rely on immersion experiments and as the LA states, exclusion of drip shield SCC is based on the determination that any such cracking would not have significant consequences. Specifically, the LA states, and Petitioner does not dispute, that:

Stress corrosion cracking is modeled to be independent of the environment although the environments to support stress corrosion may not occur within the repository. The presence of cracks will not affect the performance of the drip shield in preventing or substantially reducing the amount of water that could directly contact the waste package, and is excluded from TSPA.

SAR Subsection 2.3.6.9.1, "Summary of Significant Processes for EBS Barrier Capability," at 2.3.6-86 (citation omitted). Thus, DOE excluded drip shield SCC from the TSPA on the basis of the low consequence, not on a determination that SCC is unlikely to occur.

The SAR also shows that DOE did testing of drip shield SCC under conditions that are expected to exist in the drifts. The SAR states that:

. . . [a]vailable literature indicates Titanium Grade 7 is extremely resistant (or immune) to stress corrosion cracking initiation in repository-relevant brine environments.... Consistent with the

literature, DOE-conducted testing confirmed that no stress corrosion cracking initiation is observed over the full range of primary (constant-load) (Figure 2.3.6-28) and secondary (U-bend) stresses that were evaluated.

SAR Subsection 2.3.6.8.3 “Stress Corrosion Cracking of Drip Shield,” at 2.3.6-79 (citation omitted). As a result, Petitioner’s unsupported criticisms of DOE’s testing also miss the mark.<sup>64</sup>

With respect to Petitioner’s second claim, which relates to “the rate and degree of degradation of the EBS,” that claim apparently is nothing more than unsubstantiated speculation, based on Petitioner’s mistaken and unsupported belief that DOE’s basis for excluding drip shield SCC was inadequate testing. In any event, as discussed above, the Petition does not dispute DOE’s conclusion that the presence of cracks due to SCC will not affect the performance of the drip shields.

As for Petitioner’s third claim, it is nothing more than the culmination of Petitioner’s preceding unsupported claims. As a result, this claim is unsupported as well. Consequently, the Petition fails to demonstrate that the issue raised in this contention is material to the findings that the NRC must make to support issuance of construction authorization.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this flaw.

---

<sup>64</sup> The LA also shows that DOE’s testing did consider the potential for corrosion in drip shield crevices. In summarizing the results of long-term corrosion tests on titanium alloys to provide the technical basis for models for drip shield degradation, the SAR notes that “[r]esults from testing in repository-relevant environments show that creviced specimens exhibit slightly lower corrosion rates than weight-loss specimens; only the weight-loss data were used in the model.” SAR at 2.1-104.

As discussed above, the only specific portions of the LA cited in connection with this contention are two figures in the SAR that the Petitioner does not dispute, but rather relies upon as support for its position that there will be drip shield crevices and, as a result, SCC. Petition at 529. Petitioner does not, however, include any references to portions of the LA that Petitioner disputes and does not provide any supporting reasons for disputing any statements in the LA. More specifically, nothing in this contention indicates that the Petitioner disputes the assessment described in the LA that any SCC of the drip shields would not have a significant effect. Because Petitioner does not dispute the assessment of low consequence or otherwise claim that the TSPA results would change “significantly” if drip shield SCC was included, the Petitioner has failed to demonstrate the existence of a genuine dispute on a material issue of fact.

**99. NEV-SAFETY-99 - Boric Acid Production From HLW Dissolution**

SAR Subsection 2.3.7 (FEP 2.1.09.02.0A) and similar subsections, which describe chemical interactions with corrosion products, fail to recognize the potential corrosive role of boric acid formed from the dissolution of HLW glass waste.

**RESPONSE**

This contention alleges that SAR section 2.3.7 fails to recognize the potential corrosive role of boric acid formed from the dissolution of HLW glass waste.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada generically claims noncompliance with a litany of regulatory provisions in 10 C.F.R. Part 63, including §§ 63.31, 63.21, 63.102, 63.113, 63.114, and 63.115. Petition at 532-33. Petitioner's mere recitation of regulatory provisions does not satisfy its burden of demonstrating the issue raised in this contention is material to the findings that the NRC must make in this proceeding. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action

that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Specifically, although Nevada alleges a deficiency in DOE’s model with respect to boric acid, Petitioner has failed to establish that the error is relevant to DOE’s compliance with any Part 63 requirement. Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. See 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Nevada claims that DOE (1) fails to consider the potential corrosive role of boric acid, (2) underestimates the potential radionuclide release from the EBS, and (3) underestimates radiation doses to the RMEI (Petition at 534). But, as stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Maurice E. Morgenstein, Michael C. Thorne, and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

In order to support its assertion that "the role of boron in evaporative environments has not been favorable to the nuclear industry," Nevada cites – as an example – the "problems encountered at the Davis Besse nuclear reactor." Petition at 533. Nevada provides no justification for its claim that conditions for the reactor vessel head degradation at Davis-Besse are somehow applicable to potential corrosion in a high-level waste package at Yucca Mountain. As the Commission has ruled, a petitioner must explain the significance of any factual information upon which it relies. *See Fansteel, Inc.* (Muskogee, Oklahoma Site), CLI-03-13, 58 NRC 195, 204-05 (2003). Nevada has not done so.

In summary, this contention does not sufficiently identify any documents or expert opinion to support the contention. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention states that DOE has not considered the potential for boric acid to form in the in-drift environment as a function of the degradation of the HLW glass waste form “despite the large concentration of boron in the glass and the history of boric acid caused corrosion in the nuclear industry.” Petition at 532. For several reasons, this contention does not establish a genuine dispute of material fact.

First, this contention is filled with speculation and conjecture. By way of example, Nevada asserts the following: (1) DOE fails to recognize the “*potential* corrosive role of boric acid” from HLW dissolution (Petition at 532) and (2) “The quality of boron that *can* be released from one breached canister *may* be quite *sufficient* to affect the corrosion of other canisters encapsulated in the same drift – thus a domino effect can occur.” Petition at 534 (emphasis added). The Board should not accept such causal, hypothetical, and unsupported assertions. Even if these claims were construed to have been submitted by an expert, it would not be sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26. Furthermore, Nevada’s unsupported conclusion, that DOE should have considered boric acid based on the “history of boric acid caused corrosion in the nuclear industry,” (Petition at 532), should likewise not be accepted by the Board. Conclusory statements cannot provide

“sufficient” support for a contention. *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006).

Second, the contention alleges that because DOE did not consider boric acid corrosion, the LA is deficient and underestimates potential radionuclide release. Petition at 534. As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency. Nevada provides no quantitative or even qualitative information regarding whether and the extent to which radionuclide releases and radiation dose to the RMEI would result from consideration of boric acid formation in the in-drift environment. Thus, Nevada fails to demonstrate a genuine dispute.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 535. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster (Savannah River Mixed Oxide Fuel Fabrication Facility)*, LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada’s contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected.

**100. NEV-SAFETY-100 - Ground Support Components and In-Drift Modeling**

SAR Subsection 1.3.4.4 describes the ground support system as including Bernold-type sheets that have the potential to degrade during heat-up, the peak thermal period, and cool down generating oxyhydroxide debris fields on drip shields (comprising dust, scale and granular debris) and waste canisters (comprising oxyhydroxide dust and scale). These debris fields will result in the formation of mineralized crevices that can trap acid vapors formed by deliquescent salts derived from dust and percolation, thereby increasing corrosion rates and adversely affecting the containment properties of the system. However, SAR Subsection 2.3.5 and similar subsections, which describe the in-drift chemical environment models, fail to take account of the ground support components in defining the chemical composition of the in-drift environment.

**RESPONSE**

In this contention, Nevada challenges SAR Subsection 2.3.5 and “similar” (though unspecified) subsections for failing to take into account the ground support components in defining the chemical composition of the in-drift environment. Petition at 536.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 537-38, section 4. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 538. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp. (Oconee Nuclear Station, Units 1, 2, & 3), CLI-99-11, 49 NRC 328, 333-34 (1999).*

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere,

and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

The contention argues DOE did not consider that ground support systems could degrade and generate debris fields and in turn, the corrosion “potential” of the critical EBS components, including the C-22 canister surface, will be “affect[ed].” Petition at 536. Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the

licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section IV.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), and as discussed in the specific response below: (1) the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach three affidavits (by Michael C. Thorne, Maurice E. Morgenstein, and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” these otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

In this contention, Nevada claims that DOE neglected to consider the “potential” of the ground support components to degrade and thus produce oxyhydroxide debris fields on the drip shields and waste canisters. Petition at 538. According to Nevada, this has two implications: the oxyhydroxide dust can (a) sorb transition metals, and (b) “physically promote” the crevice

formation, which “can” harbor acid vapors. Petition at 536, 538-39. Although Nevada claims that the debris fields will have a “deleterious chemical effect” and can “harbor acid vapors,” *id.*, Nevada fails to quantify the amount of debris fields that supposedly will result from the degradation of the ground support components or suggest what amount of debris that could cause these effects. Nor does Nevada state that the debris fields would have a material effect on DOE’s corrosion model. In short, all of the assertions in the contention are nothing more than broad speculation about what might happen, and, moreover, they are wholly unsupported by any scholarly authority.

Without proper support, Nevada asserts that DOE was deficient for not taking these debris fields into account in developing the in-drift chemical environmental models, which in turn (Nevada claims) would affect DOE’s corrosion model. Petition at 536. The Board should not accept these hypothetical, unsupported assertions. *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 N.R.C. 451, 472 (2006). Nevada is required to back up its assertions with a citation to scholarly authority. Nevada does not do so.

If a petitioner, like Nevada, “has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation,’” the contention must be dismissed. *Fansteel, Inc. (Muskogee, Oklahoma Site)* CLI-03-13, 58 NRC 195, 203 (2003) (quoting *GPU Nuclear, Inc. (Oyster Creek Nuclear Generating Station)*, CLI-00-06, 51 NRC 193, 208 (2000)). The three boilerplate expert affidavits that “adopt” the contention do not change that outcome here. These affidavits are wholly inadequate support for Nevada’s argument that DOE should have considered these coupled processes. *See* Petition at Attachment Nos. 3, 17, and 18. These one-page affidavits contain no reasoning or substantive discussion of the specific contention issues. An expert affidavit, no less than any other purported factual basis

for a contention, must be grounded in fact and reasoned explanation. *USEC*, CLI-06-10, 63 NRC at 472. Absent any tangible information or substance—let alone a “reasoned basis or explanation”—these affidavits offer no support for this contention, rendering it inadmissible. *Fansteel, Inc.* CLI-03-13, 58 NRC at 203. The inadequacy of these affidavits is underscored by the fact that the contention itself does not even mention them. Nevada’s failure to cite supporting scientific or factual materials in the contention cannot be salvaged by these paltry affidavits. *See USEC*, CLI-06-10, 63 NRC at 472.

