For these reasons and for the reasons noted above in paragraphs d. and e., there is no genuine dispute on any material issue of law or fact contrary to 10 C.F.R. § 2.309(f)(1)(vi), and the contention must therefore be dismissed.

**110. NEV-SAFETY-110 - Rock Bolt Corrosion**

SAR Subsection 1.3.4.4.1 and similar subsections, which claim that the corrosion performance of the rock bolts will be satisfactory in the 100-year preclosure period, fail to consider realistic environments or modern understanding of corrosion processes.

**RESPONSE**

This contention asserts that the stainless steel rock bolts planned for the ground support system are likely to corrode and fail sooner than the 100 year design objective stated in SAR Subsection 1.3.4.4.1, that the failure of the bolts may allow drift collapse before permanent closure, preventing drip shield installation, and that because this is not considered in the TSPA, the TSPA is insufficient.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention seeks to raise an issue that is outside the scope of this proceeding, because it argues for the application of a stricter standard than NRC regulations require. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff'd*, CLI-01-17, 54 NRC 3 (2001). Nevada alleges that DOE failed to comply with 10 C.F.R. § 63.114(f), because it failed to consider the possible impact of corrosion of ground support system rock bolts during preclosure. Nevertheless, 10 C.F.R. § 63.114(f) only requires

the inclusion of a degradation, deterioration, or alteration process, such as corrosion of ground support system rock bolts “*if* the magnitude and time of the resulting radiological exposures to the reasonably maximally exposed individual, or radionuclide releases to the accessible environment, would be *significantly* changed by their omission.” (emphasis added). Nevada does not allege that the omission of corrosion of ground support system rock bolts would have the requisite *significant* effect, yet argues that DOE should have considered it.

In effect, Nevada argues that 10 C.F.R. § 63.114(f) requires DOE to demonstrate through a performance assessment, such as its TSPA analysis, that inclusion of rock bolt corrosion, as described in this contention, would not significantly change the results of the TSPA analysis. Petition at 586. Moreover, Nevada appears to argue that such a confirmatory performance assessment must include every identified feature, event or process (FEP) to verify that including the combination of all such low probability and low consequence FEPs would not significantly change the TSPA results. Acceptance of this argument, however, would be tantamount to requiring DOE to include in its TSPA every known FEP, regardless of its likelihood of occurrence or potential consequences. This obviously asks the Board to impose a stricter requirement than what 10 C.F.R. § 63.114 requires, which Nevada is not permitted to do. *See Fla. Power & Light Co., supra.*

Similarly, the fact that Nevada also claims that no one but DOE is capable of performing the modeling referenced in this contention, Petition at 586, is also deficient. By urging the admissibility of this contention while conceding that it does not know whether the alleged deficiency in the corrosion performance of the rock bolts would impact its results or cause the dose to exceed the regulatory limits, Nevada essentially argues that DOE must show that the contention does not raise a genuine dispute on a material issue of fact. This argument constitutes

an improper attempt by Nevada to shift its burden to DOE, and provides an additional basis for rejection.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Taken together, paragraphs 4, 5 and 6 of this contention assert that: the ground support system rock bolts will fail during the preclosure period due to stress corrosion cracking (SCC); and that the TSPA is deficient because it does not include SCC of the rock bolts. These assertions do not demonstrate that this issue is material, since Nevada does not claim that the dose to the RMEI would be significantly affected. In fact, statements in the LA that Nevada has not challenged show that there would be no effect on the TSPA results.

This contention concerns the ground support system, but does not cite any regulatory requirement associated with the ground support system. Paragraph 4 of this contention discusses requirements of 10 C.F.R. §§ 63.31, 63.21, 63.102, 63.113, 63.114 and 63.115, but does not cite any basis for considering the ground support system to be an engineered barrier that must be considered in the TSPA. Moreover, Petitioner does not claim that the effects of failure of the ground support system, including the rock bolts, would prevent the NRC from making any finding that the NRC must make to support issuance of construction authorization.

The LA also confirms that this contention does not raise a material issue. SAR Subsection 1.3.4.4 “Ground Support System” states that:

The emplacement drift ground support is classified as non-ITS because it is not relied on to prevent or mitigate a Category 1 or Category 2 event sequence, and it is not ITWI because the total system performance assessment (TSPA) does not take credit for ground support during the postclosure performance period.

SAR at 1.3.4-8. This classification means that failure of the entire ground support system would not affect the results of the PCSA or TPSA. Nothing in this contention disputes DOE's classification of the ground support system as non-ITS and non-ITWI.

Paragraph 5 of this contention asserts that “[r]ock bolt failure seems likely, and will potentially allow drift collapse before repository closure, leading to an inability to install the drip shields.” Petition at 585. This unsupported assertion, even if true, would not demonstrate that the issue raised in the contention is material because any pattern of rock bolt failures or the collapse of a drift would be identified during preclosure and would be subject to the regulatory requirements for corrective action, such as 10 CFR §§ 63.132(d), 63.142(q), and 63.51(a)(1). *See also* SAR Subsections 1.3.1.2.1.6, “Monitoring Activities” at 1.3.1-10 (stating that emplacement drifts will be remotely monitored to detect any indications of rockfall, drift degradation or instability) and 4.2.1.8, “Drift Inspection” at 4-24 (describing planned inspection of nonemplacement and emplacement drifts, including a thermally accelerated drift), and sections 15.0, “Nonconforming Materials, Parts, Or Components” (providing that items, including but not limited to, samples, boreholes, and services that do not conform to requirements shall be documented and reported) and 16.0, “Corrective Action” (addressing implementation of corrective actions associated with significant conditions adverse to quality) of the Office of Civilian Radioactive Waste Management (OCRWM) Quality Assurance Requirements and Description (QARD), (*See* LSN# DEN001574022), which is incorporated by reference in the SAR at page 5.1-1.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

The legal standards that require adequate factual support or expert opinion in order for a contention to be admitted are discussed in Section V.A.3 above. This contention fails to meet

those standards because it presents only unsupported arguments of counsel. It should also be noted that, although not referenced in the body of this contention, attachments to four of the affidavits included with Nevada's Petition reference this contention, albeit broadly.

Nevertheless, these references do not somehow save this contention from being dismissed for failure to provide an adequate statement of alleged fact or expert opinion. As discussed in Section V.A.3. above, the referenced expert affidavits fall far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Additionally, paragraph 5 of this contention consists of three basic assertions, that: (1) there is an inadequate basis for the SAR statements that the ground support system is expected to fulfill its function for at least 100 years because failure of the rock bolts is likely; (2) such failure will potentially allow drift collapse before repository closure; and (3) drift collapse would lead to the inability to install the drip shields. Petition at 584-85. None of these assertions is adequately supported.

Nevada cites two bases to support its first assertion: (a) DOE's assessment "takes no account of the deposits of concentrated salt solutions that are liable to be formed near the drift end of the rock bolts;" and (b) a published paper reported SCC of type 316 stainless "at temperatures as low as 25°C in the presence of salt deposits containing MgCl<sub>2</sub>." Petition at 585. The first of these bases is not supported by any explanation of Nevada's view on what salt solutions may be formed or specific reference to the DOE report cited by the Petition ("Longevity of Emplacement Drift Ground Support Materials for LA" (9/16/2003), LSN# DN2001087393). Indeed, the DOE report clearly *does* take into account the chemical environment in the emplacement drifts. *Id.* at section 6.2.3, "Ground Water and Air in Emplacement Drifts" (at 19); section 6.4.4.2, "Humid-Air Corrosion" (at 29-30); section 6.4.4.3,

“Aqueous Corrosion” (at 31-32); section 6.4.4.4, “Pitting and Crevice Corrosion” (at 33); section 6.4.4.5, “Stress Corrosion Cracking” (at 34). The Petition does not identify any error in DOE’s analysis of the chemical environment in the drifts and rock bolt bore holes. It also does not explain or give a basis for its vague assertion that “deposits of concentrated salt solutions... are liable to be formed.” Petition at 585. Thus, this basis is unfounded.

The second basis, that DOE relied on outdated information in stating that SCC of type 316 stainless steel does not occur below 100 °C, challenges only one of the three independent reasons given in the DOE report for concluding that “SCC will probably not occur to friction-type rock bolts during the preclosure.” (LSN# DN2001087393 at 40). The other DOE reasons are that: (1) the tensile stress in the friction type rock bolts is lower than the critical stress level to initiate cracks; and (2) for SCC to occur “it must have an aqueous environment containing chloride, which is not expected to exist for friction-type rock bolts at the emplacement drifts during the preclosure period” (*Id.* at 34). Thus, although the Petition does cite a basis for its assertion regarding the minimum temperature for SCC of type 316 stainless steel, it does not provide adequate support for challenging DOE’s conclusion that SCC probably will not occur. Consequently, the Petition does not provide adequate support for the first assertion, that rock bolt failure is likely.

As for Nevada’s two other assertions, Nevada does not attempt to support the assertions that rock bolt failure would lead to drift collapse (the second assertion) or that drift collapse could prevent installation of the drip shields (the third assertion). Indeed, the SAR indicates that the emplacement drifts are expected to be stable without any ground support (SAR at 1.3.2-17), and Nevada does not challenge that statement or cite any basis for challenging it. Moreover, as

discussed above, any significant deterioration of the ground support system or emplacement drift collapse would be identified for corrective action, and Nevada does not claim otherwise.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Ultimately, in paragraph 6, Nevada asserts that: (1) “[DOE fails] to consider realistic environments or modern understanding of corrosion process”; and (2) SAR Subsection 1.3.4 and similar subsections “do not comply with 10 C.F.R. § 63.114(f).” Petition at 585. The discussion above shows that both of these assertions are unfounded and wrong. In particular, ground support is classified as non-ITS and non-ITWI, and the TSPA does not assume that the ground support or the rock bolts remain intact during the postclosure period. The Petition does not reference or challenge the portions of the LA that deal directly with the classification of the ground support system. The Petition also does not provide any basis for concluding that corrosion of rock bolts could have any effect on compliance with any regulatory requirement.

Finally, as discussed in section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. That principle applies to this contention, since it does not specify any alleged ramifications other than the conclusory assertion that the SAR does not comply with 10 C.F.R. § 63.114(f). Consequently, this contention does not establish that there is a genuine dispute on a material issue of fact or law and does not satisfy 10 C.F.R. § 2.309(f)(vi).

**111. NEV-SAFETY-111 - HLW Waste Glass Dissolution**

SAR Subsection 2.3.7.9 and similar and related subsections, which state and/or assume that HLW borosilicate waste glass degradation and radionuclide release rates can be congruently modeled with only orthosilicic acid controlling glass dissolution, are incorrect because in an advective flow regime and under acidic conditions different more rapid modes of dissolution will occur.

**RESPONSE**

This contention argues that the assumption in SAR section 2.3.7.9 that HLW borosilicate waste glass degradation and radionuclide release rates can be congruently modeled with only orthosilicic acid controlling glass dissolution is incorrect. According to the Petitioner, in an advective flow regime and under acidic conditions, different more rapid modes of dissolution will occur.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Petitioner generically claims noncompliance with a litany of regulatory provisions in 10 C.F.R. Part 63, including §§ 63.31, 63.21, 63.102, 63.113, 63.114, and 63.115. Petition at 588-89. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” Petition at 589. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Specifically, although Petitioner alleges an error in the DOE glass dissolution model, Petitioner has failed to establish that the error is relevant to DOE’s compliance with any Part 63 requirement. Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However,

as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing glass dissolution is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative

analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Thus, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Maurice E. Morgenstein and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

In order to support a limited proposition (*i.e.*, that the protective gel layer will not form in advective conditions and in lower pH environments), Petitioner references an entire article regarding hydration-rind dating of glass artifacts. Petition at 590. The contention fails to cite any particular paragraph or page of the article as support and, therefore, the reference to this document is not sufficient to satisfy Section 2.309(f)(1)(v). Vague references to documents are

not permissible. A petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H. (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989)*. Consistent with this requirement, the Case Management Order directs petitioners to ensure that documentary references “be as specific as reasonably possible.” Case Management Order at 7. Contrary to long standing Commission case-law and the Case Management Order, Petitioner fails to identify specify portions of the only document on which it relies.

In summary, this contention does not sufficiently identify documents or expert opinion to support the contention. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention states that DOE’s glass dissolution model is, at best, applicable only to a narrow rage of near-neutral pH, a limited temperature range, and conditions in which the reacting aqueous phases are ponded with the waste glass. According to the Petitioner, the model is not applicable to a wide range of pH values and temperatures adopted by DOE. Petition at 588. For several reasons, this contention does not establish a genuine dispute of material fact.

First, the contention alleges withouth support that glass dissolution rates will be higher than those adopted by DOE. Petition at 590. As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency. Despite its capacity to run the TSPA, the Petitioner fails to identify and produce alternative TSPA results, thereby challenging DOE’s results. Indeed, Nevada makes no

attempt to provide a quantitative or qualitative assessment of the alleged errors in DOE's glass dissolution model.

Second, even if Petitioner's claims were to be accepted, it ignores significant conservatisms, such as DOE's consideration of uncertainty in the HLW glass dissolution model. As the SAR explains, uncertainty in the glass dissolution test results is accounted for by conservatively using the release rate of boron to represent the glass dissolution rate. SAR at 2.3.7-49. Because boron is the most rapidly released structural element of borosilicate waste glass, it bounds selective leaching, and the release of boron is a conservative treatment of the dissolution rate and the release rates of all radionuclides. *Id.*

As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Petition at 592, Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is

Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* Section V.A.3 of the Answer for a more detailed discussion of this position.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected.

**112. NEV-SAFETY-112 - HLW Waste Glass Degradation**

SAR Subsection 2.3.7.9.3 and similar subsections, which utilize a release rate formula for HLW glass degradation employing a glass surface area exposure factor that ranges between 4 and 17, are based upon insufficient laboratory testing and exclusion of a fundamental hydration reaction, and therefore result in an incorrect measure of radionuclide release.

**RESPONSE**

This contention argues that DOE's glass degradation model is based on insufficient laboratory testing and exclusion of a fundamental hydration reaction, and therefore results in an incorrect measure of radionuclide release.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies various regulations in support of the contention. *See* Petition at 593-94. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance

with these regulatory provisions and therefore raises a material issue.” Petition at 594. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Specifically, although Petitioner alleges deficiencies in the DOE glass degradation model, Petitioner has failed to establish that these deficiencies are relevant to DOE’s compliance with any Part 63 requirement. Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing glass degradation is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Maurice E. Morgenstein and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada cites to only two documents of its own, which stand for a limited proposition regarding the geometric increase in surface area of the glass log through time during the hydration process. Petition at 597. Neither of these articles specifically challenges DOE's glass degradation model. Therefore, this contention does not comply with 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention alleges that DOE's glass degradation model is flawed because it is based on insufficient laboratory testing and exclusion of a fundamental hydration reaction. Petition at 598. According to Nevada, the model results in an incorrect measure of radionuclide release.

Petition at 598. For the reasons discussed below, this contention does not establish a genuine dispute of material fact.

First, the contention alleges without support that DOE's laboratory-testing program has produced insufficient data and that DOE has not utilized all of its laboratory results. Petition at 595. Citing to a DOE document regarding the HLW glass degradation model, Nevada asserts that "[t]here does not appear to be any mechanistic rationale to support the concept that 4-17 is the correct exposure factor range based upon DOE laboratory data." Petition at 596. To the contrary, on the very next page of the DOE document to which Nevada cites, DOE indicates that it discounted the Sene et al. data because it is not representative of what would happen inside a breached package. See "Defense HLW Glass Degradation Model," LSN#: DN2001053803 at 87 (Aug. 2003). With regard to the higher values of 13 to 61, DOE indicates the following:

This was due to Sample 2 breaking into loose fragments. This leads to a "more complete exposure of all the fractured glass surfaces to the leaching solution" (Sené et al. 1999, Section 5.5.2). The Soxhlet results for Sample 2 are not representative of a canistered waste glass. The fracture ratios for the other analyses are within the range of 4 to 17 that is used in the base model.

*Id.* Contrary to Nevada's assertion, DOE does provide its rationale for using 4-17 as the correct exposure factor range. Thus, Nevada fails to demonstrate a genuine dispute.

Second, as discussed in detail in section V.A.3, *supra*, despite Nevada's capacity to produce quantitative analyses, it does not provide any concrete data to refute the DOE's glass degradation analysis. In fact, Nevada makes no attempt to provide a quantitative or qualitative assessment of the alleged errors in DOE's glass degradation model. Conclusory allegations are all that Nevada provides, and these are insufficient to establish a genuine dispute. *Duke Energy*

*Corp.* (McGuire Nuclear Station, Units 1 and 2; Catawba Nuclear Station, Units 1 and 2), LBP-03-17, 58 NRC 221, 240 (2003), *aff'd*, CLI-03-17, 58 NRC 419 (2003).

Third, Nevada asserts that “[i]f DOE were to utilize a single glass log equal in size to the waste form during a long-term experiment, the results *might* be considerably different from those presented in the SAR.” Petition at 596. This argument amounts to nothing more than speculation and conjecture. Even if Nevada’s claim were to be accepted, the contention provides no basis for believing that it would have any material effect on glass degradation as calculated by DOE. In particular, the contention does not allege, even qualitatively, that the use of a different exposure factor range would result in a change to the glass degradation estimate, or is inconsistent with the reasonable expectation standard. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model.

*Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

Furthermore, Nevada claims that DOE did not consider hydration volume increases as a cause of fracturing, and, consequently, “DOE’s calculated rates of radionuclide release cannot be correct.” Petition at 597. Such bare assertions, “without any specific source of evidence concerning the importance of the alleged omission,” in the form of precise facts or “expert sources on this subject,” do not raise a valid basis for attacking the model. *Fla. Power and Light Co.*, (Turkey Point Plant Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 515, 521 (1990). Similarly, Nevada provides no quantitative or qualitative analysis to refute DOE’s radionuclide release rate and, thus, fails to establish a genuine issue of material fact.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Petition at 599, Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada’s contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. See Section V.A.3 of the Answer for a more detailed discussion of this position.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected.

### **113. NEV-SAFETY-113 - Competitive Sorption In The Unsaturated Zone**

SAR Subsection 2.3.8.3.1, and similar and related sections, assume without validation that “chromatographic effects” will limit the competitiveness of mixtures of radionuclides (and other cations and metals) for sorption sites in the unsaturated zone during transport.

#### **RESPONSE**

This contention alleges that, in “SAR Subsection 2.3.8.3.1, and similar and related sections,” DOE wrongly assumed that chromatographic effects will limit the competitiveness of mixtures of radionuclides and other cations and metals for sorption sites in the UZ. Petition at 601. Nevada also explains that competition between radionuclides and other components will decrease sorption, thereby increasing the speed of transport of radionuclides through the UZ, and increasing dose to the RMEI. *See* Petition at 603.

#### **a. Statement of Issue of Law or Fact to be Controverted**

The contention fails to define the relevant issue because, at different points in the contention, it identifies varying subjects of its dispute. In contrast to the issue raised in Paragraphs 1 and 6 of the contention that “‘chromatographic effects’ will limit the competitiveness of mixtures of radionuclides (and other cations and metals) for sorption sites in the unsaturated zone during transport,” Petition at 601 and 603, in Paragraph 5, Nevada introduces a new area of dispute, alleging that “fingering of flow and limited fracture matrix interaction in the unsaturated zone would likely reduce any residual effects.” Petition at 603. The contention makes no other reference to “fingering of flow and limited fracture matrix” and provides no support for this allegation. This amounts to another (albeit surreptitiously added) dispute, which violates the Board’s Case Management Order requiring petitioners to provide “narrow, single-issue contentions.” *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 6).

Thus, as written, the contention fails to give DOE sufficient notice of the issues of law or fact that Nevada seeks to dispute. Moreover, the contention does not comply with the Board's Case Management Order that contentions be "narrow, single-issue contentions" that are "sufficiently specific as to define the relevant issues" and do not require the Parties or Board to exhaust extensive resources to clarify the issue. *U.S. Dep't of Energy*, LBP-08-10, 67 NRC \_\_\_ (slip op. at 6). Based on the information Petitioner has provided, this contention lacks the specificity required by 10 C.F.R. § 2.309(f)(1)(v) and, therefore, must be rejected.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 601-602. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." *Id.* at 602. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Moreover, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. See 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in assessing radionuclide transport is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and

analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Nevada asserts that “the assumption of limited competition for sorption sites by radionuclides (or metals, or other cations) in the [UZ] is unproven and lacks validation by DOE.” Petition at 603. Nevada also notes that competition will decrease sorption, resulting in increased transport of radionuclides and “increase doses received by the RMEI.” Petition at 603. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Nevada alleges that DOE has not conducted experiments with combinations of radionuclides because “it has been assumed that the concentrations, for the most part, are too low, or ‘chromatographic effects’ would limit the competition for sorption sites.” Petition at 602. Nevada challenges DOE’s assumptions regarding chromatographic effects, but presents no opposition to the assumption that radionuclide concentrations are low enough to limit competition for sorption sites. Accordingly, it is unclear to what extent Nevada is challenging

DOE's assumptions regarding competition or results regarding the degree sorption in UZ transport. Accordingly, even if proven, it is unclear whether the positions alleged in this petition would entitle Nevada to relief. This omission, compounded by Nevada's failure to quantify the results of its alleged deficiency, illustrates that Nevada has failed to present a material issue.

Nevada does not allege that chromatographic effects will *not* influence radionuclide transport. It references the statement in SAR section 2.3.8.3.1 that "chromatographic effects ... will limit the influence of competitive effects *at the front* of any releases from the repository." See Petition at 601 (citing SAR Section 2.3.8.3.1 at 2.3.8-21). In this contention, Nevada admits that chromatographic effects "would increase with distance from the source," acknowledging the potential influence of chromatographic effects on radionuclide migration and effectively supporting the SAR statement cited. See Petition at 603. It appears only to question the degree to which chromatographic effects will influence transport in the UZ. Nevada does not quantify the relationship between distance and chromatographic effects, nor does it predict any measurable result for the influence of chromatographic effects. It therefore fails to establish the materiality of its position.

This contention therefore fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below, (1) the contention does not reference any documents, other than the license application and DOE's

supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition attaches several affidavits (by Maurice E. Morgenstein, Don L. Shettel, Jr., Adrian H. Bath, and Michael C. Thorne) that purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada fails to provide *any* references or support for a number of assertions and conclusory statements in this contention, contrary to the requirement to present "claims rooted in fact, documents, or expert opinions." *Yankee Atomic Elec. Co.*, CLI-96-7, 43 NRC at 262 (referencing 10 C.F.R. § 2.714, the predecessor to 10 C.F.R. § 2.309). The crux of Nevada's argument is its statement that "any 'chromatographic effects' would increase with distance from the source and would likely be minimal in the unsaturated zone; also fingering of flow and limited fracturematrix interaction in the unsaturated zone would likely reduce any residual effects." Petition at 603. However, here and elsewhere in its contention, Nevada fails to provide any factual support or expert opinion for that assertion. Without support, Nevada's assertions amount to little more than an unsubstantiated argument of counsel, and certainly fails the requirement of 10 C.F.R. § 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention criticizes DOE's consideration of chromatographic effects with respect to its analysis of radionuclide sorption and transport in the UZ, and claims that "the assumption of limited competition for sorption sites by radionuclides (or metals, or other cations) in the [UZ] is

unproven and lacks validation by DOE.” Petition at 603. DOE has already demonstrated that Nevada’s contention regarding DOE’s sorption analyses presents an issue that is not material. For this reason, and because Nevada also mischaracterizes and ignores DOE’s relevant analyses and neglects to establish that its alleged deficiencies would result in increased radiological release or exposure, this contention does not establish a genuine dispute of material fact.

This contention acknowledges that chromatographic effects will be present at the repository, and challenges only the extent to which they will influence transport in the UZ. *See* Petition at 603 (“In summary, any ‘chromatographic effects’ would increase with distance from the source and would likely be minimal in the [UZ]”). However, Nevada never attempts to quantify the relationship between chromatographic effects and distance transported, or the effect on DOE’s sorption experiments. Such speculation cannot create a genuine dispute with the LA. As a result, Nevada has not established that this issue has a material effect on the results of DOE’s calculations, and this contention must be dismissed.

In addition, Nevada’s unsupported suggestions that chromatographic effects “would *likely* be minimal in the unsaturated zone” and that “fingering of flow and limited fracture matrix interaction in the unsaturated zone would *likely* reduce any residual effects” do not suffice to present a litigable issue. Petition at 603 (emphasis added). A contention that does not directly controvert a position taken by the applicant in the application is subject to dismissal. *See Tex. Utils. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992). Nevada’s qualified submissions fail to directly challenge the LA, and therefore do not raise a material issue.

Although Nevada challenges DOE’s sorption coefficients for UZ transport, it does not challenge (and apparently did not consider) DOE’s relevant analyses. Potential competition for

sorption sites among radionuclides and various groundwater ions is addressed both experimentally and theoretically in the selection of K<sub>d</sub> values and their uncertainty distributions used in TSPA. *See* SNL 2007, “Radionuclide Transport Models Under Ambient Conditions,” LSN# DN2002466365, Table 6-1(a). Experiments on sorption in crushed tuff consider potential effects of competing ions by including both a relatively dilute groundwater (J-13) and a Ca-Mg-carbonate-rich groundwater (UE25p#1). *Id.* at Tables A-2, L-1, L-2, and L-3. In addition to using these two disparate water chemistries, natural variability in the composition of rock samples used for sorption experiments conducted over an extended time span can also be expected to add variability in K<sub>d</sub>s determined from sorption experiments, and is included in the selection of K<sub>d</sub>s and their uncertainty distributions used in TSPA-LA. *See* SAR Section 2.3.8.3.1 at 2.3.8-20.

Furthermore, TSPA considers the effects of potentially competing groundwater ions by augmenting experimentally determined K<sub>d</sub> values with results of modeling calculations by using PHREEQC Software Code: PHREEQC. V2.3. PC, LINUX, Windows 95/98/NT, Redhat 6.2. 10068-2.3-00, LSN# DN2002089680, which include variations in groundwater compositions, matrix surface areas, binding constants for the elements of interest, and thermodynamic data for solution species. LSN# DN2002466365 at 3-2. These modeling calculations provide a basis for interpolation and extrapolation of experimentally derived sorption distribution-coefficient datasets. *Id.* at Section 3 and Appendix A. Appendix A, Sections A6, A7, A8 and A1[a] of SNL 2007 describe the approach used and results obtained. *See* LSN# DN2002466365. As noted in Appendix L3 of SNL 2007, “The results of this modeling, in conjunction with the experimental data, inform the process of expert judgment to arrive at the uncertainty distributions for sorption coefficients for Am (Appendix A8.1), Np (Appendix A8.3), Pu (Appendix A8.4), and U

(Appendix A8.9).” *Id.* In nearly every case, Kd distributions selected for use in TSPA are biased towards conservative values (*i.e.*, smaller than measured values – sometimes by as much as an order of magnitude; *e.g.*, plutonium). *Id.* at Table 6-1(a). Radionuclides for which sufficiently reliable modeling calculations are not available (Cs, Pa, Ra, Se, Sr, Th, Sn), Kd distributions are consistently conservative relative to measured values by 10 to nearly 100 times compared to measured values (with the exceptions of Th, Sn, and Se sorption on zeolitized tuff). *Id.* at Appendix A2(a).

Thus, through the use of multiple experiments, thermodynamic modeling, and conservative selection of Kd values and their uncertainty ranges, the concerns addressed in this contention are, in fact, suitably addressed by DOE, with considerable margin of error accounted for by generally biasing Kd values and uncertainties to the low end of those observed experimentally. *Id.* at Sections A8 and A2[a].

As discussed in the applicable Legal Standards Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts the Application fails to address an issue that the Application does address, is defective. Nevada’s contention suffers from this deficiency. Nevada ignores the relevant portions of the Application and fails to explain the materiality of the alleged defects. In short, this contention is inadmissible because “the Petitioner’s assertion that the application[] [is] deficient is simply based upon a failure to read or perform any meaningful analysis of the application[].” *Dominion Nuclear Conn., Inc.*, LBP-04-15, 60 NRC at 95 (2004) *aff’d*, CLI-04-6, 60 NRC 631 (2004).

The above moreover supports a finding that DOE’s analyses were consistent with the reasonable expectation standard of 10 C.F.R. §§ 63.31(a)(2) and 63.101(a)(2) (“what is required is reasonable expectation, making allowance for the time period, hazards, and uncertainties

involved, that the outcome will conform with the objectives for postclosure performance for the geologic repository”).

As discussed in the applicable Legal Standards section and section (d) above, this contention alleges potential errors and omissions -- without specifying the ramifications or results of such alleged deficiencies. Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Accordingly, Nevada has failed to raise a genuine dispute of material fact or law and, therefore, this contention is inadmissible. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *See Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises genuine dispute on a material issue of fact or law in this proceeding, which it fails to do.

#### **114. NEV-SAFETY-114 - Applicability Of Sorption Data**

SAR Subsections 2.3.8.1, 2.3.9, 2.1.2.3, 2.1.4 and similar subsections, which describe sorption characteristics of the upper and lower natural barriers, are not an adequate basis for safety assessment since they evaluate the retardation potential of the host rock data from crushed tuff column experiments that do not represent *in situ* characteristics of sorption.

#### **RESPONSE**

This contention alleges that DOE incorrectly represented the *in situ* characteristics of sorption in its experiments relating to the crushed tuff column, because (1) it takes credit for the full sorbing mineral inventory in the Calico Hills formation, and (2) it incorrectly quantifies sorption based on flawed experiments. Petition at 607. Nevada concludes that, because of these alleged errors, DOE's analyses regarding the sorption characteristics of the upper and lower natural barriers constitute an inadequate basis for the performance assessments.

##### **a. Statement of Issue of Law or Fact to be Controverted**

The contention fails to define the relevant issue because it raises two separate issues. In Paragraph 5, Nevada explains that DOE properly does not take credit for sorption in fractures, and then asserts that DOE should similarly have not taken credit for sorption in the Calico Hills formation. *See* Petition at 607. Nevada then asserts that the experiments that DOE conducted to quantify sorption were flawed because they do not have the modeling capability to measure fracture flow conditions or a porous tuff matrix. *See* Petition at 608. Although both assertions challenge DOE's sorption characteristics, they represent separate and distinct challenges to DOE's methodology. This amounts to two separate disputes, which violates the Board's Case Management Order requiring petitioners to provide "narrow, single-issue contentions." *U.S. Dep't of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 6). Accordingly, this contention lacks the

narrow specificity required by 10 C.F.R. § 63.309(f)(1)(v) and the Board, and therefore, must be rejected.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 605-06. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 606. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC 328, 333 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would

make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Moreover, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used to model sorption is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Nevada asserts that DOE improperly evaluated sorption characteristics because it used the full sorbing mineral inventory of the Calico Hills formation and because it relied upon experiments that overly estimate sorption capacity. *See* Petition at 608-09. However, Nevada

fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Nevada’s conclusions that the “sorption characteristics of the upper and lower natural barriers[] are not an adequate basis for a safety assessment,” Petition at 605, and that these sorption characteristics “overly estimate sorption capacity and do not represent Yucca Mountain conditions,” Petition at 609, do not suffice to present a litigable issue. A petitioner must allege not only that more accurate input data could be used in an applicant’s model, but the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339 (2006). Nevada fails to establish – or even assert – that DOE’s alleged deficiency would result in mean doses above regulatory limits, or would otherwise materially affect this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below, (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition attaches several affidavits (by Maurice E. Morgenstein, Don L. Shettel, Jr., and Adrian H. Bath) that purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Despite a significant number of assertions and conclusory statements provided in this contention, Nevada cites to only one reference document, and then only to support two limited statements. *See* Petition at 606 and 609 (citing Burns, R.G., *et al.*, "Reactivity of Zeolites Forming in Vitric Tufts in the Unsaturated Zone at Yucca Mountain, Nevada (1990) (LSN# NEV 000000568)). This document is an undated, apparently unpublished, 26-page paper. Moreover, Nevada fails to point to a specific page or section of that document for support. A petitioner must identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). Consistent with that requirement, the Case Management Order directs petitioners to ensure that documentary

references “be as specific as reasonably possible.” Case Management Order at 7. Petitioner’s contention fails in this regard.

The first time that Nevada’s referenced document is cited, it is for the proposition that DOE does not take credit for sorption of radionuclides onto fracture walls because of the difficulty in characterizing fracture walls. *See* Petition at 606. Nevada explicitly agrees with DOE’s position in this regard, however, so even though Nevada provides a reference to support the statement, the statement itself provides no support for the contention. The second time the document is cited by Nevada, the proposition for which it stands lacks sufficient specificity. *See* Petition at 609 (“[the paper] found that uptake of long-lived ... *may be compromised* by competitive effects”) (emphasis added).

For the remainder of the document, Nevada neglects to provide *any* scientific or technical references, contrary to its obligation to present “claims rooted in fact, documents, or expert opinion.” *See also* *Yankee Atomic Elec. Co.*, CLI-96-7, 43 NRC at 262 (referencing 10 C.F.R. § 2.714, the predecessor to 10 C.F.R. § 2.309). Such unsubstantiated arguments of counsel include Nevada’s first argument that DOE erroneously took credit for the “full sorbing mineral inventory of the Calico Hills formation rather than a limited volume of sorbing minerals that actually will see transporting fluids.” Petition at 607-08. Nevada’s other argument, that DOE’s experiments to quantify sorption were flawed, *see id.* at 608-09, is equally devoid of support that meets the standards imposed by 10 C.F.R. § 2.309(f)(1)(v). Licensing boards have held that a contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-

06, 51 NRC 193, 208 (2000)). Accordingly, Nevada has not satisfied this regulation and its contention should be dismissed on that basis.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada's contention, criticizing DOE's sorption characteristics of the upper and lower natural barriers, is not material. DOE has also demonstrated that Nevada has failed to proffer adequate factual support or expert opinion. For these reasons, and because it is unduly speculative and neglects to specify the ramifications of its alleged errors, Nevada's contention does not raise a genuine dispute of material fact or law.

The unsupported conclusions employed in this contention contain certain fundamental errors and omit relevant analyses conducted by DOE. For example, Nevada faults DOE's use of crushed tuff for sorption experiments, alleging that these experiments "incorrectly expose all crystal faces to transporting fluids" and "[s]pecific surface areas for reactions in crushed tuff experiments are so much greater than exposed specific surface areas for either fracture flow or matrix transport." Petition at 608. However, DOE did consider the effect of grain size and crushing of tuffaceous rock on the valuation of sorption, as extensive documentation demonstrates. SAR Section 2.3.8.2.1 notes that crushing tuff does not impact sorption because of the high surface area of the intact rock. Section 6.1.3.1 of "Radionuclide Transport Models Under Ambient Conditions" further addresses this result, discussing in more detail the numerous studies on the effects of crushing rock samples for sorption measurements. *See* "Radionuclide Transport Models Under Ambient Conditions", Bechtel SAIC, Co. LLC, (July 13, 2007), LSN# DN2002466365 at 6-12 to -13. One such study concludes that crushed tuff samples with particle sizes in the range 75 to 500 micrometers (the size fraction used for most Kd determinations used in TSPA-LA) show essentially the same sorption characteristics as does intact tuffaceous rock.

*See Yucca Mountain Site Description*, LSN# DN2002481434, Section 5.3.3.2 at 5-65, and underlying subsections.

In fact, DOE long ago addressed NRC's concern that using crushed tuff to evaluate Kd values could "inject a nonconservative bias" due to the potential presence of more active sorption sites than might be present in whole rocks. *See Summary and Synthesis Report on Radionuclide Retardation for the Yucca Mountain Site Characterization Project*, Triay et al., LSN# DEN000855121 (1997). Triay et al. noted that, in the case of tuffaceous rocks, this does not appear to be a problem. *See id.* at 250-51. They cite the work of Rundberg (1987), who found that sorption coefficients of alkali and alkaline-earth elements on crushed tuff were essentially equal to coefficients obtained for these elements on solid wafers of the same tuffaceous samples. Triay et al. suggested two explanations for this: (1) crushed rocks "pre-react" with groundwater in the experiments, and (2) crushing tuffaceous rock to a 75 – 500 micrometer grain size results mainly in separation of crystals along pre-existing grain boundaries. *See* LSN# DEN000855121 at 250. That is, no new grain boundaries are created in a fine-grained tuff, as might be expected in, for example, a coarse-grained granite.

For another example, Nevada also erroneously alleges that the crushed tuff experiments are flawed because they do not consider competing ions in aqueous solution. *See* Petition at 609. Nevada provides, as an example, the finding that the uptake of cesium into zeolite "may be compromised by competitive effects." *Id.* DOE has investigated potential competitive effects on cesium adsorption by zeolite through its experiments, and has accounted for these effects with the range of Kds selected.

Specifically, experiments on sorption in crushed tuff consider potential effects of competing ions by including both a relatively dilute groundwater (J-13) and a Ca-Mg-carbonate-

rich groundwater (p#1). In addition to using these two disparate water chemistries, natural variability in the composition of rock samples used for sorption experiments conducted over a nearly 25-year time span can also be expected to add some variability in Kds determined from sorption experiments. Furthermore, the TSPA considers the effects of potentially competing groundwater ions by augmenting experimentally determined Kd values with results of modeling calculations by using PHREEQC, *see* V2.3. PC, LINUX , Windows 95/98/NT, Redhat 6.2. 10068-2.3-00, LSN# DN2002089680, which includes variations in groundwater compositions, matrix surface areas, binding constants for the elements of interest, and thermodynamic data for solution species, *see* SNL 2007, Section 3, p. 3-2, LSN# DN2002466365. These modeling calculations provide a basis for interpolation and extrapolation of experimentally derived sorption distribution-coefficient datasets.

Appendix A, Sections A6, A7, A8 and A1[a] of LSN# DN2002466365 describe the approach used and results obtained. *See* LSN# DN2002466365. As noted in Appendix L3 of SNL 2007, “[t]he results of this modeling, in conjunction with the experimental data, inform the process of expert judgment to arrive at the uncertainty distributions for sorption coefficients for Am (Appendix A8.1), Np (Appendix A8.3), Pu (Appendix A8.4), and U (Appendix A8.9).” *Id.* at L-3. In nearly every case, Kd distributions selected for use in the TSPA are biased towards conservative values (*i.e.*, smaller than measured values – sometimes by as much as an order of magnitude; *e.g.*, plutonium). *See id.* at Table 6-1(a). For those radionuclides for which sufficiently reliable modeling calculations are not available (Cs, Pa, Ra, Se, Sr, Th, Sn), Kd distributions are consistently conservative, as they are 10 to nearly 100 times measured values (with the exceptions of Th, Sn, and Se sorption on zeolitized tuff). *See* SNL 2007, LSN# DN2002466365, Appendix A2[a].

With respect to the specific concern raised in this contention regarding Cs sorption experiments that used crushed zeolitic tuff, the range of Kds used in TSPA for modeling cesium sorption onto zeolitized tuff (425 to 20,000, mean = 5,000, *see* LSN# DN2002466365 at Table 6-1(a)) is strongly conservative compared to the range of measured values (approximately 1,000 to 75,000, *see* SNL 2007 LSN# DN2002466365 at Figure A-14b). Thus, through the use of multiple experiments, thermodynamic modeling, and conservative selection of Kd values and their uncertainty ranges, the concerns addressed in this contention are, in fact, suitably addressed by DOE, with considerable margin of error accounted for by generally biasing Kd values and uncertainties to the low end of those observed experimentally. SNL 2007, LSN# DN2002466365 at Sections A8 and A2[a].

The above two examples illustrate how Nevada not only neglects to provide any tangible support for its allegations and fails to explain how the alleged defects in the Application will significantly affect the performance assessments, but it also completely ignores the relevant portions of the Application. As discussed in the applicable Legal Standards Section V.A.3 above, a contention that mistakenly asserts that the Application fails to address an issue that the Application does address, is defective. As established here, Nevada's contention suffers from this deficiency. In short, this contention is inadmissible because "the Petitioner's assertion that the application[] [is] deficient is simply based upon a failure to read or perform any meaningful analysis of the application[]." *Dominion Nuclear Conn., Inc.*, LBP-04-15, 60 NRC at 95 (2004) *aff'd*, CLI-04-6, 60 NRC 631 (2004).

This contention moreover fails to raise a genuine dispute of a material issue because Nevada makes no attempt to show that, if correct, the resulting dose estimate would exceed regulatory requirements or significantly change the performance assessments.

First, Nevada asserts that DOE did not comply with 10 C.F.R. § 63.114(b), which requires DOE to “[a]ccount for uncertainties and variabilities in parameter values and provide for the technical basis for parameter ranges, probability distributions, or bounding values used in the performance assessment.” Petition at 609. Yet, Nevada ignores the comprehensive discussions of uncertainties and variabilities in the SAR and supporting analytical reports. *See e.g.*, SAR 2.3.8, “Radionuclide Transport in Unsaturated Zone,” Subsections 2.3.8.3, “Data and Data Uncertainty,” and 2.3.8.4.5, “Impacts of Uncertainties and Variability;” *see also* “Radionuclide Transport Models Under Ambient Conditions,” Sections 6.8.3, 6.9.3, 6.10.3, LSN# DN2002466365. Nevada similarly ignores the equally extensive documentation of the technical basis for DOE’s sorption model. *See* SAR 2.3.8 and LSN# DN2002466365.

Second, Nevada also asserts that DOE’s testing process, which formed the basis for its determination of radionuclide sorption characteristics, did not adequately represent in situ characteristics. However, the fact that DOE’s tests did not exactly reproduce in situ sorption is not an adequate basis for discarding its results as used in the sorption model. Indeed, the NRC has recognized the appropriateness of using pragmatic approaches. As stated in NUREG-1804, “Yucca Mountain Review Plan,” pg. 2.2-2:

In many regulatory applications, a conservative approach can be used to decrease the need to collect additional information or to justify a simplified modeling approach. Conservative estimates for the dose to the reasonably maximally exposed individual may be used to demonstrate that the proposed repository meets U.S. Nuclear Regulatory Commission regulations and provides adequate protection of public health and safety. Approaches designed to overestimate a specific aspect of repository performance (e.g., higher temperatures within the drifts) may be conservative with respect to temperature but could lead to nonconservative results with respect to dose. The total system performance assessment is a complex analysis with many parameters, and the U.S. Department of Energy may use

conservative assumptions to simplify its approaches and data collection needs.

YMRP at 2.2-2. The Commission has also noted this in the context of simplified dose calculations:

Mathematical models describing the various sequences of natural phenomena which relate releases of radioactive material to radiation dose vary in detail and complexity. This was frequently observed in the hearing. Through circumstances peculiar to his case, one applicant may be able to present to the Regulatory Staff adequate support for his proposal through the use of simple models and conservative parameter values, while another applicant cannot prove his case so easily. There is no regulatory necessity for performing the most realistic dose estimates that are technologically achievable if a less complex and less expensive analysis can be made to demonstrate compliance with licensing requirements. The use of the simpler procedure may, however, introduce a wider range of uncertainty in estimated doses than a more complicated analysis. Hence the proper choice of parameter values for a simple calculation might be more conservative than values appropriate for a more precise calculation.

*In the Matter of Rulemaking Hearing Numerical Guides for Design Objectives and Limiting Conditions for Operation to Meet the Criterion "As Low as Practicable" for Radioactive Material in Light-Water-Cooled Nuclear Power Reactor Effluents*, CLI-75-5, 1 NRC 277, 339 (1975). Nevada has not alleged that the sorption characteristics used by DOE were not conservative.

To the contrary, the "crushed tuff column experiments," about which Nevada complains, produced conservative results:

The K<sub>d</sub> values used in the Yucca Mountain studies have been estimated from batch experiments using crushed tuffs with a particle size of 75–500  $\mu$ m under saturated conditions (Appendix A, this model report).

...

Note that the determination approach in the Yucca Mountain studies (Appendices A and B of present model report) tends to underestimate the Kd values because (a) it involves an averaging of Kd values obtained from experiments using both low and high solution concentrations, while (b) the release concentrations are expected to be low at the repository.

“Radionuclide Transport Models Under Ambient Conditions.” MDL-NBS-HS-000008 REV 02

ADD 01, 6-8, LSN# DN2002466365 at 6-8.

Similarly,

Sorption-coefficient probability distribution functions were derived for radionuclides of interest to be used in transport calculations. Experimental and modeling results were used to constrain the distributions. In general, the approach used in derivation of the distributions tended to underestimate the range and median or expected value. This was done to provide some conservatism in the derivation, given potential scaling uncertainties in the application of these distributions to transport calculations at the Yucca Mountain site.

*Id.* at A-85.

The above moreover supports a finding that DOE’s analyses were consistent with the reasonable expectation standard of 10 C.F.R. §§ 63.31(a)(2) and 63.101(a)(2) (“what is required is reasonable expectation, making allowance for the time period, hazards, and uncertainties involved, that the outcome will conform with the objectives for postclosure performance for the geologic repository”).

Nevada has not alleged an increase in the mean dose above the regulatory limit. And as discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from that deficiency.

### **115. NEV-SAFETY-115 - Matrix Diffusion**

SAR Subsection 2.3.8 and similar subsections, dealing with matrix diffusion, utilize percolation fluxes that are based upon mean values rather than on individual storm events, thereby overestimating the diffusion of radionuclides during fracture-matrix interactions, even before consideration is given to additional effects due to the degree of radionuclide dilution, and authigenic mineralization along fracture wall surfaces causing matrix pore and micro-fracture plugging, which together make matrix diffusion insignificant during fracture flow transport.

#### **RESPONSE**

This contention alleges that, in “SAR Subsection 2.3.8 and similar subsections,” DOE took too much credit for matrix diffusion in the saturated (“SZ”) and unsaturated zone (“UZ”), because (1) it erroneously used percolation fluxes based upon mean values rather than individual storm events, and (2) it underplays the importance of authigenic mineralization in plugging matrix pores and micro-fractures. Petition at 610.

#### **a. Statement of Issue of Law or Fact to be Controverted**

The contention fails to define the relevant issue because it raises two separate issues. Nevada challenges the credit taken by DOE for matrix diffusion for two reasons: (1) it alleges that DOE erroneously used percolation fluxes based upon mean values rather than individual storm events, and (2) it alleges that DOE undervalued the importance of authigenic mineralization in plugging matrix pores and micro-fractures. *See generally* Petition at 610-14. Although both assertions challenge DOE’s analysis of matrix diffusion, they represent separate and distinct challenges to DOE’s methodology. Moreover, Nevada connects its second assertion to both the UZ and SZ.

This amounts to at least two separate disputes, which lacks the narrow specificity required by 10 C.F.R. § 2.309(f)(1)(v). It also violates the Board’s Case Management Order requiring petitioners to provide “narrow, single-issue contentions.” *U.S. Dep’t of Energy, LBP-08-10, 67 NRC \_\_* (slip op. at 6). Accordingly, this contention lacks the narrow specificity required by 10 C.F.R. § 2.309(f)(1)(v).