In summary, the contention fails to explain the basis for its challenges, much less identify any documents or expert opinion to support the contention. The contention therefore must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from that flaw.

Nevada is simply wrong that DOE failed to take into account the ground support components in defining the chemical composition of the in-drift environment. Even if true, it would not raise a genuine dispute of material issue of law or fact

First, in SAR 2.3.5.5.3.3.2, DOE presented a sensitivity analysis examining the effect of interactions with ground support system components on the in-drift chemical environment:

A process-level sensitivity analysis was conducted to examine the effect of interactions with introduced materials, such as components of the ground support system and invert and *their corrosion products*, on in-drift water chemistry. The results indicated that interactions with steel ground support materials will

not have a significant effect on the predicted chemistry of aqueous solutions in the drift (SNL 2007b, Section 6.8). Metal ion solubilities are low under oxidizing conditions, *and the corrosion of steel to oxides/oxyhydroxides had no effect on pH, ionic strength, or other compositional parameters.* The potential for reduction of nitrate in seepage water by interactions with metal in the drift was also evaluated. However, metal oxidation reactions greatly favor free oxygen, and this selectivity, as well as the greater abundance of oxygen relative to nitrate in the drift environment, will inhibit reduction of nitrate in seepage water.

SAR at 2.3.5-132. The details of this sensitivity analysis can be found in Section 6.8 (Steel Interactions with Seepage Water) of the “Engineered Barrier System: Physical and Chemical Environment” (“Engineered Barrier System”) (Aug. 2007), ANL-EBS-MD-000033 REV 06, LSN#: DN2002452948 at 6-132.

Nevada does not discuss or even acknowledge these analyses. Thus, Nevada clearly fails to raise a genuine dispute of material issue of fact as to whether DOE took into account the ground support components in the in-drift environment.

Second, even if DOE had failed to consider the debris fields, there would be no impact on DOE’s model because although brines associated with the existence of deliquescent salts may generate small pressures of acid-gas species, the amounts of these species will be insignificant for several reasons. In particular, there are limited amounts of deliquescent salts in the repository because they are derived from dust and seepage, with seepage occurring only after the temperature at the drift falls below 100° degrees C (at this time, the waste package would be slightly above that temperature). Further, such seepage waters will be very dilute. *See* SAR at 2.3.5.-143. In addition, as discussed in Section 6.2 (*If Brines form at Elevated Temperatures, will they Persist*) of “Analysis of Dust Deliquescence for FEP Screening”, as brine releases acid species, it becomes more alkaline, which in turn limits further release of these species. *See* Analysis of Dust Deliquescence for FEP Screening (“Analysis of Dust Deliquescence”) (Aug.

2005), ANL-EBS-MD-000074 REV 01 AD 01, LSN#: DN2002478854 at 6-22, 6-23, & 6-43.

The same report further pointed out that even small amounts of degassing (1% or less of the total chloride) result in large increases in pH (in other words, large reductions in acidity). LSN#: DN2002478854 at 6-26 & 6-43. This indicates that either only a small fraction of the total amount of nitrate or chloride in dust or seepage can be released as acid vapor as the process limits itself, *id.* at 6-43, or that the acid gases would continue to form because the gas convection down the drift removes the acid gas species to a liquid sink at lower temperature at the drift ends (condensation), *id.* at 6-40, or water in the host rock, *id.* at E-12.

The effect of small-amounts of acid-gas species due to deliquescent salts will also be limited because, as explained in “Analysis of Dust Deliquescence for FEP Screening,” once released from the brines, the acid vapors will be rapidly dispersed and diluted by other gases in the drift by diffusion and convective gas mixing both radially and along the drift length. *See* LSN#: DN2002478854 at Section 6.2.3. and at E-8, E-11, & E-12. Once dispersed, the acid species will redissolve either in condensate or in water films in the host rock, and this will result in a dilute solution. *See id.* at 6-31, E-8, E-9, & E-11. Neutralization reactions can also occur with rock forming minerals such as calcite, a constituent of the host rock. *See* Analysis of Dust Deliquescence, LSN#: DN2002478854 at Section 6.2 (pages 6-22 and 6-34); Section 6.3.3 (pages 6-51 to 6-55) and Addendum 01, Section 6.3.2[a] (AD01 pages 6-17 and 6-18; pages E-9, E-11, and E-12). Thus, for these reasons, the concentration of acid vapors in the drift will be insignificant. Although Nevada suggests that acid vapors would be selectively trapped by mineralized crevices, it cites no authority for this assertion and does not explain how it would change DOE’s model, much less materially impact it.

Third, the results of DOE's corrosion model would not be materially changed as a result of ground support debris allegedly forming crevices on the drip shield. DOE used an extremely aggressive creviced-sample geometry during the localized corrosion testing. Research has shown that the design of the "crevice-former" used to develop the localized corrosion model for titanium—a PTFE tape wrapped ceramic--was more severe than anything that would be formed by salt or other debris deposited on the surface of the drip shield (or waste package) surface. *See Shan, et al.*, "Comparison of Ceramic Polymer Crevice Formers on the Crevice Corrosion Behavior of Ni-Cr-Mo Alloy C-22", (2006) LSN# DN2002403435, at 13-14. Crevices formed by debris or deposits would be similar to a ceramic crevice-former lacking the PTFE tape, which was demonstrated to be insufficient to initiate localized corrosion by *Shan, et. al., Id.* at 7. Nevada has provided no scholarly authority for the proposition that crevices formed by debris could somehow "trap" or contain volatile acid-gas species in the repository environment.

Finally, the corrosion of ground support materials does not raise a genuine dispute of material issue of fact or law with respect to whether trace elements (Cd, Co, Cu, P, Pb, Sb, and Sn, among others) derived from degradation of ground support materials will adversely affect drip shields (or waste packages). *See* Petition at 539. As Nevada itself recognizes in connection with NEVADA-SAFETY-93, these elements will be present only as trace species. *See* Petition at 504. Nevada cited no authority that suggests that the trace levels of these constituents are deleterious to performance of the drip shield, and no evidence that they will be present at greater than trace concentrations.<sup>65</sup>

---

<sup>65</sup> Of course, Nevada also fails to address the fact that the waste packages ("waste canister") will be protected by the drip shields from contact with that debris and that analyses have shown that the drip shields will continue to perform their function, protecting the waste packages from seepage for at least 10,000 years. *See* Total System Performance Assessment Model /Analysis for the License Application, LSN#: DEN001579005, Section 6.3.5.2.3, p. 6.3.5-29. The drip shields will similarly protect the waste canisters from ground support debris.

Thus, even assuming that DOE did not take into account the ground support components as alleged, Nevada's bare assertion that the model will "increase corrosion rates and adversely affect the containment properties of the system," Nevada Pet. at 536, does not raise a valid basis for attacking the model. *Fla. Power and Light Co.*, (Turkey Point Plant Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 515 (1990). This is particularly true in light of the clear record that DOE developed showing the contrary. Nevada must demonstrate how the corrosion of the ground support components would change the results, and then tie those changes to a regulatory requirement that was not met. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Unit 2), LBP-03-12, 58 NRC 75, 92-93 (2003), *aff'd*, CLI-03-14, 58 NRC 207 (2003). Nevada does not make any argument to counter this analysis. Therefore, no genuine dispute is raised in this contention.

Indeed, the regulations require evaluation of degradation processes in detail only "if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be *significantly changed by their omission.*" 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that the debris fields would increase those risks at all, let alone that the risks would be "significantly changed by their omission." Accordingly, Nevada fails to raise a genuine dispute of material issue of fact or law.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada's contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. Petitioner at 540. The petitioner has the burden of showing

that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, the contention fails to raise a genuine dispute of a material issue of fact or law and must be dismissed.

**101. NEV-SAFETY-101 - Sulfur Accumulation At The Metal-Passive Film Interface**

SAR Subsection 2.3.6.3 (and subsections therein), which addresses the general corrosion of the waste package outer barrier, fails to consider the possibility of sulfur accumulation at the metal-passive film interface during slow passive corrosion, which could lead to an increased rate of uniform corrosion.

**RESPONSE**

This contention alleges that SAR subsection 2.3.6.3 fails to consider the possibility of sulfur accumulation at the metal-passive film interface during slow passive corrosion, which could lead to an increased rate of uniform corrosion.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada generically claims noncompliance with a litany of regulatory provisions in 10 C.F.R. Part 63, including §§ 63.31, 63.21, 63.113, and 63.114. Petition at 541-42. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere

assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” Petition at 542. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied,” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Specifically, Nevada argues that DOE’s “conceptual model does not take into account ... the accumulation of trace elements in the alloy (notably sulfur) at the metal-passive film interface, which produce very high corrosive rates for nickel once the sulfur coverage reaches about one monolayer.” Petition at 541. Nevertheless, Nevada fails to establish that the error is relevant to DOE’s compliance with any Part 63 requirement.

Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. See 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the

uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing corrosion of the waste package outer barrier is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit

being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. To the extent this contention relies upon expert opinion, it fails to meet those standards because Nevada's Petition does attach several affidavits (by Maurice E. Morgenstein, Michael C. Thorne, and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention alleges that because DOE failed to consider sulfur accumulation at the metal-passive film interface during slow passive corrosion, the SAR is incomplete and inaccurate. For several reasons, this contention does not establish a genuine dispute on a material issue of fact.

First, this contention is based on speculation and conjecture. In its "Statement of the Contention Itself" in the first paragraph, Nevada acknowledges that DOE does not consider "the

*possibility* of sulfur accumulation at the metal-passive film interface during slow passive corrosion, which *could* lead to an increase rate of uniform corrosion.” Petition at 541 (emphasis added). Indeed, with respect to a DOE document, Nevada acknowledges that “no attempt is made to quantify the *possible* increase in corrosion rate that *might* be produced by the presence of sulfur. *Id.* at 543 (emphasis added).

Furthermore, Nevada’s cited references in this contention hardly amount to sound support. Regarding the proposition that “it is well-known within the corrosion community that the corrosion rate of nickel is markedly increased by the generation of a layer of sulfur at the metal-passive film interface by a process known as ‘anodic segregation’”, Nevada cites to a document on corrosion mechanism in theory and practice. Petition at 542. This document indicates, however, that the “anodic segregation rate *depends* on the sulfur content of the material and on the rate of anodic dissolution.” Marcus, P. Corrosion Mechanisms in Theory and Practice (CRC Press) (2002) at 294 (emphasis added).

Nevada speculates that Alloy 22 is more susceptible to corrosion in the presence of sulfur, but it bases that conclusion on research conducted on the passive film of nickel and Alloy 600, not Alloy 22. Petition at 542. Indeed, the same researcher Nevada used as support for this premise has acknowledged that he had “no published data on quantitative measurements of the composition of the passive film on Alloy 22 under the conditions of the Yucca Mountain repository site.” P. Marcus, “Long Term Extrapolation of Passive Behavior,” Proceedings from an International Workshop on Long-Term Extrapolation of Passive Behavior (July 19-20, 2001), United States Nuclear Waste Technical Review Board, LSN#: NEV000003496 at 56. Moreover, not only was sulfur accumulation only hypothesized as a mechanism that “may” be responsible for passivity breakdown (*id.*), but the researcher concluded that whether passivity breakdown

“could occur on Alloy 22 under repository condition is not known.” *Id.* at 59. Thus, Nevada’s reliance on this single study is unwarranted.

Nevada further speculates that “interfacial sulfur concentration approaching one monolayer” is required for passivity breakdown (Petition at 542), but it offers no support for that measurement with respect to Alloy 22. Again, it relies on research related to nickel and nickel-iron alloys, not Alloy 22 (for which the researcher had no data).

As another of Nevada’s reference sources observed, the calculations for passivity breakdown for nickel-iron alloys “may not be applicable if the sulfur-related degradation mechanism for Alloy 22 is different than that for Ni-Fe alloys.” H. Jung, *et al.*, “A Review of the Long-Term Persistence of the Passive Film on Alloy 22 in Potential Yucca Mountain Repository Environments” (Oct. 2007), LSN# NRC000029382 at 4-13 [hereinafter, “Review of Long-Term Persistence”]. In fact, Alloy 22 is based on a different composition of metals – including chromium and molybdenum – that have been shown to counteract the effects of sulfur accumulation.

Nevada attempts to minimize this fact, asserting that there is “no direct experimental evidence” to show that “molybdenum tends to counter the deleterious effect of sulfur.” Petition at 543. To the contrary, the Sandia National Labs report on which much of SAR 2.3.6.3 is based observed, on the very same page cited by Nevada, that there is a “consensus” that molybdenum reduces the rate of anodic dissolution and thus inhibits passivity breakdown. Sandia National Laboratories (2007) “General Corrosion and Localized Corrosion of Waste Package Outer Barrier,” ANL-EBS-MD-000003 Rev 03, LSN# DN2002460404 at 6-14.

Nevada simply offers no evidence that Alloy 22, as opposed to other materials, is subject to passive film breakdown in the repository environment. Indeed, Nevada ignores contrary data in its own cited references:

Based on the currently available long-term corrosion test data for Alloy 22, such as that obtained at the DOE long-term corrosion test facility, there is no evidence or any indication of sulfur-induced film breakdown for Alloy 22, suggesting that the beneficial role of alloying elements (e.g., molybdenum and chromium) overcome any potential anodic sulfur segregation.

Review of Long-Term Persistence, LSN# NRC000029382 at 4-15. Nevada's unsupported speculation to the contrary simply does not create a genuine dispute on a material issue.

Nevada also asserts that because DOE's consideration of increased uniform corrosion due to sulfur accumulation is deficient, the SAR is "materially incomplete and inaccurate." Petition at 544. With regard to its analysis regarding general corrosion of the waste package, however, DOE has incorporated substantial conservatism into its model. *See generally* SAR section 2.3.6.3. For example, DOE indicates that the "TSPA conservatively applies aqueous general corrosion degradation rates to the waste package for all repository conditions and discounts dry oxidation which is slower than aqueous corrosion." SAR at 2.3.6-18. In addition, DOE indicates the general corrosion model is "conservatively independent of relative humidity and with a time invariant corrosion rate." SAR at 2.3.6-24. Despite the fact that DOE already has incorporated conservatism in its model, Nevada fails to explain why this conservatism is not sufficient.

Moreover, as discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this infirmity. Nevada

provides no quantitative or even qualitative information regarding whether and the extent to which this corrosion would impact the disposal system.

Furthermore, the regulations require evaluation of degradation processes in detail only *if* the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be *significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that the possible presence of sulfur accumulation – which is uncertain and unverified by any study – would increase those risks at all, let alone that they would be “significantly changed by their omission.” Thus, Petitioner fails to demonstrate a genuine dispute.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 545. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada’s contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected.

## **102. NEV-SAFETY-102 - Sulfur Accumulation And Localized Corrosion**

SAR Subsection 2.3.6.4 and similar subsections fail to consider the possibility of sulfur accumulation at the metal-passive film interface during slow passive corrosion, which could lead to an increased susceptibility to localized corrosion.

### **RESPONSE**

Nevada alleges that SAR Section 2.3.6.4 and similar subsections failed to consider the possibility of sulfur accumulations at the passive film interface of Alloy 22, which Nevada contends could increase the waste package's susceptibility to localized corrosion. In short, Nevada contends that DOE has not sufficiently studied a *possible* cause of corrosion on the waste package. Nevada offers little more than speculation and conjecture, however, to demonstrate that sulfur accumulations are a problem for Alloy 22. Moreover, even if Nevada could show that DOE underestimated the possible causes of corrosion, Nevada fails to demonstrate that the waste packages will be compromised as a result or that the alleged deficiency would have any impact on DOE's ability to limit radiological exposures and releases. Consequently, this contention fails to raise a genuine dispute on a material issue of law or fact.

#### **a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

#### **b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. §

63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. While Nevada contends that DOE’s tests were insufficient to account for sulfur accumulation, Nevada has not alleged an increase in the mean dose *above regulatory limits*. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a

difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The premise of Nevada’s contention is that DOE allegedly failed to adequately account for the “*possibility*” sulfur accumulations at the passive film interface of Alloy 22, which Nevada contends could increase the chance of localized corrosion on the waste package. Petition at 549. As explained above, these assertions do not give rise to a material deficiency. As such, they do not support a finding that there is a genuine dispute on a material issue of law or fact. An allegation that some aspect of a license application is “inadequate” or unacceptable does not give rise to a genuine dispute unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990).

While Nevada speculates that sulfur accumulation “could” increase rates of localized corrosion (Petition at 548), Nevada fails to demonstrate any significance for DOE’s corrosion analysis. DOE already has incorporated numerous cautious but reasonable assumptions. *See*

SAR 2.3.6.4.3.1.3. Nevada does not explain why that approach is not consistent with the reasonable expectation standard and is not sufficient. Nevada provides no quantitative or even qualitative information regarding whether and the extent to which possible sulfur accumulation would materially change DOE's corrosion analysis, let alone what impact it would have on DOE's ability to limit radiological exposures and releases.

Nevada's own cited references hardly amount to sound support for this contention, much less do they establish a genuine dispute of a material issue. For example, referencing "Corrosion Mechanisms in Theory and Practice," Nevada asserts that "it is well-known within the corrosion community that the corrosion rate of nickel is markedly increased by the generation of a layer of sulfur at the metal-passive film interface by a process known as "anodic segregation." Petition at 542. This same document, however, notes that the "anodic segregation rate *depends* on the sulfur content of the material and on the rate of anodic dissolution." Marcus, P. (2002), Corrosion Mechanisms in Theory and Practice, ISBN 0824706668, 9780824706661 (CRC Press) at 294 (emphasis added). Nevada speculates that Alloy 22 is more susceptible to corrosion in the presence of sulfur, but it bases that conclusion on research conducted on the passive film of nickel and Alloy 600, not Alloy 22. Petition at 547. Indeed, the same researcher acknowledged that he had "no published data on quantitative measurements of the composition of the passive film on Alloy 22 under the conditions of the Yucca Mountain repository site." P. Marcus, "Long Term Extrapolation of Passive Behavior," Proceedings from an International Workshop on Long-Term Extrapolation of Passive Behavior (July 19-20, 2001), United States Nuclear Waste Technical Review Board, LSN#: NEV000003496 at 56. Moreover, not only was sulfur accumulation only hypothesized as a mechanism that "may" be responsible for passivity breakdown (*id.*), but the researcher concluded that whether passivity breakdown "could occur on

Alloy 22 under repository condition is not known.” *Id.* at 59. Thus, Nevada’s reliance on this that single study is unwarranted.

Nevada also speculates that “interfacial sulfur concentration approaching one monolayer” is required for passivity breakdown (Petition at 547-48), but it offers no support for that measurement with respect to Alloy 22. Again, it relies on research related to nickel and nickel-iron alloys, not Alloy 22 (for which the researcher had no data). Nevada hedges by asserting that sulfur can aid initiation of localized corrosion, which it says “does not appear to be subject to a critical potential requirement” (Petition at 548), but it offers no support for that statement.

As another of Nevada’s reference sources observed, the calculations for passivity breakdown for nickel-iron alloys “may not be applicable if the sulfur-related degradation mechanism for Alloy 22 is different than that for Ni-Fe alloys.” H. Jung, et al., “A Review of the Long-Term Persistence of the Passive Film on Alloy 22 in Potential Yucca Mountain Repository Environments” (Oct. 2007), LSN# NRC000029382 at 4-13 [hereinafter, “Review of Long-Term Persistence”]. In fact, Alloy 22 is based on a different composition of metals – including chromium and molybdenum – that have been shown to counteract the effects of sulfur accumulation.