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 610-11. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 610. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp., CLI-99-11, 49 NRC at 333-34.*

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied,” because specific

citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Moreover, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in assessing matrix diffusion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Nevada asserts that DOE took too much credit for matrix diffusion in the SZ and UZ. Petition at 610. But as stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Thus, the simple conclusions presented in Paragraph 6 that “SAR Subsection 2.3.8 and similar subsections, dealing with matrix diffusion, utilize percolation fluxes that are based upon mean values rather than on individual storm events, thereby underestimating the flux of fracture flow and overestimating the diffusion of radionuclides during fracture-matrix interactions,” and “DOE underplays the importance of diagenetic mineral reactions,” do not suffice to present a litigable issue. Petition at 613.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the

contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Maurice E. Morgenstein, Adrian H. Bath, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

In this regard, Nevada fails to provide references or support for the significant number of assertions and conclusory statements provided in this contention, despite its obligation to present "claims rooted in fact, documents, or expert opinions." *Yankee Atomic Elec. Co.*, CLI-96-7, 43 NRC at 262 (referencing 10 C.F.R. § 2.714, the predecessor to 10 C.F.R. § 2.309). In fact, Nevada cites to *not one* paper or supporting document. A contention "will be ruled inadmissible if the petitioner 'has offered no tangible information, no experts, no substantive affidavits', but instead only 'bare assertions and speculation.'" *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). As written, Nevada's amalgamation of unsupported assertions amounts to little more than pure speculation by counsel.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada's contention, regarding DOE's treatment of matrix diffusion, presents an issue that is not material. For this reason, and because it is unduly

speculative, fails to directly challenge the LA, and neglects to specify the ramifications of its alleged errors, this contention does not establish a genuine dispute of material fact.

Aside from the three related attachments, Nevada's only supporting references in this contention are to what it claims are the relevant portions of the LA, "SAR Subsection 2.3.8 and similar subsections." Petition at 610. Although a substantial portion of this contention relates to matrix diffusion in the SZ, it fails to reference SAR 2.3.9, "[SZ] Flow and Transport." See Petition at 612-613 ("In summary, ... [i]n the [SZ], authigenic mineralization of the fracture walls is more extensive than in the [UZ]"). The Commission has stated that the petitioner must "read the pertinent portions of the license application, . . . state the applicant's position and the petitioner's opposing view," and explain why it disagrees with the applicant. Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. at 33,170; *Dominion Nuclear Conn., Inc.*, CLI-01-24, 54 NRC at 358. Because Nevada references only that portion of the LA related to radionuclide transport in the UZ, it fails to raise a genuine dispute regarding matrix diffusion in the SZ.

This contention also fails to raise a genuine dispute because, in failing to provide any support for its assertions, it provides only bare arguments of counsel that contradict current understanding of flow and transport processes in fractured systems and field observations of tracer tests conducted at Yucca Mountain. The contention alleges that the TSPA overestimates matrix diffusion in both UZ and SZ, because: 1) the rock matrix is nearly saturated; 2) individual infiltration events will lead to pulsed flow in the UZ; 3) UZ flow will occur in a thin skin along fracture surfaces in between the pulsed flows; and 4) thin-skinning results in authigenic mineralization. The following sections explain why Nevada's allegations are flawed in each of those four areas.

*Matrix Saturation:* Nevada's allegation that, "if the matrix is 90 percent or more saturated, liquid diffusion from a fracture ... has to be an extremely slow process in comparison with the downward event-driven flux of fracture flow transport", Petition at 610, is not supported by any analysis or reference, and is misleading. Petition at 610. Under unsaturated conditions, the permeability (k) is a function of liquid saturation and k increases with saturation or moisture content. See *Groundwater*, Freeze, R.A. and Cherry, J.A. Englewood Cliffs, New Jersey: Prentice-Hall. TIC: 217571 at 42 (1979). In addition, matrix diffusion is positively correlated with matrix permeability and porosity. See SNL 2008, Equation 6.5.5-1, MDL-NBS-HS-000020 REV 02 AD 01 LSN# DEN001583083. Therefore, higher matrix saturation leads to increased matrix permeability, and stronger effect of matrix diffusion on radionuclide transport.

*Individual Infiltration Events:* Nevada also alleges that individual infiltration events will dominate the flow in the UZ and lead to infiltration rates that are higher than estimated by DOE. However, this allegation is not supported by any analysis or reference. The basis for DOE's infiltration estimates is described in SAR Section 2.3.1, with additional details provided in MDL-NBS-HS-000023 REV 01 AD 01 (LSN# DEN001575070). The infiltration study referenced in the latter concludes that "the infiltration estimates are reasonably conservative, based on the comparison to the other infiltration studies in Nevada and the Southwestern U.S., See MDL-NBS-HS-000023 REV 01 AD 01, Section 7.2.1.2, LSN# DEN001575070, and based on the evaluation of infiltration uncertainty using subsurface data such as temperature and porewater/perched water chloride concentrations, see MDL-NBS-HS- 000006 REV 03 AD01, Section 6.8, LSN# DEN001572665. Nevada has not provided any support that would demonstrate that DOE's infiltration rates are *not* conservative, or even alleged as much.

*Thin-Skinning/Film Flow:* Nevada claims that UZ flow will be controlled by a thin film along fracture surfaces that will remain in between pulsed infiltration events, and radionuclide concentrations within this “thin skin” “are presumed to be quite minimal so that actual radionuclide diffusion into the matrix between pulsed flows should be rather insignificant.” Petition at 612. Again, the contention provides no quantitative analysis or reference that supports this claim, and it fails to account for DOE’s analyses in this area. In particular, DOE has represented the potential effects of film flow in the seepage test data acquired in *In Situ Field Testing of Processes*, see BSC 2004, Section 6.2, LSN#2001977697, and developed by *Seepage Calibration Model and Seepage Testing Data*, see BSC 2004, Sections 6.1.2, 6.3.3, and 6.6.3, LSN#DN2001643806. Water originating from film flow seeping into the opening of test alcoves and boreholes during a liquid-release test is reflected in the corresponding seepage data point used for model calibration. Film flow is thus accounted for in the estimated seepage-related capillary-strength parameter from the seepage calibration model. See BSC 2004, Table 6-8, LSN#2001643806. In addition, uncertainty in advective transport in the UZ is addressed, in part, by sampling over a range of other transport parameters. See SAR Section 2.3.8.5.2; MDL-WIS-PA-000005 REV 00 AD 01, Section 6.3.9, LSN#DEN001579005.

*Authigenic Mineralization/Deposition of Secondary Minerals:* The contention further claims, again with no support or references, that “often the thin-skinning results in authigenic mineralization” and “[t]hese authigenics also often clog matrix pore space.” Petition at 612. This contradicts with the field observations of secondary minerals made by the USGS. The field data show that the deposits of secondary minerals occur primarily along the footwalls of open fractures and floors of lithophysal cavities. See, e.g., Whelan J.F.; Paces, J.B.; and Peterman, Z.E. 2002, “Physical and Stable-Isotope Evidence for Information of Secondary Calcite and

Silica in the Unsaturated Zone, Yucca Mountain, Nevada,” *Applied Geochemistry*, 17, ([6]), 735-750, [New York, New York]; Elsevier, TIC: 253462; SAR Section 2.3.3.5 at 2.3.3-78. Such deposits are present in less than 10% of open fractures and lithophysal cavities within the UZ. *See, e.g.*, Whelan et al. 2002 at 747. This slow deposition process has continued for thousands to millions of years, resulting in partial filling of some fractures and cavities without any significant clogging of the rock matrix. *See, e.g.*, Whelan et al. 2002 at 747. These observations are consistent with how the fractured flow system at Yucca Mountain is characterized in the SAR, because the fractures have relatively higher permeability than the matrix. *See* SAR at 2.3.2-131 to-139 (Tables 2.3.2-8 to 12), LSN# DN2002492928. The filling of fractures results in a reduction in fracture permeability, which would result in a reduction of the rate of radionuclide transport. *See* ANL-NBS-HS-000054 REV 00 ACN 01, Figure 6-12, LSN# DN2002492928. The film flow effects of cavities are also not considered in the site-scale transport model, resulting in further underestimation of the performance of the UZ, that is, more conservative results. *See* MDL-NBS-HS-000008 REV 02 AD 01, p. 7-44, LSN# DN2002466365.

In addition, the unsupported claims in this contention also fail to recognize or acknowledge field observations of tracer concentrations from the transport tests conducted at Alcove 1 and Alcove 8 – Niche 3. *See* SAR Sections 2.3.8.4.4.5 and 2.3.8.4.4.4; Liu, H-H.; Haukwa, C.B.; Ahlers, C.F.; Bodvarsson, G.S.; Flint, A.L.; and Guertal, W.B. 2003. “Modeling Flow and Transport in Unsaturated Fractured Rock: An Evaluation of the Continuum Approach.” *Journal of Contaminant Hydrology*, 62-63, 173-188; BSC 2006 ANL-NBS-HS-000056 REV 00 LSN# DN200226487. An analysis of the test results from Alcove 1 indicates that one would need to increase the effective matrix diffusion coefficient implemented in the TSPA model to match the observed tracer concentrations. Similarly, results from the Fault and Large Plot tracer

tests conducted at Alcove 8 also indicate that an enhancement to the matrix diffusion coefficient of up to a factor of 45 is required to match observed tracer concentrations at the underlying Niche 3. *See* LSN#DN2002286487, Section 6. Put another way, the treatment of matrix diffusion in the SAR is conservative when compared to the aforementioned test results.

Similar matrix diffusion enhancements also have been reported in the literature for other test sites. *See* Neretnieks I. 2002. "A Stochastic Multi-Channel Model for Solute Transport—Analysis of Tracer Tests in Fractured Rock." *Journal of Contaminant Hydrology*, 55, ([3-4]), 175-211. New York, New York: Elsevier. TIC: 253977. The test data provide direct support for the incorporation of matrix diffusion into the transport models for TSPA. Moreover, because these tests were conducted under near saturation conditions with higher than normal infiltration rates and because matrix diffusion effects tend to be more significant under lower infiltration rates, the actual matrix diffusion under repository operation conditions could be even higher than the data from other test sites indicate. The enhancement to the matrix diffusion coefficient has not been implemented for the TSPA, which therefore ensures that the current TSPA model treatment of matrix diffusion is relatively conservative for the purpose of assessing performance of the lower natural barrier.

As shown above, this contention contains certain fundamental errors, and moreover, illustrates the need for tangible support of Nevada's allegations. Such speculation cannot create a genuine dispute with the LA. As a result, Nevada has not established that this issue has a material effect on the results of DOE's calculations.

Nevada has not established a genuine issue because, as noted above, it makes no attempt to show that, if its unsupported assertions are correct, it would result in an increase in mean dose above regulatory requirements, or otherwise significantly change the performance assessments.

Nevada also neglects to demonstrate that DOE did not comply with 10 C.F.R. § 63.114(b) or the postclosure performance objectives of § 63.113. Nevada does not show that DOE did not “[a]ccount for uncertainties and variabilities in parameter values and provide for the technical basis for parameter ranges, probability distributions, or bounding values used in the performance assessment.” 10 C.F.R. § 63.114(b). Nevada’s unsupported assertions are particularly glaring in light of the extensive analysis conducted by DOE. SAR Section 2.3.8.3.2 explains that matrix diffusion coefficients for UZ transport calculations were determined using data obtained from laboratory tests as a function of matrix porosity and matrix permeability. *See* SAR Section 2.3.8.3.2 at 2.3.8-21. Statistical analyses verified that both matrix porosity and matrix permeability make significant contributions to the regression of matrix diffusion coefficient at the 95th confidence interval. *Id.* at 2.3.8-22. Repeated lab tests with same rock wafers and different rock wafers confirmed that the uncertainty in the estimated matrix diffusion coefficient is within the acceptable range. *Id.* In addition, field tracer tests conducted at Alcove 1 and Alcove 8 – Niche 3 verified the conceptualization of matrix diffusion in the UZ transport model, and indicated that the current estimates of matrix diffusion coefficient are relatively conservative. *See* SAR Sections 2.3.8.4.4.4 and 2.3.8.4.4.5. Uncertainties in the matrix diffusion coefficient are appropriately propagated into the TSPA by sampling the tortuosity (which equals to the ratio of matrix diffusion coefficient and free-water diffusion coefficient) as a function of matrix porosity and matrix permeability. *See* SAR Section 2.3.8.5.2.4.

Moreover, the above supports a finding that DOE’s analyses were consistent with the reasonable expectation standard of 10 C.F.R. §§ 63.31(a)(2) and 63.101(a)(2) (“what is required is reasonable expectation, making allowance for the time period, hazards, and uncertainties

involved, that the outcome will conform with the objectives for postclosure performance for the geologic repository”).

Nevada has not alleged an increase in the mean dose above the regulatory limit. And as discussed in the Section V.A.3 *infra*, contentions that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute on a material issue of fact or law and are, therefore, inadmissible. This contention suffers from that deficiency and should be dismissed.

**116. NEV-SAFETY-116 - Saturated Zone Redox Conditions**

SAR Subsection 2.4 and similar and related subsections, which state or assume that potential variations in redox conditions (reducing or anoxic conditions) in the saturated zone could enhance radionuclide adsorption, are unrealistic and invalid. Therefore, this aspect of the PMA (LSN# DN20023695678) is invalid and cannot be used in support of post-development validation of the TSPA. Petition at 616.

**RESPONSE**

This contention argues that the assumption in SAR section 2.4, and similar related subsections – that potential variations in redox conditions in the saturated zone could enhance radionuclide adsorption – is unrealistic and invalid. Nevada further alleges that this aspect of the performance margin analysis (PMA) model is invalid and cannot be used in support of post-development validation of the TSPA. Petition at 616.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada generically claims noncompliance with a litany of regulatory provisions in 10 C.F.R. Part 63, including §§ 63.31, 63.21, 63.102, and 63.115. Petition at 616-17. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 617. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Although Nevada alleges that enhanced radionuclide sorption in the saturated zone based on redox conditions is unrealistic, Petitioner fails to demonstrate that this issue is material to the findings the NRC must make to authorize construction of the repository. Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section

V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing reducing conditions in the saturate zone is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit

being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Don L. Shettel, Jr. and Adrian H. Bath), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. The most fundamental defect in this contention is that Nevada fails to provide any support for its basic, underlying premise, *i.e.*, that no reducing zones have been delimited beneath the repository footprint. Thus, pursuant to 10 C.F.R. § 2.309(f)(1)(v), this contention must be dismissed.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention states that DOE's assumption – that radionuclide adsorption would be enhanced by potential reducing conditions in the saturated zone – is without foundation; Nevada asserts that no such reducing zones have been delimited beneath the repository footprint. For several reasons, this contention does not establish a genuine dispute of material fact.

First, the contention provides no explanation or justification for its claim. Initially, Nevada concedes that redox regions in the saturated zone could enhance radionuclide adsorption, as DOE maintains. Petition at 617. Without providing any citation, however, Nevada asserts that “no such reducing regions have been delimited beneath the repository footprint.” *Id.* Nevada then speculates that “[a]lthough there are reducing regions down-gradient from the repository footprint, it is *highly unlikely* that groundwater flow bearing redox-sensitive radionuclides would enter those regions. *Id.* (emphasis added). Even if these claims were construed to have been submitted by an expert, it would not be sufficient to support admission of the contention. As the Commission has stated, “an expert opinion that merely states a conclusion (*e.g.*, the application is ‘deficient,’ ‘inadequate,’ or ‘wrong’) without providing a reasoned basis or explanation for that conclusion is inadequate because it deprived the Board of the ability to make the necessary, reflective assessment of the opinion” of the alleged basis for the contention. *USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006) (quoting *Private Fuel Storage, L.L.C.* (Independent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 181 (1998), *aff'd on other grounds*, CLI-98-13, 48 NRC 26 (1998)).

Second, to the extent that Nevada is arguing that DOE has merely assumed the existence of reducing zones beneath the repository footprint, Nevada is simply incorrect. DOE neither makes this claim in the SAR or in its supporting documents. Since Nevada's imprecise reading

of a document cannot be the basis for a litigable contention, *Ga. Inst. of Tech.* (Georgia Tech Research Reactor), LBP-95-6, 41 NRC 281, 300 (1995), this contention does not establish a genuine issue of material fact. Furthermore, as referenced in SAR section 2.4.2.3.2.3.2.4, DOE provides its analysis showing reducing conditions in volcanic rocks of the saturated zone along flow paths immediately to the south and east of the footprint (*See* “Impacts of Solubility and Other Geochemical Processes on Radionuclide Retardation in the Natural System,” LSN# DN2002455269 (Figure 2.1-1 and pages 2-3-2.6) (Jan. 2006)), and Nevada fails to directly contravene this analysis. Thus, the contention is subject to dismissal. *See Tex. Utils. Electric Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

Lastly, even if Nevada’s claims were to be accepted, the contention provides no basis for believing that it would have any material effect on the PMA model or on the validation of the TSPA. As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this flaw. Nevada fails to specify a different result from no enhancement to radionuclide adsorption by reducing conditions in the saturated zone, or the implications of that result with respect to the PMA or the validation of the TSPA. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

In summary, this contention does not establish a genuine dispute on a material issue of fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

**117. NEV-SAFETY-117 - Radionuclide Sorption In The Saturated Zone**

SAR Subsection 2.3.9.3.2.2 and similar subsections, which address radionuclide sorption in the saturated zone, rely on distribution coefficients that are derived from invalid experimental procedures, and as a consequence, the radionuclide transport calculations in the LA cannot be relied upon.

**RESPONSE**

This contention alleges that SAR section 2.3.9.3.2.2, and similar subsections, which addresses radionuclide sorption in the saturated zone, relies on distribution coefficients that are derived from invalid experimental procedures; thus, the data cannot be used for radionuclide transport calculations used in the LA for evaluating dose to the RMEI. Petition at 619.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 619-20. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere

assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 620. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Nevada asserts that the experimental data upon which the LA relies for its analysis of radionuclide sorption in the saturated zone is deficient. Petition at 619. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository.

Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each

postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing radionuclide sorption in the saturated zone is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Specifically, although Nevada asserts that the erroneous data cannot be used in radionuclide transport calculations for evaluating dose to the RMEI, it has failed to establish that

resolution of the contention would make a difference in the outcome of the proceeding. Petition at 625.

Further, Nevada claims that DOE's data is deficient in two respects: (1) "the LA relies on experimental data from sorption experiments in which the initial concentration was above the radionuclide solubility limit in the derivation of radioelement probability density functions, without addressing potential complications arising from precipitation and surface precipitation;" and (2) "the LA does not adequately quantify or define the dissolved radionuclide concentration upon which its result depend." Petition at 619. Neither Nevada's allegation regarding experimental data that is "not *appropriate* to the determination of sorption" (Petition at 622) (emphasis added), nor its assertion that an inadequate definition of dissolved radionuclide concentration amounts to a "*shortcoming* in [DOE's] work" demonstrate that the contention's resolution would make a difference in the outcome of the proceeding. *Id.* at 623 (emphasis added).

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, contrary to 10 C.F.R. § 2.309(f)(1)(iv), and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and

(3) the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (by Don L. Shettel, Jr., Maurice E. Morgenstein, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Although Nevada makes copious technical assertions, it does not provide *any* scholarly support. Therefore, this contention does not comply with 10 C.F.R. 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention states that the data on which the LA relies for its analysis of radionuclide sorption in the saturated zone is deficient because (1) the LA relies on experimental data from sorption experiments in which the initial concentration was above the radionuclide solubility limit in the derivation of radioelement probability density functions, without addressing potential complications arising from precipitation and surface precipitation; and (2) the LA does not adequately quantify or define the dissolved radionuclide concentration upon which its results depend. Petition at 619. For several reasons, this contention does not establish a genuine dispute of material fact.

First, this contention contains only unsupported speculation. For example, with regard to its claims regarding the initial concentrations above the solubility limit, Nevada asserts that there are “*potential* complications arising from precipitation and surface precipitation.” Petition at 619 (emphasis added). In addition, Nevada indicates that [p]recipitation and surface-precipitation

effects can artificially increase the partitioning of the radionuclide from the solution phase to the solid phase compared to sorption alone” and acknowledges that this will “*potentially* lead to an over estimate of sorption distribution coefficients.” Petition at 622 (emphasis added). With regard to its claims regarding the definition of dissolved radionuclide concentrations, Nevada maintains that, depending on the nature and fines content of the solid phase, “the measured distribution ratio *may* be dependent on the phase separation method applied,” and [f]ine material that would be removed by a fine filter *may* pass through a coarser filter.” Petition at 622-23 (emphasis added). Nevada also alleges that because the measured distribution ratio is dependent on the phase separation method applied, “*it is often the practice* to carry out phase separation by more than one method to identify whether this may be an issue.” Petition at 624 (emphasis added).

The Board should not accept such hypothetical, and unsupported assertions. Even if these claims were construed to have been submitted by an expert, it would not be sufficient to support a contention. With respect to factual information or expert opinion proffered in support of a contention, “the Board is not to accept uncritically the assertion that a document or other factual information or an expert opinion supplies the basis for a contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 181, *aff’d on other grounds*, CLI-98-13, 48 NRC 26. Furthermore, Nevada’s unsupported conclusion that DOE’s sorption data cannot be used in radionuclide transport calculations for evaluating dose to the RMEI should likewise not be accepted by the Board. Petition at 625. Conclusory statements cannot provide “sufficient” support for a contention. *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006).

Second, the contention alleges that sorption data that are relied upon by DOE is not based upon sound experimental protocols and are inadequately reported. Petition at 625. As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this infirmity. Nevada provides no quantitative or even qualitative information regarding the whether and the extent to which DOE's sorption data used for its radionuclide transport calculations effect its evaluation of dose to the RMEI. Thus, Nevada fails to demonstrate a genuine dispute.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

**118. NEV-SAFETY-118 - Estimation of Uncertainties In Soil-To-Plant Transfer Factors**

SAR Subsection 2.3.10.3, and similar subsections, identify the source of soil to plant transfer factors used in the License Application as a number of secondary reviews of relevant literature that are not independent and do not adequately reflect the range of variability in the data reported in the primary literature, such that the performance assessments based on these soil to plant transfers do not fully account for the uncertainties and variabilities in parameter values for 10,000 years after disposal.

**RESPONSE**

This contention claims that SAR Subsection 2.3.10.3, and similar subsections, do not comply with 10 C.F.R. § 63.114(b) because DOE, in identifying the soil to plant transfer factors used in its performance assessments, relied upon “secondary reference sources” that “fail to represent the full range of uncertainty and variability recorded in the underlying primary literature.” Petition at 627. This contention must be dismissed for the reasons set forth below.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

To the extent that Nevada argues that DOE violated 10 C.F.R. § 63.114(b) because it did not rely on primary literature in identifying soil-to-plant transfer factors, Petition at page 627, this contention presents an issue that is outside the scope of this proceeding. Neither 10 C.F.R. §

63.114(b), nor any other NRC regulation applicable to DOE in this proceeding requires DOE to base its performance assessment only on data obtained from primary sources. It is well settled that, absent a waiver, “no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding.” 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission’s regulations. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff’d*, CLI-01-17, 54 NRC 3 (2001).

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that it material to the findings that the Commission must make in this proceeding. First, as noted above, the NRC imposes no requirement that DOE restrict information it may use to primary sources and, therefore, to the extent that this contention argues otherwise, it is outside the scope of this proceeding and, therefore, does not raise a material issue.

Second, in its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met.

This contention makes no such showing. Indeed, it merely claims that DOE’s derivation of soil-to- plant transfer factors “does not fully account for the uncertainties and variabilities ....” Petition at 627. This is not a material issue because Nevada does not assert that the mean dose limit to the RMEI would actually be exceeded if the alleged full accounting of uncertainties and variabilities of soil-to- plant transfer factors were taken into account. Nevada is required to demonstrate that the resolution of the issue would prevent the NRC from finding that there is a

reasonable expectation that the materials can be disposed of without unreasonable risk to the health and safety of the public. 10 C.F.R. § 63.31(a)(2).

Moreover, although Nevada challenges the DOE's assessment of uncertainty and variabilities in various soil-to-plant transfer factors, it has not claimed that those factors, in the manner presented in the SAR, or the results from the biosphere model (which uses these factors as input parameters), are inconsistent with the reasonable expectation standard. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

The method the DOE used in addressing soil-to-plant transfer factors is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a "reasonable expectation": (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as

mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach one affidavit (Michael C. Thorne), which purportedly provides expert opinion to support this contention. However, rather than providing information to support the assertions in paragraph 5 and 6 of this contention, the affidavit simply “adopts” the otherwise unsupported assertions made in paragraph 5 and 6 of the contention. That approach falls short of the requirement to provide conclusions supported by

reasoned bases or explanation. Moreover, the contention does not reference any documentation other than DOE's own description of its biosphere model.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada's claim articulated in this contention is not material. DOE has also demonstrated that Nevada has failed to proffer adequate factual support or expert opinion. Accordingly, Nevada's claim of noncompliance with this regulation also does not raise a genuine dispute of material fact or law. The contention's arguments also raise no genuine dispute of material fact or law for the reasons set forth below.

With regard to Nevada's claim that DOE failed to fully account for uncertainty, the NRC has recognized that a substantial amount of uncertainty will exist in any model attempting to represent and predict the future of complex systems. *See* 66 Fed. Reg. 55732, 55747 (Nov. 2, 2001) ("The first-of-a-kind nature of the repository and the evaluation over a very long time period result in significant uncertainty being included in the performance assessment.") For that reason, 10 C.F.R. § 63.114(b) does not require that uncertainties be eliminated or even minimized, but accounted for. This is precisely what DOE has done. For instance, SAR § 2.3.10 at 2.3.10-37, fully recognized that "[m]easurements of transfer factors vary widely, mainly because of differences among soils, crops, and environmental conditions." This is also noted in one of the technical reports underlying SAR Section 2.3.10 which stated: "Because the values of transfer factors represent crop types, rather than the individual crop species, there is uncertainty associated with this parameter." "Biosphere Model Report," Rev. 02, August 2007, at 6-101 LSN# DN2002481577. Contrary to what this contention suggests, DOE took account of this uncertainty, and carried it forward through to the next model:

The dry-to-wet weight ratio was developed from measurements of reference crops and has a low degree of uncertainty. The soil-to-plant transfer factor, in contrast, was developed based on literature data for many elements and crop types and has a relatively wide distribution. This uncertainty is transferred to the biosphere model results ....

LSN# DN2002481577, at 6-394.

Moreover, the NRC has explicitly recognized the appropriateness for postclosure models to utilize simplified assumptions, and therefore, that in and of itself, is not a basis for criticizing DOE's primary reliance on secondary sources for soil to plant transfer factors. As stated in NUREG-1804, "Yucca Mountain Review Plan," p. 2.2-2:

In many regulatory applications, a conservative approach can be used to decrease the need to collect additional information or to justify a simplified modeling approach. Conservative estimates for the dose to the reasonably maximally exposed individual may be used to demonstrate that the proposed repository meets U.S. Nuclear Regulatory Commission regulations and provides adequate protection of public health and safety. Approaches designed to overestimate a specific aspect of repository performance (e.g., higher temperatures within the drifts) may be conservative with respect to temperature but could lead to nonconservative results with respect to dose. The total system performance assessment is a complex analysis with many parameters, and the U.S. Department of Energy may use conservative assumptions to simplify its approaches and data collection needs.

Thus, simplified assumptions, such as any that result from using secondary sources for soil-to-plant transfer factor determinations, are appropriate provided they are conservative. Indeed, another of the DOE's technical reports underlying SAR Section 2.3.10 described each of the sources of data for the development of the soil-to-plant transfer factors, which it characterized as follows:

The documents that were used as sources of data for development of the values of TFs are mainly review reports, compendia of biosphere parameter values, and comprehensive dose assessment reports that included the descriptions of biosphere models and the selection of model input parameter values. Descriptions of the reports that were the source of the direct input are presented below. References were published by professional organizations producing technically defensible products pertinent to this analysis as indicated in the following discussion. The data from these reports are considered appropriate for the intended use.

“Environmental Transport Input Parameters for the Biosphere Model,” LSN# DN2001625960, at p. 4-15. This document’s descriptions of these sources noted too, the conservatisms inherent in many. For instance, this document noted, regarding the source Davis et al. 1993 –”The Disposal of Canada’s Nuclear Fuel Waste: The Biosphere Model, BIOTRAC, for Postclosure Assessment,” that:

The report includes a discussion of the reliability of BIOTRAC in terms of experimental validation, model and data evaluation, peer review, model intercomparisons, conservative assumptions, quality assurance procedures, and natural analogs (Chapter 11 and references within). Values for the BIOTRAC model parameters were developed based on carefully screened information and were subject to peer review (p. 334) conducted by the publishing organization.

*Id.* at 4-17.

Similarly, with regard to IAEA 2001–”IAEA Safety Reports Series No. 19, Generic Models for Use in Assessing the Impact of Discharges of Radioactive Substances to the Environment,” LSN# DN2001625960 states:

The report was developed through a series of consultant and advisory group meetings, followed by extensive technical review of the contents. The objective of the report was to provide simplified but conservative dose assessment methods. The report provides an overview of these methods and the selection of generic parameters for assessing transfers between various model

components. Because of the objective of the report, the parameter values are generally conservative and not likely to lead to underestimations of the doses.

*Id.* Accordingly, there is no legal or factual basis for Nevada’s contention that DOE’s “performance assessments based on these soil to plant transfers do not *fully account* for the uncertainties and variabilities in parameter values for 10,000 years after disposal.” Petition at 627.

As discussed in Section V.A.3 above, contentions expressing only generalized “uncertainties” in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from this deficiency.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the soil-to-plant transfer factor properties at the proposed repository site or to specifically state the radiological impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada’s contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed

contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**119. NEV-SAFETY-119 - Estimation Of Uncertainties In Animal Product Transfer Coefficients**

SAR Subsection 2.3.10.3, and similar subsections, identify the source of animal product transfer coefficients used in the License Application as a number of secondary reviews of relevant literature that are not independent and do not adequately reflect the range of variability in the data reported in the primary literature, such that the performance assessments based on these animal product transfer factors do not fully account for the uncertainties and variabilities in parameter values for 10,000 years after disposal.

**RESPONSE**

This contention claims that “SAR Subsection 2.3.10.3, and similar subsections,” do not comply with 10 C.F.R. § 63.114(b) because DOE, in identifying the animal product transfer coefficients used in its performance assessments, relied upon “secondary reference sources” that “fail to represent the full range of uncertainty and variability recorded in the underlying primary literature.” Petition at 633. This contention must be dismissed for the reasons set forth below.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

To the extent that Nevada argues that DOE violated 10 C.F.R. § 63.114(b) because it did not rely on primary literature in identifying animal product transfer coefficients, Petition at 637, this contention represents an impermissible collateral attack on the NRC’s regulations, and,

accordingly is outside the scope of this proceeding. Neither 10 C.F.R. § 63.114(b), nor any other NRC regulation applicable to DOE in this proceeding requires DOE to base its performance assessment only on data obtained from primary sources. It is well settled that, absent a waiver, “no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding.” 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission’s regulations. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff’d*, CLI-01-17, 54 NRC 3 (2001).

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that it material to the findings that the Commission must make in this proceeding. First, as noted above, the NRC imposes no requirement that DOE restrict information it may use to primary sources and, therefore, to the extent that this contention argues otherwise, it is outside the scope of this proceeding and, therefore, does not raise a material issue.

Second, in its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a

difference in the outcome of the proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met.

This contention makes no such showing. Indeed, this contention merely claims that DOE’s derivation of animal product transfer coefficients “does not fully account for the uncertainties and variabilities ....” Petition at 633. This is not a material issue because Nevada does not assert that the mean dose limit to the RMEI would actually be exceeded if the alleged full accounting of uncertainties and variabilities of animal product transfer coefficients were

taken into account. Nevada is required to demonstrate that the resolution of the issue would prevent the NRC from finding that there is a reasonable expectation that the materials can be disposed of without unreasonable risk to the health and safety of the public. 10 C.F.R. § 63.31 (a)(2).

Moreover, although Nevada challenges the DOE's assessment of uncertainty and variabilities in various animal product transfer coefficients, it has not claimed that those factors, in the manner presented in the SAR, or the results from the biosphere model which uses these factors as input parameters, are inconsistent with the reasonable expectation standard. As stated by another licensing board, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC at 514, 534-44, 550 (1985). The question is not whether uncertainties exist, but rather, whether DOE has dealt with uncertainties in a cautious but reasonable manner that is consistent with present knowledge. Accordingly, Nevada has failed to raise a genuine dispute of material law or fact by this claim.

The method the DOE used in addressing animal product transfer coefficients is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a "reasonable expectation": (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach one affidavit (Michael C. Thorne), which purportedly provides expert opinion to support this contention. However, rather than

providing information to support the assertions in paragraph 5 and 6 of this contention, the affidavit simply “adopts” the otherwise unsupported assertions made in paragraph 5 and 6 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

With the exception of two references, the contention does not cite to any other documentation other than DOE’s own description of its biosphere model. One of the cited documents, “Radionuclide Distribution and Transport in Terrestrial and Aquatic Ecosystems, Volume 3,” merely supports the proposition that “the transfer factor for chlorine to milk can be accurately predicted from the amount of stable chloride in the diet of the animal, varying from 0.062 d L<sup>-1</sup> at 22 g d<sup>-1</sup> to 0.0038 d L<sup>-1</sup> at 360 g d<sup>-1</sup>.” Petition at 636. However, this does not state that DOE’s overall range of transfer coefficient values for chlorine transfers to milk of 0.0029 to 0.1 d L<sup>-1</sup> is inadequate to satisfy the requirements of 10 C.F.R. § 63.114(b), and, therefore, this document provides no support the contention. Nevada cites to the other document, “Biosphere Modeling and Dose Assessment for Yucca Mountain,” simply to note that some of the sources DOE used to determine transfer factors themselves relied in part upon others. Petition at 635. This, in and of itself, is not controversial in any way, and does not lend credence to Nevada’s assertion that use of secondary sources is improper.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada’s claim articulated in this contention is not material. DOE has also demonstrated that Nevada has failed to proffer adequate factual support or expert opinion. Accordingly, Nevada’s claim of noncompliance with this regulation also does not raise a genuine dispute of material fact or law. The contention’s arguments also raise no genuine dispute of material fact or law for the reasons set forth below.

With regard to Nevada's claim that DOE failed to fully account for uncertainty, the NRC has recognized that a substantial amount of uncertainty will exist in any model attempting to represent and predict the future of complex systems. *See* 66 Fed. Reg. 55,732 (Nov. 2, 2001) (“The first-of-a-kind nature of the repository and the evaluation over a very long time period result in significant uncertainty being included in the performance assessment.”) For that reason, 10 C.F.R. § 63.114(b) does not require that uncertainties be eliminated or even minimized, but accounted for. This is precisely what DOE has done. For instance, SAR Section 2.3.10 at p. 41, fully recognized that “These coefficients differ among elements, chemical forms, and animal products, and uncertainty is considerable for most elements.” This is also noted in one of the technical reports underlying SAR Section 2.3.10 which stated: “[d]irect measurements of transfer coefficients are scarce. Many published values are derived from sources other than explicit experimental data . . . Therefore, uncertainty in the transfer coefficient values is considerable for most elements.” “Biosphere Model Report,” Rev. 02, August 2007, at 6-108 LSN# DN2002481577. Contrary to what this contention suggests, DOE took account of uncertainty: “[t]o incorporate uncertainty and variation in the transfer coefficients, geometric means and standard deviations were calculated for each element using values reported in the reviewed literature.” SAR Section 2.3.10, at p. 40.

Moreover, the NRC has explicitly recognized the appropriateness for postclosure models to utilize simplified assumptions, and therefore, that in and of itself, is not a basis for criticizing DOE's primary reliance on secondary sources for animal product transfer coefficients. As stated in NUREG-1804, “Yucca Mountain Review Plan,” pg. 2.2-2:

In many regulatory applications, a conservative approach can be used to decrease the need to collect additional information or to justify a simplified modeling approach. Conservative estimates for

the dose to the reasonably maximally exposed individual may be used to demonstrate that the proposed repository meets U.S. Nuclear Regulatory Commission regulations and provides adequate protection of public health and safety. Approaches designed to overestimate a specific aspect of repository performance (e.g., higher temperatures within the drifts) may be conservative with respect to temperature but could lead to nonconservative results with respect to dose. The total system performance assessment is a complex analysis with many parameters, and the U.S. Department of Energy may use conservative assumptions to simplify its approaches and data collection needs.

Thus, simplified assumptions, such as any that result from using secondary sources for animal product transfer coefficients determinations, are appropriate provided they are conservative. Indeed, another of the DOE's technical reports underlying SAR Section 2.3.10 described each of the sources of data for the development of the animal product transfer coefficients, which stated that the sources of data used for the development of transfer coefficients for animal products "are suitable for the intended use, *i.e.*, to develop distributions of TCs for the animal product types included in the biosphere model." "Environmental Transport Input Parameters for the Biosphere Model," LSN# DN2001625960, at p. 4-47. This document's descriptions of these sources noted too, the conservatisms inherent in many. For instance, this document noted, regarding the source Davis et al. 1993 –"The Disposal of Canada's Nuclear Fuel Waste: The Biosphere Model, BIOTRAC, for Postclosure Assessment," that:

The report includes a discussion of the reliability of BIOTRAC in terms of experimental validation, model and data evaluation, peer review, model intercomparisons, conservative assumptions, quality assurance procedures, and natural analogs (Chapter 11 and references within). Values for the BIOTRAC model parameters were developed based on carefully screened information and were subject to peer review (p. 334) conducted by the publishing organization.

*Id.* at 4-17.

Similarly, with regard to IAEA 2001–“IAEA Safety Reports Series No. 19, Generic Models for Use in Assessing the Impact of Discharges of Radioactive Substances to the Environment,” LSN# DN2001625960 states:

The report was developed through a series of consultant and advisory group meetings, followed by extensive technical review of the contents. The objective of the report was to provide simplified but conservative dose assessment methods. The report provides an overview of these methods and the selection of generic parameters for assessing transfers between various model components. Because of the objective of the report, the parameter values are generally conservative and not likely to lead to underestimations of the doses.

*Id.* Accordingly, there is no legal or factual basis for Nevada’s contention that DOE’s “performance assessments based on these animal product transfer factors do not *fully account* for the uncertainties and variabilities in parameter values for 10,000 years after disposal.” Petition at 633.

As discussed in Section V.A.3 above, contentions expressing only generalized “uncertainties’ in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from this deficiency.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the animal product transfer coefficient properties at the proposed repository site or to specifically state the radiological impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada’s claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to

raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada's contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**120. NEV-SAFETY-120 - RMEI Diet**

SAR Subsection 2.3.10.2.5 and similar subsections identify the animal products included in the biosphere assessment model as meat, poultry, eggs and milk, but fail to consider other animal products such as liver that are likely to be consumed by people who reside in the Town of Amargosa Valley and that are very effective in accumulating radionuclides notably actinides.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section identifies various regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the

relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp. (Oconee Nuclear Station, Units 1, 2, and 3)*, CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing animal products in the biosphere assessment model is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal

system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not

reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (Steven A. Frishman and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

As discussed in the following subsection, Petitioner mischaracterizes the Application and erroneously asserts that DOE "fail[ed] to consider other animal products such as liver that are likely to be consumed by people who reside in the Town of Amargosa Valley." Petition at 639.

Even if it is assumed for purposes of argument that DOE did omit offal consumption in its food consumption survey, Petitioner provides no evidence that locally-produced offal is part of the diet of the residents of Amargosa Valley. Petitioner cites only one study, Byrom J., Robinson, C., Simmonds, J.R., Walters, B., and Taylor, R.R., "Food Consumption Rates for Use in Generalised Radiological Dose Assessments," *J. Radiol Prot.*, Vol. 15 (1995), to show "that offal consumption can be comparable with meat consumption in high-rate consumers." Petition at 642. However, the study was based in the United Kingdom, not Amargosa Valley or even the United States. There is no evidence presented that the people of Amargosa Valley, Nevada have a diet similar to the people in the United Kingdom, nor is there any statement of alleged facts or expert opinion supporting the position that locally-produced offal, such as liver, is part of the diet of the people living in the Town of Amargosa Valley, Nevada.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Because DOE did incontrovertibly consider other animal products such as liver in its questionnaire surveying the diets of the residents of Amargosa Valley, there is no genuine dispute on any material issue of law or fact. As noted by Nevada in its contention, SAR Subsection 2.3.10.2.5 at 2.3.10-20 states that “[t]he animal products were selected based on a survey of the diet of the residents of Amargosa Valley (DOE 1997).” The reference cited is “The 1997 ‘Biosphere’ Food Consumption Survey Summary Findings and Technical Documentation,” November 1, 1997, (LSN# DEN000684324), which provides in Section 3.6 at 30 that the survey used 11 food groups and a “residual” group. This document is the same as LSN# DN2001032585 cited by Petitioner. Petitioner refers to page 10 of LSN# DN2001032585 to allege that DOE only considered the animal product food groups of meat (beef and pork), milk, poultry and eggs; thereby, neglecting other animal food products such as liver.

However, Petitioner misses DOE’s actual, explicit survey materials on the subject. Appendix A, (LSN# DN2001032585/DEN000684324), provides a “Foods Definition List.” The definition of “beef” used in the survey “includes any edible meat from cattle, foods such as steaks, hamburgers, roast beef, meatloaf, tongue, and **liver**.” *Id.* at A-7 (emphasis added). Furthermore, even if other animal products such as liver were not explicitly included in the survey, they would nevertheless be covered in the residual category of “other,” which is also explained in the Foods Definition List as, “[h]ere we want to list any other food that may not have been covered in the preceding questions.” *Id.*

Appendix B, (LSN# DN2001032585/DEN000684324), provides the questionnaire actually used by DOE in its survey. Survey question 3f1, listed on page B-6, expressly asked, “[o]ver the past year, did you eat any locally-produced beef such as **liver**, steaks, roasts, fresh or

frozen; fried, grilled, baked, roasted, boiled and so forth?” *Id.* at B-6 (emphasis added). The following three questions then asked about the consumption amount of those animal products. *Id.* at B-7. Again, even if foods such as liver were not expressly asked about in the survey, question 3m1 asked, “[o]ver the past year, did you eat any other locally-produced food, such as tomatoes, *or anything I did not already mention?*” *Id.* at B-10 (emphasis added). Therefore, Amargosa Valley residents had the opportunity to mention any other animal product, such as offal, in the survey. Because DOE did not unreasonably restrict the range of animal products and, thus, adequately estimated radiological impacts on the RMEI from consumption of animal products contaminated with radionuclides, this contention presents no genuine dispute of material fact or law. These questions formed the basis for DOE’s evaluation of the diet of the RMEI in the SAR.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the burden and complexity of showing the dose effects of acceptance of Nevada’s contentions, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged

deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990).

**121. NEV-SAFETY-121 - Host Rock Geomechanical Properties**

SAR Subsection 1.3.4.4 and similar subsections, which discuss the ground support system for the emplacement drifts, reach conclusions about the geomechanical properties of the predominant host rock units used for design based on very limited numbers of physical tests that are insufficient to demonstrate that the rocks hosting the emplacement drifts will contribute to postclosure performance by functioning as a geological barrier.

**RESPONSE**

**a. Statement of Issue of Law or Fact to be Controverted**

This contention references SAR Subsection 1.3.4.4 and similar subsections, which discuss the ground support system for the emplacement drifts, and asserts that such subsections reach conclusions about the geomechanical properties of the predominant host rock units used for design based on very limited numbers of physical tests. It then goes on to assert that those tests are insufficient to demonstrate that the rocks hosting the emplacement drifts will contribute to postclosure performance by functioning as a geological barrier. Thus, this contention appears to assert that the physical tests used by DOE to reach conclusions about the geomechanical properties of the predominant host rock for use in the design of the ground support system for the emplacement drifts are not also sufficient to demonstrate that such rock will contribute to postclosure performance by functioning as a geologic barrier.

The contention does not cite a regulation that requires the physical tests used for design of the ground support system to be the same as the tests used to demonstrate the contribution of rock to postclosure performance. It also does not assert that the Application relies solely on the results of the physical tests used for design of the ground support system to demonstrate the effectiveness of the rock as a geologic barrier. Because it does not assert that either the ground

support system will not fulfill some alleged safety function, or that the repository will not meet an applicable requirement, it does not identify an issue of law or fact. The Commission has stated that “a contention must allege, with some basis, that the licensee’s application is deficient.” *Dominion Nuclear Connecticut, Inc.*(Millstone Nuclear Power Station, Unit 2), CLI-03-14, 58 NRC 207, 216 (2003). This contention does not do so.

**b. Brief Explanation of Basis**

Paragraph 2 of this contention is a statement of a different contention, not a statement of basis for this contention. Paragraph 2 does not even refer to the ground support system, or identify specific rock property tests that are challenged, or identify a regulatory or safety reason why those properties must be determined. While 10 C.F.R. § 2.309(f)(1)(ii) requires only a brief summary of basis for a contention, the summary must at least show that there is reason for further inquiry regarding the contention and give notice to the parties regarding the nature of the issue for litigation. As one Atomic and Safety Licensing Board has stated:

Certainly, it might be said that one cannot have both brevity and also extensive specificity. But it is not unreasonable to require enough specificity in the explanation offered in the basis for a contention, such that a matter relating to a particular facility is stated in sufficient detail that it clearly states an issue that is susceptible to litigation with regard to that facility.

*Nuclear Management Company, LLC* (Palisades Nuclear Plant), LBP-06-10, 63 NRC 314, 351 (2006), *aff’d*, CLI-06-17, 63 NRC 727, (2006). Paragraph 2 does not meet this test, because it does not identify the geomechanical properties at issue or explain how that issue is related to the ground support system and the TSPA. Moreover, as shown below, the other paragraphs of this contention also do not provide such information.

**c. Whether the Issue is Within the Scope of the Proceeding**

Because this contention does not identify an issue of law or fact to be controverted, it cannot show that the “issue” is within the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention does not identify an issue of law or fact to be controverted, so, therefore, it cannot show that the “issue” is material to the findings that the NRC must make. More specifically, the only portions of the LA referenced in this contention are: (1) general references to SAR Subsection 1.3.4.4 in Paragraph 1 (Petition at 646) and Paragraph 6 (Petition at 649); (2) SAR Subsection 1.3.4.4 information about repository host rock units in Paragraph 5 (Petition at 648); (3) a general reference to SAR Tables 1.3.3-2 and 1.3.3-3 in Paragraph 5 (*Id.*) and (4) a general reference to SAR Subsection 1.3.4.7 in paragraph 6 (*id.* at 650).

Neither the specific statements that Nevada challenges or an explanation for such challenges can be found in the contention’s general references to SAR Subsection 1.3.4.4 in paragraph 1 and 6. The references to SAR Subsections 1.3.4.4 in paragraphs 1 and 6 do not identify specific statements that Nevada challenges or explain the reasons for any such challenge. The references to SAR Subsection 1.3.4.4 in Paragraph 5 do not challenge any information in that subsection, but rather rely on the SAR to show that 85% of the emplacement drifts are located in the lithophysal units. The Paragraph 5 reference to SAR Tables 1.3.3-2 and 1.3.3-3 also does not challenge any information in those tables. Finally, while Paragraph 6 asserts that SAR Subsection 1.3.4.7 does not characterize rock mass properties sufficiently for assessment purposes, and therefore does not comply with 10 CFR § 63.115(b), Nevada does not specify a challenged statement in that subsection or explain the alleged inadequacy. Petition at 650. Moreover, SAR Subsection 1.3.4.7 does not purport to characterize rock mass properties; the

closest it comes to doing so is its cross-references to SAR Subsection 2.3.4.5 for information about drip shield mechanical response to rockfall. *See* SAR at 1.3.4-30.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach an affidavit (by Doug F. Hambley), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavit simply "adopts" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. *See Dominion Nuclear Connecticut, Inc.*, (Millstone Power Station, Unit 3), CLI-08-17, slip op. at 9 (Aug. 13, 2008); CLI-06-10, *supra*, 63 NRC at 472.

Paragraph 5 of this contention concerns some of the data listed in Table 6-62 of DOE's report entitled "Subsurface Geotechnical Parameters Report" (01/01/2007), LSN#: DN2002371133. Petition at 648. Nevada asserts that: (1) the table reports "only 13 samples of the lower lithophysal unit and 26 samples of the upper lithophysal unit having a diameter of 245 cm [sic] or larger under ambient temperature conditions and an additional two samples of the lower lithophysal unit and three samples of the upper lithophysal unit were tested under elevated

temperature (200 °C) conditions;” and (2) no [lithophysal] samples were tested in triaxial compression at elevated temperatures. *Id.* Based on assertions 1 and 2, Nevada concludes that “the characterization of the strength properties of the rock mass presented in the TSPA-LA cannot be considered as adequate to demonstrate that the geologic barrier will function as assumed.” *Id.*

Nevada’s first two assertions are directed at a subset of the data described in Table 6-62 of the DOE report, and do not reference the portion of the Application that uses that data, along with various other data and analyses, to develop the rockfall analysis that is used in the analysis of seismic disruption of engineered systems or drip shield response to rockfall. See SAR Subsection 2.3.4.4 “Rockfall Analysis” (SAR at 2.3.4-51 through 2.3.4-354). As described below, the discussion in the SAR describes detailed analyses of the effects of the sizes of the rock samples on the test data, and testing used to determine thermal effects on the rock.

Nevada’s first assertion is that of the 1208 samples represented in Table 6-62 of the DOE report, a limited number were of larger rock samples. Petition at 648-49; DOE report at 6-90. The Application describes an analysis of the effect of the sizes of the rock samples. See SAR Subsection 2.3.4.4.2.3.3.2 “Effect of Sample Size and Anisotropy” (SAR at 2.3.4-62), and SAR Figure 2.3.4-27 “Results of Size Effect Study Showing Variation in Sample Unconfined Compressive Strength as a Function of Sample Volume” (SAR at 2.3.4-285). In addition, the Application states that these laboratory tests were supplemented with larger in situ tests conducted at both ambient and elevated temperatures at scales commensurate with excavation dimensions. SAR Subsection 2.3.4.4.2.3.4. The discussions in the SAR demonstrate that the sample sizes were appropriately taken into consideration in DOE’s analyses, and that additional data also was used to characterize the rock properties. This contention does not dispute DOE’s

assessment of the effects of sample size or its use of other data, such as the results of in situ tests, and thus does not provide support for disputing the DOE analyses that utilize the results of the sample size analysis.

Nevada's second assertion is that there were no triaxial tests conducted at elevated temperatures from either lithophysal unit, and that this is unacceptable. Petition at 649. The DOE report cited by Nevada explains why there was no need for such tests:

**Effects of Temperature:** Figure 6-32 plots the compressive strength versus temperature for the Ttpmn and Ttpln rock samples tested under triaxial compressive loading conditions and indicates that temperature has little effect on the strength of the specimens. In other words, the temperature effect is well within the range of data expected at ambient conditions. Such a behavior is expected of the Ttppl and Ttpul rock samples too because of close resemblance in terms of matrix materials between nonlithophysal and lithophysal rock units. Furthermore, the temperature range to which the rock surrounding emplacement drifts will be exposed is rather low in comparison with the temperature ranges reportedly used to test rocks for temperature dependency.

LSN# DN2002371133 at 6-87. In addition, the Application provides an analysis of thermal properties of the rock in SAR Subsection 2.3.4.4.2.3.6 "Thermal Properties," which states that it is based on numerous tests, including laboratory tests of both small and large rock samples and field measurements. SAR at 2.3.4-65 through 67. Nevada does not reference or dispute any statement in the Application concerning the thermal properties of the rock, and thus this assertion does not provide support for disputing the DOE analyses of the thermal properties of the rock.

SAR Subsection 2.3.4 "Mechanical Degradation of the Engineered Barrier System" is the portion of the Application that describes how the geotechnical characteristics of the repository horizon host rock are considered in the TSPA. It explains that the repository will be located in 4 lithostratigraphic units of Yucca Mountain, denoted as Ttpul, Ttpmn, Ttppl, and Ttpln, and

that the Tptpl (lower lithophysal unit) will host approximately 80% of the emplacement drifts. SAR Subsection 1.3.4.4. In total, there are 434 laboratory tests conducted on core samples from these units as shown in Table 6-62 of Subsurface Geotechnical Parameters Report, LSN# DN2002371133 at 6-192. Of these 212 were core extracted from the lower lithophysal unit, providing an adequate measure of matrix rock properties. *Id.*

SAR Subsection 2.3.4.4.2.3.3.4 explains that the primary factor influencing variability of the unconfined compressive strength and Young's modulus (two primary inputs to predicting drift stability) is the sample porosity. SAR Figures 2.3.4-26 and 2.3.4-28 establish the relationships between porosity and these key mechanical properties. Porosity of the rock mass is quantified in SAR Figure 2.3.4-24 for all of the emplacement drift stratigraphic units, and is provided in greater detail in SAR Figure 2.3.4-25 for the lower lithophysal unit, which will host the bulk of the repository. Based on these properties then, the rock mass was modeled and validated against laboratory and field observations as explained in SAR Subsection 2.3.4.4.5.3.2.

This contention does not address any of these analyses, and thus does not provide support for Nevada's assertion that the TSPA cannot be considered adequate.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The discussion above shows that Nevada has not demonstrated that this contention raises a material issue. In particular, it has not included references to specific portions of the LA that Nevada disputes. Moreover, where it challenged SAR Subsection 1.3.4.7, it did not provide supporting reasons for that challenge.

Finally, as discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material

fact or law and are, therefore, inadmissible. This contention suffers from this deficiency, since it does not specify any alleged ramifications other than the conclusory assertion that the SAR does not comply with 10 C.F.R. § 63.115(b). Consequently, this contention does not establish that there is a genuine dispute on a material issue of fact or law, and does not satisfy 10 C.F.R. § 2.309(f)(vi).

**122. NEV-SAFETY-122 - Screening Of Drift Degradation FEPS**

SAR Subsection 2.3.4.1 improperly excludes features, events and processes relating to seismic-induced rockfall damage, non-seismic rockfall and drift collapse that could occur within the first 10,000 years from consideration in the TSPA on the basis of low consequence or low probability.

**RESPONSE**

Nevada states that: (1) DOE should evaluate the alternative conceptual model presented by the Center for Nuclear Waste Regulatory Analyses (CNWRA); and (2) in light of that model, DOE may have improperly excluded FEPS from the TSPA related to seismic induced rockfall damage, non-seismic rockfall, and non-seismic drift collapse based on low consequence or low probability.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies a number of regulations in paragraph 4 of the

contention. *See* Petition at 651-52. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 652. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Moreover, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be

met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing rockfall and drift collapse is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository, or would otherwise make a difference in the proceeding. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a

likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

In addition, Nevada's proposed model is not material to the extent that it focuses on the post-10,000 year postclosure period. The requirement to consider alternative conceptual models applies only to the "performance assessment used to demonstrate compliance with [the postclosure performance objectives] for 10,000 years after disposal," pursuant to proposed 10 C.F.R. § 63.114(a)(3). *See* 70 Fed. Reg. 53,313, 53,318 (Sept. 8, 2005).<sup>67</sup> Accordingly, any consideration of such a model for the post-10,000 year period is not material to the findings that the NRC must make in this proceeding.

For the aforementioned reasons, this contention fails to raise a material issue, contrary to 10 C.F.R. § 2.309(f)(1)(iv).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention mainly contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by Doug F. Hambley and Michael C. Thorne), which purportedly provide expert opinions to support this

---

<sup>67</sup> In this respect, the requirements of proposed 10 C.F.R. § 63.114 are substantively the same as existing 10 C.F.R. § 63.114. The existing rule requires consideration of alternative conceptual models for performance assessments used to demonstrate compliance with 10 C.F.R. § 63.113, and that section establishes performance objectives for the first 10,000 years after permanent closure.

contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation. This contention relies almost entirely on the CNWRA’s model, which – as discussed below – does not support Nevada’s contention, is flawed in a number of respects, and provides nonspecific and imprecise generalizations.

This contention first states that 10 C.F.R. § 63.114(c) requires that DOE “[c]onsider alternative conceptual models of features and processes that are consistent with available data and current scientific understanding and evaluate the effects that alternative conceptual models have on the performance of the geologic repository.” Petition at 652. The contention then asserts that DOE should consider the alternative conceptual model presented by CNWRA regarding drift collapse. Petition at 654-55. Nevada reasons that DOE should evaluate this model because the model calls into question DOE’s exclusion justifications for certain FEPs related to rockfall and drift collapse. *Id.* However, CNWRA’s model, upon which Nevada relies, is insufficient to support this contention, much less function as a legitimate alternative conceptual model.

First, Nevada claims that “DOE and CNWRA have developed very different models for the consequences of rockfall and drift degradation.” Petition at 654. This is incorrect. The CNWRA model concerns *only* drift collapse – it does not evaluate rockfall whatsoever. Accordingly, to the extent that this contention concerns the evaluation of rockfall in the LA or in FEP exclusion justifications, those concerns are inadmissible for want of “reasoned basis or explanation.” *See Fansteel*, CLI-03-13, 58 NRC at 203.

Second, the CNWRA study *assumes* events and processes, rather than weighing them based on probability of occurrence. This represents a substantial departure from DOE's FEP evaluation, which weighed analyses according to established probabilities and resulting consequence, according to the requirements of proposed 10 C.F.R. § 63.342(a):

DOE's performance assessments conducted to show compliance with §§ 63.311(a)(1), 63.321(b)(1), and 63.331 shall not include consideration of very unlikely features, events, or processes, *i.e.*, those that are estimated to have less than one chance in 10,000 of occurring within 10,000 years of disposal (less than one chance in 100,000,000 per year). In addition, DOE's performance assessments need not evaluate the impacts resulting from any features, events, and processes or sequences of events and processes with a higher chance of occurrence if the results of the performance assessments would not be changed significantly in the initial 10,000 year period after disposal.<sup>68</sup>

70 Fed. Reg. at 53,319.

For example, the CNWRA study assumes that drift degradation from thermal loading begins at the time of closure, without providing reasoned basis or support for that assumption. *See Risk Insights Derived From Analyses of Model Updates in the Total System Performance Assessment Version 5.1 Code, Section 4.1, LSN# NRC000029711 (7/31/2008) AT 34-1.* To the contrary, the exclusion justification for FEP 2.1.07.02.0A, "Drift collapse," which discusses nominal drift collapse (*i.e.*, considering thermal and time-dependent effects, but excluding seismic effects), finds only "partial collapse of the drift (such that collapsed rock blocks do not cover the drip shield) for the first 10,000-year period of postclosure." "Features, Events, and Processes for the Total System Performance Assessment: Analyses," (LSN# DEN001584824, at 6-552, 6-554) (Mar. 6, 2008). (Note that Seismic-induced drift collapse is *included* in the TSPA.

---

<sup>68</sup> In this respect, the requirements of proposed 10 C.F.R. § 63.342 are comparable with existing 10 C.F.R. § 63.342. The proposed rule conforms § 63.342 to EPA's revised standards, which specify the types of changes DOE shall account for in the post-10,000 year period. *See* 70 Fed. Reg. 53,319 (Sept. 8, 2005).

*Id.* at 6-112, 6-118). DOE's conclusion is rooted in the extensive analyses in its supporting document, "Drift Degradation Analysis" (BSC 2004, LSN# 2002203028), to which DOE provides specific references in its exclusion justification. *See* LSN# DEN001584824, at 6-552 to -555.

For another example, the CNWRA study assumes "some fraction" of seepage through drip shields, without providing reasoned basis or support for that assumption or quantifying the fraction of seepage expected. *See* Risk Insights Derived From Analyses of Model Updates in the Total System Performance Assessment Version 5.1 Code, Section 4.1, LSN# NRC000029711 (July 31, 2008). To the contrary, the exclusion justification for FEP 2.1.03.10.0B, "Advection of liquids and solids through cracks in the drip shield," finds that through-wall cracks are not expected to occur, but that if they do occur, the resulting seepage of 4 mL/yr would be bounded by the minimum liquid influx rate (100 mL/yr) or threshold seepage rate (100 mL/yr) per waste package that are defined for the TSPA. *See* Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN# DEN001584824, 6-466 – 6-480 (Mar. 6, 2008). Again, DOE's conclusion is rooted in extensive analyses in the FEP exclusion justification and the specific references therein. *See* LSN#: DEN001584824, 6-466 – 6-480 (Mar. 6, 2008).

It is not surprising, therefore, that the CNWRA model would predict an allegedly higher (albeit unspecified) dose, given the aforementioned assumptions. These assumptions are not grounded in fact or reasoned explanation, nor are they weighted by probability. *See* USEC, CLI-06-10, 63 NRC at 472. Accordingly, the CNWRA model offers no support for this contention, rendering it inadmissible.

Yet another example of the CNWRA's inadequacy as a supporting document for this contention is its failure to quantify projected dose. No part of the cited reference quantifies the

expected dose, not even the graph showing mean dose estimates for which the “Dose” axis has no unit or scale. *See Risk Insights Derived From Analyses of Model Updates in the Total System Performance Assessment Version 5.1 Code, Section 4.1 – 4.3, LSN# NRC000029711 (July 31, 2008).* Nevada uses this vague conclusion of resulting dose – calculated from a series of unspecified rates and values, and illustrated in a graph with no scale or frame of reference – as its sole support for its similarly unspecific claim that “[t]he assessed radiological impacts ... are substantially expressed within 10,000 years.” Petition at 654. Neither this contention nor its primary reference attempts to quantify dose or even allege that the result would be significant or exceed applicable regulatory limits. That bare speculation and vague conclusion cannot sustain the contention. *Dominion Nuclear Conn., CLI-08-17, 68 NRC \_\_ (slip op. at 4).*

Nevada, nonetheless, concludes that this model should be considered by DOE. However the CNWRA model, like the contention itself, establishes multiple events of causation, asserts that these events “may” occur, but does not demonstrate (let alone assert) that these events are certain or even likely. *See “Risk Insights Derived From Analyses of Model Updates in the Total System Performance Assessment Version 5.1 Code, Section 4.1 – 4.3,” (LSN# NRC000029711) (July 31, 2008) (“[d]rift degradation resulting from thermal loading is assumed to occur” ... “localized corrosion may occur” ... “if the resulting stress is amplified by seismic acceleration, mechanical damage of the waste package may occur”).* Such hypothetical assertions fail to provide any “reasoned basis for its results,” and therefore cannot form the basis for this contention. *Fansteel, CLI-03-13, 58 NRC at 203.*

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such

alleged deficiencies – fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. For the reasons set forth below, this contention does not establish a genuine dispute of material fact and therefore must be dismissed.

This contention simply relies upon the CNWRA model of dose effects from drift degradation, and concludes that (1) DOE should evaluate this model, and (2) the model shows that DOE erroneously excluded FEPs related to rockfall and drift degradation. As shown above, however, this contention – and the model upon which it relies – fails to provide reasoned basis or explanation for its conclusions and therefore does not “provide sufficient information to show ...a genuine dispute ... with the applicant ... on a material issue of law or fact.” *See* 10 C.F.R. § 2.309(f)(1)(vi).

Furthermore, DOE considered and evaluated a variety of alternate models for drift degradation and rockfall loading, and, notwithstanding Nevada’s claim to the contrary, this *included* the CNWRA model during the process of addressing Key Technical Issues raised by the NRC through a series of meetings with CNWRA staff and technical work. *See* LSN# DN2001686826, Section 1 at 1-1 to 1-3. The use of the CNWRA model in TSPA is inconsistent with the NRC’s requirements in 10 C.F.R. § 63.101 and 63.304 to maintain “reasonable expectation” in performance assessment. DOE has therefore considered this alternate conceptual model, as required by 10 C.F.R. § 63.114(c), but has valid reasons for not including it in TSPA. Accordingly, Nevada fails to raise a genuine dispute and this contention is inadmissible because, in short, “the Petitioner’s assertion that the application[] [is] deficient is simply based upon a failure to read or perform any meaningful analysis of the application[].” *Dominion Nuclear Conn.*, LBP-04-15, 60 NRC at 95.

DOE also investigated three additional alternate conceptual models for the rockfall loads in a collapsed drift analytical, continuum, and discontinuum. *See* BSC 2004, *Drift Degradation Analysis*, LSN# 2002203028, Section 6.4.2.5. DOE's assessed the capabilities and limitations of these representative models. That DOE ultimately included the predictions of the discontinuum approach only does not alter the fact that they were considered and evaluated as required by 10 C.F.R. § 63.114(c).

Nevada's contention also contains certain errors: (i) it alleges that DOE did not consider the CNWRA model, *see* Petition at 654-55, when in fact it did consider it as an alternative conceptual model, as it addressed NRC Key Technical Issues through a series of meetings with CNWRA staff and technical work. (LSN# DN2001686826, Section 1 at 1-1 to 1-3); (ii) it alleges that FEPs related to "seismic-induced rockfall damage, non-seismic rockfall and drift collapse" have been screened from the TSPA on the basis of low consequence and low probability, *see* Petition at 651 and 655, when in fact those FEPs were all screened on the basis of low consequence only, *see* (LSN# DEN001584824 at 6-99, 6-547, 6-552); (iii) it states that "[s]eismic-induced rockfall in the lithophysal units is not excluded from the TSPA," *see* Petition at 653, however, that FEP *is* excluded; and (iv) it represents that "in light of the CNWRA report, DOE's screening of [FEPs] relating to seismic-induced rockfall damage, non-seismic rockfall and drift collapse ... has not been adequately justified," *see* Petition at 655, however the CNWRA report concerns drift collapse *only*, and makes no reference to rockfall or the effects of rockfall whatsoever, *see* LSN# NRC000029711 at 4.1 - 4.3. Nevada's imprecise readings cannot form the basis for a litigable contention. *See Ga. Inst. of Tech. (Georgia Tech Research Reactor.)*, LBP-95-6, 41 NRC 281, 300 (1995).

Moreover, this contention does not present a genuine dispute on a material issue of fact regarding the screening justification for the subject FEPs. As described above, the contention and its referenced model establish multiple events of causation, assert that these events “may” occur, but do not demonstrate (let alone assert) that these events are certain or even likely, or that the results of the performance assessments for the first 10,000 year period would be significantly changed by the inclusion of these FEPs. *See* Petition at 654 - 55 (“localized corrosion *may* occur” ... “*if* the resulting stress is amplified by seismic acceleration, mechanical damage of the waste package *may* occur”). A petitioner must allege not only that “more accurate input data could be used in applicant’s model, but the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 239-40 (2006). Such hypothetical assertions do not directly controvert a position taken by the applicant in the application (*i.e.*, the exclusion justifications of the subject FEPs), and therefore cannot form the basis for this contention. *Texas Utils. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

Finally, this contention fails to raise a genuine dispute on a material issue of fact because it acknowledges that it has not evaluated the extent to which DOE has undertaken the analyses for which it claims the LA is deficient. This contention first establishes that 10 C.F.R. § 63.114(c) requires that DOE “[c]onsider alternative conceptual models of features and processes that are consistent with available data and current scientific understanding and evaluate the effects that alternative conceptual models have on the performance of the geologic repository.” Petition at 652. This contention concludes that “[t]here is a need to show either that

the CNWRA model is inconsistent with available data and scientific understanding, or to update the screening assessment to take account of the legitimacy of this model.” *Id.* at 655.

However, between these two statements, Nevada claims that “[t]he State of Nevada *has not* evaluated the extent to which analyses of [the effects of rockfall and drift degradation on drip shields and waste packages] have been undertaken by DOE and CNWRA, and *has not* investigated differences between these analyses.” *Id.* at 654 (emphasis added). This is the very *crux* of Nevada’s contention, yet it admits that it has not evaluated the merit of its position. This contention, in essence, attempts to shift the burden to DOE to show that the issue is *not* material, contrary to 10 C.F.R. § 2.309(f)(1)(vi). Similarly, Nevada’s language at Paragraph 6 essentially admits that Nevada does not know whether this contention is material, and shifts the burden to DOE to demonstrate that its contention is *not* material, contrary to the requirements of 10 C.F.R. § 2.309(f)(1)(vi). *See* Petition at 655-56; *see also Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). For this and the aforementioned reasons, this contention does not establish a genuine dispute on a material issue and therefore must be dismissed.

**123. NEV-SAFETY-123 - Durability Of Ground Support**

SAR Subsection 1.3.4.4 and similar subsections, which discuss the ground support system in the emplacement drifts, fail to consider that the assumed 100-year life for the Super Swellex™ friction-type rock bolts and the Bernold sheets is speculative because this particular ground support system has been in use for less than 40 years.

**RESPONSE**

This contention asserts that there is no proof that the stainless steel rock bolts and Bernold sheets planned for the ground support system will meet the 100 year design objective stated in SAR Subsection 1.3.4.4., since no rock bolts or Bernold sheets have been in service for a comparable period of time.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention concerns the ground support system, but does not cite any regulatory requirement associated with the ground support system. Paragraph 4 of this contention discusses

requirements of 10 C.F.R. §§ 63.21, 63.31, 63.102, 63.113, 63.114, and 63.115, but does not cite any basis for considering the ground support system to be an engineered barrier that must be considered in the TSPA. Moreover, Petitioner does not claim that the effects of failure of the ground support system, including the rock bolts and the Bernold sheets, would prevent the NRC from making any finding that the NRC must make to support issuance of construction authorization.

The LA also confirms that this contention does not raise a material issue. SAR subsection 1.3.4.4 “Ground Support System” states that:

The emplacement drift ground support is classified as non-ITS because it is not relied on to prevent or mitigate a Category 1 or Category 2 event sequence, and it is not ITWI because the total system performance assessment (TSPA) does not take credit for ground support during the postclosure performance period.

SAR at 1.3.4-8. This classification means that failure of the entire ground support system would not affect the results of the PCSA or TSPA. Nothing in this contention disputes DOE’s classification of the ground support system as non-ITS and non-ITWI.

An issue “is ‘material’ if its resolution would ‘make a difference in the outcome of the licensing proceeding.’” *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999) (*quoting* Final Rule, Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. 33,168, 33,172 (Aug. 11, 1989)). This contention does not provide any reasoned explanation of how resolution of this issue could make a difference in the outcome of this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual or expert opinion support in order for a contention to be admitted. This contention fails to meet those standards because: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach affidavits (by Don L. Shettel, Jr., and Doug F. Hambley), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Additionally, Paragraph 5 of this contention consists of one basic assertion, that friction type rock bolts and Bernold sheets were developed in the last half of the twentieth century, and there has been much less than 100 years of experience with them. Based on this assertion, Nevada concludes that there is no proof that the ground support system will last for 100 years. Petition at 658, 660. Although Nevada claims that there is no proof that the ground support system will last for 100 years, it stops short of asserting that the ground support system will not last for 100 years, or otherwise actually dispute the referenced statement in the LA. Moreover, the LA states that "[t]he ground support system is *designed to last* at least 100 years," and does not claim that any experience proves that such systems last that long. SAR Subsection 1.3.4.4 (SAR at 1.3.4-8) (emphasis added). Moreover, the LA does not rely on demonstrations of long service life to demonstrate that the ground support system will remain effective for at least 100

years. As discussed by Nevada in NEV-SAFETY-110, and by DOE in response to that contention, an engineering analysis evaluated the longevity of the ground support system components. *See* “Longevity of Emplacement Drift Ground Support Materials for LA” (LSN#: DN2001087393). In addition, the LA does not simply rely on the expected longevity of the rock bolts and Bernold sheets, but also describes other measures taken to enhance longevity. *See id.* at 1.3.4-9.

In sum, Nevada has not demonstrated that this contention raises a material issue of fact or law, and it has failed to provide any facts or expert opinion to provide meaningful support of this contention because nothing it has provided disputes any statement in the LA.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The discussion above shows that this contention is unfounded and not material and, therefore, puts no material issue in dispute. In particular, ground support is classified as non-ITS and non-ITWI, and the TSPA does not assume that the ground support or the rock bolts remain intact during the postclosure period. Nevada does not reference or challenge the portions of the LA that deal directly with the classification of the ground support system. This contention also does not provide any basis for concluding that there is any error in the analyses that support the expectation that the rock bolts and Bernold sheets will function for at least 100 years, or that their degradation could have any effect on compliance with any regulatory requirement.

Finally, as discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this flaw, since it does not specify any alleged ramifications other than the conclusory assertion that the SAR does not

comply with 10 C.F.R. § 63.114(f). Consequently, this contention does not establish that there is a genuine dispute on a material issue of fact or law, and does not satisfy 10 C.F.R. § 2.309(f)(1)(vi).

**124. NEV-SAFETY-124 - Welding of Alpha Beta Titanium Alloy to Unalloyed Titanium**

SAR Subsection 1.3.4, Tables 1.3.4.3 and 1.3.4.4 and other similar and related subsections, which indicated that an all alpha titanium alloy (Grade 7) has been selected for the water diversion surface (WDS) of the drip shields and an alpha-beta titanium alloy (Grade 29) has been selected for structural components, fails to properly demonstrate, test, and account for the phenomena of delayed cracking due to hydrogen migration and precipitation of embrittling titanium hydrides to low solubility alpha material from higher solubility beta phase material, particularly at welds, and therefore DOE has failed to consider associated drip shield failures.

**RESPONSE**

This contention asserts that SAR Subsection 1.3.4, Tables 1.3.4.3 and 1.3.4.4 and other similar and related subsections, do not properly demonstrate, test, and account for the phenomena of delayed cracking due to hydrogen migration and precipitation of embrittling titanium hydrides to low solubility alpha material from higher solubility beta phase material, particularly at welds, and therefore DOE has failed to consider associated drip shield failures.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention does not demonstrate that the alleged cracking due to hydrogen migration and precipitation of embrittling titanium hydride would affect compliance with a regulatory requirement, safety or waste isolation. It also does not demonstrate that there is any regulatory requirement for DOE to include in the License Application, welding specifications for fabricating the drip shields, or that the omission of such information could affect compliance with any regulatory limit.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. Petition at 664. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that a petitioner must demonstrate that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Nevada asserts that this contention alleges non-compliance with 10 CFR §§ 63.31(a)(2) and (3), 63.21(c)(3)(ii) and (14), 63.102(h), 63.113 and 63.115. Petition at 664. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. But because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation:” (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as

mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach two affidavits (by Michael C. Thorne and Robert A. Cottis) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in Paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in

Paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Paragraph 5 of this contention asserts that delayed cracking of titanium, associated with welds between alpha-beta and all alpha-alloys, has been observed in a number of instances, and that DOE has not demonstrated to what extent the specific combination of materials proposed for the drip shields may be susceptible to delayed cracking due to hydrogen migration and precipitation of embrittling titanium hydrides. Nevada asserts that hydrogen will be present in the drip shield materials, and that DOE has not produced welds with these materials to demonstrate that they will not be subject to delayed cracking. In support of this assertion, Nevada states that a recent publication of the American Welding Society, AWS D1.9/D1.9M “Structural Welding Code – Titanium”(07/2007), suggests that special precautions be applied to joints between alpha and alpha–beta titanium alloys due to risks of hydrogen concentration near weld boundaries. Petition at 665-66.

Nevada’s assertion does not adequately set forth a basis for this contention. Nevada states that the delayed cracking phenomenon it cites can be avoided through special precautions in the welding procedures. Nothing in this contention asserts that the welding procedures DOE develops in accordance with the applicable quality assurance requirements will not be adequate to avoid or impede the hydrogen-induced delayed cracking referenced in this contention. Moreover, the License Application specifically discusses the possibility that the drip shield water diversion surface may be subject to cracking. The License Application states that DOE specifically considered the phenomenon of hydride cracking, or delayed hydrogen induced cracking, of the drip shield and concluded that it should be excluded from the TSPA due to its

low probability. See SAR at 2.2-210 (Table 2.2-5), FEP 2.1.03.04.0B – “Hydride cracking of drip shields,” SAR at 2.2-233.

In addition, the Licensing Support Network contains a great deal of information describing DOE’s analyses related to the potential for corrosion of the drip shields, and specifically the potential for hydrogen-induced or hydride cracking of the drip shields. See “Hydrogen-Induced Cracking of the Drip Shield,” Bechtel SAIC Company, 2004 (LSN#: DN2001649010); and “General Corrosion and Localized Corrosion of the Drip Shield,” Sandia National Laboratories, 2007 (LSN#: DN2002467884).

The information in the License Application and the Licensing Support Network provided Nevada with ample information about DOE’s analyses. To demonstrate that this contention raises a material issue, Nevada had to show that, contrary to DOE’s findings, hydride cracking is likely to occur. Nevada also had to show that hydride cracking of the drip shields could cause a significant change in the TSPA results. In this contention, however, Nevada does not assert that hydrogen-induced delayed cracking is likely or that it would have a significant effect on the TSPA results. Moreover, Nevada did not provide facts or expert opinion to demonstrate support for such conclusions. Consequently, Nevada has not demonstrated that the issue raised by this contention is material to any finding the NRC must make for issuance of construction authorization.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency, since it does not specify any alleged

ramifications other than the conclusory assertions that the SAR does not comply with 10 C.F.R. § 63.113 and that such cracking could impact the dose to the RMEI. Petition at 666.

Consequently, this contention does not establish that there is a genuine dispute on a material issue of fact or law, and does not satisfy 10 C.F.R. § 2.309(f)(vi).

**125. NEV-SAFETY-125 - Effectiveness Of Stress Relief To Eliminate SCC Or Hydrogen Effects**

SAR Subsection 2.3.6.8.3, which states that the drip shield will be fully stress-relief-annealed before emplacement reducing residual stresses by about 50% or to the point that SCC can be dismissed as an issue, fails to provide adequate information to make this demonstration and DOE did not report tests of actual material combinations proposed for the drip shield; therefore, it must be presumed that unquantified residual stresses could lead to hydride formation in areas of high stress and increased susceptibility to failure under external loads.

**RESPONSE**

This contention alleges that SAR subsection 2.3.6.8.3, which states that the drip shield will be fully stress-relief-annealed before emplacement reducing residual stresses by about 50% or the point that SCC can be dismissed as an issue, fails to provide adequate information to make this demonstration. Furthermore, the contention also alleges that DOE did not report tests of actual material combinations proposed for the drip shield and, that therefore, it must be presumed that unquantified residual stresses could lead to hydride formation in areas of high stress and increased susceptibility to failure under external loads. Petition at 668.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 668-669. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” Petition at 669. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC

from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing stress corrosion cracking of the drip shield is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values. Nevada fails to demonstrate that this issue is material to any finding the NRC must make; accordingly, this contention must be dismissed.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the

licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (by James A. McMaster, Robert A. Cottis, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Although Nevada makes copious technical assertions regarding the alleged need to consider various aspects of stress corrosion cracking of the drip shield, it does not provide *any* scholarly support. Therefore, this contention does not comply with 10 C.F.R. 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention urges that “[n]either the assumption that reducing residual stresses by 50% or that the proposed stress relief will eliminate the risk of stress corrosion cracking ... of the Grade 29 titanium has been demonstrated in the LA. Therefore, the level of these residual stresses and their effect on hydrogen accumulation that could lead to hydride formation and cracking have not been demonstrated in the LA.” Petition at 670. For several reasons, this contention does not establish a genuine dispute of material fact.

Although this contention provides pages of unsupported speculation, Nevada has failed to take issue with key points regarding stress corrosion cracking of the drip shield in SAR section 2.3.6.8.3, which provides:

The drip shield will be fully stress-relief annealed before emplacement (Section 1.3.4.7). Drip shield fabrication and handling processes will be based on the process described in Section 1.3.4.7 and will be controlled as described in Section 1.9.2. Therefore, the drip shield is not expected to be subjected to stress corrosion cracking in the absence of seismic events and rockfall. Even if stress corrosion cracking of the drip shield were to occur, the cracks would have no effect as advective flow through cracks of the drip shield is excluded from TSPA (Section 2.2, Table 2.2-5, FEP 2.1.03.10.08).

SAR Section 2.3.6.8.3.

Not only has Nevada failed to contravene the analysis in Sections 1.3.4.7 and 1.9.2 regarding the drip shield, but also it has failed to appreciate that exclusion of the drip shield SCC is based on the determination that any such cracking would not have significant consequences. Specifically, the LA states, and Nevada does not dispute, that:

Stress corrosion cracking is modeled to be independent of the environment although the environments to support stress corrosion may not occur within the repository. The presence of cracks will

not affect the performance of the drip shield in preventing or substantially reducing the amount of water that could directly contact the waste package, and is excluded from TSPA (section 2.2, Table 2.2-5, FEP 2.1.03.02.0B).

SAR Subsection 2.3.6.9.1, “Summary of Significant Processes for EBS Barrier Capability,” at 2.3.6-86. Thus, DOE excluded drip shield SCC from the TSPA on the basis of the low consequence, not on a determination that SCC is unlikely to occur. *See generally* FEP 2.1.03.02.0B, “Stress Corrosion Cracking (SCC) of Drip Shields,” Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#: DEN001584824, at 6-396 (Mar. 6, 2008) (justifying DOE’s screening due to “low consequence”). To the contrary, DOE acknowledges that [s]tress corrosion cracking in the drip shield plate material is assumed to occur ....” *Id.* In addition, DOE has found, and Nevada does not dispute that even if stress corrosion cracking of the drip shield were to occur, the cracks would have no effect as advective flow through cracks of the drip shield is excluded from TSPA based on “low consequence.” *See* FEP 2.1.03.10.0B, “Advection of Liquids and Solids Through Cracks in the Drip Shield,” *Id.* at 6-466 (justifying DOE’s screening due to “low consequence”).

Furthermore, the LA states that DOE specifically considered the phenomenon of hydride cracking of the drip shield including the phenomena of delayed cracking and concluded that it should be excluded from the TSPA due to its low probability. *See* SAR Table 2.2-5; FEP 2.1.03.04.0B – “Hydride Cracking of Drip Shields,” Features, Events, and Processes for the Total System Performance Assessment: Analyses, LSN#: DEN001584824, 6-418 (Mar. 6, 2008).

With regard to its contention, Nevada does not even allege, much less specify, why, how, and to what extent DOE’s screening justifications are somehow incorrect. Thus, Nevada fails to raise a genuine dispute.

The SAR also shows that DOE did testing of drip shield SCC under conditions that are expected to exist in the drifts. The SAR states that:

. . . available literature indicates Titanium Grade 7 is extremely resistant (or immune) to stress corrosion cracking initiation in repository-relevant brine environments .... Consistent with the literature, DOE-conducted testing confirmed that no stress corrosion cracking initiation is observed over the full range of primary (constant-load) (Figure 2.3.6-28) and secondary (U-bend) stresses that were evaluated.

SAR Subsection 2.3.6.8.3 “Stress Corrosion Cracking of Drip Shield,” at 2.3.6-79. As result, Petitioner’s unsupported criticisms of DOE’s testing also miss the mark.<sup>69</sup>

As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this infirmity. Specifically, nothing in this contention indicates that the Petitioner disputes the assessment described in the LA that any SCC of the drip shields would not have a significant effect. Because Petitioner does not dispute the assessment of low consequence or otherwise claim that the TSPA results would change “significantly” if drip shield SCC was included, the Petitioner has failed to demonstrate the existence of a genuine dispute on a material issue of fact.

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not

---

<sup>69</sup> The LA also shows that DOE’s testing did consider the potential for corrosion in drip shield crevices. In summarizing the results of long-term corrosion tests on titanium alloys to provide the technical basis for models for drip shield degradation, the SAR notes that “[r]esults from testing in repository-relevant environments show that creviced specimens exhibit slightly lower corrosion rates than weight-loss specimens; only the weight-loss data were used in the model.” SAR at 2.1-104.

attempted to determine what effect, if any, acceptance of their contention would have on doses. Petition at 674. The petitioner has the burden of showing that its proposed contentions meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

**126. NEV-SAFETY-126 - Properties Of Dissimilar Metal Weld Joints Between Grade 29 And Grade 7 Titanium**

SAR Subsection 1.3.4.7.7 and similar subsections describe the drip shield system and refer to SAR Table 1.3.4-5 where it is stated that, for Titanium Grade 7 to Titanium Grade 29 welds, Titanium Grade 28 filler material (ERTi-28) shall be used. There is no reference to an actual demonstration of welding and testing this combination of metals, there is insufficient information in the LA to demonstrate that these welds will behave mechanically as assumed in the TSPA, and in particular, there is a failure to consider that these unknown weld properties will lead to unanticipated locations of weld failures that could lead to early failure of drip shields due to external loads from rockfall. Petition at 675.

**RESPONSE**

This contention asserts that there is insufficient information in the LA to demonstrate that welds of Titanium Grade 7 to Titanium Grade 29, using Titanium Grade 28 filler material (ERTi-28) will behave mechanically as assumed in the TSPA, and fails to consider that these unknown weld properties will lead to unanticipated locations of weld failures that could lead to early failure of drip shields due to external loads from rockfall.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies 10 C.F.R. §§ 63.31(a)(2)(3), 63.21(c)(3)(ii) and (14), 63.102(h), 63.113 and 63.114(f). *See* Petition at 676-77. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 677. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7.), this direction cannot be read to dispense with the well-recognized requirement that a petitioner must demonstrate that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC

from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation:” (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a

contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Michael C. Thorne and Robert A. Cottis) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in Paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in Paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Paragraph 5 of this contention asserts that: (1) the combination of Titanium Grade 7 to Titanium Grade 29 welds, using Titanium Grade 28 filler material needs to be welded and welding procedures need to be qualified (Petition at 677); (2) use of Titanium ERTi-28 as a weld filler will result in a weld metal composition with mechanical properties that are not adequately

evaluated (Petition at 677-78); and (3) there needs to be testing to support the assumption that stress relieving will reduce residual stresses by about 50%. (Petition at 678-79).

Nevada's first assertion, that the welding procedures must be properly demonstrated and qualified, is a truism in the nuclear industry, and does not provide a reasoned basis for this contention. Consistent with generally accepted industry standards and NRC regulations (*e.g.*, 10 C.F.R. § 63.142(j)), applicable DOE quality assurance requirements already mandate that “[s]pecial processes that control or verify quality, such as welding, heat treating, chemical cleaning, and nondestructive examination are controlled and accomplished by qualified personnel using qualified procedures in accordance with applicable codes, standards, specifications, criteria, and other requirements.” DOE/RW-0333P, Revision 20, “Quality Assurance Requirements and Description” (LSN# DEN001574022), which is incorporated by reference in the LA at SAR page 5.1-1. Nothing in this contention provides support for concluding that the welding procedures DOE develops in accordance with these applicable quality assurance requirements will not be adequate.

Nevada's second assertion, that due to differences in the strength of the weld filler material and the titanium Grade 7 WDS, a rockfall onto a drip shield may cause tears to occur in the WDS, does not identify any deficiency in the LA. Nevada first states that “[n]o evaluation of how such welds would fail under external loads like a rock fall has been made by model testing or finite element analysis (FEA) (indeed, there is inadequate information in the LA on the drip shield design to even consider such analysis).” Petition at 677. This assertion is wrong; the Application describes just such a finite element analysis:

. . . the structural performance of the drip shield is evaluated in terms of postclosure functions and postulated postclosure events. The stress magnitudes, deformations, and potential failure

mechanisms are evaluated using finite element analyses and the principles of mechanics of materials. These finite element analyses allow verification of the design performance in the changing emplacement drift environment during the postclosure period, including possible drift degradation and seismic ground motions (SNL 2007c, Sections 6.4 and 6.5).

SAR Subsection 1.3.4.7.6 “Design Methodologies,” SAR at 1.3.4-31. See also the document referenced as SNL 2007c (LSN#: DN2002479003). This contention does not reference or challenge that analysis.

Nevada then states that SAR Subsection 2.3.4.5.3.1 suggests that the drip shield will continue to function after structural collapse, but because the strength of the Grade 28 weld filler may be greater than the strength of the Grade 7 WDS, a rockfall could cause the WDS to tear and allow water seepage on to the waste package. Petition at 678. The Petition does not acknowledge, however, that the SAR also accounts for the possibility that rockfall may cause drip shield plates to tear and the drip shield to thereby lose its ability to divert seepage water away from the waste package. SAR 2.3.4.5.3 at 2.3.4-160. Rockfall-caused drip shield WDS tears are included in the TSPA. SAR 2.3.4.5.3.3 at 2.3.4-165. Thus, to the extent that the Petition avers that the SAR has failed to account for this potential phenomenon, it is in error. Thus this Nevada assertion does not demonstrate the existence of a material issue.

Nevada’s third, and final assertion is that it is not certain that DOE’s stress relief process will work, and that the effectiveness of this process must be demonstrated. Petition at 678-79. As indicated by the reference to the prototype specification in SAR Subsection 1.3.4.7.7 (SAR at 1.3.4-32), DOE has already planned such a demonstration. Thus, there does not appear to be an issue in controversy. In any event, Nevada has not claimed that an effective stress relief process can not be developed, nor has it claimed that, if the stress relief process is less effective than DOE anticipates, the TSPA results would change significantly and cause the mean dose to the

RMEI to exceed a regulatory limit. Petition at 678. Thus, this Nevada assertion also does not demonstrate the existence of a material issue.

In its discussion of the stress relief assertion, Nevada references and quotes from an American Welding Society (AWS) Guide, but does not explain the relevance of that Guide to the stress relief issue. As Nevada's comment on the AWS Guide implies, the drip shield design utilizes Grade 28 as a weld filler material (SAR at 1.9-129, parameter 07-12), and the use of this intermediate alloy between the Grade 7 WDS and the Grade 29 structural supports, is not addressed in the AWS Guide. In short, Nevada's reference to the AWS Guide does not address the DOE analysis, as reflected in the Application. *See* SAR Table 2.2-5 at 2.2-233 FEP 2.1.03.04.0B "Hydride Cracking of Drip Shields." As a result, neither Nevada's stress relief assertion nor its reference to the AWS Guide provides sufficient support for concluding that this contention raises a material issue.

Because, Nevada's statements in connection with this contention do not challenge the model of drip shield postclosure performance that is abstracted for use in the TSPA, and do not challenge the TSPA results, Nevada has not provided adequate support for concluding that this contention raises a material issue.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention does not specify any alleged ramifications other than the conclusory assertions that the SAR does not comply with 10 C.F.R. § 63.114 and that the drip shield welds could lead to early failure of drip shields that are subject to rockfall.

Petition at 675. Nevada does not claim that the effect of this contention on the model of the probability of early drip shield failure could cause the TSPA results to change significantly and cause the mean dose to the RMEI to exceed a regulatory limit. Consequently, this contention does not establish that there is a genuine dispute on a material issue of fact or law, and does not satisfy 10 C.F.R. § 2.309(f)(vi).

**127. NEV-SAFETY-127 - Hydrogen And ERTi-28 Filler Metal For Welded Joints Between Grade 29 And Grade 7 Titanium**

SAR Subsection 1.3.4.7.7 and similar subsections, which describe the drip shield system, refer to SAR Table 1.3.4-5 where it is stated that, for Titanium Grade 7 to Titanium Grade 29 welds, Titanium Grade 28 filler material (ERTi-28) shall be used, with the objective of reducing the aluminum gradient across the weld as a means to mitigate hydrogen induced delayed cracking issues in these welds, but DOE's failure to include adequate controls on the use of such techniques or to qualify welding procedures and prepare samples to demonstrate that the aluminum gradient concept is truly valid may result in welds that fail to perform as hoped and that are not adequately evaluated for joining the Grade 29 structural members to the Grade 7 Water Diversion Surface (WDS), so such welds cannot be relied upon to behave as anticipated or required for postclosure performance purposes, and could lead to early failure of drip shields.

**RESPONSE**

This contention asserts that the LA does not include adequate controls on the welding of Titanium Grade 7 to Titanium Grade 29, using Titanium Grade 28 filler material (ERTi-28), to demonstrate that these welds will perform as DOE hopes and the welds could lead to early failure of drip shields. Petition at 681.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies 10 C.F.R. §§ 63.31(a)(3), 63.21(c)(3)(ii) and (c)(14), 63.102(h), 63.113, 63.115 and 63.114(f) in the contention. Petition at 682. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7.), this direction cannot be read to dispense with the well-recognized requirement that a petitioner must demonstrate that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC

from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation:” (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a

contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach three affidavits (by Michael C. Thorne, James A. McMaster and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Paragraph 5 of this contention identifies perceived uncertainties regarding DOE's plans for Titanium Grade 7 to Titanium Grade 29 welds, using Titanium Grade 28 filler material, including: (1) it is not clear whether the Grade 28 filler or Grade 29 will have better corrosion resistance (Petition at 683); (2) use of Grade 28 as a weld filler for welding Grade 7 has not been

demonstrated industrially (*id.* at 684); (3) if the corrosion rate of the filler metal is significantly greater than that of the base metal galvanic corrosion may occur (*id.*); (4) it is not clear that the stress relief process will be as effective as DOE envisions (*id.* at 685); (5) Grade 28 may not be effective in preventing hydrogen migration (*id.*); (6) an AWS Guide warns of the potential for hydrogen migration and precipitation when welding alpha materials to alpha-beta materials (*Id.* at 686-87); and (7) alternative welding techniques may be more effective and should be tested (*id.* at 687).

Nevada's assertions need not be considered individually because they all share the characteristics of being attempts to raise speculation or questions about the selection of the optimum approach to welding titanium Grade 7 to titanium Grade 29, without providing substantiated answers or specific disagreement with any specific portion of the Application. Nothing in paragraph 5 controverts a statement in the Application; in fact, paragraph 5 does not contain a single specific reference to the Application. The SAR describes detailed analyses of the corrosion of the drip shield water diversion surface and the drip shield structural supports, and the repository features, events and processes that could affect the drip shields. *See* SAR Subsection 2.3.4.5.5, *passim*. Additional details concerning associated DOE studies are provided in "General Corrosion and Localized Corrosion of the Drip Shield," ANL-EBS-MD-000004 REV 02 ADD 01, which is identified as reference SNL 2007f in SAR Subsection 2.3.4., and as LSN#DN2002467884. Nothing in any of the assertions included in paragraph 5 appears to challenge a statement in the SAR, or the associated technical report.

As discussed in Section V.A.3 above, contentions expressing only generalized "uncertainties" in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63,

which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from this deficiency.

Nevada also fails to identify alternatives that Nevada believes would more accurately characterize the properties of the proposed drip shield weld materials or to specifically state the impact of those new properties. Accordingly, it is impossible to assess what effect, if any, Nevada's claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990)

Nevada's concerns about selection of the optimum weld technique, qualification of the welding procedures and welders, demonstration of the effectiveness of the stress relief process, and other similar details, are addressed by the DOE prototype program (referenced in the SAR at 1.3.4-32) and other ongoing project activities. In addition, before a welding procedure is allowed to be used to fabricate drip shields for use in the repository, applicable quality assurance requirements state that there must be a demonstration that the procedure will produce adequate welds. *See* 10 C.F.R. § 63.142(j). Consistent with the NRC regulation, DOE quality assurance requirements, which are incorporated by reference in SAR Subsection 5.1 at 5.1-1, provide that “[s]pecial processes that control or verify quality, such as welding, heat treating, chemical cleaning, and nondestructive examination are controlled and accomplished by qualified personnel using qualified procedures in accordance with applicable codes, standards, specifications, criteria, and other requirements.” “OCRWM Quality Assurance Requirements and Description, Revision 20” (LSN# DEN001574022, at 75).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada's statements in paragraph 5 of this contention do not challenge any specific statement in the Application or any other DOE document, or show that this contention would affect the models reflecting drip shield performance that are abstracted in the TSPA, and thereby cause the TSPA results to exceed a regulatory limit. As discussed in section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this flaw, since it does not specify any alleged ramifications other than the conclusory assertions that the SAR does not comply with 10 C.F.R. § 63.113. Petition at 688. Consequently, this contention does not establish that there is a genuine dispute on a material issue of fact or law, and does not satisfy 10 C.F.R. § 2.309(f)(vi).