Nevada tries to downplay or ignore this fact, insisting that there is “no direct experimental evidence” to show that “molybdenum tends to counter the deleterious effect of sulfur.” Petition at 548. To the contrary, the Sandia National Labs report on which much of SAR 2.3.6.4 is based observed, on the very same page cited by Nevada, that there is a “consensus” that molybdenum reduce the rate of anodic dissolution and thus inhibits passivity breakdown. Sandia National Laboratories (2007) “General Corrosion and Localized Corrosion

of Waste Package Outer Barrier,” ANL-EBS-MD-000003 Rev 03, LSN# DN2002460404 at 6-14.

Nevada simply offers no evidence that Alloy 22, as opposed to other materials, is subject to passive film breakdown in the repository environment. Indeed, Nevada ignores contrary DOE test data cited by Nevada’s own cited references:

Based on the currently available long-term corrosion test data for Alloy 22, such as that obtained at the DOE long-term corrosion test facility, there is no evidence or any indication of sulfur-induced film breakdown for Alloy 22, suggesting that the beneficial role of alloying elements (e.g., molybdenum and chromium) overcome any potential anodic sulfur segregation.

Review of Long-Term Persistence, LSN# NRC000029382 at 4-15. Nevada’s unsupported speculation to the contrary simply does not create a genuine dispute on a material issue.

Furthermore, the regulations require evaluation of degradation processes in detail only “*if* the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be *significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that possible presence of sulfur accumulation – which is uncertain and unverified by any study – would increase those risks at all, let alone that they would be “significantly changed by their omission.”

Nevada essentially admits in paragraph 6 of its contention that it does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 570. The petitioner has the burden of showing that its proposed

contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. For this reason and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**103. NEV-SAFETY-103 - Sulfur Accumulation And Stress Corrosion Initiation**

SAR Subsection 2.3.6.5 and similar subsections fail to consider the possibility of sulfur accumulation at the metal-passive film interface and at grain boundaries in the alloy during a combination of slow passive corrosion and exposure at relatively high temperature, which would create a strong susceptibility to stress corrosion crack initiation.

**RESPONSE**

This contention alleges that SAR subsection 2.3.6.5 and similar subsections fail to consider the possibility of sulfur accumulation at the metal-passive film interface and at grain boundaries in the alloy during a combination of slow passive corrosion and exposure at relatively high temperature, which would create a strong susceptibility to stress corrosion crack initiation.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada generically claims noncompliance with a litany of regulatory provisions in 10 C.F.R. Part 63, including §§ 63.31, 63.21, 63.113, 63.114, and 63.115. Petition at 551-52. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere

assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” Petition at 552. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Specifically, although Nevada alleges that DOE failed to consider the possibility of sulfur accumulation at the metal-passive film interface and at grain boundaries in the alloy during a combination of slow passive corrosion and exposure at relatively high temperature (Petition at 554), Nevada fails to establish that the alleged error is relevant to DOE’s compliance with any Part 63 requirement.

Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. See 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the

uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing stress corrosion cracking is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit

being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. To the extent this contention relies upon expert opinion, it fails to meet those standards because Nevada's Petition does attach several affidavits (by Maurice E. Morgenstein, Michael C. Thorne, and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

According to Nevada, the SAR fails to consider the possibility of sulfur accumulation at the metal-passive film interface and at grain boundaries in the alloy during a combination of slow passive corrosion and exposure at relatively high temperature, which would create a strong susceptibility to stress corrosion crack initiation. For several reasons, this contention does not establish a genuine dispute of material fact.

First, this contention is filled with speculation and conjecture. In its “Brief Summary of the Contention” in the second paragraph, Nevada acknowledges that “sulfur accumulation at the alloy-passive film interface, coupled with sulfur segregation to grain boundaries, *may be expected to facilitate* crack initiation ....” Petition at 551 (emphasis added). Indeed, Nevada indicates that [s]ulfur *is expected* to accumulate under the passive film ... and it *can be expected* to surface diffuse to grain boundaries during the high temperature phase of repository life.” Petition at 553.

Nevada’s own cited references hardly amount to sound support for this contention, much less do they establish a genuine dispute on a material issue. For example, as indicated above, Nevada alleges that sulfur is expected to accumulate under passive film as sulfur in the alloy is left behind during the slow passive corrosion. Petition at 553. The same researcher Nevada used as support for this premise has acknowledged, however, that he had “no published data on quantitative measurements of the composition of the passive film on Alloy 22 under the conditions of the Yucca Mountain repository site.” P. Marcus, “Long Term Extrapolation of Passive Behavior,” Proceedings from an International Workshop on Long-Term Extrapolation of Passive Behavior (July 19-20, 2001), United States Nuclear Waste Technical Review Board, LSN#: NEV000003496 at 56. Moreover, not only was sulfur accumulation only hypothesized as a mechanism that “may” be responsible for passivity breakdown (*id.*), but the researcher concluded that whether passivity breakdown “could occur on Alloy 22 under repository condition is not known.” *Id.* at 59. Thus, Nevada’s reliance on this single study is unwarranted.

As another of Nevada’s reference sources observed, the calculations for passivity breakdown for nickel-iron alloys “may not be applicable if the sulfur-related degradation mechanism for Alloy 22 is different than that for Ni-Fe alloys.” H. Jung, et al., “A Review of the

Long-Term Persistence of the Passive Film on Alloy 22 in Potential Yucca Mountain Repository Environments” (Oct. 2007), LSN# NRC000029382 at 4-13 [hereinafter, “Review of Long-Term Persistence”]. In fact, Alloy 22 is based on a different composition of metals – including chromium and molybdenum – that have been shown to counteract the effects of sulfur accumulation.

Nevada attempts to minimize this fact, asserting that there is “no direct experimental evidence” to show that “molybdenum tends to counter the deleterious effect of sulfur.” Petition at 553. To the contrary, the Sandia National Labs report on which much of SAR 2.3.6 is based observed, on the very same page cited by Nevada, that there is a “consensus” that molybdenum reduces the rate of anodic dissolution and thus inhibits passivity breakdown. Sandia National Laboratories (2007) “General Corrosion and Localized Corrosion of Waste Package Outer Barrier,” ANL-EBS-MD-000003 Rev 03, LSN# DN2002460404 at 6-14.

Nevada simply offers no evidence that Alloy 22, as opposed to other materials, is subject to passive film breakdown in the repository environment. Indeed, Nevada ignores contrary data in its own cited references:

Based on the currently available long-term corrosion test data for Alloy 22, such as that obtained at the DOE long-term corrosion test facility, there is no evidence or any indication of sulfur-induced film breakdown for Alloy 22, suggesting that the beneficial role of alloying elements (e.g., molybdenum and chromium) overcome any potential anodic sulfur segregation.

Review of Long-Term Persistence, LSN# NRC000029382 at 4-15. Nevada’s unsupported speculation to the contrary simply does not create a genuine dispute on a material issue.

Nevada asserts that because DOE’s consideration of stress corrosion crack initiation due to sulfur accumulation is deficient, the SAR is “non-conservative.” Petition at 553. As DOE explains in the SAR, however, “[f]or modeling purposes, it is conservatively assumed that,

regardless of the environment, the waste package will undergo stress corrosion cracking if the stress conditions are met. This is a *significant* conservatism in light of the high corrosion resistance of Alloy 22 and the fact that only aggressive environments support stress corrosion cracking.” SAR 2.3.6.5.1. Despite the fact that DOE already has incorporated conservatism in its model, Nevada fails to explain why this conservatism is not sufficient.

Moreover, as discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this infirmity. Nevada provides no quantitative or even qualitative information regarding whether and the extent to which this corrosion would impact the disposal system.

Furthermore, the regulations require evaluation of degradation processes in detail only “*if* the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be *significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that possible presence of sulfur accumulation—which is uncertain and unverified by any study—would increase those risks at all, let alone that they would be “significantly changed by their omission.” Thus, Petitioner fails to demonstrate a genuine dispute.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 555. The petitioner has the burden of showing that its proposed contentions meets the

requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected.

**104. NEV-SAFETY-104 - Sulfur Accumulation and Stress Corrosion Propagation**

SAR Subsection 2.3.6.5 and similar subsections fail to consider the possibility of sulfur accumulation at the metal-passive film interface, and at grain boundaries in the alloy during a combination of slow passive corrosion and exposure at relatively high temperature, which could lead to an increased susceptibility to stress corrosion crack propagation.

**RESPONSE**

This contention alleges that SAR subsection 2.3.6.5 and similar subsections fail to consider the possibility of sulfur accumulation at the metal-passive film interface and at grain boundaries in the alloy during a combination of slow passive corrosion and exposure at relatively high temperature, which would lead to an increased susceptibility to stress corrosion crack propagation.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada generically claims noncompliance with a litany of regulatory provisions in 10 C.F.R. Part 63, including §§ 63.31, 63.21, 63.113, 63.114, and 63.115. Petition at 556-57.

Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 557. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied,” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Specifically, although Nevada alleges that “sulfur accumulation at the alloy-passive film interface, coupled with sulfur segregation to grain boundaries, may be expected to lead to a reduced value of  $K_{ISCC}$  and more parid crack growth” (Petition at 556), Nevada fails to establish that the alleged error is relevant to DOE’s compliance with any Part 63 requirement.

Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere,

and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing stress corrosion cracking is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. To the extent this contention relies upon expert opinion, it fails to meet those standards because Nevada’s Petition does attach several affidavits (by Maurice E. Morgenstein, Michael C. Thorne, and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

According to Nevada, the SAR fails to consider the possibility of sulfur accumulation at the metal-passive film interface and at grain boundaries in the alloy during a combination of slow passive corrosion and exposure at relatively high temperature, which could lead to an increased susceptibility to stress corrosion crack propagation. For several reasons, this contention does not establish a genuine dispute on a material issue of fact.

First, this contention is filled with speculation and conjecture. In its “Brief Summary of the Contention” in the second paragraph, Nevada acknowledges that “sulfur accumulation at the alloy-passive film interface, coupled with sulfur segregation to grain boundaries, *may be*

*expected* to lead to a reduced value of  $K_{ISCC}$  and more rapid crack growth.” Petition at 556 (emphasis added). Indeed, Nevada indicates that [s]ulfur *is expected* to accumulate under the passive film ... and it *can be expected* to surface diffuse to grain boundaries during the high temperature phase of repository life.” *Id.* at 558 (emphasis added).