Finally, paragraph 6 of this contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

**128. NEV-SAFETY-128 - Nuclear Code and Fabrication Quality Assurance Standards**

SAR Subsection 1.3.2.7 and similar subsections, and reference document “Drip Shield and Waste Package Emplacement Pallet Design Report, 000-00C-SSE0-00100-000-00B” (08/09/2007), LSN# DN2002459185, Para 6.2.4 at 20, and SAR Table 1.3.2-5 make reference to sections of the ASME Code, various Nuclear Codes and other standards to guide drip shield fabrication that DOE proposes to use but the cited codes and standards do not provide adequate information to evaluate the conceptual design or to specify subsequent detailed design, fabrication, or quality assurance requirements necessary to build drip shields.

**RESPONSE**

Nevada states that although SAR Subsection 1.3.2.7 and similar subsections, and a reference document address the ASME Code, various Nuclear Codes and other standards to guide drip shield fabrication, these codes and standards do not provide adequate information to evaluate the conceptual design or to specify subsequent detailed design, fabrication or quality assurance (QA) requirements necessary to build drip shields.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Nevada in this contention cites to several regulatory provisions regarding requirements for the natural and engineered barriers in the repository and includes a lengthy discussion of

different welding techniques (Petition at 690) to support its allegation that there is insufficient information in the SAR to evaluate the drip shields. In essence, the contention is not a challenge to the drip shields per se, but rather a request for additional information to assist in the evaluation of the drip shields. As such, the issues raised by this contention are more properly the subject of requests for additional information by the NRC staff, than an adjudicatory challenge to the Application.

The notice of hearing, which is the only basis Nevada asserts for supporting its position that this contention raises an issue within the scope of this proceeding, states that “[t]he matters of fact and law to be considered are whether the application satisfies the applicable safety, security, and technical standards of the AEA and NWPA and the NRC’s standards in 10 CFR Part 63 for a construction authorization for a high-level waste geologic repository.” 73 Fed. Reg. 63,029, 63,029 (Oct. 22, 2008). Mere reference to the scope of the hearing is insufficient, without more, to satisfy the requirement of 10 C.F.R. §2.309(f)(1)(iii) and the Case Management Order for demonstrating that the contention is within the scope of the proceeding. *See* CMO, at p. 7.

Accordingly, if for no other reason, the contention should be dismissed for failure to demonstrate that it raises issues that are within the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

The contention fails to raise an issue that is material to the findings that the NRC must make because it fails to identify the information that is lacking from the Application with respect to the drip shields and fails to identify a particular provision of any of the regulations that seeks the information regarding the drip shields that was not provided.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 689-90. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceedings.” Petition at 690. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Nevada asserts that the cited regulations relate to the design of the engineered barrier system, its relationship with the natural barriers and the postclosure performance objectives. Petition at 690. Nevada, however, fails to demonstrate what information, with regard to the drip shields, is missing from the Application required by these regulations and is material to any finding that the NRC must make to authorize construction of the repository.

Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. Nevada merely seeks additional information. Accordingly, this

contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (by James A. McMaster, Doug F. Hambley and Robert A. Cottis), which purportedly provide expert opinions to support this contention. Rather than providing information to support the assertions in paragraph 5 of this contention, however, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Further, the one document that Nevada cites in paragraph 5 in support of the contention does not relate to drip shields. Although the contention challenges the specifications associated with the drip shields, the specification it cites in paragraph 5 ("Waste Package Fabrication, 000-3SS-DSC0-00100-000-00B" (03/13/2007), LSN# DN2002380114) is restricted to the waste package and is not relevant to the fabrication of the drip shields. (Petition at 690).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention fails to raise a genuine dispute on a material issue of law or fact because, as discussed in section d, above, Nevada fails to identify the information regarding the drip shields that is missing from the Application and required by regulation to be part of the Application.

The contention also states in its first paragraph, without further discussion or support, that the SAR and supporting documents do not specify the “quality assurance requirements necessary to build the drip shields.” Petition, at 689. The SAR at 5.1-1 incorporates the Quality Assurance Requirements Description (QARD), which describes the quality assurance program applicable to systems, structures and components important to safety, barriers important to waste isolation and to related activities. QARD, Rev. 20, at 19 (Oct. 1, 2008). The drip shields are a barrier important to waste isolation (SAR, §1.3.4.7.3 at 1.3.4-29), and thereby subject to the QARD. As such, Nevada’s statement that DOE has failed to specify the quality assurance requirements applicable to the drip shields does not raise a genuine dispute of a material issue.

Finally, the contention includes a lengthy discussion of potential welding techniques<sup>70</sup> that may be applied to the drip shields, without identifying whether and why any one of the techniques that may be selected by DOE is not appropriate. Yet, Nevada broadly claims that DOE has not adequately defined the welds or the quality controls applicable to each weld. *See* Petition at 691. This information is not required by any regulatory standard at this stage of the project and will be provided through the prototyping program for the drip shields, which is

---

<sup>70</sup> One of the techniques referenced in the contention, Manual Metal Arc, is not discussed in *Yucca Mountain Project Engineering Specification Prototype Drip Shield*. 000-3SS-SSE0-00100-000 REV 000. Las Vegas, Nevada: Bechtel SAIC Company. ACC: ENG.20071206.0013. LSN#: DN2002502316, and the contention omits the option for the vendor to propose other welding techniques.

described in the SAR. *See* SAR, §1.3.4.7.7 at p. 1.3.4-32; Yucca Mountain Project Engineering Specification Prototype Drip Shield. 000-3SS-SSE0-00100-000 REV 000. Las Vegas, Nevada: Bechtel SAIC Company. ACC: ENG.20071206.0013. LSN#: DN2002502316 (2007).

Nevada fails to meet its burden of identifying information absent from the SAR or a regulatory requirement that has not been met. Further, the SAR and incorporated documents provide detailed descriptions of the drip shields, and the prototyping process will develop additional information. The contention, as such, must be dismissed for failure to raise a genuine dispute on a material issue of law or fact.

**129. NEV-SAFETY-129 - Early Failure Mechanisms Associated With Titanium Fabrication**

SAR Subsection 2.3.6.8.4 and similar subsections, which describe drip shield early failure due to manufacturing and handling defects, consider only a limited range of possible defects associated with titanium fabrication and welding (*e.g.*, improper heat treatment, base metal selection flaws, and improper weld filler material) and fail to include many additional defects that could result from fabrication and could lead to early failure of drip shields.

**RESPONSE**

In this contention, Nevada alleges that SAR subsection 2.3.6.8.4 and similar (but unidentified) subsections fail to consider the appropriate range of possible defects associated with the fabrication and welding of the titanium for the drip shields. Petition at 693. Nevada lists a variety of specific types of defects that it contends have not been adequately considered. *Id.*

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 694-95. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue . . . .” *Id.* at 694-95. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic

setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation:” (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Nevada fails to explain *how* the potential titanium fabrication and welding deficiencies it identifies, even if they occur, will make a difference in the outcome of this proceeding. *See generally* Petition at 695-700. Accordingly, Nevada has not demonstrated that the issues raised in this contention are material to any finding the NRC must make to authorize construction of the repository.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below, Nevada has failed to provide any tangible information, expert opinion or affidavits to support its claims. Nevada's Petition attaches affidavits (by James A. McMaster, Michael C. Thorne, and Robert A. Cottis), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavit simply "adopts" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada's basis statement is a litany of potential titanium fabrication and welding defects. Petition at 693. The same list begins Nevada's statement of alleged facts or expert opinion. *Id.* at 695. These purported problems fall into two categories. The first are eleven issues that are identified in the basis statement and initial paragraph of section 5, but are never specifically mentioned again. These are: (1) titanium cracking during forming and bending; (2) surface iron contamination; (3) missing welds; (4) undersized welds; (5) lack of weld penetration; (6) lack of

weld fusion; (7) hydrogen induced porosity; (8) high density and tungsten inclusions; (9) hydrogen contamination from stress relief; (10) inconsistent stress relief over the entire structure; (11) localized contamination due to flame impingement on the structure during stress relief.

Therefore, as a threshold matter, these eleven specific allegations amount to nothing more than bare unsupported assertions and cannot support the admission of this contention. *See Dominion Nuclear Conn., Inc.* (Millstone Power Station, Unit No. 3), LBP-08-09, 67 NRC \_\_ (June 4, 2008) (slip op. at 13) (finding that a contention that does not offer tangible information, expert opinion or substantive affidavits is based on just “bare assertions and speculation” and inadmissible).

As to the remaining issues, rather than providing a reasoned basis or explanation, Nevada merely presents a disorganized collection of vague and unsupported assertions. Nevada must set forth “the necessary technical analysis to show why the proffered bases support its contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 180 (citing *Ga. Inst. of Tech*, LBP-95-6, 41 NRC at 305); *see also USEC*, CLI-06-10, 63 NRC at 472 (an expert opinion that merely states a conclusion “without providing reasoned bases or explanation for that conclusion is inadequate . . .”). A cursory review of the “support” for this contention, however, reveals a consistent lack of reasoned basis or explanation for any of Nevada’s additional purported issues. It also reveals a series of unsupported assumptions regarding the titanium fabrication and welding methods DOE intends to use and an *unstated and unsupported assumption that DOE’s QA program is inadequate*. For example:

- (1) “undetected base metal flaws such as laps or seams” (Petition at 695):
  - “Depending on the ingot melting methods utilized, there can be composition variances and inclusions in the materials.” *Id.* (emphasis added).

- “Improper hot working . . . can leave *undetected* laps or seams in the material.” *Id.* (emphasis added).
  - “*Inadequate acid pickling of plate can* leave an excessive oxygen-rich surface zone that exhibits low ductility and *can* lead to cracking during fabrication or in service under loads that cause significant strains.” *Id.* (emphasis added).
- (2) “surface contamination” (Petition at 695):
- “[E]xcessive surface oxygen contamination causes a low ductility surface layer that *can* . . . lead to premature equipment failures in service. . . .” *Id.* at 695 (emphasis added).
- (3) weld contamination due to oxygen, nitrogen, iron, erosion or other unspecified causes (*see* Petition at 695):
- “[T]he quality of a titanium weld is vitally dependent on both the procedure used and the exact detail of how the procedure is applied.” *Id.* at 696.
  - “Much of the quality is dependent on the welder’s understanding of the contamination problem and instant recognition of the sources.” *Id.*
  - “Loss of control [over the welding process] *can* come from numerous sources, none of which are addressed in DOE’s [unspecified] FEP analysis.” *Id.* (emphasis added).
- (4) “improper filler metal selection” (Petition at 695):
- “[W]elding filler metal *may* have a minor amount of drawing compound left even after careful manufacture.” *Id.* at 697 (emphasis added).
- (5) “weld root contamination due to improper or inadequate inert gas shielding” (Petition at 695):
- “Drafts in the welding shop *can* disrupt inert gas shielding during welding.” *Id.* (emphasis added).
- (6) “nondestructive testing and inspection errors” (Petition at 695):
- “There is no standardized or universally accepted test for detecting contaminated titanium welds.” *Id.* at 697.
  - “At low levels, such contamination [of the weld shielding gas] *may* be difficult to detect . . . .” *Id.* (emphasis added).

Nevada provides no references to documentation corroborating its bare assertions regarding these alleged potential titanium fabrication or welding issues. Nevada cites no industry documentation, scholarly journal articles, codes or standards, nor does it provide any other technical analysis supporting the claim that its issues present serious problems in titanium fabrication or welding in general, or that DOE's QA procedures will be inadequate to address these purported problems. Accordingly, this contention must be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Because Nevada raises issues that, as explained in Sections d, and e above, are not material to the NRC's findings and are unsupported by facts or expert opinion, it also fails to raise a genuine dispute on a material issue of law or fact.

Moreover, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Petition at 700, Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. *Id.* at 699. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

Finally, Nevada fails to identify the pertinent portions of DOE's Application and explain its opposing view. *See* Rules of Practice for Domestic Licensing Proceedings—Procedural

Changes in the Hearing Process, 54 Fed. Reg. at 33,170; *Dominion Nuclear Conn., Inc.*, CLI-01-24, 54 NRC at 358. This is true with respect to each of the eleven issues that Nevada mentions in its basis statement but does not further explain. It is also true with respect to the remaining alleged titanium fabrication or welding defects.

- (1) Nevada presents the bare assertion that “DOE does not adequately address . . . undetected base metal flaws such as laps or seams.” Petition at 695. Allegedly, this problem is linked to certain unspecified “ingot melting methods,” “improper hot working,” and “[i]nadequate acid pickling of plate.” *Id.* Nevada, however, fails to address or identify any deficiency in DOE’s analysis of base metal flaws in SAR subsection 2.3.6.8.4.3.2.1, in which DOE acknowledges this potential problem and accounts for its frequency of occurrence in the TSPA. SAR at 2.3.6-82.
- (2) Nevada asserts that “DOE does not adequately address . . . surface contamination” in titanium manufacture. Petition at 695. For example, “excessive surface contamination [allegedly] causes a low ductility surface layer that can . . . lead to premature equipment failures . . . .” *Id.* (citing no authorities or examples of this phenomenon). This issue is addressed in SAR subsection 2.3.6.8.4.3.1. SAR at 2.3.6-81. Nevada fails to identify or explain any alleged deficiencies in the discussion of surface contamination in that subsection, or in the analyses cited therein.
- (3) Nevada asserts that “DOE does not adequately address . . . weld contamination due to oxygen” nitrogen, iron, erosion or other unspecified causes. *See* Petition at 695. Allegedly, because stress relief annealing “is not capable of eliminating

weld flaws,” DOE improperly relies upon it to avoid stress corrosion cracking (“SCC”) of titanium welds. *Id.* at 698. This ignores the fact that DOE does not rely on stress relief annealing to eliminate all such flaws. SAR § 2.3.6.8.3 at 2.3.6-79 (“Even if stress corrosion cracking of the drip shield were to occur, the crack would have no effect . . . .”) (citing FEP 2.1.03.02.0B). Nevada does not identify or dispute this information.<sup>71</sup>

- (4) Nevada asserts that “DOE does not adequately address . . . improper filler metal selection.” Petition at 695. Similarly, it alleges that “DOE does not consider the . . . risk of weld contamination from inadequately cleaned base or filler metal.” *Id.* at 699. As is the case with its allegations of base metal flaws, however, Nevada fails to address or identify any deficiency in DOE’s analysis of improper weld filler material in SAR subsection 2.3.6.8.4.3.2.2, in which DOE acknowledges this potential problem and accounts for its frequency of occurrence in the TSPA. SAR at 2.3.6-82.
- (5) Nevada’s allegations related to “weld root contamination due to improper or inadequate inert gas shielding” ignore the fact that the drip shield will be fabricated in accordance with the requirements of the ASME Boiler and Pressure Vessel Code, which include requirements for inspection by an authorized and certified nuclear inspector. *See* SAR Table 1.3.2-5 at 1.3.2-42 to -43. The relevant ASME Code provisions also include strict cleanliness and quality specifications. Nevada fails to explain why such controls would be inadequate to address this problem. Indeed, Nevada essentially admits that this problem is

---

<sup>71</sup> Nevada presents similar or related allegations in NEV-SAFETY-125 and -126, and -127. Those claims fail to raise a genuine dispute for the reasons set forth in DOE’s responses to those contentions, above.

within the capacity of an effective QA program to address. *See* Petition at 697 (“Detection of many of these problems depends on the skill and training of the welder, and as importantly on the attitude of the management of the welding shop . . . .”).

- (6) Nevada’s final allegation relates to “nondestructive testing and inspection errors.” Petition at 695. Nevada relies upon the following speculation: “the assumption that [weld contamination] defects will all be detected is wishful thinking.” Petition at 697-98. This assertion, however, is unsupported by evidence, example, analysis, or citation to any scholarly or industry documentation. Indeed, as explained in paragraph (5), above, it is contradicted by other speculation provided by Nevada in this contention. Therefore, this speculation fails to raise a genuine dispute.<sup>72</sup>

For all these reasons, this contention must be denied.

---

<sup>72</sup> Nevada presents similar allegations in NEV-SAFETY-128. Those claims fail to raise a genuine dispute for the reasons set forth in DOE’s responses to that contention, above.

**130. NEV-SAFETY-130 - Drip Shield Emplacement Plan, Equipment, And Schedule**

SAR Subsection 1.3.4 at 1.3.4-1 identifies two engineered components within the repository drift that are important to waste isolation – the waste package and the drip shield – and the license application relies on installation of drip shields to prevent exceeding the allowable dose to the RMEI. The drip shields are a new technology that has never been designed in detail, prototyped, fabricated, or installed in any actual application in order to develop a basis for predicted performance or to demonstrate that drip shields can be installed and perform as assumed in the TSPA; therefore, the contribution of the drip shields in the predicted performance of the repository should be ignored in the TSPA or, at a minimum, the no drip shield scenario should be considered as an alternative conceptual model and propagated through the assessment.

**RESPONSE**

In this contention, Nevada alleges that because “drip shields are a new technology that has never been designed in detail, prototyped or installed,” the contribution of drip shields to the TSPA must be ignored, or “at a minimum, the no drip shield scenario should be considered.” Petition at 701. This contention presents a collection of vague assertions and unsupported speculation with no specific connection to any requirement in 10 C.F.R. Part 63. As such, it is inadmissible.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**c. Whether the Issue is Within the Scope of the Proceeding**

To the extent Nevada seeks to litigate issues related to “Drip Shield Fabrication,” “Material Resources,” “Competing Uses of Materials,” or “Funding,” Petition at 705, 707-08, it cannot do so because such issues are outside the scope of this proceeding.

As to drip shield fabrication, Nevada announces its desire for more information about how DOE intends to “organize and manage the resources necessary to fabricate the drip shields.” Petition at 705. Nevada also expresses concerns about the supply of drip shield and waste package materials, the alleged associated strain on the “material supply industry” and raw material resources, and whether DOE “will convince Congress to allocate funds” for the drip shields. *Id.* at 707-08. In sum, Nevada asserts that, because of these and other issues it raises in this contention, drip shield installation “cannot be assumed to occur.” *Id.* at 701.

This proceeding, however, addresses whether the Application before this Board “satisfies the applicable safety, security, and technical standards” under the AEA, NWPA, and Part 63. Hearing Notice, 73 Fed. Reg. at 63,029. It is not a forum to adjudicate the generalized resource, funding, and material supply issues that Nevada seeks to raise. The Commission has rejected similar contentions that were based on speculation that applicants will not obtain sufficient funding or resources to implement the activities specified in a license application.

For example, in *Private Fuel Storage*, the State of Utah argued that after operation commenced, the applicant might fail to generate sufficient revenue and so might attempt to cut operating costs by reducing the number of trained firefighting personnel, contrary to the licensee’s commitments. *Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), CLI-01-9, 53 NRC 232, 234 (2001). The Commission rejected this argument on appeal, stating that “we will neither assume that PFS will operate without sufficient financing,

nor will we assume that an unexpected funding shortfall will induce PFS to ignore its responsibility to train and employ a sufficient number of firefighters.” *Id.* at 235; *see also Curators of the Univ. of Mo.*, CLI-95-8, 41 NRC 386, 400 (1995) (rejecting intervenor’s request “to base our findings on the assumption that the University will violate an explicit and unambiguous condition of the license”). Here, Nevada presents similar speculation that DOE will be unable to obtain sufficient financing or secure sufficient resources to implement the repository design as described in the Application.

Speculation regarding government funding decisions is also insufficient to support an admissible contention. In *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-90-10, 32 NRC 218 (1990), a petitioner sought to reopen the record of an operating license proceeding by arguing that future budget cuts might force the State of New Hampshire to fail to maintain sufficient emergency response staff. *Id.* at 221-23. The Commission found that petitioner’s “[s]peculation about future effects of budget curtailments” failed to provide sufficient factual basis for his concerns. *Id.* at 223. This contention is similarly based on speculation that DOE will not receive sufficient government funding to implement the design presented in the Application, and is therefore inadmissible.

Accordingly, in this proceeding Nevada cannot litigate questions about DOE’s plan to organize and manage the resources necessary to fabricate the drip shields, nor can it litigate similar concerns about material resources, competing uses of materials, and funding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 702.

Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere

assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue. . . .” *Id.* at 702. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations, Case Management Order, slip op. at 7, this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” *Id.* at 3.

Each allegation Nevada proffers in this contention is addressed in detail below. In every case, Nevada fails to link its complaints to a specific deficiency in the Application. Thus, Nevada fails to carry its burden of showing that the resolution of its complaints would make a difference to the outcome of this proceeding.

(1) General Issues: Nevada begins the supporting information in this contention with a “General” discussion which vaguely asserts that DOE’s drip shield emplacement plan is “not credible.” Petition at 703. Building on this assertion, Nevada posits that, if one assumes that drip shields are not present, then the repository would not meet the groundwater protection standards of 10 C.F.R. § 63.331 nor would it meet the dose requirements of 10 C.F.R. § 63.311. *Id.* at 703-704. Nevada’s conclusions with respect to groundwater standards are completely unsupported,

but its conclusions regarding dose are purportedly based on an (unspecified) “analysis of DOE’s own documentation.” *See id.* The “General” discussion ends with an expression of Nevada’s desire that, “At a minimum, the drip shield placement system . . . should be demonstrated numerous times in drifts prior to placement of the first waste packages to demonstrate that it may actually work as planned.” *Id.* (emphasis in original).

In essence, this portion of the contention restates—in a completely conclusory fashion—the allegations in NEV-SAFETY-133 (Drip Shield Gantry Description), in which Nevada speculates that drip shields may be difficult to install, and NEV-SAFETY-161 (Critical Role of the Drip Shield), in which Nevada provides a cursory calculation purportedly showing that dose limits are not met without the drip shield.<sup>73</sup> DOE’s responses to those contentions explain why they fail to raise issues that are material to the NRC’s required findings. Briefly, in NEV-SAFETY-133, Nevada fails to tie any specific alleged deficiencies in the level of detail in the Drip Shield Gantry design to any regulatory requirement, and in NEV-SAFETY-161, Nevada mistakenly claims that individual engineered barriers within the repository must be subjected to a quantitative performance evaluation. The additional allegation that appears in NEV-SAFETY-130 regarding groundwater protection is also immaterial for the same reasons set forth in DOE’s response to NEV-SAFETY-161.

Thus, Nevada has not shown that the specific drip shield emplacement demonstrations that it desires are required by the regulations.<sup>74</sup>

---

<sup>73</sup> Nevada provides no references, however, indicating that, in NEV-SAFETY-130, it intends to rely upon any additional information provided in NEV-SAFETY-133 or -161. Nevada therefore cannot do so. 10 C.F.R. § 2.309(f)(1)(v) (requiring “references” to support petitioner’s position).

<sup>74</sup> Drip shields will, however, be fabricated and emplaced within the performance confirmation drift shortly after commencement of operations at the repository. *See* SAR at 4-14 (explaining that performance confirmation activities will include direct monitoring of “waste package and drip shield condition in a thermally accelerated drift”). Nevada fails to address this information or explain why it believes that this aspect of the Application is insufficient.

(2) Drip Shield Design: In this section, Nevada expresses its desire for additional drip shield design information and manufacturing specifications, but it fails to identify any specific regulatory requirement associated with its desires. Accordingly, this information is not material.

(3) Drip Shield Fabrication: Because Nevada's allegations regarding drip shield fabrication are outside the scope of this proceeding, they are also immaterial to the NRC's findings. This section of the contention, however, further asserts that "[k]ey manufacturing processes, like welding the Grade 28 to the Grade 7, or the proposed thermal stress relieving, have not been demonstrated or qualified." Petition at 705. This vague statement appears to reflect allegations similar to those presented in NEV-SAFETY-126 through -129, although Nevada does not reference any of those contentions here, nor does it elaborate beyond the conclusory statement quoted above. In its response to those contentions above, DOE explains why Nevada's concerns about titanium welding fail to raise material issues.

(4) Gantry Design: This section reiterates Nevada's desire for additional information regarding the drip shield gantry design. Here, Nevada attempts, but fails, to articulate a connection between its desires and a regulatory requirement: "Failure of the gantry system to perform as assumed in the TSPA *can* result in exceeding the individual and groundwater protection standards." Petition at 705 (emphasis added). This conclusory statement, however, falls far short of carrying Nevada's burden of demonstrating that its contention, if true, would make a difference in the outcome of this proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

(5) Emplacement Procedures: Here, Nevada expresses its desire for training of drip shield emplacement operators, and its desire to change the schedule presented in the Application to begin drip shield emplacement "shortly after the beginning of placement of waste packages."

Petition at 706. Once again, Nevada fails to identify any specific regulatory requirement associated with its desires. Thus, as in the “General” issues section addressed above, Nevada fails to show any connection between its desire for a demonstration or “[p]ractice[]” in drip shield emplacement and any regulatory requirement. Petition at 706.

(6) Material Resources, Competing Uses of Materials, and Funding: As explained in Section c, above, the speculation in these sections is outside the scope of this proceeding. It is also therefore immaterial. In addition, as in previous sections, Nevada fails to identify any specific regulatory requirement associated with its desires, so it has failed to carry its burden of demonstrating the materiality of its allegations.

(7) Drift Deterioration/Collapse: In this section, Nevada accuses DOE of assuming, “that no anticipated or unanticipated event can or will occur during this [undefined] time interval that will hinder or prevent placement of the drip shields or during the act of installing the drip shields except for a low probability scenario of one misplaced drip shield due to operator error.” Petition at 708. No citation is provided in support of this accusation. Nevada goes on to reference certain other contentions (NEV-SAFETY-123, NEV-SAFETY-136, and NEV-SAFETY-173) that purportedly “specify rock fall and drip shield collapse scenarios that can occur prior to repository closure, including prior to drip shield installation.” *Id.* Nevada provides no further explanation of any alleged *material* impact of these claims, thus failing to carry its burden.<sup>75</sup> Accordingly, this information is not material.

For all these reasons, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and must be dismissed.

---

<sup>75</sup> In addition, DOE’s responses to the allegations in NEV-SAFETY-123, NEV-SAFETY-136, and NEV-SAFETY-173 are provided in this Answer brief.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to those requirements: (1) the contention does not reference any documents, other than the Application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach affidavits (by James A. McMaster, Allen Messenger, and Michael C. Thorne), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

In addition, this contention is rife with unsupported assertions of fact and vague statements that render it inadmissible. *See USEC, CLI-06-10, 63 NRC at 472* (requiring a contention to be supported with a "reasoned basis or explanation"). For example:

- "Without proper installation of the drip shields, the proposed Yucca Mountain repository will not perform as modeled in the TSPA and it will not meet the ground water protection standards set forth in 10 C.F.R. § 63.331." Petition at 703.
- "Today, there are insufficient specialist titanium subcontractor resources in the United States to fabricate drip shields on the schedule required." *Id.* at 705.
- "Failure of the gantry system to perform as assumed in the TSPA can result in exceeding the individual and groundwater protection standards." *Id.*
- "There are other similar FEPs that may occur and have not been assessed by DOE." *Id.* at 707.

- “Palladium and ruthenium in particular are mined, and mined resources are limited and the exploitation lifetime is finite.” *Id.*
- “The cost of drip shields is likely to rise relative to inflation and will most likely be impacted by speculation in at least palladium and ruthenium as the project grows closer to realization.” *Id.* at 708.

Accordingly, this contention must be rejected for failure to provide adequate support in fact or expert opinion.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Because Nevada raises issues that, as explained in Sections c, d and e above, are outside scope, immaterial to the NRC’s findings and unsupported by facts or expert opinion, it also fails to raise a genuine dispute on a material issue of law or fact.

In particular, Nevada fails to identify the pertinent portions of DOE’s Application and explain its opposing view. *See* Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. at 33,170; *Dominion Nuclear Conn., Inc.*, CLI-01-24, 54 NRC at 358.

(1) General Issues: To the extent Nevada seeks to rely upon information NEV-SAFETY-133 or -161 to support this contention, it cannot—DOE explains why those contentions fail to raise a genuine dispute in its responses to NEV-SAFETY-133 and -161. Briefly, among other things, in NEV-SAFETY-133, Nevada fails to address, refute, or otherwise provide any explanation of why the information on Drip Shield Gantry design described below is inadequate under 10 C.F.R. §§ 63.21(c), 63.114(a), or any other provision of Part 63. NEV-SAFETY-161 rested primarily upon a “back of the envelope” calculation—based on unsupportable assumptions—purportedly showing that without drip shields, postclosure dose requirements would not be met.

It also rested on impermissible speculation that DOE would not implement the design in the Application.

(2) Drip Shield Design: Nevada fails to identify and explain its dispute with any information presented in the Application. *See* SAR § 1.3.4.7; *see also* “Yucca Mountain Project Engineering Specification Prototype Drip Shield,” LSN No. DN2002502316, cited at SAR 1.3.4-32.

(3) Drip Shield Fabrication: Nevada fails to identify and explain its dispute with any information presented in the Application. *See* SAR § 1.3.4.7; LSN No. DN2002502316, cited at SAR 1.3.4-32.

(4) Gantry Design: Nevada fails to identify and explain its dispute with any information presented in the Application. *See generally* SAR § 1.3.4.7; DOE’s response to NEV-SAFETY-133, below.

(5) Emplacement Procedures: Although Nevada complains that “DOE concludes that errors in waste emplacement (that could prevent drip shield installation) will not exist at the time of closure because such errors are excluded by regulation (FEP: 1.1.03.01.0A),” Petition at 706, Nevada fails to address the information presented in this FEP and explain why it disagrees with DOE’s analysis. Indeed, instead of providing an explanation for its disagreement, Nevada engages in hyperbole: “DOE has not even identified the types of Category 1 accidents that could impact the waste package.” *Id.* (emphasis added). With respect to its specific “concern” about waste package obstruction of the drip shield gantry, Nevada fails to address or refute the relevant information in FEP: 1.1.03.01.0A: “The regulatory requirements for performance confirmation and quality assurance require that any deviation from design be evaluated for potential impact, and that significant deviations which are detected during the operational period be corrected.” “Features, Events; and Processes for the Total Systems Performance Assessment: Analyses,”

(Mar. 6, 2008) (LSN# DEN001584804 at 6-39). In particular, Nevada does not explain why it believes such a waste package obstruction would not be identified, nor why it could not be corrected.

Moreover, contrary to Nevada's accusations, DOE's decision to perform an additional analysis of a TEV collision with a waste package is not an admission of any deficiency in the current Application. In particular, and again contrary to Nevada's innuendo, DOE's decision to perform additional analysis is certainly not an admission that such a collision would cause *irreparable* problems with respect to the emplacement of drip shields. *Cf. Duke Energy*, CLI-99-11, 49 NRC at 337 ("Petitioners seeking to litigate contentions must do more than attach a list of RAIs and declare an application 'incomplete.' It is their job to review the application and to identify what deficiencies exist and to explain why the deficiencies raise material safety concerns.").

(6) Material Resources, Competing Uses of Materials, and Funding: Nevada fails to identify and explain its dispute with any information presented in the Application.

(7) Drift Deterioration/Collapse: As noted above, Nevada provides no citations for its accusations against DOE in this section. In addition, DOE's responses to NEV-SAFETY-123, NEV-SAFETY-136, and NEV-SAFETY-173 show that the information presented in those contentions fails to raise a genuine dispute.

For all these reasons, this contention must be denied.

**131. NEV-SAFETY-131 - Rock Debris Removal**

SAR Subsection 1.3.4.4 and similar subsections, which discuss the design and performance of the waste emplacement areas of the repository, fail to include sufficient detail to demonstrate that consideration has been given to the potential need to remove rock debris from around the waste packages prior to removal of the waste packages, if necessary, and/or installation of the drip shields, and as a result, the TSPA-LA assumptions relating to drip shield emplacement and effectiveness of the EBS are unfounded.

**RESPONSE**

This contention asserts that SAR Subsection 1.3.4.4 does not demonstrate that consideration has been given to the potential need to remove rock debris from around the waste packages prior to any removal of the waste packages or installation of the drip shields, and as a result, the TSPA assumptions relating to drip shield emplacement and effectiveness of the EBS are unfounded.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

As discussed in Section V.A.3, a contention is outside the scope of the proceeding if it challenges the regulations set forth in 10 C.F.R. Part 63 and advocates a stricter requirement than NRC rules impose. This contention challenges Part 63 by asserting that the SAR must

discuss methods to remove a waste package after emplacement, if the waste package is covered in debris or damaged, Petition at 713; by a large rockfall. Contrary to Nevada's contention, 10 C.F.R. Part 63 requires only that the SAR include analyses of Category 1 and Category 2 events. *See* 10 C.F.R. § 63.112(e). Nevada does not claim that a significant rockfall in an emplacement drift would be a Category 1 or Category 2 event. Moreover, as described below and in more detail in SAR section 1.7, DOE determined that a significant rockfall in an emplacement drift is not a Category 1 or Category 2 event. Consequently, Nevada's contention that the SAR must address such circumstances is outside the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 712-13. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding." *Id.* at 713. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would

make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. Petition at 713. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach an affidavit (by Doug F. Hambley), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavit simply “adopts” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Paragraph 5 of this contention makes two assertions: (1) “[p]resumably, the need to repair or replace a component of the ground support system would be triggered by a significant roof fall,” and therefore the SAR should have addressed the possibility of a waste package being covered with debris or damaged (Petition at 713-14); and (2) the SAR statement that “[b]enefits

of repairs and replacements would be weighed against potential radiological exposures and other operational concerns specific to the situation” implies that minor rock falls will be left in place, and that DOE appears not to recognize that rockfalls could interfere with drip shield installation (*Id.* at 714).

Nevada’s first assertion is premised on the occurrence of a significant rockfall, but it does not claim that such a rockfall would meet the definition of an event sequence that must be considered in the SAR; and it does not provide any basis for making such a claim. Nevada also completely ignores SAR Subsection 1.7.5.6, which states that DOE’s analysis determined that there are no Category 1 subsurface event sequences that lead to exposure of individuals to radiation, and the Category 2 subsurface event sequences do not involve rockfall in the emplacement drift. SAR at 1.7-49. Consequently, there is no requirement for the SAR to address such an event.

Moreover, this contention does not discuss the portions of the License Application that address action that would be taken in the event of an occurrence or condition outside the bounds of routine operations. For example, SAR Subsection 1.3.1.2.1.7 “Off-Normal Response Activities” (SAR at 1.3.1-12) states that handling such events requires procedures and controls specific to that operation, which are developed for the specific situations when they occur, and discusses examples of such events, as well as procedures in the event of need for emergency egress or refuge. In addition, SAR Subsection 1.3.4.8.2.2 (SAR at 1.3.4-36) discusses waste package recovery; SAR Subsection 1.3.6.1.1 (SAR at 1.3.6-3) discusses the final inspection of waste packages before closure, including actions in the event of a damaged waste package. Other relevant information is provided in reference documents available in the Licensing Support Network. For example, “Ground Support Maintenance Plan,” Bechtel SAIC 2008, LSN#:

DEN001584677, includes a discussion of off-normal scenarios (“If rockfalls are detected after some or all of the waste packages have been emplaced in an emplacement drift and a decision is made to proceed with repair, the following required sequence of maintenance activities will be implemented . . .” LSN#: DEN001584677 at 37), and “Strategies For Recovery After An Off-Normal Event To The Waste Package Transport And Emplacement Vehicle,” Bechtel SAIC 2007, LSN#: DN2002411321, discusses concepts for recovery from various unanticipated events, including realigning a misaligned waste package, and removing debris due to a significant rockfall. Thus, the SAR and related documents do address potential actions to respond to off-normal events such as a significant rockfall.

Nevada’s second assertion is pure speculation. Nevada presumes that because the SAR indicates that a decision on repair or replacement of the ground support in an emplacement drift would take into consideration the potential radiological exposures and any other operational concerns specific to the situation, that: (1) DOE would not repair deteriorating ground support, and instead allow minor rockfalls; (2) such rockfalls would interfere with drip shield installation; (3) DOE would decide not to take action to assure proper installation of the drip shield; (4) NRC approves of that decision; and (5) there would nevertheless be a significant effect on the TSPA results. Nevada does not claim or provide any basis for claiming that such a chain of events would meet the definition of a Category 1 or Category 2 event sequence. In addition, each step in this hypothesized chain of events involves speculation. To be admissible, a contention must be founded on facts, not on such speculation. *See Dominion Nuclear Connecticut, Inc.*, (Millstone Nuclear Power Station, Unit 2), CLI-03-14, 58 NRC 207, 213 (2003). Consequently, this second assertion also does not provide meaningful support for this contention.

Thus, Nevada has failed to provide adequate support for this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact,  
With Supporting References to the License Application**

For the reasons discussed in d. and e. above, the information Nevada has provided to support this contention is not sufficient to show that a genuine dispute exists with DOE on a material issue of law or fact. Nothing that Nevada states in connection with this contention constitutes a reasoned statement of why the Application is unacceptable in some material respect. Consequently, Nevada has not demonstrated that there is a genuine dispute on a material issue and this contention should be dismissed.

### **132. NEV-SAFETY-132 - TEV Description**

SAR Subsection 1.3.3.5.1.1 and similar subsections, which identify the Transport and Emplacement Vehicle (TEV) as the crane-rail-based transport assembly that moves waste packages on emplacement pallets from surface facilities to the emplacement drifts, fail to include sufficient detail to determine whether the TEV will fulfill the requirements that the TSPA-LA places on it, and as a result, the TSPA-LA assumptions relating to waste package emplacement and effectiveness of the engineered barrier system are unfounded.

### **RESPONSE**

In this contention, Nevada alleges that “SAR Subsection 1.3.3.5.1.1 and similar subsections . . . fail to include sufficient detail to determine whether the TEV will fulfill the requirements that the TSPA-LA places on it, and as a result, the TSPA-LA assumptions relating to waste package emplacement and effectiveness of the engineered barrier system are unfounded.” Petition at 716. As explained below, this contention is inadmissible because it fails to raise an issue material to the NRC’s required findings, is unsupported by fact or expert opinion, and fails to raise a genuine dispute on a material issue of law or fact.

#### **a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

#### **b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 716-17. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue. . . .” *Id.* at 717. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations, Case Management Order, slip op. at 7, this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” *Id.* at 3.

Nevada asserts that “precise geometry” of waste package emplacement is required to demonstrate compliance with postclosure requirements. *Compare* Petition at 718 *with id.* at 716-17. However, Nevada cites no evidence for or further explanation of this “precision”

requirement, nor does it provide any quantitative or qualitative evaluation of why it believes that resolution of this issue will make a difference to the outcome of this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to those requirements: (1) the contention does not reference any documents, other than the Application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Doug F. Hambley and Steven A. Frishman), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Moreover, as explained in Section V.A.3 above, Boards must carefully scrutinize factual allegations and the documents cited in support of contentions. This includes a review of the information relied upon to confirm that it supports the proposed contention. Section f, below, discusses Nevada's allegations in detail and explains why they fail to provide the requisite factual or expert opinion support for this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons set forth in Section d, above, this contention fails to raise a genuine dispute on a material issue of law or fact. In addition, the Application provides sufficient details on the design of the TEV for the NRC to make its required determinations under 10 C.F.R. Part 63. Nevada identifies no available information that DOE has not considered, nor has Nevada addressed any of the information that is in the Application or explained why it believes that information does not meet the requirements of Part 63. Nevada's curiosity and desire for additional information do not raise a litigable issue.

Instead of identifying or explaining any specific deficiencies in the TEV design information provided in the Application, Nevada identifies two statements from the same paragraph in the Application: (1) "most components of the TEV are based on commercially available equipment"; and (2) "Codes and standards have been evaluated and design requirements and testing specifications are being developed". Petition at 717 (quoting SAR at 1.3.3-30). From these statements, Nevada jumps to the conclusion that DOE has admitted "there is no engineering design for the TEV." *Id.* Nevada does not address or refute any of the detailed information that *is* in the Application (indeed, in the very subsection that includes DOE's purported admission), nor does Nevada articulate how the design information provided in the LA does not meet the regulatory requirements of Part 63.

Building on DOE's purported admissions of deficiencies, Nevada next speculates about the alleged consequences of the "lack of design information." Petition at 718. *Assuming* the "absence of a TEV design," Nevada speculates that in a "restricted, high radiation, underground environment, it is not possible to have any confidence that the precise emplacement geometry

required on thermohydrological grounds can be achieved.” *Id.* Nevada provides no citations to any evidence to support this allegation.<sup>76</sup>

Nevada fails to address, refute, or otherwise provide any explanation of why the information on TEV design described below is inadequate under 10 C.F.R. §§ 63.21(c), 63.114(a), or any other provision of Part 63. The regulations specify that the SAR must include a “description of the design of the various components of the geological repository operations area and the engineered barrier system,” including the “design bases and their relationship to the design criteria.” 10 C.F.R. § 63.21(c)(3). In turn, Part 63 defines “design bases” to include:

information that identifies the specific functions to be performed by a structure, system, or component of a facility and the specific values or ranges of values chosen for controlling parameters as reference bounds for design. These values may be constraints derived from generally accepted “state-of-the-art” practices for achieving functional goals or requirements derived from analysis (based on calculation or experiments) of the effects of a postulated event under which a structure, system, or component must meet its functional goals.

10 C.F.R. § 63.2. In addition, 10 C.F.R. § 63.21(c)(9) requires an “assessment to determine the degree to which those of the features, events and processes of the site that are expected to materially affect compliance with 10 C.F.R. § 63.113 . . . have been characterized.”

To meet these regulatory requirements, the SAR provides an extensive, specific, and detailed description of the TEV design, which Nevada ignores. SAR § 1.3.3.5.1.1 provides approximately six pages describing the TEV design, with references to Project documents and other sections of the Application, including:

---

<sup>76</sup> As explained in Section d, above, Nevada does not draw any connection between the purported need for “precise geometry” and any regulatory requirement. Thus, even if one assumes that this speculation reflects the opinion of Messrs. Hambley and Frishman—which, as explained above, one cannot—it still falls far short of the reasoned basis or explanation required to support an admissible contention. *See* Section V.A.3, above.

- Power supply;
- Pallet lifting operational processes;
- Frame structure;
- Specific electronic control features designed to permit operation in high-radiation environments;
- Braking process and specific procedural controls to ensure proper braking system operation;
- Collision and speed control design features;
- Analysis of the potential for TEV tipover and derailment and a description of specific safety features designed to minimize the consequences of derailment;
- Seismic restraint features included in the TEV design;
- Analysis of the efficacy of the shielded enclosure with respect to personnel radiation protection and potential rockfall; and
- Analysis of required thermal performance characteristics.

In addition, Table 1.3.3-5 of the SAR provides a direct comparison of the preclosure nuclear safety design bases with the TEV design criteria, as specified in 10 C.F.R. § 63.21(c)(3). SAR at 1.3.3-56 to -57. Table 1.3.3-6 provides a comparison of TEV design requirements with the implementation of those requirements. SAR at 1.3.3-58 to-61. Table 1.3.3-7 describes component development activities for specific nuclear design basis requirements for the TEV. SAR at 1.3.3-62. Tables 1.3.3-8 (at pages 1.3.3-66 to -67) and 1.3.4-5 (at pages 1.3.4-55 and 57) address postclosure parameters applicable to the TEV, including operational limits that the TEV must meet to satisfy the initial conditions for the TSPA-LA, to demonstrate compliance with 10 C.F.R. §§ 63.21(c)(9) and 63.114(a). This information includes specifications for monitoring equipment, instrumentation, and sensors designed to ensure proper waste package emplacement.

A petitioner must “read the pertinent portions of the license application . . . state the applicant’s position and the petitioner’s opposing view,” and explain why it disagrees with the

applicant. *Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC 349, 358 (2001), *recons. denied*, CLI-02-1, 55 NRC 1 (2002). This contention, however, does not address or refute the information that appears in the Application, nor does it take the next required step of explaining why it believes that information fails to satisfy the applicable regulations with respect to either the required level of detail or the NRC's required safety findings.

Moreover, Nevada also fails to explain why it believes that any defect or omission in this information will lead to the problems that it speculates about: the alleged difficulties of conducting "precise" TEV operations in a "hot, spatially restricted, high radiation environment." Petition at 718. With respect to temperature, the SAR shows that the TEV is designed for a maximum bounding ambient temperature of 50° C, SAR § 1.3.3.5.1.1 at 1.3.3-34, which is greater than the maximum ambient temperature for repository operations, which is 47° C. *Id.* Table 1.2.2-1 at 1.2.2-45. The TEV is also designed to operate in the "spatially restricted" subsurface environment. *See id.* Table 1.3.4-5 at 1.3.4-50; Figure 1.34-20 at 1.34-99 (describing the operating envelope of the TEV with a waste package in the re-emplacment drift); Figure 1.3.5-10 at 1.35-51 (showing typical turnout bulkhead and emplacement access door dimensions). Finally, the SAR explains that the TEV design and materials selected address the high radiation environment inside the emplacement drifts. *See id.* § 1.3.3.5.7 at 1.3.3-45. Nevada does not recognize or refute any of this information.

Thus, this proposed contention fails to raise a demonstrate a genuine dispute on a material issue of law or fact and is inadmissible.

### **133. NEV-SAFETY-133 - Drip Shield Gantry Description**

SAR Subsection 1.3.4.7 and similar subsections, which identify the Drip Shield Gantry as the crane-rail-based transport assembly that moves the drip shields from surface facilities to the emplacement drifts and into position covering the waste packages, fail to include sufficient detail to determine whether the Drip Shield Gantry will fulfill the requirements that the TSPA-LA places on it, and as a result, the TSPA-LA assumptions relating to drip shield emplacement and effectiveness of the engineered barrier system are unfounded.

#### **RESPONSE**

Nevada alleges that in SAR Subsection 1.3.4.7 and similar subsections, the Application “fail[s] to include sufficient detail to determine whether the Drip Shield Gantry will fulfill the requirements that the TSPA-LA places on it, and as a result, the TSPA-LA assumptions relating to drip shield emplacement and effectiveness of the engineered barrier system are unfounded.” Petition at 720. As explained below, this contention is inadmissible because it fails to raise an issue that is material to the NRC’s required findings, is unsupported by fact or expert opinion, and fails to raise a genuine dispute on a material issue of law or fact.

#### **a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

#### **b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 720-21. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue. . . .” *Id.* at 721. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations, Case Management Order, slip op. at 7, this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” *Id.* at 3.