Nevada’s cited references do not support for this contention, nor do they establish a genuine dispute on a material issue of fact. For example, as discussed above, Nevada alleges that sulfur is expected to accumulate under passive film as sulfur in the alloy is left behind during the slow passive corrosion. *Id.* at 558. The same researcher Nevada used as support for this premise has acknowledged, however, that he had “no published data on quantitative measurements of the composition of the passive film on Alloy 22 under the conditions of the Yucca Mountain repository site.” P. Marcus, “Long Term Extrapolation of Passive Behavior,” Proceedings from an International Workshop on Long-Term Extrapolation of Passive Behavior (July 19-20, 2001), United States Nuclear Waste Technical Review Board, LSN#: NEV000003496 at 56. Moreover, not only was sulfur accumulation only hypothesized as a mechanism that “may” be responsible for passivity breakdown (*id.*), but the researcher concluded that whether passivity breakdown “could occur on Alloy 22 under repository condition is not known.” *Id.* at 59. Thus, Nevada’s reliance on this single study is unwarranted.

As another of Nevada’s reference sources observed, the calculations for passivity breakdown for nickel-iron alloys “may not be applicable if the sulfur-related degradation mechanism for Alloy 22 is different than that for Ni-Fe alloys.” H. Jung, *et al.*, “A Review of the Long-Term Persistence of the Passive Film on Alloy 22 in Potential Yucca Mountain Repository Environments” (Oct. 2007), LSN# NRC000029382 at 4-13 [hereinafter, “Review of Long-Term Persistence”]. In fact, Alloy 22 is based on a different composition of metals –

including chromium and molybdenum – that have been shown to counteract the effects of sulfur accumulation.

Nevada attempts to minimize this fact, asserting that there is “no direct experimental evidence” to show that “molybdenum tends to counter the deleterious effect of sulfur.” Petition at 559. To the contrary, the Sandia National Labs report, on which much of SAR 2.3.6 is based observed, on the very same page cited by Nevada, that there is a “consensus” that molybdenum reduce the rate of anodic dissolution and thus inhibits passivity breakdown. Sandia National Laboratories (2007) “General Corrosion and Localized Corrosion of Waste Package Outer Barrier,” ANL-EBS-MD-000003 Rev 03, LSN# DN2002460404 at 6-14.

Nevada simply offers no evidence that Alloy 22, as opposed to other materials, is subject to passive film breakdown in the repository environment. Indeed, Nevada ignores contrary data cited in its own references:

Based on the currently available long-term corrosion test data for Alloy 22, such as that obtained at the DOE long-term corrosion test facility, there is no evidence or any indication of sulfur-induced film breakdown for Alloy 22, suggesting that the beneficial role of alloying elements (e.g., molybdenum and chromium) overcome any potential anodic sulfur segregation.

Review of Long-Term Persistence, LSN# NRC000029382 at 4-15. Nevada’s unsupported speculation to the contrary simply does not create a genuine dispute on a material issue.

Nevada also asserts that because DOE’s consideration of stress corrosion propagation due to sulfur accumulation is deficient, the SAR is “non-conservative.” Petition at 558. As DOE explains in the SAR, however, “[f]or modeling purposes, it is conservatively assumed that, regardless of the environment, the waste package will undergo stress corrosion cracking if the stress conditions are met. This is a *significant* conservatism in light of the high corrosion

resistance of Alloy 22 and the fact that only aggressive environments support stress corrosion cracking.” SAR 2.3.6.5.1. Despite the fact that DOE already has incorporated conservatism in its model, Nevada fails to explain why this conservatism is not sufficient.

Moreover, as discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this infirmity. Nevada provides no quantitative or even qualitative information regarding whether and the extent to which this corrosion would impact the disposal system.

Furthermore, the regulations require evaluation of degradation processes in detail only “*if* the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be *significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that possible presence of sulfur accumulation—which is uncertain and unverified by any study – would increase those risks at all, let alone that they would be “*significantly changed by their omission.*” Thus, Petitioner fails to demonstrate a genuine dispute.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 560. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is

Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, this contention does not establish a genuine dispute on a material issue of fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected.

**105. NEV-SAFETY-105 - Drip Shield Corrosion Environment**

SAR Subsection 2.3.6.8 and similar subsections, fail to provide a realistic model of the corrosion behavior of the drip shield because they are based on inappropriate test conditions.

**RESPONSE**

In this contention, Nevada alleges that DOE's model of the drip shields' corrosion behavior, which is discussed in SAR Section 2.3.6.8, is based on unrealistic test conditions. In addition to its pleading deficiencies discussed herein, Nevada fails to provide a reasoned basis to substantiate its conclusions. Moreover, even if Nevada could show that DOE underestimated the rate of corrosion, Nevada fails to demonstrate that the drip shields will be compromised as a result or that the alleged deficiency would have any impact on DOE's ability to limit radiological exposures and releases. Consequently, this contention fails to raise a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” Petition at 562. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic

setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Although Nevada quarrels with the test conditions DOE used to model corrosion behavior of the drip shields (Petition at 562-64), Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative

analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

While Nevada asserts that DOE's test conditions have the *potential* to underestimate the rate of corrosion, which it contends has the *potential* to underestimate dose exposure to the reasonably maximally exposed individual (Petition at 563), Nevada has not alleged an actual increase in the mean dose *above regulatory limits*. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. Although not referenced in this contention, three affidavits attached to Nevada's Petition to Intervene as a Full Party states that the affiant "adopts" the discussion in paragraphs 5 and 6 of this contention. *See* Petition at Attachments 3, 17, and 18. As discussed in more detail in Section V.A.3 of this Answer, such affidavits are not sufficient to satisfy the requirements of Section 2.309(f)(1)(v) to provide conclusions supported by reasoned bases or explanation. Indeed, because the contention itself does not even refer to the affidavits, it is unclear which statements are facts or opinions belonging to the technical experts as opposed to legal argument that cannot be ascribed to those experts.

Even if this contention were construed to have been written by those expert, Nevada still fails to provide any support for the proposition that DOE's model for assessing the corrosion behavior of the titanium drip shields is "unrealistic." Petition at 561. Nevada asserts that DOE should have used "drop evaporation tests" to model the corrosion properties of the drip shields.

But Nevada's references do not purport to evaluate DOE's model or to quantify what effect using the alternative tests postulated by Nevada would have on DOE's model. Thus, they do not demonstrate that DOE's model is "unrealistic."

Nevada references two studies that it says support its contention (Petition at 563), but those studies do not evaluate DOE's model, nor do they provide information showing that DOE's model is unrealistic. "[T]he Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention." *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff'd on other grounds*, CLI-98-13, 48 NRC 26.

Neither of Nevada's referenced studies involved the titanium alloy proposed for use in the drip shields. While the drip shields will be composed of the titanium alloy Ti-7 (SAR 2.3.6-70), the tests reported by Nevada's consultants involved only the C-22 Alloy proposed for the waste packages. See "Final Results for C22 Corrosion Test" (04/16/08), LSN# NEV000005219; "Effects of Concentrated Hydrochloric and Nitric Acids and NaF on the Corrosion of C-22 Alloy at 25 and 90C; a Model for Rapid Penetration of C-22" (12/30/1995), LSN# NEV000004183. Neither report even mentions titanium, let alone attempts to calculate the rate of corrosion for that alloy.

Nevada also suggests that DOE should have followed a Scientific Investigation Plan (prepared by the University and Community College System of Nevada) that proposed using a "heated electrode approach" to study the corrosion behavior of the C-22 Alloy. Petition at 563 (citing "Environmental Effects on Corrosion Properties of Alloy 22" (11/10/2004), LSN# DN2002246302 [hereinafter, "Environmental Effects"]). But that document likewise has nothing to say about Ti-7 or the drip shields. Furthermore, as with the two studies discussed

above, the Environmental Effects report does not discuss DOE's actual testing model, nor does it say that DOE's model is inadequate or unreliable. Indeed, the report makes clear that there "isn't a significant amount of work addressing wet-dry environments in detail" and it is "not known" how Alloy-22 would perform under these conditions (Environmental Effects at 22), much less could that report predict whether cyclic wet-dry testing would make any difference to DOE's corrosion modeling with respect to Ti-7 drip shields, which it never considered.

Nor does Nevada suggest any means for extrapolating relevant data from its C-22 tests to apply to Ti-7. Given that Ti-7 is composed of different elements and has corrosion properties distinct from those of C-22,<sup>66</sup> it is not evident that test results concerning C-22 would have any application to Ti-7. Nevada provides no reference to any tests, scholarly references, or expert opinion to even suggest that its "drop evaporation tests" have any application to the titanium alloy used in the drip shields.

Equally unhelpful, Nevada refers to another test of C-22 "in the particular context of SCC," which Nevada says shows that drop evaporation provides "rather severe test conditions for stainless alloys exposed to chloride solutions." Petition at 563 (citing "Corrosion of Metals and Alloys – Evaluation of Stress Corrosion Cracking by the Drop Evaporation Test," ISBN 978 0 580 60538 3). Again, Nevada does not offers no support for relating that study's supposed finding to the titanium alloy used for drip shields. Moreover, DOE excluded stress corrosion cracking (SCC) from the TSPA because "the presence of cracks will not affect the performance of the drip shield in preventing or substantially reducing the amount of water that could directly

---

<sup>66</sup> The properties of Ti-7 are described in the SAR at 2.3.6-71 and 2.3.6-144 (Table 2.3.6-23). The outer barrier of the waste package is made from C-22 Alloy, which is a nickel-chromium-molybdenum alloy, as further described in §§ 1.5.2.1, 2.3.6.7, and at 1.5.2-26 (Table 1.5.2-4).

contact the wastes package . . . .” SAR 2.3.6-86. Nevada fails to explain why a test related to SCC has any relevance in the context of drip shields.

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada fundamentally complains that DOE’s model for assessing the corrosion behavior of the drip shield’s titanium alloy has the *potential* to underestimate the degree and rate of corrosion. Petition at 563. As explained above, these assertions do not give rise to a material deficiency. Nevada has not stated what radiological impact its proposed alternative test conditions would have on the corrosion modeling. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co. (Turkey Point Plant, Unit Nos. 3 and 4)*, LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990).

Nevada has not attempted to quantify the supposed accelerated corrosion (if any) that it contends would be shown under “drop evaporation conditions.” Petition at 563. Indeed, Nevada concedes that its proposed alternative model, at best, may suggest that DOE’s model has the “*potential* to underestimate” the rate and degree of corrosion, which has the “*potential* to result in significant under-estimate” of the potential dose to the reasonably maximally exposed individual. *Id.* Thus, Nevada offers nothing more than speculation, which simply does not create a genuine dispute on a material issue.

Nevada provides no support for questioning DOE's use of "bulk liquid environments in isothermal conditions." Petition at 562. Indeed, the DOE's TSPA model "conservatively applies aqueous general corrosion of the drip shield for all repository conditions, even when the drip shield is dry." SAR at 2.3.6-71. Nevada does not explain why that conservatism is insufficient to account for Nevada's concerns.

Furthermore, the regulations require evaluation of degradation processes in detail only "if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission." 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that DOE in fact underestimated the rate of corrosion for the titanium drip shields or that it failed to account for any relevant degradation process that would have any material effect on radiological releases, much less has Nevada shown that DOE's model would be "significantly changed" by omission of the test conditions proposed by Nevada.

Nevada essentially admits in paragraph 6 of its contention that it does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 565. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada's

contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For this reason and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**106. NEV-SAFETY-106 - Waste Container Corrosion Environment**

SAR Subsection 2.3.6.3 and similar subsections fail to provide a realistic model of the corrosion behavior of the canister because they are based on inappropriate test conditions.

**RESPONSE**

In this contention, Nevada alleges that DOE's model of the waste container's corrosion behavior, which is discussed in SAR Section 2.3.6.3, is based on unrealistic test conditions. In addition to its pleading deficiencies discussed herein, Nevada fails to provide a reasoned basis to substantiate its conclusions. Moreover, even if Nevada could show that DOE underestimated the rate of corrosion, Nevada fails to demonstrate that the waste containers will be compromised as a result or that the alleged deficiency would have any impact on DOE's ability to limit radiological exposures and releases. Consequently, this contention fails to raise a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 566-67. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue . . . .” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete

assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Although Nevada objects to the test conditions DOE used to model corrosion behavior of the waste containers (Petition at 567-69), Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository.

Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. Petition at 567. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to

provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. Although Nevada references several studies that it says support its contention (Petition at 568), “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff'd on other grounds*, CLI-98-13, 48 NRC 26.

Nevada's references do not offer substantial support for this contention, as shown below.

Nevada fundamentally contends that DOE's does not use a “realistic model” for assessing the corrosion behavior of the C-22 Alloy waste canisters. Petition at 566. None of its references, however, suggest that DOE's model is unrealistic. Nevada asserts that DOE should have used a “drop evaporation test” to model the C-22 Alloy's corrosion behavior. Petition at 568. But Nevada's references on this point fail to provide any information to indicate that Nevada's supposed alternative model would tend to show that DOE's model is “unrealistic.”

Referring to ISO Standard ISO 15324:2008, Nevada asserts that “drop evaporation tests” have been shown to “provide severe test conditions for stainless alloys exposed to chloride solutions.” Petition at 568 (citing ISO Standard ISO 15324:2008, “Corrosion of Metal and Alloys – Evaluations of Stress Corrosion Cracking by the Drop Evaporation Test,” ISBN 978 0 580 605383). Evidently recognizing that C-22's corrosion behavior cannot be directly inferred

from findings reported with respect to stainless alloys, Nevada indicates that it commissioned its own experiments.

Nevada references the two reports from its experiments that it says support its theory that dry-wet cycling will “modify the severity of the corrosion conditions.” Petition at 567. Neither of the referenced reports, however, makes any comparison to the actual model used by DOE. *See* “C-22 Corrosion in Dripped Pore Water. Final Report for Phase II A & B” (2008), LSN# NEV000005216; “Experiments Devised to Studying Temperature and Geometry Effect of Corrosion of C-22 Alloy, Final Report for Phase II C & D” (2008), LSN# NEV000005235. Indeed, neither report mentions the DOE model. Nor do those reports discuss whether DOE’s conservative assumptions (*see, e.g.,* SAR at 2.3.6-18, 30, 37-38, 45-46) are sufficient to account for the effects that Nevada’s studies attempt to analyze. Thus, the reports do not support the conclusion that DOE’s model is unrealistic or unreliable.

Nevada also suggests that DOE should have followed a Scientific Investigation Plan (prepared by the University and Community College System of Nevada) that proposed using a “heated electrode approach” to study the corrosion behavior of the C-22 Alloy. Petition at 568 (citing “Environmental Effects on Corrosion Properties of Alloy 22” (11/10/2004), LSN# DN2002246302 [hereinafter, “Environmental Effects”]). As with the two reports discussed above, however, the Environmental Effects report does not discuss DOE’s actual testing model, nor does it say that DOE’s model is inadequate or unreliable. While the report’s authors postulate that cyclic wet-dry testing may better approximate repository conditions than a test involving “continuous exposure to aqueous environments” (Environmental Effects at 22), the report does not endeavor to evaluate DOE’s model, nor does it discuss whether DOE’s conservative assumptions (*see, e.g.,* SAR at 2.3.6-18, 30, 37-38, 45-46) are sufficient to account

for the effects of the authors' hypotheses. Indeed, the report makes clear that there "isn't a significant amount of work addressing wet-dry environments in detail" and it is "not known" how Alloy-22 would perform under these conditions (Environmental Effects at 22), thus it offers at most speculation that cyclic wet-dry testing would make any difference to DOE's corrosion modeling.

Although not referenced in this contention, Nevada also attaches three affidavits to its Petition that each state that the affiant "adopts" the discussion in paragraphs 5 and 6 of this contention. *See* Petition at Attachments 3, 17, and 18. As discussed in more detail in Section V.A.3 of this Answer, such affidavits are not sufficient to satisfy the requirements of Section 2.309(f)(1)(v) to provide conclusions supported by reasoned bases or explanation. Indeed, because the contention itself does not even refer to the affidavits, it is unclear which statements are facts or opinions from the technical experts as opposed to legal argument that cannot be ascribed to those experts. Even if this contention were construed to have been written by those experts, the three affidavits fail to provide any support for the proposition that "drop evaporation tests" should have been used to measure the corrosion properties of the waste canisters. Petition at 567-69. Moreover, Nevada offers no support with reference to scholarly sources, expert opinion, or test reports to show that DOE's actual model, including its conservative assumptions, is "unrealistic" or in any way inadequate.

Significantly, Nevada's theory of more aggressive corrosion than DOE has predicted depends on a mistaken premise: that the "real exposure will predominantly involve cooler liquids dripping onto [the canister's] relatively hot metal surface and evaporating." Petition at 567. This premise is mistaken for at least two reasons.

First, Nevada ignores the function of the drip shield, which will prevent water seepage from dripping onto the Alloy 22 waste canister during the period when the waste canister's surface will be "relatively hot" as postulated in Nevada's experiments. In fact, in the Nominal Modeling Case, initial breaches of the drip shield will not occur until approximately 230,000 years postclosure. *See* SNL (Sandia National Laboratories) 2008. Total System Performance Assessment Model /Analysis for the License Application. MDL-WIS-PA-000005 REV 00 AD 01. Las Vegas, Nevada: Sandia National Laboratories. ACC: DOC.20080312.0001; LLR.20080414.0037; LLR.20080507.0002; LLR.20080522.0113; DOC.20080724.0005; DOC.20080106.0001. DIRS 183478. LSN#: DEN001579005. Participant # DOC.20080312.0001. [hereinafter, TSPA Analysis] at 6.3.5-17. Even in case of seismic hazards, the drip shield are estimated to preclude seepage for at least 10,000 years. *Id.* at 7.3.2-7 and Fig. 7.3.2-16. The high temperature regime during which Alloy 22 is most susceptible to localized corrosion, however, will have been over well before 10,000 years. *Id.* at Figs. 6.3.2-5 and 6.3.2-6. Accordingly, even if there were seepage during the high temperature period, it would not drip onto the waste canister in virtually all cases because of the drip shield. Accordingly, the cyclic dripping and dryout process Nevada postulates is rendered irrelevant by the drip shield.

Second, even if the drip shield were to fail, DOE's TSPA model either simultaneously accounts for waste canister failures in those circumstances, or it evaluates the environmental conditions and assumes the waste package fails where salts may precipitate on it and evolve into corrosive brines (*see* SAR 2.3.5.5.1 (discussing salt separation process)). Thus, any additional corrosion caused by cyclic dripping and dryout would be irrelevant because the waste canister already is predicted to have failed in all relevant circumstances. For example, in the Drip Shield

Early Failure Modeling Case, DOE has conservatively assumed that any Alloy 22 waste canister underneath an early-failed drip shield will be beached. *Id.* at 6.4-4. Likewise, the Igneous Intrusion Modeling Case assumes that all canisters will fail during an igneous event (at the same time the drip shields cease functioning). *Id.* at 6.5-4. And DOE conservatively assumed that the waste package and its drip shield fail at the same time by fault displacement. *Id.* at 6.6-17. Therefore, in each case of drip shield failure, any supposed effect from cyclic dripping and dryout already will be irrelevant because the TSPA model already assumes that the waste canister has failed in those circumstances.

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention, and it is based on a faulty premise in any event. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Although Nevada questions whether DOE has used a “realistic” model of the corrosion behavior of the waste containers (Petition at 569), it has not alleged, much less shown, a deficiency that would have any impact on DOE’s ability to limit radiological exposures and releases. As explained above, Nevada’s assertions do not give rise to a material deficiency. Nevada has not stated what radiological impact its proposed alternative test conditions would have on the corrosion modeling. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co. (Turkey Point Plant, Unit Nos. 3 and 4)*, LBP-90-16, 31 NRC 509, 521 (1990).

This contention is notable for what it does not say. It does not say that the waste canisters cannot perform their function. Indeed, Nevada has not indicated that it has quantified the presumed accelerated corrosion (if any) that it suggests would be shown under its proposed “drop evaporation conditions.” Petition at 569. Furthermore, DOE’s TSPA model “conservatively applies aqueous general corrosion of the drip shield for all repository conditions, even when the drip shield is dry.” SAR at 2.3.6-71. Nevada does not explain why that conservatism is insufficient to account for Nevada’s concerns.