Nevada asserts that “precise geometry” in drip shield emplacement is required to demonstrate compliance with postclosure requirements. *Compare* Petition at 721-22 *with id.* at 720-21. However, Nevada cites no evidence for or further explanation of this “precision”

requirement, nor does it provide any quantitative or qualitative evaluation of why it believes that resolution of this issue will make a difference to the outcome of this proceeding.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to those requirements: (1) the contention does not reference any documents, other than the Application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Doug F. Hambley and Steven A. Frishman), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Indeed, in asserting this contention, Nevada relies *solely* upon the following statement:

SAR Subsection 1.3.4.7.2 at 1.3.4-27 through 1.3.4-29 describes many of the systems and components on the Drip Shield Gantry are [sic] being similar to those on the TEV. Consequently, *one can assume* that, as for the TEV, not only is there, as yet, no engineering design for the Drip Shield Gantry, but that some of the requirements to be achieved through that design have yet to be defined.

Petition at 721. (emphasis added). Thus, Nevada’s only substantive allegation is the completely unexplained and unsupported *assumption* that the TEV design is incomplete and fails to meet regulatory requirements. Building on this baseless assumption, Nevada speculates that the Drip Shield Gantry design suffers from the same deficiencies.<sup>77</sup> As explained in Section V.A.3, these types of statements are insufficient.<sup>78</sup>

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons set forth in Section d, above, this contention fails to raise a genuine dispute on a material issue of law or fact. In addition, Nevada claims that because the Drip Shield Gantry design is similar to the TEV, and because the TEV design is incomplete, that, likewise, the Drip Shield Gantry design is incomplete. Petition at 721. Nevada’s statement is conjecture and absent requisite clarity. Compounding this problem, Nevada concludes that “the TSPA-LA assumptions relating to drip shield emplacement and effectiveness of the engineered barrier system are unfounded.” *Id.* at 720. The Application, however, provides sufficient details on the design of the Drip Shield Gantry for the NRC to make its required determinations under 10 C.F.R. Part 63; and Nevada fails to address or refute any of the Drip Shield Gantry design information in the Application. Nevada’s curiosity and desire to see additional information do not raise a litigable issue. As such, even if this Board were to permit Nevada to incorporate into

---

<sup>77</sup> Even if one assumes that such speculation reflects the opinion of Messrs. Hambley and Frishman—which, as explained above, one cannot—it still falls far short of the reasoned basis or explanation required to support an admissible contention. *See* Section V.A.3, above.

<sup>78</sup> Insofar as Nevada seeks to incorporate the allegations made in NEV-SAFETY-132 (TEV Description)—a contention that is *not* referenced in this contention, it is foreclosed from doing so under 10 C.F.R. §2.309(f)(1)(v), which requires *references* to the “specific sources and documents on which the requestor/petitioner intends to rely.” *See also* Case Management Order, LBP-08-10, slip op. at 7 (“Such references shall be as specific as reasonably possible”) (internal quotations omitted); *cf. Hydro Res., Inc.* (P.O. Box 15910 Rio Rancho, NM 87174), CLI-01-04, 53 NRC 31, 46 (2001) (“The Commission should not be expected to sift unaided through large swaths of earlier briefs . . . in order to piece together and discern the intervenors’ particular concerns or the grounds for their claims.”).

this contention the claims in NEV-SAFETY-132—which, as explained above, it cannot—it still fails to raise a genuine dispute on a material issue of law or fact.

Nevada fails to address, refute, or otherwise provide any explanation of why the information on Drip Shield Gantry design described below is inadequate under 10 C.F.R. §§ 63.21(c), 63.114(a), or any other provision of Part 63. The regulations specify that the SAR must include a “description of the design of the various components of the geological repository operations area and the engineered barrier system,” including the “design bases and their relationship to the design criteria.” 10 C.F.R. § 63.21(c)(3). In turn, Part 63 defines “design bases” to include:

information that identifies the specific functions to be performed by a structure, system, or component of a facility and the specific values or ranges of values chosen for controlling parameters as reference bounds for design. These values may be constraints derived from generally accepted “state-of-the-art” practices for achieving functional goals or requirements derived from analysis (based on calculation or experiments) of the effects of a postulated event under which a structure, system, or component must meet its functional goals.

10 C.F.R. § 63.2. In addition, 10 C.F.R. § 63.21(c)(9) requires an “assessment to determine the degree to which those of the features, events and processes of the site that are expected to materially affect compliance with 10 C.F.R. § 63.113 . . . have been characterized.”

To meet these regulatory requirements, the SAR provides an extensive, specific, and detailed description of the Drip Shield Gantry design, which Nevada ignores. SAR § 1.3.4.7.2 provides a description of the Drip Shield Gantry design, with over a dozen references to Project documents and other sections of the Application. This description includes specific information on the similarities and differences between the Drip Shield Gantry design, and the TEV design that is described in more detail in SAR § 1.3.4.8. In addition, Table 1.3.4-5 of the SAR provides

a direct comparison of the subsurface facility design, including the Drip Shield Gantry, to postclosure control parameters. SAR at 1.3.4-58 to -61. Nevada fails to address, refute, or otherwise provide any explanation of why the information on Drip Shield Gantry design described above is inadequate under 10 C.F.R. §§ 63.21(c), 63.114(a), or any other provision of Part 63.

A petitioner must “read the pertinent portions of the license application . . . state the applicant’s position and the petitioner’s opposing view,” and explain why it disagrees with the applicant. *Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC 349, 358 (2001), *recons. denied*, CLI-02-1, 55 NRC 1 (2002). In this contention, however, Nevada fails to address or refute the information that appears in the Application, and fails to explain why it believes that information fails to satisfy the applicable regulations with respect to either the required level of detail or the NRC’s required safety findings.

Moreover, Nevada also fails to explain why it believes that any defect or omission in this information will lead to the problems that it speculates about: the alleged difficulties of conducting “precise” Drip Shield Gantry operations in a “hot, spatially restricted, high radiation environment.” Petition at 722.<sup>79</sup> With respect to temperature, the SAR shows that the Drip Shield Gantry is designed to operate at temperatures up to 50° C. *See* SAR at 1.3.4-28. Emplacement drift temperatures will be cooled below this value prior to drip shield emplacement operations. *See id.* The Drip Shield Gantry is also designed to operate in the “spatially restricted” subsurface environment. *See id.* at 1.3.4-58 to -61; 1.3.4-95 (showing a diagram of emplacement drift configuration for drip shield installation). Finally, the SAR explains that the Drip Shield Gantry design and the materials selected address the high radiation environment

---

<sup>79</sup> Moreover, as explained in Section d, above, Nevada does not draw any connection between the purported need for “precise geometry” and any specific regulatory requirement.

inside the emplacement drifts. *See id.* at 1.3.4-28. Nevada does not recognize or refute any of this information.

Thus, this proposed contention fails to raise a genuine dispute on a material issue of law or fact and is inadmissible.

**134. NEV-SAFETY-134 - Retrieval Or Alternate Storage Description**

SAR Subsection 1.11.1 and similar subsections, which discuss the approach to retrieval of waste packages from the repository, fail to consider that rockfall debris, breached waste packages and other “off-normal” conditions can be reasonably expected to be encountered in the emplacement drifts, such that retrieval is not simply a reversal of the emplacement process and may require development of specialized equipment.

**RESPONSE**

This contention asserts that SAR Subsection 1.11.1 and similar subsections, which discuss the approach to retrieval of waste packages from the repository, fail to consider that rockfall debris, breached waste packages and other “off-normal” conditions can be reasonably expected to be encountered in the emplacement drifts, such that retrieval is not simply a reversal of the emplacement process and may require development of specialized equipment.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention does not demonstrate that the alleged concerns regarding DOE's description of its retrieval plans would affect compliance with a regulatory requirement, safety or waste isolation.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies regulations concerning waste retrieval. Petition at 723. Nevada concludes this general description of these sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding." *Id.* 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that a petitioner must demonstrate that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

Nevada asserts that this contention alleges non-compliance with 10 C.F.R. §§ 63.21(c)(7) and 63.111(e)(1). Petition at 723. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R.

§ 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Doug F. Hambley and Steven A. Frishman) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Paragraph 5 of this contention asserts that SAR Subsection 1.11.1: (1) states that derailment of the TEV, waste package drop, damage to the TEV by impacts, and impact between the TEV and facility structures, equipment, or objects all could occur during retrieval, but dismisses such events with a statement that lessons learned from addressing similar events during emplacement will be applied during retrieval (Petition at 724); and (2) defines "recovery" as "removing or relocating selective waste packages from the subsurface as a result of concerns

related to an off-normal condition,” and thereby avoids the issue of accounting for such events in DOE’s retrieval plans (*Id.*).

Neither of these assertions provides meaningful support for this contention. Although Nevada’s contention asserts that SAR Subsection 1.11.1 “fail(s) to consider that rockfall debris, breached waste packages and other “off-normal” conditions can be expected, Nevada’s first assertion in paragraph 5 states explicitly that SAR Subsection 1.11.1 does consider such events. Petition at 724. Thus, this first assertion contradicts Nevada’s contention, and does not provide any support for it.

As for Nevada’s statement that the SAR acknowledges that such off-normal events could occur, but that the SAR dismisses them with its statement that lessons learned during waste emplacement will be applied to any similar events that occur during retrieval, Petition at 724, Nevada does not provide *any* reasoned basis for concluding that the SAR is deficient. Moreover, the SAR explains that “[o]ff-normal conditions, if any, will require an assessment to identify specific conditions and determine an appropriate operational strategy.” SAR at 1.11-7.

Nevertheless, SAR Subsection 1.11 also includes references to: “Strategies for Recovery After an Off-Normal Event to the Waste Package Transport and Emplacement Vehicle,” 800-30R-HE00-01800-000-000, ACC: ENG.20070531.0043, LSN#: DN2002399654, and “Concepts for Waste Retrieval and Alternate Storage of Radioactive Waste. 800-30R-HER0-00100-000-007, LSN#: DEN001570516, both of which provide such information. LSN#: DN2002399654 discusses conceptual approaches to recovery from various off-normal events similar to the ones listed at page 1.11-7 of the SAR, including: a conceptual multipurpose recovery vehicle for use in various recovery operations; recovery of a derailed TEV in an emplacement drift; repair of damaged rail in an emplacement drift; removing rockfall debris around the TEV; dismantling

and removing a disabled TEV from an emplacement drift; and recovery from a misaligned waste package. LSN#: : DN2002399654 at 6-17. LSN#: DEN001570516 identifies additional contingencies and general approaches to them, including: Emplacement Access Doors are Damaged, TEV Cannot Retrieve Waste Package, Rockfall or Ground Support Failure. LSN#: DEN001570516 at 17. These reports show that there is no substance to Nevada's claim that such information has not received any consideration.

Nevada's second assertion is that the SAR was in some way avoiding the issue of removing or relocating selective waste packages from the subsurface by defining recovery as a separate term from retrieval. Petition at 724. In support of this assertion, Nevada states that "It should be noted that the "retrieval" as defined in 10 C.F.R. § 63.2 includes removal of any or all waste packages, and therefore encompasses DOE's "recovery" concept." Petition at 725.

Nevada does not explain how removal of a portion of the stored waste would present more difficult or different types of problems than complete waste removal. Furthermore, contrary to Nevada's assertion, the complete definition in § 63.2 is

*Retrieval* means the act of permanently removing radioactive waste from the underground location at which the waste had been previously emplaced for disposal.

While Nevada supplements this definition with "any and all," it also omits "permanently." By stating that retrieval is permanent removal, NRC's definition excludes *temporary* removal. Consequently, a separate term is required for temporary removal (*i.e.*, "recovery"). DOE's acknowledgment that there could be a need for temporary removal to deal with an unanticipated situation cannot reasonably be described as avoiding an issue. In any event, Nevada's statements in paragraph 5 do not identify any facts or expert opinions that support this contention. This is another reason that this contention must be dismissed.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact,  
With Supporting References to the License Application**

As discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention does not specify any alleged ramifications other than the conclusory assertion that the SAR does not comply with 10 C.F.R. § 63.21(c)(7), without any showing of a requirement of that regulation that this Application allegedly fails to meet. Petition at 725. Consequently, this contention does not establish that there is a genuine dispute on a material issue of fact or law, and does not satisfy 10 C.F.R. § 2.309(f)(vi).

**135. NEV-SAFETY-135 - The Ventilation Doors At The Entry To The Emplacement Drifts**

SAR Subsection 1.3.5.1.3.3 and similar subsections, which describe the ventilation doors and associated airflow regulators intended to isolated the emplacement drifts from the access drifts and minimize leakage of radiation into the latter drifts during the waste emplacement process, fail to provide sufficient detail to determine whether the doors will fulfill the requirements that the LA places on them and as a result, the LA assumptions relating to the isolation of the emplacement drifts are unfounded.

**RESPONSE**

In this contention, Nevada claims that SAR Subsection 1.3.5.1 and similar subsections fail to provide sufficiently detailed information to determine whether the emplacement drift access doors and airflow regulators will, as the Application allegedly assumes, “provide an airtight seal” between the access mains and the emplacement drifts. Petition at 726.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 726-27. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges noncompliance with these regulatory provisions and therefore raises a material issue . . . .” *Id.* at 727. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, (Oconee Nuclear Station, Units 1, 2 and 3) CLI-99-11, 49 NRC 328, 333 (1999).

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations, (*U.S. Dep’t of Energy* (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board) LBP-08-10, 67 NRC \_\_\_ (slip op. at 7) (June 20, 2008) (Case Management Order)), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the Case Management Order focused exclusively on “format” and “procedural matters.” *Id.* at 3.

To the extent Nevada seeks to establish the importance of establishing an airtight seal at the emplacement drift entrance to prevent “leakage of radiation from the emplacement drifts into the access drifts,” Petition at 726, Nevada cites inapposite regulations. Nevada’s concerns relate only to preclosure issues. *See id.* (“during the emplacement process”). Nevada’s boilerplate

materiality statement, however, alleges deficiencies related to postclosure requirements only, and does not address preclosure regulations. *Id.* at 727 (citing 10 C.F.R. §§ 63.21(c)(9), 63.113, and 63.114). Thus, Nevada fails to identify any regulations that even relate to this contention, much less carry its burden to demonstrate that this would make a difference in the outcome of the proceeding.

Nor does such a link exist. Nevada claims that the “LA assumes that the ventilation doors will provide an airtight seal to minimize the leakage of radiation from the emplacement drifts into the access drifts.” Petition at 726. Nevada offers no citation for this statement and in any event, Nevada is wrong. The emplacement access doors are designed to limit the leakage of air, but are not required to be airtight. *See* “Subsurface Construction and Emplacement Ventilation,” LSN No. DEN001573151 at 59, cited at 1.3.5-5 (“System Location and Functional Arrangement”). The doors do not need to be airtight because, as explained in the Application, air flow is designed to always move away from the access mains into the emplacement drifts. As a result, any air leakage would be into the emplacement drifts, and away from any inhabited areas. *See* SAR at 1.3.5-1; SAR Figure 1.3.5-5 at 1.3.5-41 (showing air flow direction to be from the access mains into the emplacement drifts. Thus the Application does not rely upon the emplacement access doors to provide an airtight seal. For this reason, among others, the subsurface ventilation system is neither important to safety, SAR at 1.9-35, nor is it important to waste isolation, *id.* at 1.9-111. Nevada does not dispute these classifications. As a result, there is no direct connection between any alleged deficiency in the subsurface ventilation system and preclosure or postclosure regulatory requirements.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual or expert opinion support in order for a contention to be admitted. This contention fails to meet those standards because: (1) the contention does not reference any documents, other than the License Application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach affidavits (by Allen Messenger, Doug F. Hambley, and Steven A. Frishman), which purportedly provide expert opinions to support this contention. Petition Attachment 5 (Messenger Affidavit at 1, Attach. B); Attachment 9 (Hambley Affidavit at 1, Attach. B); Attachment 20 (Frishman Affidavit at 1, Attach. B). However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavit simply "adopts" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention fails to raise a genuine dispute on a material issue of law or fact. The Application provides an extensive and detailed description of the emplacement drift doors and associated airflow regulators. As explained in Section d, above, Nevada fails to articulate any connection between the various purported deficiencies it identifies and any specific regulatory requirement related to the NRC's findings in this proceeding. Indeed, contrary to Nevada's assumption, there is no need for the emplacement drift doors to maintain an airtight seal. As a result, none of the purported "problems" Nevada identifies relate to any regulatory or design

requirement, and so they fail to raise a genuine dispute. Accordingly, this contention is inadmissible.<sup>80</sup>

---

<sup>80</sup> Nevada's specific technical concerns, moreover, are all addressed in the SAR and its associated references, as follows. Nevada does not recognize or refute any of this information.

- To the extent Nevada expresses concerns about emplacement access door tolerances, the door actuator linkage will contain an adjustment mechanism to provide fine tuning of the door sealing, to the extent it may be necessary. *See* "Subsurface Construction and Emplacement Ventilation" January 2008, (LSN# DEN001573151 at 57) (reference BSC 2008a to SAR § 1.3.5).
- Nevada's questions about the gasket material are also addressed in the same document, LSN No. DEN001573151 at 55, and in the SAR at 1.3.5-15.
- Nevada's "concern" about "shock losses from the expansion and contraction into [sic]" the bulkhead airflow regulator is alleviated in "Subsurface Ventilation Network Model for License Application," LSN No. DEN001572123 at 37, referenced in LSN# DEN001573151 at 11.
- Finally, Nevada's desire to confirm whether the TEV will fit through the ventilation doors is also satisfied in LSN No. DEN001573151 at 54 (showing the emplacement and retrieval equipment envelope to be 16' wide and 12' high, while the emplacement access door is 16'6" wide and 12'5" high).

**136. NEV-SAFETY-136 - Phased Ground Support Installation**

SAR Subsection 1.3.4.4 and similar subsections, which discuss the ground support system in the emplacement drifts, fail to include sufficient detail to determine whether the rock support system will fulfill the requirements that the LA places on it, and as a result, the LA assumptions relating to effectiveness of the geologic and engineered barrier system are unfounded.

**RESPONSE**

This contention asserts that SAR Subsection 1.3.4.4 does not provide sufficient detail to show that the ground support system will fulfill the requirements that the Application places on it, and as a result, assumptions in the Application relating to effectiveness of the geologic and engineered barrier system are unfounded.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada broadly identifies various regulations. Petition at 730-31.

Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that, “[t]his contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 731. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied,” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, Nevada asserts that the LA “does not comply with 10 C.F.R. § 63.114(a), which requires the inclusion of information on the design of the engineered barrier system for use in a performance assessment.” Petition at 732. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of this contention would make a difference in the proceeding.

Instead, Nevada simply makes broad assertions that “[t]his will impact the assumptions concerning the heat transfer into the rock mass surrounding the drifts, the effectiveness of the ventilation system..., and the effectiveness of the capillary barrier to seepage postulated for the

postclosure period.” Petition at 732. Such statements do not come close to satisfying requisite specificity in the contention to establish materiality.

Moreover, Nevada’s burden was even greater in this instance, because the subject of this contention, the ground support system, does not have an obvious relationship to nuclear safety or waste isolation. In fact, SAR Subsection 1.3.4.4, “Ground Support System” states that:

The emplacement drift ground support is classified as non-ITS because it is not relied on to prevent or mitigate a Category 1 or Category 2 event sequence, and it is not ITWI because the total system performance assessment (TSPA) does not take credit for ground support during the postclosure performance period.

SAR at page 3.4.4-8. In this contention, however, Nevada does not dispute DOE’s classification of the ground support system as non-ITS and non-ITWI, or claim that failure of the ground support system would affect the results of the PCSA or the TSPA. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention mainly contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition does attach an affidavit (by Doug F. Hambley), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5

of this contention, the affidavit simply “adopts” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada’s comments are based entirely on information that is included in the Application regarding the emplacement drift host rock and ground support system, and therefore, do not provide any basis for concluding that more detailed information is required. Nor do they show that such additional information, even if provided, would be material. Instead of referencing expert opinion or some documentation other than the Application, this contention appears to consist entirely of arguments of counsel and, as shown in Section f. below, illustrates a fundamental misunderstanding of the ground support system installation process.

In particular, nowhere in this contention does Nevada allege that the omissions and errors that it claims exist in DOE’s description of the ground support system will result in an increase in the mean dose above regulatory limits. Nevada merely asserts that because it believes DOE has not provided enough detail for it to understand the Application, the assumptions in the Application regarding the effectiveness of the geologic and engineered barrier system are unfounded. Petition at 730. The contention does not, however, identify any specific assumptions that are alleged to be unfounded, or explain the effect of the alleged concerns on such assumptions, the safety of the repository, or the NRC’s ability to make a required finding.

Moreover, Nevada’s assertions are not borne out by any of the statements made in the contention, such as the statements in paragraph 5. Indeed, the contention makes no attempt to show that, if true, this contention would prevent the NRC from making any finding required for issuance of construction authorization, or that the proposed repository would not meet any regulatory requirement. *Id.* at 730. For example, Nevada has asserted that drift wall unevenness

will impact assumptions made in the Application, but it concludes only that such impacts “could be of significance with respect to the characteristics of water seeping into the emplacement drifts, degradation of waste packages and release of radionuclides.” Petition at 732. This claim stops far short of providing a reason to believe that the condition could cause a radiation dose to the RMEI that would exceed regulatory limits or that the issue raised by this contention would prevent the NRC from making the findings necessary for issuance of construction authorization. *Id.* Accordingly, the assertions made in support of this contention are not sufficient to show that it raises an issue that is material to the findings that the NRC must make in this proceeding, and for this reason as well, this contention must be dismissed.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention does not include references to specific portions of the LA that Nevada disputes or the supporting reasons for each dispute, and although Nevada asserts that the Application does not provide sufficient information on a relevant matter as required by law, it does not identify such a failure and provide the supporting reasons for Nevada’s belief that such information is required.

In Paragraph 2 of the contention, Nevada argues that:

[t]he LA assumes that the emplacement drifts will have a regular circular cross-section that is not significantly modified as a result of the use of a two-stage rock reinforcement and support system. Given the very close fracturing in the lithophysal units that will form the host rock for 85% of the emplacement drifts, there is no assurance that this will be achieved.

Petition at 730. Nevada does not, however, provide any specific references to such assumptions in the Application.

Similarly, in Paragraph 5 of the contention, Nevada cites, without dispute, information in the Application as a basis for asserting that “one can expect . . .significant roof falls [and that] scaling . . . will exacerbate the unevenness.” *Id.* at 731-32. At the same time, Nevada ignores the fact that DOE’s analyses of emplacement drift stability conditions are based, in part, on DOE’s experience with the excavation of the Exploratory Study Facility (ESF) and the Enhanced Characterization of the Repository Block (ECRB) Cross-Drift. *See* SAR at 1.3.4-15 and “Ground Control for Emplacement Drifts for LA,” which is reference BSC 2007e in SAR Subsection 1.3.4, (LSN# DN2002491254), Section 6.1.1, page 38. The SAR states that “[t]hese excavations have been demonstrated to be self-supporting with safety factors of 2 or greater against collapse modes for the rock mass quality conditions. Therefore, the primary role of ground support at Yucca Mountain is to prevent deterioration and loosening of the rock mass tunnel periphery.” SAR at 1.3.4-15. Nevada does not reference or dispute these statements in the SAR. Consequently, there is no foundation for Nevada’s expectations of significant roof fall and scaling.

Nevada also does not provide a reference in the Application for its assertion that the Application assumes that the perimeter of the emplacement drifts will be smooth. Petition at 732. Thus, although this statement appears to dispute the Application, Nevada does not identify any specific portion of the Application that it disputes. In fact, Nevada’s claim that the Application assumes that the emplacement drifts will be smooth is wrong. The Application states that the tunnel boring machine produces a clean bore that facilitates the installation of the ground supports and the smoother excavation also improves ventilation efficiency, but the Application also indicates that before installing the final ground support, DOE will examine the drift walls and correct significant problems. The SAR states that:

Geologic mapping is performed in the emplacement drift during development and after initial ground support has been installed for personnel safety to support engineering analyses and in conformance with the Performance Confirmation Program (Section 4.2.2.1). This includes mapping of fracture and fault zone characteristics, stratigraphic contacts, and lithophysal content in the emplacement drifts. The mapping is performed before installation of the final ground support.

\* \* \*

Anomalies could be associated with geologic faults or fault splay zones, zones of unusually large lithophysae, or changes in rock types. The emplacement panels are located to minimize the potential of encountering areas of potentially poor quality rock, but there is a possibility of encountering anomalies because characterization data do not provide complete coverage of the host rock . . . analyses and operational procedures implemented during construction of the repository will provide steps to analyze any such problem, maintain or restore excavation alignment, implement mitigation measures to ensure drift stability, and restore an excavated drift cross section.

SAR at 1.3.4-7-8. Thus, the SAR describes a process for determining if there is a need for corrective measures before installation of the final ground support system, and does not assume that the emplacement drifts will necessarily be smooth after removal of the initial ground support. Nevada ignores this process, and its implicit assumption that effective corrective measures will not be implemented has no foundation. As a result, nothing Nevada states in connection with this contention is sufficient to demonstrate the existence of a genuine dispute.

An allegation that some aspect of an application is inadequate or deficient does not give rise to a genuine dispute, unless it is supported by facts and a reasoned statement of why the application is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Units 3 and 4), LBP-90-16, 31 NRC 509, 521 n.12 (1990). Nevada has not even provided a reasoned statement of why it disputes the Application, much less demonstrated that there is a

genuine dispute on a material issue of fact or law. For this reason, too, this contention should be dismissed.

**137. NEV-SAFETY-137 - Construction Of The Emplacement Drifts**

SAR Subsection 1.3.4.3 and similar subsections, which discuss excavation of the emplacement drifts, fail to include sufficient detail to determine whether the tunnel boring machine (TBM) will fulfill the requirements that the LA places on it, and as a result the LA assumptions concerning the excavation of the emplacement drifts are unfounded.

**RESPONSE**

This contention asserts that SAR Subsection 1.3.4.4 does not provide sufficient detail to show that the TBM will fulfill the requirements that the LA places on it, and as a result, assumptions in the LA concerning the excavation of emplacement drifts are unfounded.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention does not identify any NRC requirement that allegedly is not met by the LA. Nevada simply asserts that the TBM may not work as anticipated, notwithstanding the previous successful use of TBMs at Yucca Mountain, as noted at SAR Subsection 1.3.4.3 at 1.3.4-7; and claims that without additional, unspecified information about the TBM there is no assurance that the emplacement drifts will meet specified tolerances and be in accordance with other specifications. However, the NRC regulations do not require use of a TBM to construct the emplacement drifts; the LA does not rely on the TBM to assure that the emplacement drifts meet

the design specifications; and the TBM deficiencies this contention asserts would not significantly affect the final configuration of the emplacement drifts.

SAR Subsection 1.3.4.3 describes the process to be followed during and after excavation, and before installation of the final ground support. SAR at 1.3.4-7-8. Geologic mapping is performed and operational procedures are put in place during construction that will provide steps to analyze identified problems, maintain or restore excavation alignment, implement mitigation measures to ensure drift stability, and restore, as necessary, the cross section of the excavated drift; indeed, the SAR describes procedures already implemented for a TBM during the previous drilling of the Exploratory Studies Facility tunnel and the Enhanced Characterization of the Repository Block Cross-Drift. *Id.* at 1.3.4-7-8; GI-5 at 5-6, 5-19. Nothing in this contention raises any question about whether the process described in SAR Subsection 1.3.4.3 provides reasonable assurance that the emplacement drifts will meet applicable requirements. Thus, even if this contention was correct, the issue it raises would not affect DOE's compliance with Part 63, the NWPA or the AEA. Consequently, this contention does not raise an issue that is within the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

The reasons discussed in c. above, for why this contention does not raise an issue that is within the scope of this proceeding, also demonstrate that the issue it raises is not material to the findings the NRC must make for issuance of construction authorization. This contention does not identify any safety concerns or any NRC regulatory requirement that allegedly is not met.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies 10 C.F.R. §§ 63.31(a)(2) and (3), 63.21(c)(9) and (15), 63.114 and 63.114(a). Petition at 733-34. Nevada concludes this general description

of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." *Id.* at 734. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

This contention also should be dismissed because it is not supported by any facts or expert opinion. To the contrary, the "facts" cited by Nevada fail to provide any basis for concluding that the questions about TBM performance cited in this contention are material to any determination that the NRC must make. Nevada's comments on the level of detail in the Application regarding the TBM, therefore, do not provide any basis for concluding that more detailed information is required, and do not show that such information is material. Indeed, this contention does not reference any expert opinion or documentation other than the Application. Instead, it appears to consist entirely of arguments of counsel and, as discussed further below,

illustrates a fundamental failure to consider the positive experience with operation of a TBM at Yucca Mountain.

Section V.A.3. above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the Application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach three affidavits (by Allen L. Messenger, Doug F. Hambley and Steven A. Frishman), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

In addition, paragraph 5 of this contention does not demonstrate that the effectiveness or efficiency of the TBM is a material issue. The entire crux of the contention is an assertion of a difference between TBM performance in drilling through hard rock versus Tonopah Springs tuff; yet the total basis for this proposition consists of the unsupported assertions that DOE's expectation about TBM performance in Tonopah Springs tuff is "somewhat optimistic and idealized." Petition at 734. Nevada states only that "*it is quite possible* that abandonment of a number of areas becomes necessary and *in the extreme case*, the ability of the repository to isolate waste becomes compromised." Petition at 735 (emphasis added). Implicit in this totally speculative scenario is an assumption that DOE would not take corrective action to address any

deficient TBM performance. This contention does not provide any justification for such an assumption. Consequently, Nevada has not provided adequate support for its assertion that the alleged deficiencies in TBM performance will occur or, if they did occur, that they would affect compliance with any regulatory requirement or prevent the NRC from making the findings necessary for issuance of construction authorization.

Moreover, Nevada's speculation about whether a TBM will perform as anticipated by DOE ignores the considerable positive experience with excavation at Yucca Mountain using a TBM. As mentioned above and described in the Application, a TBM was used to excavate both the Exploratory Study Facility (ESF), a 5-mile tunnel mined through Yucca Mountain during 1995 to 1997, and the Enhanced Characterization of the Repository Block (ECRB), a 2-mile cross-drift tunnel that was completed in 1998. *See* GI-5 at 5-6, 5-19; SAR at 1.3.4-7-8. Nevada does not acknowledge this experience, or provide a basis for concluding that it is not representative of the likely performance of a TBM in repository construction. Nor does it attempt to account for the obvious effect of this favorable experience on its assertion that the amount of TBM design information furnished in the LA is insufficient to assess its likely effectiveness. Consequently, Nevada's unsupported assertions do not provide sufficient support for this contention, or show that the issue raised is material to any finding the NRC must make.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency. Paragraph 4 of the contention discusses various regulations and then asserts that "[t]his contention alleges non-compliance with

these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” Petition at 733-4. But this assertion is not borne out by the actual contention or any of the statements made in connection with it. Indeed, the contention makes no attempt to show that, if true, the allegedly missing information would prevent the NRC from making any finding required for issuance of construction authorization, or that the proposed repository would not meet a regulatory requirement. Instead, Nevada merely alleges that “the LA assumptions concerning the excavation of the emplacement drifts are unfounded.” *Id.* at 735. The contention does not, however, identify any specific assumptions that are alleged to be unfounded, or any effect on the safety of the repository or NRC’s ability to make a required finding.

In Paragraph 2 of the contention, Nevada argues that:

[t]he LA assumes that the emplacement drifts will be constructed to meet specified tolerances and in conformance with other engineering specifications; however, the lack of design information on the TBM means that there is no assurance that these requirements can be achieved.

Petition at 733. Nevada does not, however, provide any references to such tolerances or specifications, or any explanation of the regulatory significance of such alleged deficiencies. In paragraph 5 of the contention, Nevada characterizes as “optimistic” the statements in SAR Subsection 1.3.4.4, that use of the TBM assures correct alignment of the drifts and produces a clean bore. Petition at 734. Nevada does not, however, challenge the statements at SAR at 1.3.4-8, in the same SAR subsection, that “analyses and operational procedures implemented during construction of the repository will provide steps to analyze any such problem, maintain or restore excavation alignment, implement mitigation measures to ensure drift stability, and restore an excavated drift cross section.” Petition at 734-35. Thus, despite Nevada’s questions about the TBM performance, it does not provide any support for questioning the Application’s discussion

showing that the emplacement drifts will be correctly aligned and stable and have the intended cross section. *Id.*

An allegation that some aspect of the Application is inadequate or deficient does not give rise to a genuine dispute, unless it is supported by facts and a reasoned statement of why the Application is unacceptable in some material respect. *See Fla. Power & Light Co. (Turkey Point Plan, Units 3 and 4), LBP-90-16, 31 NRC 509, 521 n.12 (1990).* Nevada has not provided a reasoned statement of why it disputes the Application, and has not demonstrated that there is a genuine dispute on a material issue of fact or law. For this reason, too, this contention should be dismissed.

**138. NEV-SAFETY-138 - Description Of The Ventilation System For The Repository Options Made In The TSPA-LA Regarding Waste Isolation**

SAR Subsection 1.3.5.1.3.1 and similar subsections, which describe the intake and exhaust fans for the facility, fail to provide sufficient detail to determine whether the ventilation fans will fulfill the requirements that the LA places on them and as a result, the LA assumptions relating to the isolation of the emplacement drifts during the preclosure period are unfounded.

**RESPONSE**

In this contention, Nevada alleges that “SAR Subsection 1.3.5.1.3.1 and similar subsections”: (1) rely upon ventilation fans that are not commercially available; and (2) have not adequately considered the possibility of fan blade failures. *See* Petition at 736-38. As explained below, even if one assumes that all of the unsupported speculation in this contention is true, Nevada still ignores information in the Application that directly addresses its concerns. Accordingly, this contention is inadmissible.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 736-37. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges noncompliance with these regulatory provisions and therefore raises a material issue . . . .” *Id.* at 737. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp. (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333 (1999).*

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations, (*U.S. Dep’t of Energy (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board), LBP-08-10, 67 NRC \_\_\_\_ (slip op. at 7) (June 20, 2008) (Case Management Order)*), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the Case Management Order focused exclusively on “format” and “procedural matters.” *Id.* at 3.

Nevada also proffers two allegations in this contention, but neither one carries its burden of demonstrating that the contention would make a difference in the outcome of the proceeding. With respect to Nevada’s complaint that ventilation fans of the required size are not currently commercially available, Petition at 737, Nevada does not identify any Part 63 provision requiring

such a demonstration from DOE. As to Nevada's second allegation, that DOE has not given "adequate consideration" to the "possibility of ventilation fan failures," *id.* at 738, Nevada likewise fails to carry its burden of directly linking this point to any regulatory requirement.

Accordingly, Nevada has failed to explain how this contention, if true, would make a difference in the outcome of this proceeding. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to those requirements: (1) the contention does not reference any documents, other than the License Application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach affidavits (by Allen Messenger, Doug F. Hambley, and Steven A. Frishman), which purportedly provide expert opinions to support this contention. Petition, Attachments 5, 9 and 20. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Specifically, the two allegations in this contention utterly lack support, either in fact or expert opinion. First, Nevada vaguely asserts that, "[i]n the past 15 years, few, *if any*, fans of this size [required to meet ventilation system specifications] have been built and installed and

*many* of the former manufacturers of these fans are no longer in business.” Petition at 737 (emphasis added). As is clear from the text, this statement is rife with speculation, and completely vague. Nevada does not even assert that *no* fans of the required size have been built, or that *all* manufacturers of such fans are out of business. Additionally, it is a conclusory statement, completely unsupported with reference to any verifiable supporting documentation, or any other reasoned basis or explanation. *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006).

Nevada’s second claim is equally infirm:

Blade failures associated with this type and size of fan are not unusual, and lead times for delivery and installation of replacement blades are on the order of months. Historical data would indicate that the frequency of a fan blade failure for such large fans is approximately one failure of a set of blades per fan per 10 years of operation.

Petition at 738 (emphasis added). Nevada provides no reference for its speculation regarding fan blade replacement schedules, nor to any purported “[h]istorical data” on failure rates. Strikingly, by admitting that current manufacturers are capable of manufacturing replacement blades for the types of fans specified in the Application, the assertions in this paragraph undercut Nevada’s previous claim that there is no commercial manufacturing capability for such fans.<sup>81</sup>

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Because Nevada raises issues that, as explained in Sections d and e above, are not material to the NRC’s findings and are unsupported by facts or expert opinion, it also fails to raise a genuine dispute on a material issue of law or fact.

---

<sup>81</sup> Nevada’s counsel – or the individuals who have “adopted” this text – also display a measure of confusion and misunderstanding of the repository design and basic physics when they state that the ventilation fans “are to provide the air flow for radiation and heat removal during the postclosure period.” Petition at 737. First, “radiation,” unlike air or even radioactive material, cannot be mobilized by airflow. Second, the ventilation system will not be operated during the postclosure period. SAR at 1.3.5-6.

Specifically, Nevada fails to articulate how its first assertion—that the required ventilation fans are not currently commercially available—is directly related to any deficiency in the Application. Thus, Nevada fails to “explain why the application is deficient.” Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. 33,168, 33,170 (Aug. 11, 1989).

Even if we assume that Nevada’s speculation regarding fan blade failure rates and expected repair times is true, it fails to contradict the information in the Application. Nevada’s concerns about the long lead-time for manufacturing replacement fan blades are directly addressed in SAR § 1.3.5: the Project will ensure the “[a]bility for rapid fan replacement with spare fans and parts stocked on site.” SAR at 1.3.5-3. Nevada ignores this information, and as a result, its contention fails to raise a genuine dispute and is inadmissible. *See Tex. Utils. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2) LBP-92-37, 36 NRC 370, 384 (1992) (a contention that does not directly controvert a position taken by the applicant in the application is subject to dismissal).

### **139. NEV-SAFETY-139 - Description Of Reasonable Emergencies**

SAR Subsection 5.7 and similar subsections, which discuss plans for dealing with radiological emergencies prior to permanent closure, fail to include sufficient detail to determine whether these plans will fulfill all of the requirements that the LA places on them, and as a result, the LA assumptions related to the effectiveness of the engineered barrier system are unfounded.

#### **RESPONSE**

This contention alleges that the description of the emergency plan in SAR § 5.7 contains insufficient details about responding to and recovering from radiological emergencies that may occur during operations at the repository and that, as a result, DOE's assumptions related to the effectiveness of the engineered barrier system (EBS) are also unfounded. The contention can be read to allege that the description of the emergency plan in the Application is inherently incomplete relative to the requirements of NRC regulations, though it does not state so directly. Alternatively, it can be read to allege that the level of detail in the emergency plan description is insufficient to support certain assumptions made about the effectiveness of the EBS.

#### **a. Statement of Issue of Law or Fact to be Controverted**

This contention appears to state two equally defective arguments: (1) that DOE's emergency plan description itself is deficient because it does not include certain details which will be included in the final emergency plan at the receive-and-possess license stage, but which are not included at this stage; and (2) that necessary assumptions regarding the "effectiveness" of the EBS cannot be made because various details are "missing" from the emergency plan description.

If Nevada intends to make both arguments, then it has failed to comply with the requirement of the Case Management Order for this proceeding for "narrow, single-issue

contentions” and should therefore be dismissed. *U.S. Dep’t of Energy*, (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board), LBP-08-10, 67 NRC \_\_ (slip op. at 6) (June 20, 2008) (Case Management Order). If, on the other hand, Nevada is attempting only to make one of these arguments, then, because it is unclear which one Nevada intends to make, this contention does not “provide a specific statement of the issue of law or fact to be raised or controverted,” as required by 10 C.F.R. § 2.309(f)(1)(i), and should be dismissed.

It should also be noted that this contention, if it is ultimately read to implicate the EBS, is deficient for several other reasons related to its lack of clarity. Nevada refers to allegedly missing details from the emergency plan description, but fails to specify which assumptions, or how the emergency plan even relates to the EBS. Petition at 740. Notably, various sections of the SAR discuss the EBS. *See, e.g.*, SAR § 2.1.1.2 (“Engineered Barrier System”); SAR § 2.1.2 (“Barrier Capability Description”); SAR § 2.3.4 (“Mechanical Degradation of the Engineered Barrier System”); SAR § 2.3.7 (“Waste Form Degradation and Mobilization and Engineered Barrier System Flow and Transport”); SAR § 2.1.1 (“Identification of Barriers”). Nevada makes no reference to any of these sections, or how they relate to emergency planning.

Nevada also never explains what is meant by “the effectiveness of the [EBS]” or which specific EBS features are at issue. Petition at 740. Table 1.9-8 (“ITWI Classification of Features that Support the Three Barriers”), SAR § 1.9 at 1.9-110-16, identifies nearly 20 EBS features; and EBS features are classified as Important to Safety (ITS), not Important to Safety (non-ITS), Important to Waste Isolation (ITWI), or non-ITWI, depending on their barrier function. Nevertheless, Nevada makes no reference to a specific EBS feature or even a class of EBS features. Accordingly, this contention does not alert DOE to the specific assumptions or EBS

features that Nevada seeks to challenge. For these and additional reasons discussed below, this contention should be dismissed.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

As noted at the outset, this contention is susceptible to two interpretations. To the extent that Nevada argues that the emergency plan description is deficient because it lacks certain details about emergency planning, the contention must be dismissed for raising issues that are outside the scope of this proceeding. Such an argument would amount to an impermissible attack on the regulations governing Application content by requesting that a stricter standard be applied. *See* 10 C.F.R. § 2.335(a) (stating that absent a waiver, “no rule or regulation of the Commission . . . is subject to attack . . . in an adjudicatory proceeding”); *Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159 (2001), *aff’d*, CLI-01-17, 54 NRC 3 (2001) (dismissing contention on the basis that petitioner sought “to impose requirements in addition to those set forth in the regulations”).

The regulations governing what the Application must contain regarding emergency planning could not be clearer. All that is required at this stage is a description of the plan; and that description need only contain all the information that was reasonably available *at the time of docketing*. *See* 10 C.F.R. § 63.21(c)(21) (requiring “[a] description of the plan for responding to, and recovering from, radiological emergencies”); 10 C.F.R. § 63.21(a) (requiring that the Application “be as complete as possible in the light of information that is reasonably available at

the time of docketing”). In sum, NRC regulations do not require that a full plan be submitted with the Application.

Nonetheless, Nevada appears to claim that DOE’s emergency plan description is deficient because “the types of radioactive material accidents are not identified, a classification system for classifying accidents as ‘alerts’ or ‘site-wide conditions’ is not provided, the means of detecting accidents are not given, and the methods for mitigating the consequences of each type of accident are not provided.” Petition at 740. But nowhere does Nevada contend, let alone provide any supporting evidence to show, why this particular information must be provided. Indeed, Nevada does not argue in this contention that NRC regulations require a complete emergency plan at this time, and even acknowledges that “[t]he general requirements in 10 C.F.R. § 63.21(c)(21) *do* appear to be met by discussion presented in SAR [section] 5.7.” *Id.* (emphasis added).

Despite this admission, Nevada makes reference to 10 C.F.R. § 63.161 and 10 C.F.R. § 72.32(b), and suggests that these provisions somehow demonstrate that the details identified above should have been included in SAR § 5.7. These provisions, however, describe what a complete emergency plan must contain, not what the *description* of the plan must contain. DOE has committed to include those items, consistent with 10 C.F.R. § 72.32(b). *See* SAR Subsection 5.7.3.1 at 5.7-6 to -7 (addressing types of accidents and classification system); SAR Subsection 5.7.4.2 at 5.7-8 (addressing means of detecting event sequences that lead to an alert or site area emergency); SAR Subsection 5.7.5.1 at 5.7-9 (addressing the means to mitigate consequences of each type of accident). To the extent Nevada relies on these provisions to argue that DOE’s emergency plan description (or commitment to include information in the emergency plan in the

future) is insufficient, Nevada ultimately advocates for a stricter standard than what NRC regulations currently require. As noted, such challenges are not permitted.

Given the ambiguous nature of this contention, it also is possible that Nevada is arguing that the details “missing” from the emergency plan description are required, not because of the requirements that specifically relate to emergency planning, but rather because of the relationship of these details to the performance of the EBS. As shown in section d below, however, Nevada would, again, be incorrect, because it does not demonstrate that there is any connection between the emergency plan and the performance of the EBS. Nor can it.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

As noted above, this contention discusses the emergency plan as if it were a component or feature that relates to and even supports the EBS, but Nevada does not cite any requirements associated with the performance of the EBS. Nevada simply recites selected requirements of 10 C.F.R. §§ 63.21, 63.161 and 72.32(b), all of which relate to the contents of an emergency plan. Nevada never cites to any of the requirements in 10 C.F.R. Part 63—or even to the sections of the SAR—that relate to the EBS or the performance of the repository during the preclosure or postclosure period. In other words, Nevada does not make any effort to show how details allegedly “missing” from the emergency plan description relate to, let alone could prevent the NRC from making, the requisite safety findings regarding the EBS.

Nor does Nevada mention, much less challenge, the information in the Application that demonstrates that the contents of the emergency plan are immaterial to the EBS during the preclosure and postclosure periods. For example, SAR § 1.9 states unequivocally that “[t]he *Emergency Plan is not relied upon to prevent or mitigate event sequences.*” SAR § 1.9.1.10 at 1.9-12 (emphasis added). In other words, the emergency plan is immaterial to the preclosure

performance of the repository and is treated as a non-ITS component. Likewise, for postclosure, neither the emergency plan, nor any of the information to be derived from the emergency plan, is identified as a feature that is ITWI or that supports the EBS in any way. *See generally* SAR at 1.9-110 (Table 1.9-8) (“ITWI Classification of Features that Support the Three Barriers”). Nevada never reckons with this information.

A contention, to pass the materiality test of 10 C.F.R. § 2.309(f)(1), must state a claim that, if proven, would make a difference in the outcome of the proceeding. *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3) CLI-99-11, 49 NRC 328, 333-34 (1999). Thus, each contention must be one that, if proven, would entitle the petitioner to relief. *Yankee Atomic Elec. Co.* (Yankee Power Station), CLI-96-7, 43 NRC 235, 244 (1996). The Case Management Order states that this criterion “requires citation to a statute or regulation that, explicitly or implicitly, has not been satisfied by reason of the issue raised in the contention.” *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 7); *see also* Section II.A.3.d of this consolidated Response.

Under these tests, the contention should be dismissed. The content of the emergency plan, as indicated on the face of the Application, is not material to findings about the performance of the EBS, and vice versa. The emergency plan is simply not relied upon to prevent or mitigate preclosure event sequences, and with respect to postclosure, neither the emergency plan nor any information derived from it is classified as ITWI. The contention makes no attempt to demonstrate otherwise; and the Application affirmatively demonstrates that the emergency plan is not material to any EBS-related findings.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

The contention, if read as arguing that the emergency plan description is deficient on its face, raises issues solely outside the scope of this proceeding and should be dismissed, as argued

in section c. above. If read to argue that the emergency plan description is inadequate because its level of detail is insufficient to permit evaluation of hypothesized “failure of one or more components of the engineered barrier system,” Petition at 739, it fails to allege facts or expert opinion sufficient to support its admission.