Nor do Nevada’s cited experiments (Petition at 568) establish any genuine dispute on a material issue. As discussed above, the two reports cited by Nevada do not discuss DOE’s model or any implications that cyclic dry-wet testing would have on DOE’s model for demonstrating the reliability of the waste canisters. While Nevada’s experiments may reflect alternative test considerations, they do not show any material significance with respect to the waste canister’s ability to limit radiological releases and exposures.

Nevada asserts that its experiments “suggest” three findings (Petition at 568-69), but it does not explain how those conclusions have any bearing on DOE’s model or on the waste canister’s ability to limit radiological exposures and releases. First, Nevada asserts that its experiments “suggest” that “[s]ignificant localized corrosion was observed in the form of intergranular corrosion tunnels” (Petition at 568), but it does not establish what caused that corrosion or whether such corrosion was materially different than anything observed after DOE’s testing.

Nevada also reports observing “no differences between the corrosion reactions in the vapor and salt submersion portions of test samples. *Id.* at 569. But Nevada does not explain the

significance of that finding or how it could even suggest that DOE's tests could not be relied upon.

Finally, Nevada states that “[a] significant amount of SCC [stress corrosion cracking] was observed at the bottom of re-nucleating intergranular corrosion tunnels.” *Id.* The cited references, however, make no such explicit observation. In fact, they do not even mention “re-nucleating intergranular corrosion tunnels. Furthermore, Nevada does not explain what significance that fact would have for DOE's model. Indeed, DOE already “conservatively assumed that, regardless of the environment, the waste package will undergo stress corrosion cracking if stress conditions are met.” SAR at 2.3.6-45-46. Nevada has not shown – nor do its reported experiments purport to evaluate – whether the supposed “significant amount of SCC” its researchers observed is any more (or less) than DOE's model contemplates (*see* SAR Figure 2.3.6-29 at SAR at 2.3.6-173).

Even accepting Nevada's alleged findings, they simply do not demonstrate that the waste canister's ability to limit radiological releases and exposures has been compromised in any way. Furthermore, the regulations require evaluation of degradation processes in detail only “*if* the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be *significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that DOE underestimated the rate of corrosion for the waste canisters or that it failed to account for any relevant degradation process that would have any material effect on radiological releases, or that DOE's model would be “significantly changed” by omission of the test conditions proposed by Nevada. The mere speculation that a different test would show different results does not create a genuine dispute on a material issue.

Nevada essentially admits in paragraph 6 of its contention that it does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 569. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada’s contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For this reason and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**107. NEV-SAFETY-107 - Electrochemical Reduction Of Nitrate**

SAR Subsection 2.3.6.4.3.1.1 and similar subsections, which assert that nitrate is an inhibitor of corrosion, fail to take account of the loss of nitrate by electrochemical reaction.

**RESPONSE**

Nevada alleges that DOE's model of localized corrosion of Alloy 22, which is discussed in SAR Section 2.3.6.4.3.1.1, underestimates the degree of localized corrosion by allegedly failing to account for the loss of nitrate (which inhibits corrosion) caused by electrochemical reactions. In addition to its pleading deficiencies discussed herein, Nevada fails to provide a reasoned basis to substantiate its conclusions. Moreover, even if Nevada could show that DOE underestimated the rate of localized corrosion, Nevada fails to demonstrate that the waste containers will be compromised as a result or that the alleged deficiency would have any impact on DOE's ability to limit radiological exposures and releases. Consequently, this contention fails to raise a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 571-72. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue . . . .” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete

assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Although Nevada objects to DOE’s model for assessing the localized corrosion behavior of the waste containers (Petition at 571-72), Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository.

Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. Petition at 567. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to

provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references in support of its contention. Fundamentally, Nevada contends that DOE uses an “unreliable” model for studying localized corrosion (Petition at 573), but it offers no evidence to substantiate that assessment. “[T]he Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff'd on other grounds*, CLI-98-13, 48 NRC 26.

Although not referenced in this contention, Nevada attaches three affidavits to its Petition that each state that the affiant “adopts” the discussion in paragraphs 5 and 6 of this contention. *See* Petition at Attachments 3, 17, and 18. As discussed in more detail in Section V.A.3 of this Answer, such affidavits are not sufficient to satisfy the requirements of Section 2.309(f)(1)(v) to provide conclusions supported by reasoned bases or explanation. Indeed, because the contention itself does not even refer to the affidavits, it is unclear which statements are facts or opinions from the technical experts as opposed to legal argument that cannot be ascribed to those experts. Even if this contention were construed to have been written by those experts, the three affidavits fail to provide any support for the proposition that DOE's corrosion model is unrealistic.

Nevada contends that that DOE's “bulk immersion tests” would underestimate the rate of nitrate depletion (Petition at 573), but it does not identify or describe any alternative test that would be more accurate. Nevada postulates that nitrate depletion may be greater in what Nevada

describes as “more realistic thin liquid films resulting from seepage or salt deliquescence” (*Id.*), but Nevada does not refer to or describe any alternative test replicating such “thin [thin] liquid films” to measure the rate of nitrate depletion. Even when trying to explain the effects of seepage on nitrate levels, Nevada says nothing more than it “seems likely” – without reference to scholarly sources, expert opinion, or test reports – that seepage will “replenish” nitrate in some locations but not others. *Id.* That unsupported assertion is nothing more than unsubstantiated speculation.

Nevada purports to compare the rates of consumption of nitrate by electrochemical reactions in bulk immersions versus “thin liquid films resulting from seepage or salt deliquescence” (Petition at 573), but again it does not point to a single test or scholarly reference in support of its supposition. Nor does it attempt to quantify or supply any data to make sense of what Nevada describes as a “slow” reaction as opposed to a “very long reaction,” or what it means by “more aggressive solutions.” *Id.*

In sum, Nevada offers no more than speculation that (a) DOE has underestimated the rate of nitrate depletion, and (b) the supposed nitrate depletion postulated by Nevada would make any material difference to DOE’s corrosion modeling to deem it unrealistic. Not having referenced any documents, test data, or even scholarly references to support the contention, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Although Nevada deems DOE’s localized corrosion model “unreliable” (Petition at 573), it has not alleged, much less shown, that any actual impact on DOE’s ability to limit radiological exposures and releases. As explained above, Nevada’s assertions do not give rise to a material deficiency. Nevada has not stated what radiological impact its proposed alternative test

conditions would have on the corrosion modeling. Accordingly, it is impossible to assess what effect, if any, Nevada's claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co. (Turkey Point Plant, Unit Nos. 3 and 4)*, LBP-90-16, 31 NRC 509, 521 (1990).

This contention is notable for what it does not say. It does not say that the waste canisters cannot perform their function. Indeed, Nevada has not attempted to quantify the supposed “more severe localized corrosion” that it speculates would be shown by taking account of supposed nitrate losses. Petition at 571. Thus, Nevada cannot say that the supposed increased corrosion would have any material effect on the waste canisters' performance.

Nevada has not shown – nor does it identify any experiments, tests, or scholarly reference to explain – whether the supposed loss of nitrates in a “thin liquid films” (Petition at 573) would in fact cause any more localized corrosion than DOE's model predicts (*see* SAR at 2.3.6-163 to -171) (Figures 2.3.6-19 to- 27). Nor has Nevada shown that any *material* deficiency in DOE's model.

DOE's model in fact addressed the possibility of studying thin water films to assess corrosion. DOE instead assumed that localized corrosion “generated in fully immersed conditions” is “applicable to the localized corrosion process of the waste package in contact with thin water films resulting from seepage that have the same water chemistry as the fully immersed condition.” Sandia National Laboratories, “General Corrosion and Localized Corrosion of Waste Package Outer Barrier” (2007), ANL-EBS-MD000003 Rev. 3, Las Vegas, NV. (LSN# DN2002460404 at 5-2 [hereinafter, “General Corrosion”], at 5-2. That assumption is based on

the fact that a “similar stagnant boundary layer is formed in the creviced region in both” thin film and fully immersed cases and, moreover, “under inundated conditions, the metal is in contact with a practically unlimited reservoir of corrosive solution.” General Corrosion at 5-3. “In addition, without a bulk environment, the cathodic area outside the crevice will be limited, leading to a decrease in the ability to sustain the crevice corrosion.” *Id.* In short, DOE’s model is more conservative, which Nevada overlooks.

Furthermore, Nevada ignores numerous other conservative assumptions in DOE’s model that should negate the effect that Nevada describes. For example, DOE’s model treats all localized corrosion as crevice corrosion, which requires less aggressive conditions to initiate than pitting corrosion. SAR at 2.3.6-30. It also assumes a constant rate of propagation once corrosion starts, thus not taking credit for “changing conditions that would cause the propagation rate to slow or stop completely.” SAR at 2.3.6-31. DOE also assumed that crevice corrosion would occur at a constant rate “regardless of changes in the bulk chemical exposure environment.” General Corrosion at 6-102.

DOE also used laboratory solutions that contained nitrate ions but “did not contain other potentially inhibitive ions such as carbonate and sulfate. The presence of other inhibitive ions would be expected to result in a more benign environment than that which would be predicted by the localized corrosion model.” SAR at 2.3.6-36. Nevada does not explain why that conservatism, as well as other conservative assumptions (*see* SAR 2.3.6.4.3.1.3 at 2.3.6-37 to 2.3.6-38), is insufficient to account for Nevada’s concerns.

Even accepting as true Nevada’s unsubstantiated assertion that nitrate loss results in “more severe localized corrosion” than DOE has predicted (Petition at 571), that does not demonstrate that the waste canister’s ability to limit radiological releases and exposures has been

compromised in any way. The regulations require evaluation of degradation processes in detail only “*if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.*” 10 C.F.R. § 63.114(f) (emphasis added). Nevada has not shown that DOE underestimated the rate of localized corrosion for the waste canisters or that it failed to account for any relevant degradation process that would have any material effect on radiological releases, much less has Nevada shown that DOE’s model would be “significantly changed” by omission of possible nitrate loss by electrochemical reaction as Nevada suggests. The mere speculation that this consideration would cause the model to have different results does not create a genuine dispute on a *material* issue.

Nevada essentially admits in paragraph 6 of its contention that it does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 574. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada’s contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For this reason and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**108. NEV-SAFETY-108 - Molten Salt Corrosion Of The Canister**

SAR Subsection 2.3.6 and similar subsections, which treat the corrosion of the Alloy 22 canister, fail to consider molten salt corrosion.