The contention, Petition at 740, refers to details allegedly missing from the plan description, but, as noted in section a. above, fails to specify which assumptions regarding the EBS, if any, depend on or even relate to these details. Nor does it attempt to explain what is meant by “the effectiveness of the [EBS]” or which specific EBS features are at issue, though the material is readily available. Nor does it support these general assertions with any reference to authority beyond excerpts from NRC regulations and nonspecific references to the Application, particularly SAR § 5.7. Nor does it refer to any expert opinion. And the two affidavits attached by Nevada in support of this contention (by Doug F. Hambley and Steven A. Frishman), purportedly to provide expert opinions to support it, do not in fact provide supporting information, but instead simply “adopt” the assertions made in paragraph 5 of the contention. *See* Petition, Attachment 9 (Hambley Affidavit at 1, Attach. B); Attachment 20 (Frishman Affidavit at 1, Attach. B). The allegations in the contention thus amount to little more than unsupported speculation. A petitioner must explain the significance of any factual information upon which it relies. *See Fansteel, Inc.* (Muskogee, Oklahoma Site), CLI-03-13, 58 NRC 195, 204-5 (2003). Further, conclusory expert “opinions” are not sufficient to support a contention. *See USEC, Inc.* (American Centrifuge Plant), CLI-06-10, 63 NRC 451, 472 (2006). Under these tests, the contention lacks an adequate basis in fact or expert opinion, and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention fails to raise a genuine dispute on a material issue of law or fact.

Specifically, Nevada never actually disputes that DOE is not required to submit a full emergency plan at this time. Rather, without providing any basis, it suggests that the plan description must contain additional information, but offers no support for this proposition. In the absence of any support for this argument, the contention must be dismissed. Likewise, to the extent Nevada argues that the emergency plan description casts doubt on the performance of the EBS, the contention must, again, be dismissed, because Nevada offers nothing that shows how the emergency plan could impact the EBS. Nor does Nevada dispute the treatment of the emergency plan as a non-ITS component and non-ITWI feature in the Application.

It should also be noted that Nevada does not address, let alone dispute, the detailed information that the Application *does* contain and that relates to the subject matter that Nevada references in this contention. Indeed, some of this information will be relied upon to support the development of the emergency plan and is even referenced in SAR § 5.7. For example, with respect to details concerning the identification and classification of accidents, Petition at 740, SAR § 5.7 explains that potential accidents and the classification of emergencies will be described in the emergency plan based on “the list of possible internal and external events presented in [SAR] Section 1.7.” SAR § 5.7.3.1 at 5.7-6 -7. Nevada does not address SAR § 1.7.

As for details concerning the means of detecting accidents, Petition at 740, SAR § 5.7 also provides that the “[r]adiation and radiological monitoring systems [are] described in Section 1.4.2.2.” *See* SAR Subsection 5.7.4.2 at 5.7-8. Nevada also makes no reference to SAR Subsection 1.4.2.2. Regarding methods for mitigating the consequences of accidents, Petition at

740, SAR § 5.7 indicates that information in this area will be derived from SAR §§ 1.7 and 5.11. See SAR at 5.7-9 (indicating that the emergency plan “will describe the means to mitigate consequences of each type of accident, as presented in [SAR] Section 1.7”); SAR at 5.7-13 (indicating that the emergency plan will describe radiological sampling and monitoring methods and referencing SAR § 5.11). Nevada apparently did not address or account for any of this material.

A petitioner must “read the pertinent portions of the license application [and] . . . state the applicant’s position and the petitioner’s opposing view,” and explain why it disagrees with the applicant. *Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC 349, 358 (2001) (internal quotation and citation omitted), *recons. denied*, CLI-02-1, 55 NRC 1 (2002) (quoting Final Rule, Rules of Practice for Domestic Licensing Proceedings – Procedural Change in the Hearing Process, 54 Fed. Reg. 33,168, 33,170 (Aug. 11, 1989)). In this contention, however, Nevada fails to address or refute the information that appears in the Application, and fails to explain why it believes that information fails to satisfy the applicable regulations with respect to either the required level of detail or the NRC’s required safety findings. As a result, Nevada fails to raise a genuine dispute on a material issue, and the contention should be dismissed.

**140. NEV-SAFETY-140 - Engineered Barrier System Design Basis**

SAR Subsection 1.3.4 and similar subsections, which describe the design of ground control system, ventilation system and components of the engineered barrier system, fail either to include sufficient detail to determine whether the component discussed will fulfill the requirements placed on it by the LA or to provide sufficient reference to supporting documents that provide the required detail.

**RESPONSE**

In this contention, Nevada alleges that “SAR Subsection 1.3.4 and similar subsections” contain insufficient detail or insufficient references to supporting documents with respect to the “ground control system, ventilation system, and components of the engineered barrier system.” *See* Petition at 741-44. Nevada fails to demonstrate that the contention would make a difference in the outcome of the proceeding, so this contention is inadmissible.

**a. Statement of Issue of Law or Fact to be Controverted**

Nevada’s statement of this contention and summary of its basis identify three aspects of the repository as allegedly deficient: the “ground control system, ventilation system, and components of the engineered barrier system.” Petition at 741. The information presented in support of this contention, however, bears no discernable relationship to the “ground support system.” *See generally id.* at 742-45 (presenting complaints related to the ventilation system, waste package emplacement equipment, and drip shield emplacement equipment). Thus, the statement of this contention is impermissibly vague, to the extent Nevada seeks to litigate issues related to the “ground support system.”

**b. Brief Explanation of Basis**

To the extent the basis for this contention suffers from the same infirmities described in Section a, above, it is also deficient.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 741-42. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue . . . .” *Id.* at 742. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations, Case Management Order, slip op. at 7, this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” *Id.* at 3.

Nevada proffers three allegations in this contention, but fails to carry its burden of demonstrating that they would make a difference in the outcome of the proceeding. Nevada's first claim is that the "total airflow" and "pressure capacity" parameters for each ventilation exhaust fan do not appear in the Application, or in a supporting document directly referenced in the Application. *See* Petition at 742 (*citing* SAR § 1.3.5.1.3.1; "Subsurface Construction and Emplacement Ventilation" (01/24/2008), LSN# DEN001573151 at 11 ("Ventilation Analysis")).<sup>82</sup> Nevada identifies the information it seeks in another Project document cited in the Ventilation Analysis, but complains that it is not clear whether this information is "applicable in the context of the LA." *Id.* at 742 (*citing* "Subsurface Ventilation Network Model for LA" (01/14/2008), LSN# DEN001572123 ("Ventilation Model Calculation")). Allegedly, this "illustrates a general problem in determining what design information has been used as a basis for safety related statements in the LA." *Id.* at 742-743. Nevada, however, completely fails to connect its "general problem" to any specific regulatory requirement. In particular, Nevada articulates no connection between the specific data that it seeks and any specific requirement that the data appear in the Application, rather than in a supporting calculation.

Moreover, Nevada fails to identify any regulation that prevents DOE from generally relying upon referenced documents to support its Application, or, for that matter, on more detailed calculations that support the analyses referenced in the Application. On the contrary, and as is standard procedure, the NRC's review will include a review of cited reference documents to ensure that they are sufficient to support the conclusions presented in the Application. *See* NRC Presentation at September 23, 2008 Public Outreach Meeting at 22,

---

82 This first allegation is similar in some respects to the claims presented in NEV-SAFETY-138. To the extent that NEV-SAFETY-138 alleges additional deficiencies related to ventilation fan parameters that are not reiterated in this contention, DOE addresses those issues in its response to NEV-SAFETY-138, above.

*available at* ADAMS Accession No. ML083030512. Indeed, the Ventilation Model Calculation Nevada identified is available on the LSN. It was required to be placed there, among other reasons, to assist “potential parties . . . [in] formulating meaningful contentions.” *U.S. Dep’t of Energy*, CLI-08-12, 67 NRC \_\_ (slip op. at 9). Nevada’s identification of the specific information it seeks in an underlying Project calculation, therefore, merely further confirms that there is no deficiency.

Finally, as to Nevada’s lack of clarity regarding whether the information cited in DOE’s Project reference documents is “applicable,” Nevada answers its own question: the underlying calculation is a “supporting document” to the Application reference. Petition at 742. A cursory review of the Ventilation Analysis confirms this fact. The Ventilation Analysis identifies the Ventilation Model Calculation as a “Reference” that “support[s] this analysis.” Ventilation Analysis at 8. In other words, the information that Nevada identified is “applicable in the context of the LA.” *Id.* at 742.

Nevada’s second and third claims, relating to the TEV and Drip Shield Gantry, are verbatim repetitions of information presented in NEV-SAFETY-132 and -133, respectively. DOE addresses Nevada’s failure to demonstrate the materiality of these allegations in its responses to those contentions. Specifically, Nevada cites no evidence for, nor provides further explanation of, the alleged need for “[p]recise . . . [w]aste package emplacement geometry,” Petition at 743, nor for the proposition that “precise emplacement geometry [is] required for the drip shields,” *id.* at 744, to meet any specific preclosure or postclosure regulatory requirements.

Thus, Nevada has failed to carry its burden of explaining how this contention, if true, would make a difference in the outcome of this proceeding. Accordingly, this contention fails to

raise an issue that is material to the findings that the NRC must make in this proceeding, and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to those requirements: (1) the contention does not reference any documents, other than the Application and DOE's supporting references; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach affidavits (by Doug F. Hambley and Steven A. Frishman), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Moreover, as explained in Section V.A.3 above, Boards must carefully scrutinize factual allegations and the documents cited in support of contentions. This includes a review of the information relied upon to confirm that it supports the proposed contention. Section f, below, discusses Nevada's allegations in detail and explains why they fail to provide the requisite factual or expert opinion support for this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Because Nevada raises issues that, as explained in Sections d and e above, are not material to the NRC's findings and are unsupported by facts or expert opinion, it also fails to raise a genuine dispute on a material issue of law or fact.

Also, as noted above, the three claims in this contention overlap substantially with (or, in the case of Nevada's TEV and Drip Shield Gantry claims, are identical to) the claims presented in NEV-SAFETY-138, -132, and -133, respectively. In addition to the reasons presented in Sections d and e, above, each of these three claims fails, individually, to raise a genuine dispute for the reasons set forth in DOE's responses to those contentions.

Finally, to the extent Nevada may seek to litigate this contention as a "cumulative impact" contention, its efforts fall far short of the mark. Case Management Order, slip op. at 7. First, as explained in DOE's responses to each of those contentions, none of the three are adequately supported by facts or expert opinion. Thus, as explained in Section V.A.3, above, none of these three contentions should be considered in any analysis of cumulative impacts. Second, even if one considers the substance of these three contentions, Nevada provides absolutely no analysis even purportedly showing that the impact of these three alleged deficiencies, when taken together, would materially impact the adequacy of the ground control system, the ventilation system, or the engineered barrier system, or any combination of these systems. *Id.* at 7. Thus, this contention fails to raise a genuine dispute and must be dismissed.

**141. NEV-SAFETY-141 - Ground Support Descriptions**

Subsection 1.3.4.4, and similar and related sections of the SAR, lacks detailed descriptions of ground support items, such as "super Swellex-type rock bolts" and "Bernold-type perforated liners" and treats them as generic, which is inappropriate for a final repository design.

**RESPONSE**

This contention asserts that Subsection 1.3.4.4, and similar and related sections of the SAR, lack detailed descriptions of ground support items, such as "super Swellex-type rock bolts" and "Bernold-type perforated liners" and treats them as generic, and that this is inappropriate for a final repository design.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention seeks to raise an issue that is outside the scope of this proceeding, because it argues for the application of a stricter standard than NRC regulations require. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff'd*, CLI-01-17, 54 NRC 3 (2001). Nevada asserts that DOE failed to provide design details sufficient for a final design of the ground support system, and that without such information it is not possible to evaluate the impacts of ground support items on the hydrological, thermal and mechanical characteristics of the near field of the repository. Petition

at 748. Nevada does not, however, cite any regulatory requirement for such information to be included in the LA, nor does it show how such design details could affect compliance with any regulatory requirement. As discussed below, DOE determined that the ground support system is not ITS or ITWI, and DOE did not include the ground support system in its TSPA because failure of the ground support system would not have a significant effect on the TSPA results. Nevada does not challenge DOE's determination that the ground support system should not be classified as ITS or ITWI, and does not claim that design details concerning the ground support system would have a *significant* effect on the projected dose to the RMEI. Consequently, Nevada has not demonstrated that the issue raised in this contention is within the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies 10 C.F.R. §§ 63.31(a)(2) and (3), 63.21(c)(1)(ii), (3)(ii) and (14), 63.102(h), 63.113, 63.114(a) and 63.115. Petition at 746-47. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." *Id.* 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ..., " not merely a citation of the relevant regulations.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be

read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

This contention does not claim that there is any regulatory requirement specifically associated with the ground support system that the LA does not fulfill. Paragraph 4 of this contention discusses requirements of 10 C.F.R. §§ 63.31, 63.21, 63.102, 63.113, 63.114 and 63.115, but does not explain how the ground support system design details affect compliance with any of them, or could significantly affect the TSPA results. Moreover, Nevada also does not claim that the effects of failure of the ground support system, including the rock bolts and the Bernold sheets, would prevent the NRC from making any finding that the NRC must make to support issuance of construction authorization.

In addition, as mentioned above, the Application confirms that this contention does not raise a material issue. SAR subsection 1.3.4.4 "Ground Support System" states that:

The emplacement drift ground support is classified as non-ITS because it is not relied on to prevent or mitigate a Category 1 or Category 2 event sequence, and it is not ITWI because the total system performance assessment (TSPA) does not take credit for ground support during the postclosure performance period.

SAR at 3.4.4-8. This classification means that failure of the entire ground support system would not affect the results of the PCSA or TSPA. As mentioned above, nothing in this contention disputes DOE's classification of the ground support system as non-ITS and non-ITWI.

An issue "is 'material' if its resolution would 'make a difference in the outcome of the licensing proceeding.'" *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999) (*quoting* Final Rule, Rules of Practice for Domestic Licensing Proceedings—Procedural Changes in the Hearing Process, 54 Fed. Reg. 33,168, 33,172 (Aug.

11, 1989)). This contention does not provide any reasoned explanation of how resolution of this issue could make a difference in the outcome of this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in the specific response below: (1) the contention does not reference any documents, other than the license application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Doug F. Hambley and Don L. Shettel, Jr.) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Paragraph 5 of this contention asserts that: (1) the SAR purports to be a final design document but does not reference design documents, uses generic terms for the rock bolts and Bernold-type sheets, and does not give the diameter of the rock bolt holes or the size, shape and spacing of the Bernold-type sheet perforations (Petition at 747); (2) DOE may plan to use temporary rock bolts but does not mention them in the SAR (*id.* at 748); and (3) with this limited information, it is not possible to evaluate the ground support system impacts on the near field hydrological, thermal and mechanical characteristics (*id.*). None of these assertions demonstrates the existence of a material issue.

Nevada's first assertion does not identify any regulatory requirement for such design details, nor does it provide any basis for concluding that such information is necessary to evaluate the repository design. Nevada's second assertion overlooks the specific discussion in the SAR of the initial ground support system, which specifically states that "[t]he wire mesh is removed prior to installation of the final ground support, while the initial rock bolts remain in place." SAR at 1.3.4-10. The initial ground support system also is mentioned in the SAR at 1.3.1-29, 1.3.2-16 and 1.3.3-15. Nevada's third assertion does not claim, let alone provide a basis for doing so, that the design details not yet provided could have a significant effect on the PCSA or TSPA.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The discussion above shows that this contention is unfounded and not material. In particular, ground support is classified as non-ITS and non-ITWI, and the TSPA does not assume that the ground support or the rock bolts remain intact during the postclosure period. The contention does not reference or challenge the portions of the LA that deal directly with the classification of the ground support system. The contention also does not provide any basis for concluding that there is any error in the analyses that support the expectation that the rock bolts and Bernold sheets will function for at least 100 years, or that their degradation could have any affect on compliance with any regulatory requirement.

Finally, as discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency, since it does not specify any alleged ramifications other than the conclusory assertion that the SAR does not comply with 10 C.F.R. §

63.114(a). Consequently, this contention does not establish that there is a genuine dispute on a material issue of fact or law, and does not satisfy 10 C.F.R. § 2.309(f)(vi).

## **142. NEV-SAFETY-142 - Standard Titanium Grades Considered**

In SAR Subsection 2.1.1.2 and similar subsections, DOE considered only standard ASTM specification titanium for the drip shields, which is an inadequate basis for design and results in significant differences in corrosion performance of the drip shield surface, structural members and welds, for which the LA provides inadequate information to demonstrate the performance DOE assumes for the titanium alloys selected for fabrication of the drip shields.

### **RESPONSE**

This contention appears to allege that, in “SAR Subsection 2.1.1.2 and similar subsections,” DOE erroneously considered “only standard ASTM specification titanium for the drip shields,” which may lead to early failure of the drip shields. Petition at 750. The contention claims that DOE did not provide adequate information to demonstrate performance of the titanium alloys selected, and that other materials might be preferable.

#### **a. Statement of Issue of Law or Fact to be Controverted**

The contention fails to define the relevant issue to be controverted, with the requisite specificity, because it is impossible to discern what precisely the focus of this contention is, and what exactly in the LA Nevada is challenging. At different points in the contention, Nevada identifies varying subjects of its purported dispute. For example, Paragraph 1 points to “SAR Subsection 2.1.1.2 and similar subsections,” but Nevada does not reference that section at any other point in the contention. Rather, in Paragraphs 5 and 6, Nevada points broadly to SAR Subsection 2.3.6. As another example, in the first three pages of Paragraph 5, Nevada muses on alternative materials that DOE could have considered for its drip shield design, and concludes this section on the fourth page with a one paragraph discussion of corrosion tests conducted or not conducted by DOE. *See* Petition at 752-755.

Thus, as written, the contention fails to give DOE sufficient notice of the issues of law or fact that Nevada seeks to dispute. Moreover, the contention does not comply with the Board's Case Management Order that contentions be "narrow, single-issue contentions" that are "sufficiently specific as to define the relevant issues" and do not require the Parties or Board to exhaust extensive resources to clarify the issue. *U.S. Dep't of Energy*, LBP-08-10, 67 NRC \_\_\_ (slip op. at 6). Based on the information Nevada has provided, this contention lacks the specificity required by 10 C.F.R. § 63.309(f)(1)(v) and the Board's Case Management Order and, therefore, must be rejected.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Nevada's contention concludes that "DOE has assumed that the drip shields will function for hundreds of thousands of years based on corrosion testing of wrought and welded titanium (Grade 16 and Grade 7), as described in SAR Subsection 2.3.6 and similar subsections, but has not considered custom compositions to make corrosion performance of welds and structural components more uniform." Petition at 755-56. Nevada alleges that, as a result, DOE violated a number of NRC regulations applicable to Yucca Mountain, including 10 C.F.R. § 63.113. *Id.* at 756. To the extent that Nevada is claiming that DOE is required to consider any particular alloy or material to construct drip shields (or any other component of the engineered barrier system), this represents an impermissible collateral attack on the Commission's regulations. No NRC regulation, nor combination of regulations, including those cited by Nevada in Paragraph 4 and 6 of this contention, requires DOE to conduct such an evaluation. As the Commission has held,

absent a waiver, “no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding.” 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission’s regulations. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff’d*, CLI-01-17, 54 NRC 3 (2001). Accordingly, Nevada’s contention should be dismissed as outside the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada does not demonstrate that the issue presented in its contention is material to any finding the NRC must make to authorize construction of the repository. Nevada’s contention is devoid of any qualitative, let alone *quantitative*, discussion of the impact of this alleged deficiency. Nevada neglects to establish how, if DOE had “consider[ed] composition options other than the existing ASTM ‘standard’ grades,” Petition at 752, its performance assessment would have estimated a dose to the RMEI above regulatory requirements. Even more striking, Nevada fails to allege that DOE’s drip shield design is not conservative, or is not sufficient to protect the health and safety of the public or the environment.

Accordingly, Nevada’s only objection to DOE’s assessment is that it was limited, and “has not left an option to take advantage of development of new and better materials.” Petition at 752. In other words, the data DOE used for its drip shield design could have been more robust or accurate. As another Licensing Board has held, however a petitioner must allege more than simply that “more accurate input data could be used in applicant’s model,” but the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339-340 (2006). As noted above, Nevada has not done so.

In addition, in its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 750-751. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 751. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied,” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Moreover, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete

assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The methods the DOE used in assessing drip shield performance are consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below, (1) the contention cites to only one supporting document, other than the license application and DOE's supporting documents, and then only to support a limited proposition; (2) the contention contains mostly unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition attaches several affidavits (by James A. McMaster and Robert A. Cottis) that purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

As noted above, Nevada cites to only one supporting document, and then only for the limited proposition that a certain test has shown corrosion in Alloy 22. *See* Petition at 755. For the remaining six-plus pages of assertions and conclusory statements provided in this contention, Nevada fails to provide *any* references or support, despite the requirement to present "claims rooted in fact, documents, or expert opinions." *Yankee Atomic Elec. Co.*, CLI-96-7, 43 NRC at 262 (referencing 10 C.F.R. § 2.714, the predecessor to 10 C.F.R. § 2.309). Such unsupported passages include those that are rife with asserted facts and speculative arguments of counsel, such as the following:

Ti-Ru alloy microstructures are significantly different from Ti-Pd microstructures, in that the Ti-Ru alloys have a definite second metallurgical phase. This second phase could have a significant effect on the relative sensitivity of the two materials to hydrogen effects.

Petition at 753-54.

A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel*, CLI-03-13, 58 NRC at 203 (quoting *Gen. Pub. Utils. Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). The amalgamation of unsupported assertions presented in this contention amounts to little more than pure speculation by counsel.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada’s contention regarding DOE’s analysis of drip shield materials presents an issue that is not sufficiently specific, within the scope of this proceeding, or material. For these reasons, and for the reasons discussed below, this contention does not establish a genuine dispute on a material issue of fact.

As discussed in section (a) above, Nevada asserts a number of broad challenges to the LA in this contention. Nevada alleges, generally, that DOE failed to provide adequate information to demonstrate corrosion performance of the drip shield components. *See* Petition at 750. This assertion challenges DOE’s corrosion analysis of drip shield components generally, and does not point to specific portions of the SAR or supporting documents, such as “Drip Shield and Waste Package Emplacement Pallet Design Report,” (August 2007) (LSN# DN2002459185). Moreover, this assertion finds no basis in fact, given the extensive discussion of drip shield corrosion provided in SAR Section 2.3.6.8. That section analyzes general corrosion, localized

corrosion, stress corrosion cracking, early failure, thermal aging and phase stability, and titanium creep as these processes pertain to drip shields. *See* SAR Section 2.3.6.8 at 2.3.6-71. As discussed in the applicable Legal Standards Section V.A.3, above, a contention that fails to controvert the Application directly, or mistakenly asserts that the Application fails to address an issue that the Application does address, is defective.

Nevada then proceeds to propose a number of alternative “composition options” that DOE could have considered. *See* Petition at 752-754 (“DOE failed to consider if the use of a ruthenium grade for the water diversion surface ... *might* have reduced hydrogen concerns”) (emphasis added). Such hypothetical assertions do not directly controvert a position taken by the applicant in the application, and therefore cannot form the basis for this contention. *See Texas Utils. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

Nevada’s proposals are riddled with speculation and devoid of any actual results or comparisons to DOE’s findings. *See* Petition at 755 (“DOE failed to test a realistic under-deposit ... corrosion mechanism .... Such a test has been shown by the State of Nevada to cause corrosion in Alloy 22. Tests of Grade 7 or ERTi-7 welds, let alone of Grade 29 and ERTi-29 welds or ERTi-28 welds between Grade 7 and Grade 29) [sic] under these same conditions or at the even higher temperature possible in the repository in the near term after closure *have the potential* to fail by a similar corrosion mechanism”) (emphasis added) (citations omitted). These proposals fail to establish a genuine dispute, however, because Nevada must allege more than just that “more accurate input data could be used in applicant’s model,” but that the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy*

*Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339-40 (2006).

Nevada also provides a number of misleading musings regarding the analyses and decisions undertaken by DOE. *See* Petition at 752-54 (“[DOE’s change to Grade 29 Titanium] *may* have been driven by the realization that standard Ti 6Al-4V material ... was found to be more susceptible to stress corrosion cracking” ... “DOE failed to consider Ti 6Al-4VELI-0.06Pd or 0.015 Pd alloy, *possibly* because it was not listed in the ASTM Specifications” . . . “DOE did not consider that the use of the single alloy would also reduce concerns for weld filler metal selection errors”) (emphasis added). These assertions have no basis, and altogether fail to establish a genuine dispute.

Nevada also enumerates alleged shortcomings of DOE’s analyses, yet not only fails to provide any support for these assertions, but also fails to even attempt to provide any insight into the *ramifications* of the alleged omissions. *See* Petition at 754 (“DOE failed to consider if the design *might have been safer* and more reliable using either all Ru or all Pd enhanced titanium grades or alloys”) (emphasis added). Nevada does not claim DOE’s analyses are, as a result, not conservative or not protective of the health and safety of the public and the environment. Such bare assertions, “without any specific source of evidence concerning the importance of the alleged omission,” do not raise a valid basis for attacking the DOE’s analyses. *Fla. Power and Light Co.* (Turkey Point Plant Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 515, 521 (1990).

In sum, this contention does not raise a genuine dispute of a material fact because it fails to establish – or even assert – that the drip shield compositions as designed by DOE are insufficient for protection of the health and safety of the public and the environment or would result in an increase in mean dose above regulatory limits. Its suggestions for possible

improvements to the drip shield compositions are baseless, unsupported, and not even alleged to materially affect the outcome of this proceeding. For the aforementioned reasons, and in light of the applicable legal standards provided in Section V.A.3 above, this contention fails to raise a genuine dispute on a material issue and must be dismissed.

**143. NEV-SAFETY-143 - Available Drip Shield Design Information**

In the "Yucca Mountain Project Engineering Specification for Prototype Drip Shield & Drip Shield Fabrication Specification; 000-3SS-SSE0-00100-000-00Bb" (12/06/2006), LSN# DN2002362768, in SAR Figures 1.2.3-14 and 15, and 2.3.4-56, and throughout SAR Subsection 1.3.4.7 and similar subsections, DOE fails to provide necessary information to adequately understand and evaluate the drip shield design, fabrication, or installation.

**RESPONSE**

This contention asserts that a Yucca Mountain Project Engineering and Fabrication Specification for the drip shield, SAR Figures 1.2.3-14 (SAR at 1.2.3-77), 1.2.3-15 (SAR at 1.2.3-79) and 2.3.4-56 (SAR at 2.3.4-313) and SAR Subsection 1.3.4.7 (SAR at 1.3.4-26 to 1.3.4-33) and similar subsections, do not provide necessary information to adequately understand and evaluate the drip shield design, fabrication, or installation.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 757-58. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." *Id.* 758. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7.), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

Because Nevada has not explained how specific alleged deficiencies in the License Application would violate specific requirements of 10 C.F.R. Part 63, it has not demonstrated that this contention is material to findings that the NRC must make and the contention therefore must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by James A. McMaster and Doug F Hambley), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Paragraph 5 of this contention makes essentially three assertions:

(1) Nevada asserts that SAR Subsection 1.3.4.7 and similar subsections do not provide enough design detail for Nevada to be able to assess the capability of the drip shield to perform its design functions, specifically how the structural supports would be attached to the water diversion surface (WDS). Petition at 758.

(2) Nevada asserts that DOE failed to consider certain design alternatives for fabrication of the WDS, and the Grade 29 titanium structural framework. Petition at 758-9.

(3) Nevada asserts that the SAR descriptions of the drip shield interlocking connector are not clear, and should not be relied upon without a demonstration that they will work. Petition at 759-61.

None of these assertions demonstrates the existence of a material issue, but merely reflect Nevada's apparent lack of understanding of the License Application. Although Nevada's first assertion questions the level of design detail in the SAR, the only example it cites concerns whether the structural supports would provide a "continuous high-strength framework." Petition at 758. This question does not identify any requirement that the drip shield design would allegedly not meet, and therefore, does not provide meaningful support for this contention. Moreover, the SAR provides considerable design detail in SAR Subsection 1.3.4.7, including a verbal description (SAR at 1.3.4-26), Table 1.3.4-3 (SAR at 1.3.4-46, providing drip shield dimensions and materials), Table 1.3.4-4 (SAR at 1.3.4-47, defining drip shield nomenclature) and Figures 1.3.4-14 (SAR at 1.3.4-89, depicting drip shield interlocking features) and 1.3.4-15 (SAR at 1.3.4-91, depicting drip shield structural details). Other drawings and specifications that are available in the Licensing Support Network are identified by Nevada at page 768 of its Petition. Nevada does not show that there is any inadequacy in the level of information provided.

Nevada's example appears to focus on the strength of the drip shield structural supports, but Nevada does not mention SAR Subsection 2.3.4.5.3 "Drip Shield Fragility" (SAR at 2.3.4-160 to 2.3.4-171) which deals directly with analyses of drip shield performance during postclosure that are reflected in the TSPA, including the ability of the structural supports to fulfill their design functions. Since Nevada does not reference SAR Subsection 2.3.4.5.3, or raise any question about the model of drip shield performance reflected in the TSPA, Nevada's first assertion does not provide meaningful support for this contention.

Nevada's second assertion is simply that DOE should have considered alternatives to the drip shield fabrication plan and material selection. Nevada does not allege that any aspect of

either the fabrication plan or material selection would not comply with any regulatory requirement, or is not properly reflected in the TSPA. There is no regulatory requirement for the SAR to include a discussion of design alternatives or demonstrate that the proposed design is superior to alternatives. Consequently, this Nevada assertion does not provide meaningful support for this contention.

Nevada's third and final assertion is that the description of the drip shield interlocking connector is not clear, and should be demonstrated. Petition at 759-61. Nevada's explanation of this assertion discusses several DOE documents that describe different characteristics of the drip shield interconnection. The differences do not reflect any inconsistency, but only that a drip shield characteristic that is important for one analysis is not necessarily the characteristic that is important for other analyses. The drip shield interlocking connector design diverts water, but is not air-tight.

Nevada does not show that there is any lack of clarity in the License Application regarding the drip shield design. The feature is described in SAR Subsection 1.3.4.7 (SAR at 1.3.4-26 -27) and clearly depicted in SAR Figures 1.3.4-14 (SAR at 1.3.4-89) and 1.3.4-15 (SAR at 1.3.4-91). SAR Figure 1.3.4-14 clearly identifies Drip Shield Connector Plate 1 (top, left), Drip Shield Connector Plate 2 (bottom, left), the Drip Shield Connector Guide on the underside of the Drip Shield Connector Plates, and a mating Drip Shield Connector Guide on the outside of the opposite end of the drip shield. It does not require much imagination to envision this Drip Shield being lowered on the right-hand side of an adjacent Drip Shield, so that its Drip Shield Connector Plates overlap the left-hand side of the adjacent Drip Shield, and its left-hand side Drip Shield Connector Guide is to the left of the right-hand side Drip Shield Connector Guide of the adjacent Drip Shield.

In any event, Nevada does not identify any aspect of the drip shield that would not function as described in the SAR and as reflected in the TSPA. Consequently, Nevada's third assertion also does not provide meaningful support for this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Finally, as discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency, since it does not specify any alleged ramifications other than the conclusory assertion that the SAR does not comply with 10 C.F.R. § 63.113. Nothing in this contention shows that there is a genuine dispute about whether the drip shield will fulfill its design functions, and is reflected reasonably in the TSPA. Consequently, this contention does not establish that there is a genuine dispute on a material issue of fact or law, does not satisfy 10 C.F.R. § 2.309(f)(vi), and must be dismissed.

**144. NEV-SAFETY-144 - Drip Shield Failure Mechanisms**

SAR Subsection 2.3.4.5.3.1 and similar subsections do not consider all of the applicable failure mechanisms for the drip shields or provide sufficient design information in order to evaluate all possible failure mechanisms.

**RESPONSE**

This contention alleges that, in “SAR Subsection 2.3.4.5.3.1 and similar subsections,” DOE fails to consider "all of the applicable failure mechanisms for the drip shields," and therefore has not sufficiently evaluated the performance of the EBS. Petition at 762.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Nevada alleges that DOE “failed to consider *all* of the drip shield failure mechanisms that *could* affect performance of the engineered barrier system and the timing and dose to the RMEI.” Petition at 764. On this basis, Nevada concludes that DOE violated a number of NRC regulations applicable to Yucca Mountain, including 10 C.F.R. § 63.113. *Id; see also* Petition at 762-63. To the extent that Nevada is claiming that DOE is required to consider *each and every mechanism* that could *possibly* affect performance of the engineered barrier system, this represents an impermissible collateral attack on the Commission’s regulations. No NRC regulation, nor combination of regulations, including those cited by Nevada in Paragraph 4 of

this contention, requires DOE to conduct such an evaluation. As the Commission has held, absent a waiver, “no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding.” 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission’s regulations. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff’d*, CLI-01-17, 54 NRC 3 (2001). Accordingly, Nevada’s contention should be dismissed as outside the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada does not demonstrate that the issue presented in its contention is material to any finding the NRC must make to authorize construction of the repository. Nevada’s contention is devoid of any qualitative, let alone *quantitative*, discussion of the impact of this alleged deficiency. Nevada neglects to establish how, if DOE had “considered all of the drip shield failure mechanisms,” Petition at 764, it would have resulted in DOE’s performance assessment to estimate an increased dose to the RMEI above regulatory requirements. Instead, Nevada merely asserts, without any support, that the alleged failure mechanisms it presents in its contention “*could* have a considerable impact on the assumed performance of the [EBS],” and “*could* affect performance of the engineered barrier system and the timing and dose to the RMEI.” Petition at 763-64.

Notably, Nevada does not claim that DOE did not consider *any* drip shield failure mechanisms, or challenge that the ones DOE *did* examine were not reasonable. Petition at 763. Accordingly, Nevada’s only objection with DOE’s assessment is that it was limited. In other words, the data DOE used in its failure analysis could have been more robust or accurate. However, as another Licensing Board has held, a petitioner must allege more than simply that

“more accurate input data” could be used in applicant’s model, but the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339-340 (2006). As noted above, Nevada has not done so.

In addition, in its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 762-763. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." *Id.* at 763. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, (Oconee Nuclear Station), CLI-99-11, 49 NRC at 328, 333 (1999).

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (*U.S. Dep't of Energy* (High-Level Waste Repository: Pre-Application Matters Advisory PAPO Board), LBP-08-10, 67 NRC \_\_\_\_ (slip op. at 7) (June 20, 2008) (Case Management Order), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the Case Management Order focused exclusively on "format" and "procedural matters." *Id.* at 3.

Moreover, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

Also, as stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

The method the DOE used in addressing drip shield performance is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a

“reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below, (1) the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada’s Petition attaches several affidavits (by James A. McMaster, Doug F. Hambley, and Michael C. Thorne) that purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada fails to provide *any* references or support for the assertions and conclusory statements provided in this contention, despite the requirement to present “claims rooted in fact,

documents, or expert opinions.” *Yankee Atomic Elec. Co.*, (Yankee Nuclear Power Station), CLI-96-7, 43 NRC 235, 262 (1996) (referencing 10 C.F.R. § 2.714, the predecessor to 10 C.F.R. § 2.309). A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel Inc.*, (Mukogee, Oklahoma Site) CLI-03-13, 58 NRC 195, 203 (2003) (quoting *GPU Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)). Because Nevada cites to not one paper or supporting document, its amalgamation of unsupported assertions amounts to little more than pure speculation by counsel.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada’s contention regarding DOE’s analysis of mechanisms for possible drip shield failure presents an issue that is neither within the scope of this proceeding nor material. For this reason, and because Nevada fails to consider DOE’s relevant analyses and neglects to establish that its alleged deficiencies would result in increased radiological release or exposure, this contention does not establish a genuine dispute of material fact.

Contrary to Nevada’s assertion, the SAR and underlying reports demonstrate that DOE appropriately considered the relevant failure mechanisms for drip shields, and provided design information sufficient for the purpose of evaluating possible failure mechanisms. These analyses include consideration of potential failure at welded or boundary points on the drip shield, as identified in Nevada’s contention. *See* Petition at 763. SAR Subsection 2.3.4.5, related FEPs, and supporting documentation provide a comprehensive discussion of potential drip shield failure mechanisms.

Specifically, SAR Subsection 2.3.4.5 describes potential drip shield failure mechanisms, the associated failure criteria, the computational approaches for determining failure, and the abstraction of these failure processes into the TSPA. Specific SAR subsections that are relevant to drip shield failure mechanisms, failure criteria, and abstractions for TSPA are as follows:

- SAR Subsection 2.3.4.5.1.1 provides general design information for the drip shield based on engineering drawings.
- SAR Subsection 2.3.4.5.1.2 summarizes the potential failure mechanisms for EBS features. Mechanisms 3, 6, and 7 listed in that section regard buckling of the drip shield side walls, tearing/rupture of the drip shield plates, separation of adjacent drip shields at welded points as a result of vibratory ground motion, and damage from waste package-to-drip shield impacts. Failures from creep of Titanium components of the drip shield and from nonuniform settlement of the drip shield into the invert have also been considered and evaluated. *See id.* at 2.3.4-118.
- SAR Subsections 2.3.4.5.1.2.2 and 2.3.4.5.1.2.3 provide conceptual descriptions of failure of EBS features through tensile rupture and through buckling/excessive deformation, respectively.
- SAR Subsection 2.3.4.5.1.4.2 describes the model and model uncertainty for tensile rupture, including at boundary points.
- SAR Subsection 2.3.4.5.1.3.6 explains how general corrosion of Titanium is incorporated into the structural analyses.
- SAR Subsection 2.3.4.5.3 describes failure mechanisms and design information specific to drip shields, including the uncertainties in rockfall loads and in structural integrity of the drip shield's welded joints and component thicknesses, which define the fragility of

the drip shield. This section also describes the development of the fragility curves for the drip shield framework and drip shield plates as a function of ground motion level and component thickness. The failure mode for the framework is buckling of the sidewalls and the failure mode for the plates is tensile rupture. These fragility curves directly incorporate the uncertainties in rockfall loads and structural condition into TSPA.

- SAR Subsection 2.3.4.5.2.2 summarizes structural analyses of potential damage to the drip shield resulting from the static rubble load, from the dynamic amplification of the rubble load during vibratory ground motion, and from rockfall impacts to the drip shield.
- SAR Subsection 2.3.4.5.3.1 describes the technical approach to evaluating impacts of waste packages on drip shields.

In addition, DOE describes and evaluates drip shield failure mechanisms in the following

FEPs:

- FEP 2.1.03.01.0B – General Corrosion of Drip Shields
- FEP 2.1.03.02.0B – Stress Corrosion Cracking of Drip Shields
- FEP 2.1.03.03.0B – Localized Corrosion of Drip Shields
- FEP 2.1.03.04.0B – Hydride Cracking of Drip Shields

- FEP 2.1.06.07.0B – Mechanical Effects at EBS Component Interfaces

- FEP 2.1.07.01.0A – Rockfall
- FEP 2.1.07.04.0B – Hydrostatic Pressure on Drip Shield
- FEP 2.1.07.05.0B – Creep of Metallic Materials In the Drip Shield
- FEP 2.1.09.28.0B – Localized Corrosion on Drip Shield Surface Due to Deliquescence
- FEP 2.1.11.06.0B – Thermal Sensitization of Drip Shields
- FEP 2.1.11.07.0A – Thermal Expansion/Stress of In-Drift EBS Components
- FEP 2.1.13.02.0A – Radiation Damage in EBS

*See* “Features, Events, and Processes for the Total System Performance Assessment: Analyses,” ((Mar. 6, 2008) LSN# DEN001584824 at 2.2-155 to -156 (Table 2.2-2)).

General design information for the drip shield is contained in SAR Subsection 2.3.4.5.1.1 and, contrary to the contention’s assertion, is sufficient for purposes of evaluating possible failure mechanisms. As described in that section, the main structural (load bearing) element of the drip shield is a simple framework whose bulkheads and support beams will be manufactured of Titanium Grade 29 (UNS R56404). *See* SAR at 2.3.4-115. Drip shield plates are placed continuously over the bulkheads and the support beams, and are manufactured of Titanium Grade 7. *See id.* The plates provide the ultimate functionality of the structure to prevent (1) dripping of water from the drift roof and walls onto the waste packages; and (2) impacts of loose rock blocks from the drift roof and the walls directly onto the waste packages. *Id.* This design information provides adequate information for evaluating the failure modes of the drip shield in TSPA.

The probability of failure of the drip shield in TSPA is defined by fragility curves for buckling of the sidewalls of the drip shield or tensile rupture of the drip shield plates. SAR at 2.3.4-162. A key input to the fragility calculations is the plastic load capacity of the structure,

discussed in SAR Subsections 2.3.4.5.3.1 and 2.3.4.5.3.2.3. Plastic load capacity is a random variable that represents the uncertainty in rockfall loads on the drip shield and the uncertainty in the integrity of the drip shield and its welds. *Id.* at 2.3.4-160 to 161.

The SAR anticipates that the boundary conditions on the drip shield plate are a source of uncertainty in defining plastic load capacity. SAR at 2.3.4-154. The rockfall loads on the plates may be nonuniform, producing an asymmetric response between the sides of the plate. The welds between the plates and the underlying framework may also constrain displacement and rotation of the plates to varying degrees. The resulting response of a plate may not match typical boundary conditions, such as fixed or simply supported, because of these effects. Accordingly, the range of potential boundary conditions is represented by considering two options that envelope the extremes of the response: (1) a plate that is fixed to maximize the load-bearing capacity, and (2) a plate that is free to move laterally, which tends to minimize the load-bearing capacity. *See id.*

A similar approach is used to define the plastic load capacity of the drip shield framework, based on two nonuniform rockfall load patterns, as described in SAR Subsection 2.3.4.5.3.2.1 and supporting documentation.

The above approach is consistent with 10 C.F.R. § 63.114, as required by 10 C.F.R. § 63.113, because: (1) the design of the engineered barrier system has been used to define parameters and conceptual models for TSPA (per 63.114(a)); (2) uncertainties and variabilities are accounted for in the parameter values (per 63.114(b)); (3) alternative failure mechanisms have been considered (per 63.114(c)); (4) the detailed technical basis for either inclusion or exclusion of specific failure mechanisms from TSPA has been documented (per 63.114(e)); and (5) degradation of EBS features is represented in the abstractions (per 63.114(f)). Accordingly,

Nevada completely ignores the relevant portions of the Application and fails to explain how DOE has failed to comply with applicable regulations. In short, this contention is inadmissible because “the Petitioner’s assertion that the application[] [is] deficient is simply based upon a failure to read or perform any meaningful analysis of the application[].” *Dominion Nuclear Conn., Inc.*, (Millstone Nuclear Power Station, Units 2 and 3), LBP-04-15, 60 NRC 81, 95 (2004) *aff’d*, CLI-04-6, 60 NRC 631 (2004).

As discussed above and in the applicable Legal Standards section, this contention alleges potential errors, omissions, and alternative approaches -- without specifying the ramifications or results of such alleged deficiencies. Nevada’s language at Paragraph 6 essentially admits that it does not know whether this contention is material, and attempts to shift the burden to DOE to demonstrate that its contention is *not* material, contrary to the requirements of 10 C.F.R. § 2.309(f)(1)(vi). *See* Petition at 764; *see also Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). For this and the aforementioned reasons, this contention does not establish a genuine dispute of a material issue and therefore must be dismissed.

**145. NEV-SAFETY-145 - Drip Shield Specifications**

SAR Subsections 1.3.4.7.8 and 1.3.2, and Table 1.3.2-5, and similar subsections, list design codes and standards presumed applicable to the design and fabrication of the drip shield, but include specifications that are not appropriate or relevant and omit specifications necessary to the unique requirements to fabrication of drip shields from titanium such that they will meet the assumptions used in the TSPA for this "important to waste isolation" component of the engineered barrier system.

**RESPONSE**

This contention asserts that design codes and standards referenced in SAR Subsections 1.3.4.7.8 (SAR at 1.3.4-32) and 1.3.2 (SAR at 1.3.2-1 through 1.3.2-56), and Table 1.3.2-5 (SAR at 1.3.2-42-43) and similar subsections, include specifications that are not appropriate or relevant and omit specifications necessary to fabrication of drip shields to meet the assumptions used in the TSPA.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention does not demonstrate that the alleged citation to design codes and standards that are not appropriate or relevant would affect compliance with a regulatory requirement, safety or waste isolation. It also does not demonstrate that there is any regulatory requirement to include drip shield fabrication specifications in the LA, or that the omission of such information could affect compliance with any regulatory limit.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 765-66. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” *Id.* at 766. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that a petitioner must demonstrate that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

Nevada asserts that this contention alleges non-compliance with 10 CFR §§ 63.31(a), 63.21, 63.102(h), 63.113 and 63.115. Petition at 765-66. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, Nevada has failed to demonstrate that this contention fails to raises an issue that is material to the findings that the NRC must make in this proceeding, and, thus, this contention must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE’s

supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by James A. McMaster and Doug F Hambley), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Paragraph 5 of this contention asserts that: (1) SAR Table 1.3.2-5 and other, unspecified places in the SAR reference non-applicable nuclear codes and provide inadequate process or quality guidelines (Petition at 766-8); (2) DOE's Engineering Specification for Prototype Drip Shield, and the conceptual drawing do not provide adequate fabrication guidelines and acceptance criteria (Id. at 768-69); and (3) with no design details it is difficult to assess whether the WDS will continue to function after a rockfall (Id. at 769).

Nevada's first assertion appears to be based on an incomplete review of SAR Table 1.3.2-5 (SAR 1.3.2-42 and 1.3.2-43). Nevada declares that "The LA should be specific as to just what sections of the ASME Code it is relying on." Petition at 768. SAR Table 1.3.2-5 contains just such information, and additional details. For example, a representative row of SAR Table 1.3.2-5 includes the following code description: "2001 ASME Boiler and Pressure Vessel Code (including 2002 addenda) (ASME 2001, Section II, Part D, Table TE-5)." This entry specifies the section, and also detail about the place within that section. In addition the column for "Applicability" indicates how the code was applied to a particular subsurface component, such as "Drip shield Titanium Grade 7-Mean Coefficient of Thermal Expansion." Thus, the

applicability is clear. Nevada has not explained what codes it believes to be non-applicable, and thus does not support that assertion.

In discussing this assertion, Nevada mentions various quality control considerations that it contends are required to be included in the LA, but Nevada does not cite any regulation that requires such information to be included in the LA. Moreover, as shown below, the DOE specification Nevada cites in this contention is part of DOE's process to develop appropriate drip shield fabrication and welding requirements. Consequently, Nevada's list of potential welding procedure quality control provisions does not provide any support for this assertion.

Nevada's second assertion is that there are insufficient details in DOE's "Specification Cover Sheet & Yucca Mountain Project Engineering Specification for Prototype Drip Shield & Drip Shield Fabrication Specification; 000-3SS-SSE0-00100-000-00Bb," and related drawings. Petition at 768. That specification is not referenced in the SAR subsections cited in this contention, and Nevada does not claim that it, or the drawings Nevada also references, are in any way inconsistent with the SAR subsections cited in this contention. Thus, Nevada's comments regarding the specification and drawings do not provide support for this contention.

In addition, Nevada's comments about the DOE specification and other design documents are also wrong; the specification includes numerous detailed quality requirements, including materials and material controls, dimensions, non-destructive examination, etc. *See* LSN#: DN2002362768 at 10-13, 20-22. Moreover, although Nevada correctly quotes the title of the specification, it appears not to have recognized that a specification for a prototype is not the same as one for production of drip shields for use in the repository. The specification states:

Some of the early Drip Shields to be fabricated will be prototypes. The prototype Drip Shield is intended to be used for testing such as verifying the interlock feature. In the future, actual Drip Shields will be fabricated and placed within drifts at the Yucca Mountain

facility. All such activities will be in accord with the technical and quality requirements of this document and any improvements discovered during the prototyping efforts. Improvement is part of the reason for a prototyping program.

LSN#: DN2002362768 at 4, Section 1.2 “Project Summary.” Nevada does not explain how a drip shield that will be used only for testing can affect safety, or why it would be unreasonable for DOE to seek to benefit from the experience of the contractor retained to fabricate the prototype in developing the detailed procedures. Since this specification is only for a prototype that will not be used in the repository, Nevada’s second assertion does not provide adequate support for this contention.

Nevada’s third, and final assertion is that it is difficult to assess how the drip shield will function if subjected to a rockfall. Petition at 769. The LA discusses this subject in detail in SAR Subsection 2.3.4, including analysis of the rockfall characteristics in SAR Subsection 2.3.4.4 “Rockfall Analysis” (SAR at 2.3.4-51 to -108) and the effects on the EBS features in SAR Subsection 2.3.4.5 “Structural Response of EBS Features to Mechanical Degradation” (SAR at 2.3.4-108 to -191). The latter subsection includes SAR Subsection 2.3.4.5.3 “Drip Shield Fragility,” (SAR at 2.3.4-160 to -171). These portions of the SAR specifically discuss the very subject Nevada raises. In discussing this assertion, however, Nevada does not refer to these relevant portions of the LA, and does not challenge any statement in them. Thus, this third Nevada assertion also does not provide adequate support for this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Finally, as discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore,

inadmissible. This contention suffers from this deficiency, since it does not specify any alleged ramifications other than the conclusory assertion that the SAR does not comply with 10 C.F.R. § 63.113. Consequently, this contention does not establish that there is a genuine dispute on a material issue of fact or law, and does not satisfy 10 C.F.R. § 2.309(f)(vi).

**146. NEV-SAFETY-146 - Reliance On Preliminary Or Conceptual Design Information**

Legal Issue: The LA cannot be granted because it relies on preliminary or conceptual design information for both preclosure and postclosure aspects.

**RESPONSE**

This contention—recycled from a prior pleading, as explained below—argues that the Application is incomplete because it “relies on preliminary or conceptual design information for both preclosure and postclosure aspects.” Petition at 770. In Nevada’s view, 10 C.F.R. Part 63 requires “an essentially one-step licensing process in which the final design must be submitted and approved before construction authorization may be issued.” *Id.* This contention is inadmissible because it fails to specify the information allegedly missing from the Application; impermissibly challenges 10 C.F.R. Part 63; lacks adequate factual support; and creates no genuine dispute on a material issue of law or fact regarding the completeness of the Application’s design information.

**a. Statement of Issue of Law or Fact to be Controverted**

The Licensing Board must dismiss this contention because the one-line statement of the contention fails to provide a specific statement of the issue of law or fact to be raised or controverted. Although Nevada asserts that this contention raises a single issue of law, it in fact raises numerous challenges to the sufficiency of the Application’s compliance with 10 C.F.R. Part 63, as well as the NRC’s Staff’s underlying sufficiency determination that resulted in docketing of the application. Indeed, as the contention acknowledges, it “challenges the legal sufficiency of DOE’s description of its pre- and postclosure designs in *all pages* of SAR Subsections 1.2.1, 1.2.2, 1.2.3, 1.2.4, 1.2.5, 1.2.6, 1.2.7, 1.3.1, 1.3.2, 1.3.3, 1.3.4, 1.3.5, 1.3.6, 1.4.1, 1.4.2, 1.4.3, 1.4.4, 1.5.2 1.9, 2.1.2.2, and related sections.” *Id.* at 771 (emphasis added).

This is yet another attempt by Nevada to challenge the sufficiency of the application, as it refers the reader to the “specific examples of deficiencies” in its July 21, 2008, pleading seeking to reject docking of the Application. *Id.* The cited examples, however, do not even remotely touch upon the numerous SAR sections cited here. As such, this contention violates 10 C.F.R. § 2.309(f)(1)(i).

Furthermore, this contention runs afoul of the Case Management Order governing this proceeding, which requires that petitioners raise a “narrow, single-issue [contention].” *U.S. Dep’t of Energy* (High Level Waste Repository: Pre-Application Matters, Advisory PAPO Board), LBP-08-10, 67 NRC \_\_ (slip op. at 6) (June 20, 2008). In issuing the Case Management Order, the Advisory PAPO Board stated that “contentions should be sufficiently specific as to define the relevant issues for eventual rulings on the merits, and not require the parties or licensing boards to devote substantial resources to narrow or to clarify them.” *Id.* To adjudicate this contention, however, the parties and Licensing Board would need to ferret out and define each and every unspecified design detail that Nevada believes is unavailable, and evaluate whether its unavailability is material to the NRC’s findings under Part 63, resulting in inefficiency and expenditure of resources. Such an outcome is antithetical to and undermines the purpose of the Case Management Order.

The Commission has explained that a contention must be “reasonably specific.” *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2 and 3), CLI-99-11, 49 NRC 328 (1999). In *Duke Energy*, a Licensing Board rejected a contention that the application was incomplete, based on the NRC Staff’s having issued a large number of requests for additional information. In affirming, the Commission stated that:

Petitioners seeking to litigate contentions must do more than attach a list of RAIs and declare an application “incomplete.” It is their job to review the application and to identify *what* deficiencies exist and to explain *why* the deficiencies raise material safety concerns.

*Id.* at 337 (emphasis added); *see also Entergy Nuclear Operations, Inc.* (Indian Point Nuclear Generating Units 2 and 3), LBP-08-13, 68 NRC \_\_ (slip op. July 31, 2008) (denying contention, which challenged Staff’s docketing decision, “as too broad and that [Petitioner] must deal with each ‘deficiency’ in the [Application] in a separate, specific, and well-supported contention”). Similarly, this contention constitutes a generalized claim that the Application lacks required information, which does not cite the specific regulatory requirements at issue or the information allegedly omitted. Accordingly, the Licensing Board must dismiss it.

**b. Brief Explanation of Basis**

As explained above, the cited basis supporting this contention is impermissibly vague and lacking specificity. To merely state that “[p]reliminary and conceptual design information of the type found in the LA is not final design information,” Petition at 770, without some reasonable level of explanation or supporting detail is not adequate to support admitting a contention.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is also outside the scope of the proceeding because it impermissibly challenges the regulations set forth in Part 63 and advocates a stricter requirement than NRC rules impose. Contrary to Nevada’s allegations, Part 63 does *not* require that “the final design must be submitted . . . before a construction authorization may be issued.” Petition at 770. Rather, Part 63 requires only that the Application “be as complete as possible in light of information that is reasonably available at the time of docketing.” 10 C.F.R. § 63.21(a). This provision, by itself, demonstrates that final design information is not required if it is not reasonably available at the time of docketing.

The NRC Staff has also stated that the regulations setting forth the NRC’s fundamental safety findings—10 C.F.R. § 63.31(a)(1) and (a)(2)—do not require DOE to submit final design information. According to the NRC Staff, these “regulations do not require DOE to fully describe all design aspects before the Commission may give a construction authorization, so long as DOE provides *sufficient* information about the design aspects that are most important to radiological safety.” NRC Staff Response Opposing Nevada’s June 4, 2008 Petition at 8 (June 16, 2008) (emphasis added) (NRC Staff Response); *see also id.* (noting that the Commission “has not established a level of detail or prescribed a percentage of compliance for safe operation”). The Application meets this standard and Nevada has not proven otherwise.

NRC Chairman Dale E. Klein also addressed this issue in Congressional correspondence. In a letter dated March 11, 2008, Chairman Klein explained to Senator Barbara Boxer that “[p]ercent completion of the total design is not a valid indicator of the sufficiency of the safety information contained in an application.” Letter from NRC Chairman Dale E. Klein to Senator Barbara Boxer, Chairman of the Senate Committee on Environment and Public Works, Mar. 11, 2008, *available at* ADAMS Accession No. ML080380182. He further stated that the NRC Staff’s first step would be to determine if the Application contained all of the information required by the Commission’s regulations and he assured the senator that the NRC would not begin its review unless the Application contained sufficient information to evaluate the proposed repository’s safety. *Id.*

Together, the regulations and Commission statements confirm that DOE’s application need not contain final design information. To the extent that Nevada asserts that all final design information must be provided at the time of docketing, Nevada impermissibly challenges the regulations, contrary to 10 C.F.R. § 2.335.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

The Licensing Board should also dismiss this contention because Petitioner has failed to demonstrate that the issue raised in the contention is material to the findings that the NRC must make in this proceeding. Before it grants a construction authorization, the NRC must make a safety finding that (1) there is reasonable assurance that the types and amounts of radioactive materials described in the application can be received and possessed without unreasonable risk to public health and safety; and (2) there is reasonable expectation that the materials can be disposed of without unreasonable risk to public health and safety. 10 C.F.R. § 63.31(a)(1-2).

The issue raised in this contention is not material because, as explained above, Part 63 does not require that the NRC make any findings about whether the Application provides final design information. In this regard, Petitioner has misinterpreted the underlying regulatory requirement. Thus, this proposed contention fails to demonstrate that resolving this contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

The Licensing Board must reject this contention because it is not supported by adequate factual information or expert opinion. In an obvious attempt to sidestep this precondition for admissibility, Nevada claims that “[t]his contention raises a purely legal question, and supporting facts and opinions are not necessary beyond those discussed below.” Petition at 771. However, “as discussed below” in Section 6 of the contention, Nevada argues that the description of the pre- and postclosure designs in more than twenty subsections of the LA is insufficient. The purported inadequacy of such design-related information does not raise a “purely legal” question,

however, and Nevada has not supported its design-related claims with any facts or expert opinion. On this basis as well, the Licensing Board must reject the contention.

Petitioner also does not cite any legal authorities or expert opinion to support its allegation that Part 63 requires DOE to provide all final design information in its initial Application. Nevada solely relies upon vague references to the “history [of 10 C.F.R. Part 63] and contemporaneous NRC and DOE interpretations[.]” Petition at 770. Nevada, however, does not actually discuss the “history” of 10 C.F.R. Part 63 or “contemporaneous NRC and DOE interpretations,” nor does it provide any citation to these authorities. The Licensing Board should not make assumptions of fact that favor the petitioner or supply information that is lacking. *See Ariz. Pub. Serv. Co.* (Palo Verde Nuclear Generating Station, Unit Nos. 1, 2 and 3), CLI-91-12, 34 NRC 149, 155 (1991). Again, such generalities, unsupported by fact, do not suffice for purposes of admissibility in this proceeding.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For yet another reason, the Licensing Board must reject this contention. It fails to raise a genuine dispute on a material issue of law or fact. Significantly, except for a brief mention of the TAD—“there is no final TAD design”—this contention does not identify *any* alleged inadequate design information. Petition at 771. Although the contention states that it challenges all of the pages in a long list of SAR subsections, it does not identify *any* required information that is missing from the LA.

The contention further suggests that “[s]pecific examples of deficiencies are offered in Nevada’s July 21, 2008 Supplement to its June 4, 2008 Petition Asking the NRC to Reject DOE’s Yucca Mountain License Application as Unauthorized and Substantially Incomplete” *id.* but does not elaborate on these alleged deficiencies. The Commission has previously cautioned

against generalized claims followed by citations of earlier briefs: “The Commission should not be expected to sift unaided through large swaths of earlier briefs . . . in order to piece together and discern the intervenors’ particular concerns or the grounds for their claims.” *Hydro Res., Inc.* (P.O. Box 15910 Rio Rancho, NM 87174), CLI-01-04, 53 NRC 31, 46 (2001).

In any case, to the extent such claims are asserted in that prior pleading, they were fully addressed in DOE’s Response to the State of Nevada’s Supplemental Pre-Docketing Petition To Reject The Yucca Mountain License Application at 6–10 (July 31, 2008). There, DOE addressed Nevada’s assertion that the NRC should reject the Application before the Staff made its docketing decision because the Application allegedly lacked information regarding (1) the transportation and emplacement vehicle (TEV) and (2) the multi-canister overpack (MCO).

DOE's Response stated as follows:

1. *The LA Contains Sufficient Information Concerning the Transportation and Emplacement Vehicle*

Contrary to Nevada’s assertion, that the “codes and standards and design requirements for the critically important TEV . . . necessary to ensure safety do not exist,” the LA details the applicable codes and standards and design requirements in [SAR] Section 1.3.3.5, which total approximately 20 pages of text, plus figures. In [SAR] Sections 1.6, 1.7, and 1.9 of the LA, DOE has analyzed and identified potential hazards, and developed relevant master logic diagrams and fault trees to assess what aspects of the TEV are important to safety. Based upon the foregoing analyses, DOE has been able to assess the design bases and design criteria important to safety related to the equipment. Final design of the equipment will occur in the future and it will need to be verified that it is in conformance with the design bases and design criteria specified in the LA. Accordingly, Nevada’s claim regarding the TEV provides no basis for rejecting the LA or terminating the NRC Staff’s docketing review.<sup>83</sup>

---

83 Nevada also raises concerns about the TEV in NEV-SAFETY-132, alleging that the Application fails to include sufficient detail. That contention should be dismissed for the reasons provided in DOE’s response to

## *2. The LA Contains Sufficient Information Concerning the Multi-Canister Overpack*

For the MCO, Nevada mischaracterizes DOE's position with respect to these containers in the LA. Nevada asserts that "the design detail, event sequence, and reliability analysis needed to determine the nuclear safety design basis" for the MCO have not been completed and therefore, NRC cannot make the required safety determination in accordance with 10 C.F.R. § 63.31(a)(3)(i) and (ii). DOE's LA, however, makes it clear that DOE does not seek any safety determination from the NRC on the use of the MCO based on the analyses described in the LA. As discussed in [SAR] Section 1.5.1, page 1.5.1-1, "[t]he MCO is included in this section to provide a description of the analyses that have been completed and to demonstrate the intent of DOE to complete the above analyses and include DOE SNF in MCOs in future licensed operations of the repository." DOE further acknowledges the need to "obtain authorization to receive DOE SNF in MCOs once the safety analyses are completed." Therefore, DOE does not currently request that the NRC make a preclosure operations safety determination on the use of the MCO based on the LA. Accordingly, Nevada's claim regarding the MCO provides no basis for rejecting the LA or terminating the NRC Staff's docketing review.

DOE's Response to the State of Nevada's Supplemental Pre-Docketing Petition to Reject the Yucca Mountain License Application at 8-10 (July 31, 2008) (internal citations omitted).

Accordingly, the purported "deficiencies" identified in Nevada's July 2008 Supplement to its Petition to reject the Application create no genuine dispute on a material issue of law or fact.

Furthermore, there is no validity or basis for the assertion that the Application is deficient because it allegedly lacks final design information on the TAD. As discussed above in detail, final design information is not required if it is not reasonably available at the time of docketing. Additionally, using the TAD as an example, because it is the only one Nevada even remotely

---

NEV-SAFETY-132. This contention (NEV-SAFETY-146) should also be rejected for the reasons set forth in response to NEV-SAFETY-132.

identifies, the following briefly demonstrates that the level of information contained in the Application is entirely consistent with NRC regulations.

The regulations specify that the SAR must include a “description and discussion of the design of the various components of the [GROA] and the engineered barrier system,” including the “design bases and their relationship to the design criteria.” 10 C.F.R. § 63.21(c)(3)(iii). The engineered barrier system includes the TAD. *See* SAR § 2.1.1.2 and Table 2.1-1 at page 2.1-115.

To satisfy these regulations, the SAR provides an extensive, specific, and detailed description of the TAD design that meets regulatory requirements:

- Table 1.5.1-7 of the SAR provides the preclosure nuclear safety design bases with the TAD design criteria, as specified in 10 C.F.R. § 63.21(c)(3). SAR at 1.5.1-102 to -108.
- The SAR subsection 1.5.1.1.1.2.1.3 states that the safety functions for the TAD canisters include (1) providing containment and (2) reducing the frequency of criticality. SAR at 1.5.1-13.
- The detailed description of the TAD design includes general characteristics, relevant operational processes, thermal controls, criticality controls, shielding and structural requirements. SAR at 1.5.1-14 to -17.
- For criticality control, the SAR subsection 1.5.1.1.1.2.2.2 provides specific dimensions, composition, and analytical requirements for TAD internals. SAR at 1.5.1-16 to -17.
- The SAR also includes a conceptual representation of a TAD. SAR Figure 1.5.1-5. at 1.5.1-237
- For containment characteristics, SAR subsection 1.5.1.1.1.2.6.1.2 provides a description of the backfilling operation and the final closure weld. SAR at 1.5.1-23

- For dose and shielding characteristics, SAR subsection 1.5.1.1.1.2.6.4 addresses source terms and dose rate design objectives. SAR at 1.5.1-24
- The SAR subsection 1.5.1.1.1.2.8 identifies over one dozen design codes and standards that the TAD “shall” meet. SAR at 1.5.1-25 to -26.

Put simply, before it issues a construction authorization, the NRC must make the safety findings set forth in 10 C.F.R. § 63.31(a)(1) and (a)(2). This contention offers no explanation of how the information set forth in the Application regarding TAD or other design information is insufficient for the NRC to make these required findings. Accordingly, this contention fails to demonstrate that there is a genuine dispute on a material issue of law or fact relating to TAD design, or more generally to the completeness of the Application’s design information. For these, and all of the reasons set forth above, this contention must be rejected.

**147. NEV-SAFETY-147 - Evaluation Of Data Used In Drip Shield Failure Probability**

SAR Subsection 2.3.6.8.4.3.2.4 and similar subsections, which give an estimate for the occurrence that a drip shield is improperly installed in the repository, fail to provide an appropriate technical basis for parameter ranges and probability distributions used in the performance assessment due to the use of inappropriate data.

**RESPONSE**

This contention argues that Subsection 2.3.6.8.4.3.2.4, and similar subsections, which estimates the occurrence of a drip shield being improperly installed in the repository, uses inappropriate data for the relevant human error probabilities.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies a number of regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that this contention alleges noncompliance with these regulatory provisions and

therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in the contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there

is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

The contention asserts that DOE has erred in its estimate of the occurrence of a drip shield being improperly installed in the repository because it uses inappropriate data for the relevant human error probabilities. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3, above, discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Michael C. Thorne and Douglas F. Hambley) (Thorn Affidavit at 1; Hambley Affidavit at 1), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention criticizes DOE for using certain human reliability data from "Handbook of Human Reliability Analysis with Emphasis on Nuclear Power Plant Applications Final Report", NUREG/CR-1278 (1983), LSN# DN2002064865, and "Savannah River Site Human Error Data Base Development for Nonreactor Nuclear Facilities (U)" (02/28/1994), (LSN# DEN001584210). Based on this allegation, Nevada claims that the overall error in the assessed frequency of improper drip shield installation "could be several orders of magnitude." Petition at 776-77. For several reasons, this contention does not establish a genuine dispute of material fact.

First, while the contention alleges that the human error probabilities (HEPs) used do not relate closely to the activities involved, Nevada does not point to any HEPs that relate more closely to the drip shield installation activities. The contention cites as its only example, inspection of the connection between two drip shields by video camera observation being represented by a HEP entitled, “Error of commission of check reading analog meter with difficult to *see* limit marks, such as scribe lines.” Petition at 867. In DOE’s analysis, this second of the four initiating events for improper installation of the drip shield is described as, “Detection of misplacement on camera” (“Analysis of Mechanisms for Early Waste Package/Drip Shield Failure” (06/2007), LSN# DN2002451287, Figure B-22).

Contrary to Nevada’s assertion, use of the analog meter check reading HEP is appropriate as an analytical representation of the probability of failure to detect drip shield misalignment through inspection with the camera. Interpretation of the display resulting from a camera inspection for the drip shield connections can be modeled by an operator monitoring a visual display on which the view of correctly-connected drip shields is the normal condition. Failure of this inspection occurs when the operator fails to note a deviant condition on the display (i.e., incorrectly connected drip shields); thus classifying this error as an error of commission is appropriate. Moreover, monitoring the analog visual display for deviant conditions is similar to monitoring an analog meter or chart recorder for a reading within acceptable limits, because no quantitative information is recorded, and because the operator will examine more closely any apparent deviation from the normal condition (i.e., gaps, unexpected view of components of a drip shield that should be occluded from view, etc.). DOE Response to RAI 3.2.2.1.2.2-008, Jan. 16, 2009. Furthermore, the design of the drip shield sections, as described in SAR 1.3.4.7.1, is such that any misalignment will be readily apparent to the operator through the camera. If the

drip shields are placed too far apart, the connector guide would be visible, whereas if the shields are placed too close together, the overlying drip shield would be improperly elevated by at least 65 mm (SAR at 1.3.4-46 (Table 1.3.4-3)), which would be large enough to be obvious to the operator. Thus, “check-reading of an analog display” is an appropriate model for the probability of human error in the inspection process during drip shield installation.

Second, the contention does not properly characterize the license application. The contention states that the HEPs used as inputs to the drip shield failure analysis “have not been demonstrated to be relevant to the proposed application.” Petition at 776. Contrary to Nevada’s allegation, all four of the HEPs were developed for estimating human errors associated with operations at nuclear facilities and were determined to be relevant to activities that will occur at Yucca Mountain. The sources of data for the HEPs are an NRC guidance document (“Handbook of Human Reliability Analysis with Emphasis on Nuclear Power Plant Applications Final Report,” NUREG/CR-1278 (1983), LSN# DN2002064865 and a Savannah River Site study of human error (“Savannah River Site Human Error Data Base Development for Nonreactor Nuclear Facilities (U)” (02/28/1994), LSN# DEN001584210). The data in NUREG/CR-1278 is “applicable to, and has been used in evaluating human reliability in other large process plants, *e.g.*, chemical plants, oil refineries, off-shore oil production, and other power-generating plants” NUREG/CR-1278 (LSN# DN2002064865) at 2-1. The Savannah River study was conducted to develop a human error data base for nonreactor nuclear facilities. Therefore, the HEPs are applicable to nuclear facilities, including nonreactor facilities such as the repository.

In addition, Nevada quotes a paragraph from DOE’s analysis in support of its allegation that DOE failed to adapt the data to the specific conditions at Yucca Mountain. On the contrary, the quoted DOE paragraph does not reflect a failure to adapt the data to specific conditions at

Yucca Mountain. In fact, this very paragraph provides DOE's explanation that it would have been inappropriate to use performance-shaping factors to alter the nominal HEPs to account for specific design and operational factors because the drip shield installation procedures and equipment have not yet been precisely identified.

Third, while the contention claims that the human error probabilities (HEPs) used do not relate closely to the activities involved, the contention does not allege that use of unidentified HEPs that supposedly relate more closely to the drip shield installation activities would have the effect of increasing the rate or extent of degradation of the Engineered Barrier System (EBS). The contention does not allege, much less provide support for an allegation that DOE's estimates of EBS degradation are not conservative or do not bound the rate or extent of degradation that would be estimated if Nevada's approach were adopted. Therefore, the contention does not establish a genuine dispute of material fact. *See* Section V.A.3 above.

Fourth, from a risk-informed perspective, waste package and drip shield early failure is a minor contributor to the calculated mean annual dose, so that even if alternative HEPs that are significantly higher are assumed, their use is unlikely to materially impact the final dose results. As discussed in SAR Section 2.4.2.2.1.2, mean annual doses calculated for both the 10,000-year and the post-10,000-year time periods are dominated by releases from the seismic ground motion and igneous intrusion modeling cases. Mean annual doses from the drip shield early failure and volcanic eruption cases are least important to the total mean annual dose and comprise on the order of 0.1% or less of the total mean annual dose in the first 10,000 years and on the order of 0.01% or less of the total mean annual dose in the post-10,000-year period. Therefore, the contention does not establish a genuine dispute of material fact.

Fifth, as discussed in the applicable Legal Standards section above in Section V.A.3, contentions that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. The contention also suffers from this deficiency. Specifically, Nevada states that, “the overall error in the assessed frequency of improper drip shield installation *could be several orders of magnitude.*” Petition at 776 (emphasis added). This statement is pure speculation, with no scientific basis in fact, analysis, or expert support. Nevada’s failure to directly and specifically challenge the calculated frequency of improper drip shield installation renders the contention inadmissible based on the lack of a genuine dispute of material fact. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Unit 2), LBP-03-12, 58 NRC 75, 93-94 (2003), *aff’d*, CLI-03-14, 58 NRC 207 (2003).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” (Petition at 96) Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, this contention does not establish a genuine issue of material fact.  
Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected.

**148. NEV-SAFETY-148 - Evaluation Of Computational Procedure Used In Drip Shield Failure Probability**

SAR Subsection 2.3.6.8.4.3.2.4 and similar subsections, which give an estimate for the occurrence that a drip shield is improperly installed in the repository, fail to provide an appropriate technical basis for parameter ranges and probability distributions used in the performance assessment due to manipulation of the underlying human reliability data by use of an inappropriate computational procedure.

**RESPONSE**

This contention asserts that the estimate that a drip shield is improperly installed in the repository, as documented in SAR Subsection 2.3.6.8.4.3.2.4, uses an inappropriate computational procedure. Nevada claims that this results in an underestimation of the frequency of improper drip shield installation, which “directly impacts estimates of the numbers of early waste package failures and hence the overall results from the performance assessment.” Petition at 779, 781-82.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies a number of regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete

assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in the contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Nevada asserts that DOE has erred in its estimate of the occurrence of a drip shield being improperly installed in the repository because it uses an inappropriate computational procedure.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Michael C. Thorne and Douglas F. Hambley), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada presents no reference which demonstrates, or even remotely suggests, that DOE used an "inappropriate" calculational procedure to estimate the probability that a drip shield is improperly installed. Nevada proffers only one document, a book entitled, *See* "The Psychology of Risk," as ostensible factual support for a single general statement in the contention. "The Psychology of Risk," Glynis M. Breakwell, Cambridge Univ. Press (2007). This book is an overview of the psychology of risk from the perspective of a psychologist who specializes in leadership, identity processes, risk communication, and military cultures. It is not, and does not

purport to be, particularly applicable to the operation of nuclear facilities. The only proposition for which Nevada cites this book is that, “where acts of human volition are involved, it is widely recognized that accidents or failures of performance tend to occur when rules are violated.”

Petition at 780. Because Nevada fails to provide any evidence to overcome the strong presumption that rules will be followed, as explained in f below, this statement is not even applicable. Consequently, Nevada’s citation to “The Psychology of Risk” does not provide any support for this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention asserts that the methodology DOE used to calculate the probability of improper drip shield installation was flawed in that it did not properly account for human error. Based on this allegation, Nevada claims that “DOE has systematically underestimated this frequency.” Petition at 781. For the reasons discussed below, this contention does not establish a genuine dispute of material fact.

First, the contention alleges that one key factor that makes DOE’s approach to the analysis of improper drip shield installation erroneous is that “[i]t assumes that the process malfunction annunciator is operating. If it is not operating then the operator cannot respond to it and the checker cannot recognize that failure to respond.” Petition at 780. This contention neither asserts nor provides any basis for the proposition that annunciator inoperability would have any material effect on the probability of improper drip shield installation. As a licensing board has ruled in another proceeding, the mere fact that a model may not provide completely accurate results, or does not provide an exact representation of the actual conditions, is not a sufficient basis for rejecting the model. The existence of such concerns does not preclude use of a model, provided that the analysis is performed in a conservative manner and margins of safety

exist. *Cleveland Elec. Illuminating Co.* (Perry Nuclear Power Plant, Units 1 and 2), LBP-85-35, 22 NRC 514, 543-44, 550 (1985). See Section V.A.3. above for a more detailed discussion of this principle.

Furthermore, subsequent to Nevada's Petition, and in response to a Request for Additional Information from the NRC, DOE developed an alternate event tree for evaluating the improper emplacement of the drip shield which demonstrates that mechanical or equipment reliability is not significant to the probability of improper drip shield installation. This analysis, which is documented in DOE's response to RAI 3.2.2.1.2.2-008, includes an event sequence that accounts for the possibility that faults in the alarm system (referred to by Nevada as the process malfunction annunciator) may result in improper emplacement of the drip shield. Inclusion of alarm system faults (in addition to mechanical faults in the camera) results in an increase in the probability of drip shield early failure which is three orders of magnitude smaller than the total estimated probability for drip shield early failure, and is therefore insignificant. The analysis and results are or will be reflected in DOE's response to RAI 3.2.2.1.2.2-008, scheduled to be submitted on January 16, 2009.

Second, Nevada's primary basis for its claim that DOE has underestimated the probability of improper drip shield installation is a presumption that DOE's personnel will violate required procedures and circumvent QC measures. Nevada opines that, "there may be a tendency to switch off or ignore such QC measures, or to continue operations when one of the systems is out of operation" and further goes on to speculate that, "if the camera provides ambiguous information then it may cease to be relied upon." Petition at 780. These highly speculative allegations fall far short of the particularized demonstration required to provide a reasonable basis to believe DOE and its personnel would act contrary to its procedures. See

*GPU Corp.* (Oyster Creek Nuclear Generating Station), LBP-96-23, 44 NRC 143, 164 (1996). Assertions that DOE's personnel may violate procedures and circumvent QC measures cannot provide the basis for a contention unless Nevada provides evidence that DOE's workers will ignore or fail to be properly trained on the applicable procedures. *See Private Fuel Storage, LLC*, (Independent Spent Fuel Storage Installation), LBP-00-35, 52 NRC 364, 405-406 (2000). Furthermore, Nevada's argument ignores the fact that "NRC inspections and enforcement action go a long way toward ensuring compliance with our requirements." *GPU Nuclear, Inc.*, (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 207 (2000) (quoting *Louisiana Energy Services, L.P.*, (Claiborne Enrichment Center), CLI-97-15, 294, 306-07 (1997)). Nevada has provided not a scintilla of evidence to overcome the strong presumption that DOE's personnel will comply with the required procedures and controls.

Remarkably, Nevada also claims that, "the very fact that both camera inspection and malfunction annunciator are provided may mean that one of these two sources of information is ignored (*e.g.*, there is no perceived need to look at the camera images because the annunciator will provide an alert as to there being a failure of emplacement)." Petition at 780. In other words, Nevada contends that the very existence of redundant indicators, a fundamental safety measure in the nuclear industry, may lead to DOE's personnel violating operating procedures. Again, Nevada offers no support whatsoever for its conjecture, much less the specific evidence necessary to overcome the presumption that DOE and its personnel will comply with procedures and controls.

Third, as discussed in the applicable Legal Standards section above in Section V.A.3, contentions that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine

dispute of material fact or law and are, therefore, inadmissible. The contention also suffers from this infirmity. Specifically, Nevada states that, “the underlying principles are *suspect* and the result is *of little value*.” Petition at 780 (emphasis added). Nevada concludes by stating, “DOE has *systematically underestimated* this frequency.” *Id.* at 781 (emphasis added). These statements are pure speculation, with no scientific basis in fact, analysis, or expert support. Nevada’s failure to directly and specifically challenge the calculated frequency of improper drip shield installation renders the contention inadmissible based on the lack of a genuine dispute of material fact. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Unit 2), LBP-03-12, 58 NRC 75, 93-94 (2003), *aff’d*, CLI-03-14, 58 NRC 207 (2003).

Fourth, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. Petition at 782. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

Finally, Nevada has not demonstrated that the resolution of this contention would significantly affect any finding the NRC must make to authorize construction. In particular, Nevada is required to demonstrate that the resolution of the issue would prevent the NRC from

finding that there is reasonable expectation that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). In other words, Nevada would have to show that the License Application does not support findings that there is reasonable expectation that the repository will be able to limit radiological exposures and releases as required by 10 C.F.R. § 63.113. Since this contention does not make any such showing, it does not demonstrate that the issue is material.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

**149. NEV-SAFETY-149 - Deviations In Design And Waste Emplacement**

Legal issue: In SAR Subsection 2.2.1.2 at 2.2-17, DOE excludes deviations from repository design or errors in HLW emplacement from events considered in the TSPA (FEP 1.1.03.01.0A) on purely legal grounds that are unexplained and erroneous.

**RESPONSE**

This contention claims that DOE improperly excluded FEP 1.1.03.01.0A, “Error in Waste Emplacement,” from consideration in the TSPA on purely legal grounds that it alleges are unexplained and erroneous.

**a. Statement of Issue of Law or Fact to be Controverted**

This contention fails to explain why the exclusion of a FEP on purely legal grounds is incorrect. The Commission requires that a contention “explain, with specificity, particular safety or legal reasons requiring rejection of the contested [application].” *Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC 349, 359-60 (2001).

This contention lacks the specificity required by 10 C.F.R. § 63.309(f)(1)(v) and, therefore, must be rejected.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada asserts that DOE did not comply with regulations regarding compliance with postclosure performance objectives. *See* Petition at 784. Essentially, it alleges that DOE excluded FEP 1.1.03.01.0A, “Error in Waste Emplacement” on “purely legal grounds” that are both “unexplained and erroneous.” Petition at 783-784. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository.

Moreover, Nevada neglects to establish how the alleged deficiency could produce any alternative TSPA results. It fails to provide any qualitative, let alone *quantitative*, results of this alleged deficiency. A petitioner must allege not only that “more accurate input data could be used in applicant’s model, but the use of it “could materially impact the computed outcome.” *Entergy Nuclear Generation Co. and Entergy Nuclear Operations, Inc.* (Pilgrim Nuclear Power Station), LBP-06-23, 64 NRC 257, 339-340 (2006).

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 784. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]he issue is therefore material.” Petition at 783. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, (Oconee Nuclear Station), CLI-99-11, 49 NRC at 328, 333 (1999).

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (*U.S. Dep't of Energy* (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board), LBP-08-10, 67 NRC \_\_\_\_ (slip op. at 7) (June 20, 2008) (Case Management Order), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the Case Management Order focused exclusively on "format" and "procedural matters." *Id.* at 3.

Moreover, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing errors in waste emplacement or deviations from design is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a "reasonable expectation": (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses

due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above, (1) the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada fails to provide *any* references or support for the assertions and conclusory statements provided in this contention, despite the requirement to present “claims rooted in fact, documents, or expert opinions.” *Yankee Atomic Elec. Co.*, (Yankee Nuclear Power Station), CLI-96-7, 43 NRC 235, 262 (1996) (referencing 10 C.F.R. § 2.714, the predecessor to 10 C.F.R. § 2.309). A contention “will be ruled inadmissible if the petitioner ‘has offered no tangible information, no experts, no substantive affidavits’, but instead only ‘bare assertions and speculation.’” *Fansteel, Inc.*, (Mukogee, Oklahoma Site) CLI-03-13, 58 NRC 195, 203 (2003) (quoting *Gen. Pub. Utils. Nuclear, Inc.* (Oyster Creek Nuclear Generating Station), CLI-00-06, 51 NRC 193, 208 (2000)).

Accordingly, the statements made in this contention are unsupported assertions of counsel, that fall far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE has already demonstrated that Nevada’s contention regarding DOE’s screening of FEP 1.1.03.01.0A, “Error in Waste Emplacement,” presents an issue that is not material and not adequately supported. For this reason, and because Nevada mischaracterizes the LA and neglects to establish that its alleged deficiencies would result in increased radiological release or exposure, this contention does not establish a genuine dispute of material fact.

First the contention alleges that that FEP 1.1.03.01.0A, “Error in Waste Emplacement,” is excluded from the TSPA on the basis of regulation. Petition at 784. In fact, the FEP is excluded on the basis of low consequence. *See* “Features, Events, and Processes for the Total System Performance Assessment: Analyses,” (LSN# DEN001584824 at 6-39) (Mar. 6, 2008). DOE identified this error in Condition Report 12015 and corrected it in Scientific Analysis/Calculation

Error Resolution Document ANL-WIS-MD-000027 ERD 01, dated May 23, 2008. *See* LSN# DEN001595379. Specifically, the Error Resolution Document identifies the following corrections:

(1) Page 6-39, FEP 1.1.03.01.0A, change the screening decision from "Excluded by Regulation" to "Excluded by Low Consequence."

(2) Page 6-40, FEP 1.1.03.01.0A, change the last sentence from:

In summary, FEP 1.1.03.01.0A (Error in Waste Emplacement) is excluded from the performance assessments conducted to demonstrate compliance with proposed 10 CFR 63.311 and 63.321 (70 FR 53313 [DIRS 178394]), and with 10 CFR 63.331 [DIRS 180319], on the basis of regulation.

to:

In summary, FEP 1.1.03.01.0A (Error in Waste Emplacement) is excluded from the performance assessments conducted to demonstrate compliance with proposed 10 CFR 63.311 and 63.321 (70 FR 53313 [DIRS 178394]), and with 10 CFR 63.331 [DIRS 180319], on the basis of low consequence.

No other changes were required to FEP 1.1.03.01.0A because the rest of the text supports a low consequence screening decision. In addition, the screening decision for this FEP is correctly listed in SAR at 2.2-5 as "Excluded – low consequence." SAR 2.2 at 2.2-212.

Second, Nevada's assertion that the exclusion basis for the subject FEP is "unexplained and erroneous" is simply wrong. To the contrary, the exclusion justification for FEP 1.1.03.01.0A explains that deviations from design or errors in waste emplacement will be of low significance because the quality assurance program and quality control procedures will evaluate and disposition any nonconformances or deviations from design. *See* LSN# DEN001584824 at 6-39. It also directs the reader to excluded FEP 1.1.08.00.0A, "Inadequate Quality Control and Deviations from Design," which contains a more detailed discussion of the exclusion bases. That FEP provides roughly eight single-spaced pages supporting the low-consequence exclusion

of FEPs related to DOE's QA Program. *See* LSN# DEN001584824 at 6-52. Because the allegedly missing information is, in fact, provided, this contention does not raise a genuine dispute. Even if the LA had not contained the allegedly missing information, the contention does not raise a genuine dispute because it fails to explain the consequences of such omissions.

Third, the contention inaccurately portrays the DOE's justification as "the repository will be constructed and operated *exactly* as proposed in the LA." Petition at 784 (emphasis added). To the contrary, DOE explained in its FEP exclusion justification that some deviations or nonconformances are anticipated but that "[t]he regulatory requirements for performance confirmation and quality assurance require that any deviation from design be evaluated for potential impact, and that significant deviations which are detected during the operational period be corrected." LSN# DEN001584824 at 6-39. An imprecise reading such as Nevada's cannot form the basis for a litigable contention. *See Ga. Inst. of Tech.* (Georgia Tech Research Reactor), LBP-95-6, 41 NRC 281, 300 (1995).

Nevada also failed to establish a genuine dispute with DOE regarding whether this facility, like others regulated by the NRC, will be constructed and operated as originally designed. In fact, DOE recognizes that some nonconformances or deviations from design may occur, and has established administrative and procedural controls to evaluate and disposition any deviations and ensure that construction and operation of the facility are within analyzed conditions and design bases. LSN# DEN001584824 at 6-53. DOE explains that its QA controls and procedures were developed from those established for Part 50 reactors, which the NRC has found provide reasonable assurance of safety. *See id.* Accordingly, DOE not only agrees with Nevada that decades of nuclear experience have shown that some deviations from design may

occur, but it has drawn on that experience to establish a sound QA Program in accordance with 10 C.F.R. § 63.142.

Finally, this contention does not establish any genuine dispute of material fact because it fails to even suggest that the inclusion of the subject FEP could produce any alternative TSPA results. Nevada fails to suggest either qualitative, or quantitative, results of such inclusion. Moreover, 10 C.F.R. §§ 63.114(e) and (f) – which Nevada cites in its contention – require DOE to provide the technical basis for inclusion or exclusion of a FEP if the dose to the RMEI or release to the accessible environment would be “*significantly* changed” by its omission. *See* 10 C.F.R. § 63.114(e) and (f) (emphasis added). Although DOE provides its low consequence exclusion justification for the subject FEP in multiple pages of supporting documentation, Nevada fails to provide even one sentence of explanation as to how inclusion of this FEP could *significantly* change the outcome of the TSPA, or materially affect the NRC’s findings in this proceeding.

As discussed in Section V.A.3, above, contentions that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. For the aforementioned reasons, this contention does not establish a genuine dispute of material fact and therefore must be dismissed.

### **150. NEV-SAFETY-150 - Basaltic Magma Melting Depth**

SAR Subsections 2.2.2.2.3.1, 2.3.11.2.2 and related sections, which indicate that the probability of igneous activity disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year, underestimates that probability, likely by two or more orders of magnitude, because it is assumed incorrectly that melting to produce basaltic magma will be in the shallow lithospheric mantle and not in the deeper asthenosphere.

#### **RESPONSE**

Nevada alleges that DOE underestimates the probability of igneous activity disrupting a repository drift by two or more orders of magnitude because: (1) DOE assumes that basaltic magma will originate in the shallow lithospheric mantle; (2) a shallow lithospheric source for basaltic magma "infers a dwindling supply of new basalt and little chance of future events"; and (3) "published data and interpretations [] indicate that melting to produce basalt [in the vicinity of Yucca Mountain] is in the asthenosphere and not in the lithosphere[,] " which "implies a more active igneous future for Yucca Mountain and a higher probability of igneous activity disrupting repository drifts." Petition at 786. As discussed below, Nevada's argument is not material, lacks appropriate expert support, and fails to raise a genuine issue because, among other things, DOE's assessment of future igneous activity included the possibility that the asthenosphere was the source of basaltic magma.

#### **a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada sets forth and describes a number of regulations. Petition at 786-87 (citing 10 C.F.R. §§ 63.31(a)(2) and (a)(3), 63.21(c)(9) and (c)(15), 63.113, 63.114, and Subpart E). Nevada concludes its general description of these regulations with the mere assertion that "this contention alleges noncompliance with these provisions and therefore raises a material issue within the scope of the licensing proceeding." *Id.* at 787. But 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ..., " not merely a citation to regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2 and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (*U.S. Department of Energy* (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board), LBP 08-10, 67 NRC \_\_\_\_ (Slip op. at 7) (June 20, 2008) (Case Management Order) at 7), this direction cannot be read to

dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." Case Management Order at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the potential impacts to the repository from an igneous event is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a "reasonable expectation": (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not "make a difference in the outcome of the licensing proceeding." *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

The last paragraph of the contention essentially admits that Nevada does not know whether this contention is material. Petition at 792-93. That paragraph indicates that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. *Id.* Since the petitioner has the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), it is Nevada that must show that its contention raises an issue that is material to this proceeding. In contrast, the last paragraph of the contention essentially argues that DOE must show that Nevada's contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* 10 C.F.R. § 2.309(f)(1)(iv).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because the contention does not reference any expert opinion. Nevada's Petition does attach several affidavits (Petition Attachments 3 (Dr. Michael Thorne) and 11 (Dr. Eugene Smith)), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 and 6 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Furthermore, Nevada argues that if the source of basaltic magma in the Yucca Mountain Region is the asthenosphere, then the probability of igneous activity disrupting a repository drift would increase "likely by two or more orders of magnitude." Petition at 792. This statement, which only appears in paragraphs 1 and 6 of the contention, is only adopted by Dr. Thorne. Thorne Affidavit, at 1. Yet Dr. Thorne's adoption of the statement still fails as a valid supporting position because he provides no support for this assertion. He provides no modeling results or evaluations, nor does he state that he performed any such evaluations. There is no evidence in the Petition or its attachments as to how Nevada arrived at this 2+ order of magnitude change in probability. Accordingly, the Board must treat Dr. Thorne's conclusory statement as speculation that is inadequate to support admissibility of a contention. Conclusory statements cannot provide "sufficient" support for a contention, simply because they are

proffered by an alleged expert.<sup>84</sup> See *USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The Licensing Board also must dismiss this contention because it does not establish that a genuine dispute exists with DOE on a material issue of law or fact. For background, DOE estimates that the mean annual frequency of a volcanic event disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year. SAR at 2.3.11-21. This probability "was developed from the results of an expert elicitation that was completed in 1996." SAR at 2.3.11-9. This expert elicitation process was the basis for DOE's Probabilistic Volcanic Hazards Assessment (PVHA) which culminated in a publicly-available PVHA Report. SAR at 2.3.11-14 (referencing CRWMS M&O 1996 (PVHA Report) (LSN# DEN000861156)). The PVHA Report documents the judgments of the ten experts who participated in the elicitation process on various aspects of the PVHA, including the volcanic/tectonic setting, event definition, region of interest, and event counts. PVHA Report, Appendix E (Elicitation Interview Summaries).

Nevada's entire argument relies on a few sentences in the SAR:

The PVHA experts generally view volcanism in the Yucca Mountain region as a regional-scale phenomenon resulting from melting processes in the upper lithospheric mantle. . . .

---

<sup>84</sup> Nevada's conclusion that the probability could change by two or more orders-of-magnitude is presented in six igneous-related contentions. See Petition at 786-822 (NEV-SAFETY-150 to -155). But the claim is made for each contention individually and independently. *Id.* The term "probability" in this context is equivalent to the mean annual frequency of intersection of the repository by an igneous event. PVHA Report at 1-1. DOE assumes that Nevada intended to allege a 2+ order-of-magnitude increase for these six contentions, cumulatively. This is because the mean annual frequency provided in the LA is only  $1.7 \times 10^{-8}$  events/year (SAR at 2.3.11-21), and a 2+ order-of-magnitude increase for each contention, independently, would result in basaltic magma intruding into the repository 10,000 times *each and every* year (12 orders-of-magnitude larger than  $10^{-8}$ ). This clearly has not happened in the past, and could not realistically occur in the future.

Analyses of magmatic processes in the Yucca Mountain region generally indicate that the magnitude of mantle melting has significantly decreased since the middle Miocene. The analyses also suggest that melts in the past few million years were generated within relatively cool ancient lithospheric mantle (compared to asthenospheric mantle), which is a factor that may contribute to the relatively small and decreasing volume of basaltic melt erupted in the Yucca Mountain region since the Miocene period (BSC 2004k, Section 6.3.3).

Petition at 787 (quoting SAR at 2.2-97 and 2.3.11-23). Nevada argues that "[t]hese statements are contrary to published research that clearly points out that melting of lithospheric mantle to produce basalt late in an extensional event, as DOE assumes, is difficult if not impossible." *Id.* at 788. Nevada then lists and discusses scientific articles and papers that purport to support its argument. *Id.* at 788-91. Nevada concludes that "[i]f DOE were to make the correct assumption," that the source of basaltic magma in the Yucca Mountain Region is the asthenosphere, then the mean probability would increase "likely by two or more orders of magnitude." *Id.* at 792.

These arguments and scientific articles do not raise a genuine dispute of material fact or law because Petitioner misreads the SAR, and Petitioner's expert's own published papers acknowledge that his opinion about asthenospheric-origins are in the minority, and that DOE's interpretation is equally valid.