**RESPONSE**

In this contention, Nevada alleges that “SAR Subsection 2.3.6 and similar subsections, which treat the corrosion of the Alloy 22 canister, fail to consider molten salt corrosion.” Petition at 575.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support

the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system

performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also, as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references to justify admission of its proffered contention. In particular, this contention does not reference any expert opinion or adequate documentary materials in support of its position. Therefore, it does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any relevant supporting documents -- the one document cited by Nevada appears to only offer background information relating to its assertion; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Maurice E. Morgenstein and Robert A. Cottis), which purportedly provide expert opinions to support this contention. Petition, Attachments 3, 17, and 18. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Even if the claims were construed to have been submitted by an expert, they still would not be sufficient to support admission of this contention.

First, Nevada asserts, without support or reference to any relevant scholarship, that "[i]t is well known in the corrosion community that molten salts *may be* significantly more corrosive than aqueous solutions, both because the temperature tends to be higher, and because of the

potential for fluxing oxides that are protective in aqueous solutions.” Petition at 577. Nevada also asserts that “[h]owever, there is no attempt to consider the possibility of molten salt corrosion in the SAR despite this clear evidence that molten salt mixtures can form with species that are expected to be available from the unsaturated zone water.” Petition at 577. Nevada concludes that “[t]he inclusion of molten salt corrosion *may* significantly degrade the performance of the waste package and the performance of the waste package is linked to the predicted dose to the RMEI.” Petition at 577 (emphasis added). However, Nevada fails to assert that the hypothetical circumstance it describes is certain to occur, or that it is probable, or even plausible. Nevada’s claims in this regard are conclusory and mere speculation, and cannot serve as adequate support for the admission of a contention.

Even if these claims were construed to have been submitted by an expert, they would not be sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26.

With respect to Nevada’s broad assertion that DOE failed to consider the possibility of corrosion due to the effects of molten salt, Nevada’s assertions provide no support to sustain the admissibility of the contention. In this regard, Nevada ignores the discussion provided in “Analysis of Dust Deliquescence for FEP Screening” (September 5, 2007), ANL-EBS-MD-000074 REV 001 AD 001, LSN# DN2002478854, relating to the potential occurrence of molten salts. In pertinent part, the discussion provides that there are thermal limitations for the formation of potential salt melts and that “... it appears that there is essentially no ‘temperature

limit' to deliquescent activity that can be applied to either [of the two assemblages of molten salts] as they both transition to salt melts at approximately 300°C and > 400°C, respectively.”

*See* “Analysis of Dust Deliquescence for FEP Screening (September 5, 2007), ANL-EBS-MD-000074 REV 001 AD 001, LSN# DN2002478854, in section 6.1.1[a] at 6.1.

As shown in Table 2.3.5-7 (“Peak Drift Wall and Waste Package Temperatures Over All Waste Packages Summarized for Seven Uncertainty Cases”), the peak waste package surface temperature will not go above 211°C even considering all of the uncertainty and variability. *See* SAR § 2.3.5 at 2.3.5-175. In the case of seismically induced drift collapse, if it occurs early some waste package peak surface temperatures will be higher, but the mean peak waste package surface temperature will still be less than 300°C. *See* SAR Figure 2.3.4-98 at 2.3.4-354. Further, SAR 2.3.5.6 provides that “[f]or seismically-induced drift collapse, a number of FEPs are thermally sensitive, but the likelihood for the peak temperature of any waste package to exceed 300°C is insignificant, considering the probability of a seismic event sufficient to cause drift collapse during the 90 years immediately after repository closure....” *See* SAR § 2.3.5.6 at 2.3.5-146.

Given the above analyses, there is negligible potential for the formation of even minor amounts of molten salt on the drip shield surface, and therefore potential corrosion effects from them are insignificant. In summary, the mass and conditional constraints on even the existence of molten salts on the drip shield in the post-closure system are more limited than those for the extensively evaluated process of dust deliquescence effects on corrosion of the drip shield, and therefore, this molten salt corrosion process is of no material consequence.

Thus, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

In an attempt to demonstrate a genuine dispute in subsection 6 of the contention, Nevada states that its “... contention challenges SAR Subsection 2.3.6 and similar subsections, which treat the corrosion of the Alloy 22 canister, because they fail to consider molten salt corrosion.” Petition at 577. In this regard, Nevada merely repeats its unsupported, conclusory and speculative claim from its purported “Statement of the Facts or Expert Opinions” discussed above. This bare assertion cannot provide adequate support for a contention. A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc. (Oyster Creek Nuclear Generating Station)*, CLI-00-06, 51 NRC 193, 208 (2000)).

Nevada states that SAR Subsection 2.3.6 and similar subsections “do not comply with 10 C.F.R. § 63.114(f), which requires that any performance assessment used to demonstrate compliance with Section 63.113 must provide the technical basis for either inclusion or exclusion of degradation, deterioration, or alteration processes of engineered barriers in the performance assessment . . . and that . . . degradation, deterioration, or alteration processes of engineered barriers must be evaluated in detail if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.” Petition at 577.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada's contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

For these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**109. NEV-SAFETY-109 - Molten Salt Corrosion Of The Drip Shield**

SAR Subsection 2.3.6.8 and similar subsections, which treat the corrosion of the drip shield, fail to consider molten salt corrosion.

**RESPONSE**

In this contention, Nevada alleges that “SAR Subsection 2.3.6 and similar subsections, which treat the corrosion of the drip shield, fail to consider molten salt corrosion.” Petition at 579.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies a number of regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support

the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the effects of corrosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system

performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada has failed to provide the requisite supporting facts, expert opinion, or references to justify admission of its proffered contention. In particular, this contention does not reference any expert opinion or adequate documentary materials in support of its position. Therefore, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any relevant supporting documents -- the one document cited by Nevada appears to only offer background information relating to its assertion; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach three affidavits (by Maurice E. Morgenstein, Robert A. Cottis, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

First, Nevada asserts, without support or reference to any relevant scholarship, that "[i]t is well known in the corrosion community that molten salts may be significantly more corrosive than aqueous solutions, both because the temperature tends to be higher, and because of the *potential* for fluxing of oxides that are protective in aqueous solutions." Petition at 580 (emphasis added). Nevada also asserts that "[h]owever, there is no attempt to consider the

*possibility* of molten salt corrosion of the drip shield, which if considered *may* significantly degrade the performance of the drip shield and the performance of the drip shield is linked to the predicted dose to the RMEI.” Petition at 581 (emphasis added). However, Nevada fails to assert that the hypothetical circumstance it describes is certain to occur, or that it is probable, or even plausible. Nevada’s claims in this regard are conclusory and mere speculation, and cannot serve as adequate support for the admission of a contention.

Even if these claims were construed to have been submitted by an expert, they would not be sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26.

With respect to Nevada’s broad assertion that DOE failed to consider the possibility of corrosion due to the effects of molten salt, Nevada’s assertions provide no support to sustain the admissibility of the contention. In this regard, Nevada ignores the discussion provided in “Analysis of Dust Deliquescence for FEP Screening (September 5, 2007), ANL-EBS-MD-000074 REV 001 AD 001, LSN# DN2002478854, relating to the potential occurrence of molten salts. In pertinent part, the discussion provides that there are thermal limitations for the formation of potential salt melts and that “it appears that there is essentially no ‘temperature limit’ to deliquescent activity that can be applied to either [of the two assemblages of molten salts] as they both transition to salt melts at approximately 300°C and > 400°C, respectively.” See “Analysis of Dust Deliquescence for FEP Screening” (September 5, 2007), ANL-EBS-MD-000074 REV 001 AD 001, LSN# DN2002478854, in section 6.1.1[a] at 6.1.

The temperature of the drip shield is not ever expected to reach these values, even during the peak thermal period, because the drip shields will be at slightly lower temperatures than the waste packages, which are not expected to reach these values even at peak temperature. As shown in Table 2.3.5-7 (“Peak Drift Wall and Waste Package Temperatures Over All Waste Packages Summarized for Seven Uncertainty Cases”), the peak waste package surface temperature will not go above 211°C even considering all of the uncertainty and variability. *See* SAR § 2.3.5 at 2.3.5-175. In the case of seismically induced drift collapse, if it occurs early some waste package peak surface temperatures will be higher, but the mean peak waste package surface temperature will still be less than 300°C. *See* SAR Figure 2.3.4-98 at 2.3.4-354. Further, SAR § 2.3.5.6 provides that “[f]or seismically-induced drift collapse, a number of FEPs are thermally sensitive, but the likelihood for the peak temperature of any waste package to exceed 300°C is insignificant, considering the probability of a seismic event sufficient to cause drift collapse during the 90 years immediately after repository closure....” *See* SAR § 2.3.5.6 at 2.3.5-146.

Given the above analyses, there is negligible potential for the formation of even minor amounts of molten salt on the drip shield surface, and therefore potential corrosion effects from them are insignificant. In summary, the mass and conditional constraints on even the existence of molten salts on the drip shield in the post-closure system are more limited than those for the extensively evaluated process of dust deliquescence effects on corrosion of the drip shield, and therefore, this molten salt corrosion process is of no material consequence.

Thus, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy the requirements of 10 C.F.R. § 2.309(f)(v) and must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

In an attempt to demonstrate a genuine dispute in subsection 6 of the contention, Nevada states notes that its “... contention challenges SAR Subsection 2.3.6.8 and similar subsections, which treat the corrosion of the drip shield, because they fail to consider molten salt corrosion.” Petition at 581. In this regard, Nevada merely repeats its unsupported, conclusory and speculative claim from its purported “Statement of Alleged Facts or Expert Opinion” discussed above. This bare assertion cannot provide adequate support for a contention. A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc. (Oyster Creek Nuclear Generating Station)*, CLI-00-06, 51 NRC 193, 208 (2000)).

Nevada next states that SAR Subsection 2.3.6.8 and similar subsections “do not comply with 10 C.F.R. § 63.114(f), which requires that any performance assessment used to demonstrate compliance with Section 63.113 must provide the technical basis for either inclusion or exclusion of degradation, deterioration, or alteration processes of engineered barriers in the performance assessment ...” and that “... degradation, deterioration, or alteration processes of engineered barriers must be evaluated in detail if the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be significantly changed by their omission.” Petition at 581.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada’s contentions, Nevada has not attempted to determine what effect, if any, acceptance of its

contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.