First, Petitioner misreads the SAR. The SAR does not state that DOE's PVHA experts assumed that the lithosphere was the only source of basaltic magma. Rather, it states that the "PVHA experts *generally* view volcanism in the Yucca Mountain region as a regional-scale phenomenon resulting from melting processes in the upper lithospheric mantle." SAR at 2.2-97 (emphasis added). Indeed, there were some experts who specifically discussed the asthenosphere as the possible source of basaltic magma in the Yucca Mountain Region. *See* PVHA Report,

Appendix E, at MK- 2 of 22 (discussion of "volcanic/tectonic setting" in the elicitation interview for Dr. Mel A. Kuntz) ("The low volumes of recent basaltic eruptions and the lack of recent rhyolitic volcanism may be due largely to the fact that both the upper asthenosphere and the entire lithosphere in the [Yucca Mountain] region have been drained of their low-temperature, partial-melting fractions by previous melting events, resulting in an asthenosphere and a lithosphere that are essentially non-fertile with respect to future melting events."); *id* at MS-2 of 22 (discussion of volcanic/tectonic setting in the elicitation interview for Dr. Michael F. Sheridan) ("The basic process leading to volcanism involves generation of a melt from a source zone within the asthenosphere or lower lithosphere and migration of the magma to the surface where it erupts."). If a petitioner alleges that the applicant omits information, but the allegedly missing information is indeed there, then the contention does not raise a genuine issue. *See, e.g., Fla. Power & Light Co. (Turkey Point Plant, Units Nos. 3 & 4), LBP-90-16, 31 NRC 509, 521 n.12 (1990).*

And second, Petitioner's expert acknowledges that his own interpretation is controversial and that DOE's interpretation is valid. Attachment 11 of the Petition includes a list of Petitioner's expert's published papers. In one of those papers, Petitioner's expert states the following about his theory that the asthenosphere will be the origin of future basaltic magma at Yucca Mountain: "We realize that our observations and conclusions are controversial and anticipate that many questions will be asked about both temporal and mantle melting models." Smith, E.I., Keenan, D.L., and Plank, T., "Episodic Volcanism and Hot Mantle: Implications for Volcanic Hazard Studies at the Proposed Nuclear Waste Repository at Yucca Mountain, Nevada, *GSA Today*, (April 2002, v. 12, no. 4) at 7.

In a more recent paper, cited in the Petition at 788, this same expert states that:

Basaltic magmatism beneath the western US derives from the mantle, but considerable uncertainty exists as to the cause and location of mantle melting beneath volcanoes. *There are valid arguments for magma sources in the mantle lithosphere* (the old, cold roots to continents). Equally valid arguments have been made that magma derives from the mantle asthenosphere (the deeper, hot, flowing upper mantle).

Smith, E.I., Conrad, C.P., Plank, T., Tibbetts, A., Keenan, D., “Testing Models for Basaltic Volcanism: Implications For Yucca Mountain, Nevada” American Nuclear Society, Proceedings of the 12th International High-Level Radioactive Waste Management Conference, (2008) at 156 (emphasis added).

Accordingly, this contention does not raise a genuine dispute because DOE considered the very information that Nevada alleges it did not. Because Nevada has failed to controvert a position taken by the applicant in the Application, the contention must be dismissed. *See Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_\_ (slip op. at 18, 29, 39-40, 42) (Sept. 12, 2008); *Tex. Utils. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

**151. NEV-SAFETY-151 - Time Span Of Basaltic Volcanism**

SAR Subsections 2.2.2.2.3.1, 2.3.11.2.2 and related sections, which indicate that the probability of igneous activity disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year, underestimates that probability, likely by two or more orders of magnitude, because DOE ignored the entire 11 million year span of basaltic volcanism near Yucca Mountain.

**RESPONSE**

Nevada alleges that DOE underestimates the probability of igneous activity disrupting a repository drift “likely by two or more orders of magnitude, because DOE ignored the entire 11 million year span of basaltic volcanism near Yucca Mountain.” Petition at 794. As discussed below, Nevada’s argument is not material, lacks appropriate expert support, and fails to raise a genuine dispute because DOE's assessment of future igneous activity did not ignore the entire 11 million year span of basaltic volcanism near Yucca Mountain.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada sets forth and describes a number of regulations. Petition at 795 (citing 10 C.F.R. §§ 63.31(a)(2) and (a)(3), 63.21(c)(9) and (c)(15), 63.113, 63.114, and Subpart E). Nevada concludes its general description of these regulations with the mere assertion that "this contention alleges noncompliance with these provisions and therefore raises a material issue within the scope of the licensing proceeding." *Id.* But 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ..., " not merely a citation to regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2),

“because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the potential impacts to the repository from an igneous event is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide

even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

The last paragraph of the contention essentially admits that Nevada does not know whether this contention is material. Petition at 798. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Since the petitioner has the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), it is Nevada that must show that its contention raises an issue that is material to this proceeding. In contrast, the last paragraph of the contention essentially argues that DOE must show that Nevada’s contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* 10 C.F.R. § 2.309(f)(1)(iv).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (Petition, Attachments 3 (Dr. Michael Thorne) and 11 (Dr. Eugene Smith)), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 and 6 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

The contention is not adequately supported for other reasons as well. Nevada does not provide a single citation to a scientific article or scholarly document that supports its factual positions. Nevada cites to the SAR (*see e.g.*, Petition at 796) and to “Valentine, G.A. and Perry, F.V. (2007), ‘Tectonically Controlled, Time-Predictable Basaltic Volcanism from a Lithospheric Source’ (02/07/2007), LSN# DN2002382703 at 201-216,” *Id.*, but solely to explain why these documents are wrong. Accordingly, there is literally no appropriate support for the contention.

And the facts in paragraph 5 of the contention lack citations and/or specificity. For example:

- Nevada says that the “Yucca Mountain core provides a unique opportunity to view the volcanic history of the Yucca Mountain area back to 11 million years ago.” Petition at 796. But the contention does not provide a cite for this sentence, nor does it explain what this “core” is, who collected it, when it was collected, how long it is, etc. Is this core one of the “rock cores from the North Ramp” (SAR at 2.3.11-36), as this is the *only* occurrence of the word “core” in all of SAR § 2.3.11.
- Nevada says that “the record from the core combined with data from surface exposures” supports its position. *Id.* But the contention does not provide a citation for this sentence either, nor does it explain what the “data” are or what the “surface exposures” are.
- Nevada says that there is “chemical evidence of early larger degrees of melt formation followed by a pattern of waning volcanism as revealed by higher Ce/Yb and increasing epsilon Nd values.” *Id.* But the contention does not provide a citation for this sentence either.

Conclusory statements cannot provide “sufficient” support for a contention, simply because they are proffered by an alleged expert. *See* USEC, Inc. (*American Centrifuge Plant*), CLI-06-10, 63 NRC 451, 472 (2006).

Furthermore, Nevada argues that if the DOE had not ignored the entire 11 million year span of basaltic volcanism near Yucca Mountain, then the probability of igneous activity disrupting a repository drift would increase "likely by two or more orders of magnitude." Petition at 794, 797. This statement, which only appears in paragraphs 1 and 6 of the contention, is only adopted by Dr. Thorne. Petition, Attachment 3 at 1. Yet Dr. Thorne’s adoption of the statement still fails as a valid supporting position because he provides no support for this assertion. He provides no modeling results or evaluations, nor does he state that he performed any such evaluations. There is no evidence in the Petition or its attachments as to how Nevada arrived at this 2+ order of magnitude change in probability. Accordingly, the Board must treat Dr. Thorne’s conclusory statement as speculation that is inadequate to support admissibility of a contention. Again, conclusory statements cannot provide “sufficient” support for a contention, simply because they are proffered by an alleged expert. *See USEC, Inc.*, CLI-06-10, 63 NRC at 472.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The Licensing Board also must dismiss this contention because it does not establish that a genuine dispute exists with DOE on a material issue of law or fact. For background, DOE estimates that the mean annual frequency of a volcanic event disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year. SAR at 2.3.11-21. This probability "was developed from the results of an expert elicitation that was completed in 1996." SAR at 2.3.11-9. This expert elicitation process was the basis for DOE's Probabilistic Volcanic Hazards Assessment (PVHA) which culminated

in a publically-available PVHA Report. SAR 2.3.11-14 (referencing CRWMS M&O 1996 (LSN# DEN000861156)). The PVHA Report documents the judgments of the ten experts who participated in the elicitation process on various aspects of the PVHA, including the volcanic/tectonic setting, event definition, region of interest, and event counts. PVHA Report, Appendix E (Elicitation Interview Summaries).

Nevada's entire argument relies on a few sentences in the SAR:

The decreased eruptive volume through time, together with geochemical evidence (Perry, Crowe, et al., 1998, p. 4-8) indicates that the intensity of mantle-melting processes beneath the Yucca Mountain region has waned over the past 5 million years (Perry and Crowe 1992, p. 2359; Perry, Crowe, et al., 1998, p. 4-1). Considered in terms of total eruption volume, recurrence intervals, and duration of volcanism during the past 5 million years, the Crater Flat volcanic field, adjacent on the west to Yucca Mountain, is one of the least active basaltic volcanic fields in the western United States (BSC 2004a, Section 6.1.1.1).

Petition at 795-96 (quoting SAR at 2.3.11-16). Nevada argues that “SAR Subsection 2.3.11.2.1 and similar subsections . . . advocate that the volcanic system near Yucca Mountain represents a simple system that began with high volume activity and is now in a waning period.” *Id.* at 797. If DOE used the “entire 11 million year record” it would see that “another super-episode of activity could occur.” *Id.* Therefore, Nevada concludes, DOE’s “probability of igneous activity disrupting a repository drift [of]  $1.7 \times 10^{-8}$  events/year, underestimates that probability, likely by two or more orders of magnitude.” *Id.*

These arguments do not raise a genuine dispute of material fact or law because DOE did not ignore the entire 11 million year record. SAR Section 2.3.11 and the PVHA Report demonstrate that this entire 11 million year period was considered:

- Silicic volcanism was approximately synchronous with a period of major crustal extension or stretching, which occurred between 13 and 9 million years ago. SAR at 2.3.11-15.
- Around 11 million years ago, the character of volcanism changed from rhyolitic (silicic) to basaltic, and the volume of material erupted decreased dramatically compared to the final rhyolitic eruptions. SAR at 2.3.11-16.
- Silicic volcanism has not occurred in the region in the last 7 or 8 million years and, as a result, is not included as part of the igneous conceptual model. SAR at 2.3.11-16.
- Small-volume basaltic volcanism has continued into the Quaternary as part of the general decline in eruption volume over the past 11 million years in the Yucca Mountain region. *Id.*<sup>85</sup>
- The observed record of basaltic volcanism in the Yucca Mountain region during the last 10 million years indicates that volcanic centers have been constructed of both effusive and pyroclastic deposits. *Id.* at 2.3.11-18.

The supporting PVHA Report also confirms that the 11 million year record was not ignored. The expert hazard models developed for the PVHA considered the regional spatial and temporal patterns of igneous activity as a basis to describe event counts at various volcanic centers. *See* PVHA Report, Figures 3-3(a), 3-62 and 3-63. Figure 3-62 summarizes the experts' assessments for various spatial and temporal components of the PVHA model and shows that

---

85 Nevada acknowledges this quote from the SAR. Petition at 796. After providing this quote, Nevada argues that DOE's experts, however, placed "emphasis ... on activity over the past 5 million years." *Id.* But the "Statement of the Contention Itself" claims that DOE "ignored" the 11 million year period. Petition at 794; *see also id.* at 794 (DOE "do[es] not consider the entire history of volcanism") (emphasis added). A statement that DOE's experts placed "emphasis" on the past 5 million years (in section 5 of a contention), does not support a contention that DOE "ignored" or "do[es] not consider" the past 11 million years (in paragraphs 1 and 2 of a contention).

events as old as 11 Ma were considered in the PVHA. Hence, the allegation that DOE ignored the entire 11 million year span of basaltic volcanism near Yucca Mountain is not correct.

Nevada's misreading of the SAR and the PVHA does not raise a genuine dispute to litigate in this proceeding.

Because DOE considered the entire 11 million year span of basaltic volcanism near Yucca Mountain, there is no genuine dispute of material fact or law, and the contention must be rejected.

**152. NEV-SAFETY-152 - Focus On Upper Crustal Extension Patterns**

SAR Subsections 2.2.2.2.3.1, 2.3.11.2.2 and related sections, which indicate that the probability of igneous activity disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year, underestimate that probability, likely by two or more orders of magnitude, because DOE focuses improperly on upper crustal extension patterns to explain volcano location and the timing of volcanic events.

**RESPONSE**

Nevada alleges that DOE underestimates the probability of igneous activity disrupting a repository drift “likely by two or more orders of magnitude, because DOE focuses improperly on upper crustal extension patterns to explain volcano location and the timing of volcanic events.” Petition at 799. As discussed below, Nevada’s argument is not material, lacks appropriate expert support, and fails to raise a genuine dispute because DOE's assessment of future igneous activity did not focus improperly on upper crustal extension patterns.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada sets forth and describes a number of regulations. Petition at 800 (citing 10 C.F.R. §§ 63.31(a)(2) and (a)(3), 63.21(c)(9) and (c)(15), 63.113, 63.114, and Subpart E). Nevada concludes its general description of these regulations with the mere assertion that "this contention alleges noncompliance with these provisions and therefore raises a material issue within the scope of the licensing proceeding." *Id.* But 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ..., " not merely a citation to regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2),

“because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the potential impacts to the repository from an igneous event is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide

even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

The last paragraph of the contention essentially admits that Nevada does not know whether this contention is material. Petition at 806-07. That paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. Since the petitioner has the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), it is Nevada that must show that its contention raises an issue that is material to this proceeding. In contrast, the last paragraph of the contention essentially argues that DOE must show that Nevada’s contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* 10 C.F.R. § 2.309(f)(1)(iv).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (Petition, Attachments 3 (Dr. Michael Thorne) and 11 (Dr. Eugene Smith)), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in paragraph 5 and 6 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Furthermore, Nevada argues that if the DOE had not focused improperly on upper crustal extension patterns, then the probability of igneous activity disrupting a repository drift would increase "likely by two or more orders of magnitude." Petition at 799, 806. This statement, which only appears in paragraphs 1 and 6 of the contention, is only adopted by Dr. Thorne. Petition, Attachment 3 at 1. Yet Dr. Thorne's adoption of the statement still fails as a valid supporting position because he provides no support for this assertion. He provides no modeling results or evaluations, nor does he state that he performed any such evaluations. There is no evidence in the Petition or its attachments as to how Nevada arrived at this 2+ order of magnitude change in probability. Accordingly, the Board must treat Dr. Thorne's conclusory statement as speculation that is inadequate to support admissibility of a contention. Again, conclusory statements cannot provide "sufficient" support for a contention, simply because they are proffered by an alleged expert. *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472. (2006)

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The Licensing Board also must dismiss this contention because it does not establish that a genuine dispute exists with DOE on a material issue of law or fact. Nevada's entire argument relies on a few sentences in the SAR. The first sentence is:

"[f]or regional volcanism, no single base-case conceptual model is appropriate because the underlying physical processes that control the precise timing and location of volcanic events within a particular region remain uncertain (BSC 2004a, Section 6.3.1.6)."

Petition at 800 (quoting SAR at 2.3.11-23). Nevada concludes from this sentence that "DOE clearly does not understand the processes that control volcanism." *Id.* at 800-01.

This argument does not raise a genuine dispute because Nevada's own expert confirms that underlying physical processes that control the precise timing and location of volcanic events within a particular region remain uncertain. Page 801 cites to articles authored by Nevada's expert to support the contention. In one of those articles (Smith, E.I., Conrad, C.P., Plank, T., Tibbetts, A., Keenan, D., "Testing Models for Basaltic Volcanism: Implications for Yucca Mountain, Nevada," American Nuclear Society, Proceedings of the 12th International High-Level Radioactive Waste Management Conference (2008) (LSN# CLK000000085), Nevada's expert states that:

Basaltic magmatism beneath the western US derives from the mantle, but *considerable uncertainty exists* as to the cause and location of mantle melting beneath volcanoes. *There are valid arguments for magma sources in the mantle lithosphere* (the old, cold roots to continents). Equally valid arguments have been made that magma derives from the mantle asthenosphere (the deeper, hot, flowing upper mantle).

*Id.* at 156 (emphasis added). Thus, although the contention alleges that DOE does not understand the processes that control volcanism, Nevada's expert agrees that there is uncertainty in those processes and that DOE's model is valid.

Nevada then cites other sections of the SAR which it characterizes as DOE "call[ing] upon crustal structures and extension rates to explain the location and timing of volcanism." Petition at 801. Nevada claims that there is "considerable literature that contradicts [DOE's] conclusion for basaltic volcanism and suggests that thermal anomalies, mantle flow patterns, and topography at the base of the lithosphere explain the location and timing of volcanism." *Id.* Nevada further claims that "DOE *ignores* the role of the mantle and published geochemical and geophysical work that suggests that deep melting of asthenospheric mantle caused by upwelling associated with low-viscosity 'pockets' and a step in lithospheric thickness explain the

occurrence of volcanic activity near Yucca Mountain, and the episodic nature of volcanism.” *Id.* (emphasis added). For support, Nevada provides citations to articles published by its expert.

These arguments also do not raise a genuine dispute of material fact or law because DOE neither solely relied upon crustal structures and extension rates to explain the location and timing of volcanism, nor did it ignore the role of the mantle, deep melting from the asthenosphere, etc.

For background, DOE estimates that the mean annual frequency of a volcanic event disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year. SAR at 2.3.11-21. This probability "was developed from the results of an expert elicitation that was completed in 1996." SAR at 2.3.11-9. This expert elicitation process was the basis for DOE's Probabilistic Volcanic Hazards Assessment (PVHA) which culminated in a publicly-available PVHA Report. SAR 2.3.11-14 (referencing CRWMS M&O 1996 (LSN# DEN000861156)). The PVHA Report documents the judgments of the ten experts who participated in the elicitation process on various aspects of the PVHA, including the volcanic/tectonic setting, event definition, region of interest, and event counts. PVHA Report, Appendix E (Elicitation Interview Summaries).

The SAR and the PVHA Report confirm that DOE did not “focus[] improperly on upper crustal extension patterns to explain volcano location and the timing of volcanic events” (Petition at 799), or “*ignore[]* the role of the mantle and published geochemical and geophysical work that suggests []deep melting of asthenospheric mantle . . .” Petition at 801 (emphasis added). The hazard estimate produced by the PVHA’s expert elicitation process is based on spatial and temporal patterns of volcanism observed in the region surrounding Yucca Mountain. BSC, *Characterize Framework for Igneous Activity at Yucca Mountain, Nevada*, ANL-MGR-GS-000001 REV 02, Section 6.3.1.3 (2004) ( LSN# DN2001632124; DN2002077196; DEN001580092). The hazard estimate described in the SAR was revised based on the PVHA to

consider changes in the repository footprint that occurred after the PVHA was completed. *Id.* The revision also considered alternative conceptual models of volcanism (*Id.*, Section 6.3.1.6) and effects of buried volcanic centers (*Id.*, Section 6.3.1.7), alternative estimates of the probability of intersection (*Id.*, Section 6.3.1.8), and descriptions of the Crater Flat structural domain (*Id.*, Section 6.4).

The upper crustal extension patterns described in Crater Flat were considered by the experts *along with other independent pieces of information*, identified above, that were incorporated into the hazard estimate. PVHA Report, Section 4.3. All of this information, plus information from analog studies completed following completion of the PVHA, were incorporated into the updated hazard estimate (BSC 2004, Table 7-1) that is presented in SAR Sections 2.2.2.2 and 2.3.11.2. Hence, the premise for the contention is wrong.

Accordingly, this contention does not raise a genuine dispute because DOE considered the very information that Nevada alleges it did not. Because Nevada has failed to controvert a position taken by the applicant in the Application, the contention must be dismissed. *See Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (slip op. at 18, 29, 39-40, 42) (Sept. 12, 2008); *Texas Utilities Electric Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

**153. NEV-SAFETY-153 - Exclusion Of Death Valley From Volcanism Calculations**

SAR Subsections 2.2.2.2.3.1, 2.3.11.2.2 and related sections, which indicate that the probability of igneous activity disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year, underestimate that probability, likely by two or more orders of magnitude, because DOE does not include the Death Valley volcanic field in the Greenwater Range as part of the area to be considered for hazard calculations.

**RESPONSE**

Nevada alleges that DOE underestimates the probability of igneous activity disrupting a repository drift by two or more orders of magnitude because: (1) DOE “does not include the Death Valley volcanic field in the Greenwater Range as part of the area to be considered for hazard calculations”; and (2) DOE “ignores volcanic activity in the Greenwater Range” despite “chemical, mineralogical, and age similarities to those [volcanic rocks] near Yucca Mountain.” Petition at 808. As discussed below, Nevada’s argument is not material, lacks appropriate factual and expert support, and fails to raise a genuine dispute of material fact because, among other things, the Death Valley and Greenwater Range volcanic field *was* considered in DOE’s assessment of future igneous activity.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 809. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges non-compliance with these regulatory provisions, and therefore raises a material issue within the scope of the licensing proceeding." *Id.* But 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ..., " not merely a citation to regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be

disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the potential impacts to the repository from an igneous event is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

The last paragraph of the contention essentially admits that Nevada does not know whether this contention is material. Petition at 812. This paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. *Id.* Since the petitioner has the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), it is Nevada that must show that its contention raises an issue that is material to this proceeding. In contrast, the last paragraph of the contention essentially argues that DOE must show that Nevada’s contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* 10 C.F.R. § 2.309(f)(1)(iv).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (Petition, Attachments 3 (Dr. Michael Thorne) and 11 (Dr. Eugene Smith)), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in

paragraph 5 and 6 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Furthermore, Nevada argues that if DOE had considered an expanded volcanic region, then the probability of igneous activity disrupting a repository drift would increase "likely by two or more orders of magnitude." Petition at 808, 811. This statement, which only appears in paragraphs 1 and 6 of the contention, is only adopted by Dr. Thorne. Petition, Attachment 3, at 1. Yet Dr. Thorne's adoption of the statement still fails as a valid supporting position because he provides no support for this assertion. He provides no modeling results or evaluations, nor does he state that he performed any such evaluations. There is no evidence in the Petition or its attachments as to how Nevada arrived at this 2+ order-of-magnitude change in probability. Accordingly, the Board must treat Dr. Thorne's conclusory statement as speculation that is inadequate to support admissibility of a contention. Conclusory statements cannot provide "sufficient" support for a contention, simply because they are proffered by an alleged expert. *See USEC, Inc.*, CLI-06-10, 63 NRC at 472.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The Licensing Board also must dismiss this contention because it does not establish that a genuine dispute exists with DOE on a material issue of law or fact. For background, DOE estimates that the mean annual frequency of a volcanic event disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year. SAR at 2.3.11-21. This probability "was developed from the results of an expert elicitation that was completed in 1996." SAR at 2.3.11-9. This expert elicitation process was the basis for DOE's Probabilistic Volcanic Hazards Assessment (PVHA) which culminated in a publicly-available PVHA Report. SAR at 2.3.11-14 (referencing CRWMS M&O 1996 (LSN# DEN000861156)). The PVHA Report documents the judgments of the ten experts who

participated in the elicitation process on various aspects of the PVHA, including the volcanic/tectonic setting, event definition, region of interest, and event counts. PVHA Report, Appendix E (Elicitation Interview Summaries). At issue in this contention is the volcanic/tectonic setting of the Yucca Mountain Region.

Nevada's entire argument relies on the assumption that DOE did not “include the Death Valley volcanic field in the Greenwater Range as part of the area to be considered for hazard calculations.” Petition at 808. But DOE did consider this volcanic field. The PVHA was conducted using an expert panel that based its assessments on the spatial and temporal patterns of volcanism in the Yucca Mountain Region and in the region including volcanism in the Death Valley volcanic field in the Greenwater Range. Documentation in the PVHA Report (Figures 3-23, 3-28, 3-32, 3-46, and 3-51), clearly shows that at least 5 experts explicitly considered igneous activity in the Greenwater Range in the development of their models for regional igneous activity. *See also id.* at Appendix E (example discussions in elicitation interviews), at RC-3 of 20 (elicitation interview of Dr. Richard W. Carlson), GW-1 of 15 and GW-3 of 15 (elicitation interview of Dr. George P.L. Walker). Generally, the Greenwater Range activity was considered in the context of alternative regions of interest. *E.g., id.*, Figures 3-23, 3-28, 3-46, and 3-51. Therefore, information related to the Death Valley volcanic field in the Greenwater Range was not ignored by DOE, but was considered by the PVHA expert panel members in their evaluations.

Accordingly, this contention does not raise a genuine dispute because DOE considered the very information that Nevada alleges it did not. Because Nevada has failed to controvert a position taken by the applicant in the Application, the contention must be dismissed. *See Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (slip op.

at 18, 29, 39-40, 42) (Sept. 12, 2008); *Texas Utilities Electric Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

**154. NEV-SAFETY-154 - Igneous Event Probability For 10,000 Years And 1,000,000 Years**

DOE wrongly assumes in SAR Subsections 2.3.11 and 2.3.11.1 and related subsections that its approach to estimating the probability of igneous events for the first 10,000 years is applicable to the probability estimate for the period from 10,000 to 1,000,000 years as well, because its approach fails to consider deep melting models or the entire period of volcanism from 11 million years to the present.

**RESPONSE**

Nevada alleges that DOE wrongly applied its approach for estimating the probability of igneous events for the first 10,000 years is the same for the period from 10,000 to 1,000,000 years because DOE did not “consider deep melting models” or the “period of volcanism from 11 million years to the present.” Petition at 813. Moreover, Nevada alleges that, as a result of this assumption, DOE underestimates the probability of igneous activity disrupting a repository drift “likely by two or more orders of magnitude.” Petition at 816. As discussed below, these arguments are not material, lack appropriate expert support, and fail to raise a genuine dispute of material fact because, among other things, DOE did consider deep melting models and the entire 11 million year period.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 814. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges non-compliance with these regulations provisions and therefore raises a material issue" *Id.* But 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation to regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. §

63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the potential impacts to the repository from an igneous event is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. See 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative

analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

The last paragraph of the contention essentially admits that Nevada does not know whether this contention is material. Petition at 817. This paragraph indicates that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. *Id.* Since the petitioner has the burden of showing that its proposed contentions meet the requirements in 10 C.F.R. § 2.309(f), it is Nevada that must show that its contention raises an issue that is material to this proceeding. In contrast, the last paragraph of the contention essentially argues that DOE must show that Nevada’s contention is not material. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. *See* 10 C.F.R. § 2.309(f)(1)(iv).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because the contention does not reference any expert opinion. Nevada’s Petition does attach several affidavits (Petition, Attachments 3 (Dr. Michael Thorne) and 11 (Dr. Eugene Smith)), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply “adopt” the otherwise unsupported assertions made in

paragraph 5 and 6 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Furthermore, Nevada argues that if DOE had considered deep melting models and volcanism from 11 million years to the present, then the probability of igneous activity disrupting a repository drift would increase "likely by two or more orders of magnitude." Petition at 816. This quote, which only appears in paragraph 6 of the contention, is only adopted by Dr. Thorne. Petition, Attachment 3, at 1. Yet Dr. Thorne's adoption of the statement still fails as a valid supporting position because he provides no support for this assertion. He provides no modeling results or evaluations, nor does he state that he performed any such evaluations. There is no evidence in the Petition or its attachments as to how Nevada arrived at this 2+ order of magnitude change in probability. Accordingly, the Board must treat Dr. Thorne's conclusory statement as speculation that is inadequate to support admissibility of a contention. Conclusory statements cannot provide "sufficient" support for a contention, simply because they are proffered by an alleged expert. *See* USEC, Inc., CLI-06-10, 63 NRC at 472.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The Licensing Board also must dismiss this contention because it does not establish that a genuine dispute exists with DOE on a material issue of law or fact. For background, DOE estimates that the mean probability of igneous activity disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year. SAR at 2.3.11-21. This probability "was developed from the results of an expert elicitation that was completed in 1996." SAR at 2.3.11-9. This expert elicitation process was the basis for DOE's Probabilistic Volcanic Hazards Assessment (PVHA) which culminated in a publicly-available PVHA Report. SAR at 2.3.11-14 (referencing CRWMS M&O 1996 (LSN# DEN000861156)). The PVHA Report documents the judgments of the ten experts who

participated in the elicitation process on various aspects of the PVHA, including the volcanic/tectonic setting, event definition, region of interest, and event counts. PVHA Report, Appendix E (Elicitation Interview Summaries).

Nevada's entire argument relies on the assumption that DOE did not “consider deep melting models or the entire period of volcanism from 11 million years to the present.” Petition at 813. Nevada relies on its arguments provided in NEV-SAFETY-150 and 151. Petition at 815.

But DOE did consider deep melting models. PVHA Workshop 1 was conducted using an expert panel that identified 27 technical issues of interest to the experts (PVHA Report, Appendix C, Table 1 at C-4), including, *e.g.*, correlation of tectonic activity with recent or synchronous volcanism, structural control of spatial distribution of regional/local volcanic features, definition of “event,” and model for magma generation and migration. The event definition and magma generation and migration items included consideration of deep melting models. PVHA Report, Appendix E, at RC-1 to -3, BC-1 to -3, WD-1, RF-4, WH-1 to -2, MH-1 to -2, AM-1, and GT-1, 9. The PVHA experts requested and were provided information on basalt geochemistry, ages, and melt generation characteristics (PVHA Report, at 2-25), but DOE included no restrictions on the use of that information in the development of conceptual models of volcanism in the Yucca Mountain Region. PVHA Report, Appendix E, at RC-1 to -3, BC-1 to -3, WD-1, RF-4, WH-1 to -2, MH-1 to -2, AM-1, and GT-1, 9. This information is reflected in the definition of an igneous event developed by the experts in the PVHA, which was explicitly based on a mantle melting source for basalts in the Yucca Mountain Region: “In the context of the PVHA, a volcanic event is a spatially and temporally distinct batch of magma ascending from the mantle through the crust as a dike or system of dikes ([PVHA Report,] Appendix E).” BSC, *Characterize Framework for Igneous Activity at Yucca Mountain, Nevada*, ANL-MGR-

GS-000001 REV 02, at 1-2 (LSN: DN2001632124) (2004). In addition, various PVHA experts specifically discussed the asthenosphere as the possible source of basaltic magma in the Yucca Mountain Region. PVHA Report, Appendix E (example discussions in elicitation interviews), at MK-2 of 22 (elicitation interview of Dr. Mel A. Kuntz) and MS-2 of 22 (elicitation interview of Michael F. Sheridan). Therefore, the allegation that DOE's approach fails to consider deep melting models is not correct.

DOE also considered the period from 11 million years to the present. SAR § 2.3.11 demonstrates that this entire 11 million year period was considered:

- “Silicic volcanism was approximately synchronous with a period of major crustal extension or stretching, which occurred between 13 and 9 million years ago.” SAR at 2.3.11-15.
- “Around 11 million years ago, the character of volcanism changed from rhyolitic (silicic) to basaltic, and the volume of material erupted decreased dramatically compared to the final rhyolitic eruptions.” SAR at 2.3.11-16.
- “Silicic volcanism has not occurred in the region in the last 7 or 8 million years and, as a result, is not included as part of the igneous conceptual model.” SAR at 2.3.11-16.
- “Small-volume basaltic volcanism has continued into the Quaternary as part of the general decline in eruption volume over the past 11 million years in the Yucca Mountain region.” SAR at 2.3.11-16.
- “The observed record of basaltic volcanism in the Yucca Mountain region during the last 10 million years indicates that volcanic centers have been constructed of both effusive and pyroclastic deposits.” SAR at 2.3.11-18.

The supporting PVHA Report also confirms that the 11 million year record was not ignored. The expert hazard models developed for the PVHA considered the regional spatial and temporal patterns of igneous activity as a basis to describe event counts at various volcanic centers. *See* PVHA Report, Figures 3-3(a), 3-62 and 3-63. Figure 3-62 summarizes the experts' assessments for various spatial and temporal components of the PVHA model and shows that events as old as 11 Ma were considered in the PVHA. Generally, however, the experts assigned low weights to the significance of events older than about 5 Ma in the development of their hazard models (*e.g., id.*, Figure 3-3(a)), because most experts considered the post-5 Ma events as more relevant to the hazard model. *See id.*, and Appendix E (Elicitation Interview Summaries). Hence, the allegation that DOE did not consider the entire 11 million year span of basaltic volcanism near Yucca Mountain is not correct. Nevada's failure to understand the SAR or the PVHA does not raise a genuine dispute to litigate in this proceeding.

Because DOE considered deep melting models and the entire 11 million year span of basaltic volcanism near Yucca Mountain, there is no genuine dispute of material fact or law, and the contention must be rejected. *See Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (slip op. at 18, 29, 39-40, 42) (Sept. 12, 2008); *Texas Utilities Electric Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

**155. NEV-SAFETY-155 - 11-Million Year vs. 5-Million Year Volcanism Data**

DOE's approach to determining the frequency of future igneous events wrongly ignores the data set obtained from core, which along with surface data provides a record of volcanism back to 11 million years that requires consideration, and wrongly relies instead on the chemistry of surface basalt erupted over the past 5 million years. This approach obscures long-term trends and provides an inaccurate prediction of future events.

**RESPONSE**

Nevada alleges that DOE underestimates the probability of igneous activity disrupting a repository drift "likely by two or more orders of magnitude," Petition at 821, because DOE "ignores the data set obtained from core, which along with surface data provides a record of volcanism back to 11 million years that requires consideration, and [DOE] wrongly relies instead on the chemistry of surface basalt erupted over the past 5 million years." Petition at 818. As discussed below, Nevada's argument is not material, lacks appropriate expert support, and its reasoning is flawed because DOE considered the entire 11 million year record and did not rely on surface basalt chemistry.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 819. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges non-compliance with these regulations provisions and therefore raises a material issue." *Id.* But 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation to regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. §

63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the potential impacts to the repository from an igneous event is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. See 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative

analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

In Nevada's other igneous contentions, the last paragraph of the contention explains that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Petitioner has not attempted to determine what effect, if any, acceptance of their contention would have on doses. *See e.g.*, Petition at 793 (NEV-SAFETY-150), 798 (NEV-SAFETY-151), and 807 (NEV-SAFETY-152). We have explained in response to those contentions why such a statement is inadequate to demonstrate an issue material to the findings that the NRC must make. But NEV-SAFETY-155 does not even include this language in its last paragraph. All the more reason why this contention does not demonstrate a material issue under 10 C.F.R. § 2.309(f)(1)(iv).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because the contention does not reference any expert opinion. Nevada's Petition attaches one affidavit (Petition, Attachment 11 (Dr. Eugene Smith)), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavit simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Furthermore, Nevada makes an ultimate conclusion in paragraph 6 of the contention that is not even supported by Dr. Smith. It argues that if DOE had done what Nevada suggests, then the probability of igneous activity disrupting a repository drift would increase "likely by two or more orders of magnitude." Petition at 821. This statement only appears in paragraph 6 of the contention and is, therefore, not supported by any expert opinion.

Nevada provides no modeling results or evaluations, nor does it state that its experts performed any such evaluations. There is no evidence in the Petition or its attachments as to how Nevada arrived at this 2+ order of magnitude change in probability. Accordingly, the Board must treat this conclusory statement as speculation of counsel that is inadequate to support admissibility of a contention. Again, conclusory statements cannot provide "sufficient" support for a contention, even when proffered by an alleged expert. *See USEC, Inc. (American Centrifuge Plant)*, CLI-06-10, 63 NRC 451, 472 (2006).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The Licensing Board also must dismiss this contention because it does not establish that a genuine dispute exists with DOE on a material issue of law or fact. For background, DOE estimates that the mean annual frequency of a volcanic event disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year. SAR at 2.3.11-21. This probability "was developed from the results of an expert elicitation that was completed in 1996." SAR at 2.3.11-9. This expert elicitation process was the basis for DOE's Probabilistic Volcanic Hazards Assessment (PVHA) which culminated in a publicly-available PVHA Report. SAR 2.3.11-14 (referencing CRWMS M&O 1996 (LSN# DEN000861156)). The PVHA Report documents the judgments of the ten experts who participated in the elicitation process on various aspects of the PVHA, including the

volcanic/tectonic setting, event definition, region of interest, and event counts. PVHA Report, Appendix E (Elicitation Interview Summaries).

Nevada's entire argument relies on a few sentences in the SAR:

Major-element, trace-element and isotopic data were obtained from the buried basalt bodies and indicate that all are broadly basaltic in composition with typical SiO<sub>2</sub> contents of 42-50%. These geochemical results are consistent with geochemical analyses of basalt samples from surface exposures near Yucca Mountain (Perry and Bowker 1998).

Petition at 819-20 (quoting SAR at 2.3.11-17).

To refute these sentences in the SAR, Nevada cites to findings in a Research Report that its expert prepared in anticipation of this proceeding. *Id.* at 820 (citing and discussing "Report of Research Activities in 2007 Prepared to Satisfy the Requirements of a Clark County Contract for Volcanic Hazard Assessment of the Proposed Nuclear Waste Repository at Yucca Mountain, Nevada" (07/08/2008), LSN# CLK000000071 at 9-10) (hereafter in this contention response, Smith's Research Report). Nevada provides no other support for its argument.<sup>86</sup>

Nevada lists three alleged findings from Smith's Research Report to refute the SAR: (1) the chemistry in basalt from borings collected in Crater Flat and Amargosa Valley is quite different from the 1.0 million year old cinder cones in Crater Flat; (2) the range of SiO<sub>2</sub> is different between the core (43 to 52 wt. %) and Crater Flat (47-50 wt. %), and has lower light rare-earth element concentrations; and (3) three rock types were observed in the core that were not found at the surface. Petition at 820. Nevada concludes that "[h]ad DOE considered core data, which provides a record from the beginning of basalt volcanism 11 million years ago, [the Application], which indicate[s] that the probability of igneous activity disrupting a repository

---

<sup>86</sup> Nevada cites to Valentine, G.A. and Perry, F.V. (2007), "Tectonically Controlled, Time-Predictable Basaltic Volcanism from a Lithospheric Source" (02/07/2007), LSN# DN2002382703 at 1-22, but only to state why its findings are wrong. Petition at 820, 821.

drift is  $1.7 \times 10^{-8}$  events/year, would have had to be revised as [it] underestimate[s] that probability, likely by two or more orders of magnitude.” *Id.* at 821.

The arguments contained within Smith’s Research Report do not raise a genuine dispute of material fact or law for two reasons. First, the contention incorrectly asserts that DOE’s estimate of the annual frequency of intersection ignores data obtained from core and surface studies that provide a record of volcanism back to 11 million years ago. Nevada ignores the PVHA which is the primary input to DOE’s igneous evaluation. The igneous hazard estimate for Yucca Mountain is based on spatial and temporal patterns of volcanism as observed in the region. The record of volcanism in the region was used by the PVHA experts to describe the spatial and temporal patterns of volcanism, and the experts’ considered igneous activity that extended back 11 million years. *See e.g.*, PVHA Report, Figures 3-3(a), 3-62 and 3-63. Figure 3-62 shows that events as old as 11 million years were considered in the PVHA, but generally the experts assigned little weight to events older than about 5 million years in the development of their hazard models. *See e.g.*, Figure 3-3. However, the assignment of little weight by the experts cannot be correctly interpreted as ignoring the record of volcanism back 11 million years; so the contention has misstated the actual method used to develop the hazard estimate.

Second, the contention alleges that the DOE approach wrongly relied on the chemistry of surface basalt erupted over the past 5 million years, but does not explain how basalt chemistry relates to the development of the hazard estimate. The explanation offers tenuous ties between basalt chemistry and basalt ages, but ignores the fact that the basalts intersected by the most recent drilling are 10 million years or older. *See* Smith’s Research Report at 3, 10 and 17. As noted earlier in this response, basalts older than about 5 million years were considered, but given

little weight in the experts' hazard models. Therefore, Nevada has not demonstrated what effect these data would have had on the magnitude of the experts' hazard estimates.

In sum, DOE's igneous hazard estimate is based on the record of volcanism back to 11 million years. Hence, the allegations that DOE ignored the record of volcanism back to 11 million years and wrongly relied on the chemistry of surface basalt erupted over the past 5 million years are not correct. Accordingly, the Licensing Board cannot admit this contention, because it does not meet 10 C.F.R. § 2.309(f)(1)(vi).

**156. NEV-SAFETY-156 - Alternative Igneous Event Conceptual Models**

DOE's assessment of the frequency of igneous events does not consider appropriate alternative conceptual models that are consistent with available data and current scientific understanding, with the result that uncertainty is underestimated and not properly characterized.

**RESPONSE**

This contention is another attempt by Nevada to litigate its expert's controversial theory that the asthenosphere is the source of basaltic magma in the Yucca Mountain region.

Specifically, Nevada alleges that "DOE's assessment of the frequency of igneous events does not consider appropriate alternative conceptual models that are consistent with available data and current scientific understanding, with the result that uncertainty is underestimated and not properly characterized." Petition at 823. As discussed below, this issue is not material, lacks appropriate expert support, and it does not raise a genuine dispute of fact because DOE did consider alternative conceptual models that are consistent with available data and current scientific understanding.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada sets forth and describes a number of regulations. Petition at 823-24 (citing 10 C.F.R. §§ 63.31(a)(2) and (a)(3), 63.21(c)(9) and (c)(15), 63.102(h), 63.113, 63.114, and Subpart E). Nevada concludes its general description of these regulations with the mere assertion that "this contention alleges violations of these provisions and therefore raises a material issue within the scope of the licensing proceeding." *Id.* But 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation to regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2),

“because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the potential impacts to the repository from an igneous event is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. See 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide

even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

In many of Nevada's other igneous contentions, the last paragraph of the contention explains that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. *See e.g.*, Petition at 792 (NEV-SAFETY-150), 298 (NEV-SAFETY-151), and 806 (NEV-SAFETY-152). We have explained in response to those contentions why such a statement is inadequate to demonstrate an issue material to the findings that the NRC must make. But NEV-SAFETY-156 does not even include this language in its last paragraph. All the more reason why this contention does not demonstrate that Nevada has not met its burden under 10 C.F.R. § 2.309(f)(1)(iv).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

The contention does not reference any supporting expert opinion. However, one of the affidavits attached to the Petition states that the affiant "adopts" the discussion of the contention, but only for paragraph 5. Petition, Attachment 11, at 1 (Dr. Eugene Smith). As discussed in more detail in Section V.A.3 of this Answer, such an affidavit is not sufficient to satisfy the requirements of Section 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention asserts that "DOE's assessment of the frequency of igneous events does not consider appropriate alternative conceptual models that are consistent with available data and current scientific understanding, with the result that uncertainty is underestimated and not

properly characterized.” Petition at 823. The fundamental basis for this assertion is an allegation that DOE’s volcanic hazards assessment is based on an outdated PVHA, and that the PVHA experts based their results on the assumption of shallow melting to produce basaltic magma. *Id.* This assertion is incorrect—and therefore does not raise a genuine dispute of material fact—for three reasons: 1) the PVHA experts considered a wide range of alternative conceptual models, 2) neither DOE nor the PVHA experts assumed that shallow melting produces basaltic magma in the Yucca Mountain region, and 3) DOE evaluated data and conceptual models developed since the completion of the PVHA in 1996, and determined that they have no significant effect on the estimates of the mean annual frequency of igneous events, as discussed below.

**(1) Alternative Conceptual Models Were Considered in the PVHA**

For background, DOE estimates that the mean annual frequency of a volcanic event disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year. SAR at 2.3.11-21. This probability "was developed from the results of an expert elicitation that was completed in 1996." SAR at 2.3.11-9. This expert elicitation process was the basis for DOE's Probabilistic Volcanic Hazards Assessment (PVHA) which culminated in a publicly-available PVHA Report. SAR 2.3.11-14 (referencing CRWMS M&O 1996 (LSN# DEN000861156)). The PVHA Report documents the judgments of the ten experts who participated in the elicitation process on various aspects of the PVHA, including the volcanic/tectonic setting, event definition, region of interest, and event counts. PVHA Report, Appendix E (Elicitation Interview Summaries).

The PVHA was designed and conducted with the fundamental purpose of quantifying the annual frequency of intersection of a basaltic dike with the repository and to estimate the uncertainties associated with that hazard estimate. PVHA Report at 1-1. A key part of the

uncertainty quantification was the identification and evaluation by the experts of alternative conceptual models. For example, two workshops were devoted to the identification and discussion of alternative conceptual models: Workshop 2 on Alternative Hazard Models and Workshop 3 on Alternative Interpretations. PVHA Report, Section 2.1, at 2-20 to 2-21. At those workshops, researchers from the Center for Nuclear Waste Regulatory Analysis, State of Nevada, Los Alamos National Laboratory, US Geological Survey, and several universities discussed their alternative models for characterizing the future spatial and temporal distribution of volcanism. *Id.* at 1-8, 1-9, and 2-20. The PVHA was in essence an exercise in combining multiple alternative conceptual models into a single probability distribution for each expert and, in turn, a probability distribution across all ten experts that captured the uncertainty in the experts' conceptual models of the physical behavior of volcanism in the Yucca Mountain Region. BSC, *Characterize Framework for Igneous Activity at Yucca Mountain, Nevada*, ANL-MGR-GS-000001 REV 02, Section 6.3.1.6, at 6-16 (LSN: DN2001632124) (2004). Contributions of various conceptual models to the hazard results are given in the PVHA Report, Section 4.2, at 4-9 to 4-52.

Therefore, the claim that “DOE’s assessment of the frequency of igneous events does not consider appropriate alternative conceptual models that are consistent with available data and current scientific understanding, with the result that uncertainty is underestimated and not properly characterized” is not correct. If a petitioner alleges that the applicant omits information, but the allegedly missing information is indeed there, then the contention does not raise a genuine dispute. *See e.g. Florida Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 & 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990).

**(2) No Assumption of Shallow Melting Was Made by the PVHA Experts**

Nevada also states that:

The PVHA panel of experts based their results on the *assumption* of shallow melting to produce basaltic magma. Using this *assumption* results in an underestimate of the probability of repository disruption, and at the least, the alternative model whereby melting to produce basalt occurs in the asthenosphere should have been included in the total systems performance assessment.

Petition at 823 (emphasis added). An assumption is something that is taken for granted as true or a supposition arrived at without the benefit of due consideration or evaluation. *See generally* American Heritage Dictionary (2nd ed.). As used in the contention, the implication is that DOE (or the experts on the PVHA panel) began their assessments with a supposition of shallow melting and that this somehow eliminated their ability to consider alternative conceptual models, including the conceptual model that melting occurs in the asthenosphere.

But no such assumption was made by the PVHA experts nor was it imposed by DOE: consistent with an expert elicitation process, all experts were exposed through workshops and field trips to a wide range of technical viewpoints and alternative conceptual models. PVHA Report at 2-25 to -29. In making their technical evaluations, they were encouraged to act as evaluators and consider all viewpoints as well as their own experience in making their assessments and in quantifying their uncertainties. *Id.* at 2-10 to -12 (describing roles of the PVHA participants).

Petitioner also misreads the SAR, because the SAR does not state that DOE's PVHA experts assumed a lithospheric potential source of basaltic magma, thereby ignoring an asthenospheric source. Petition at 825. Rather, it states that the "PVHA experts *generally* view volcanism in the Yucca Mountain region as a regional-scale phenomenon resulting from melting

processes in the upper lithospheric mantle." SAR at 2.2-97. Indeed, there were some experts who specifically discussed the asthenosphere as the possible source of basaltic magma in the Yucca Mountain Region. *See* PVHA Report, Appendix E, at MK- 2 of 22 (discussion of "volcanic/tectonic setting" in the elicitation interview for Dr. Mel A. Kuntz) ("The low volumes of recent basaltic eruptions and the lack of recent rhyolitic volcanism may be due largely to the fact that both the upper asthenosphere and the entire lithosphere in the [Yucca Mountain] region have been drained of their low-temperature, partial-melting fractions by previous melting events, resulting in an asthenosphere and a lithosphere that are essentially non-fertile with respect to future melting events."); *id* at MS-2 of 22 (discussion of volcanic/tectonic setting in the elicitation interview for Dr. Michael F. Sheridan) ("The basic process leading to volcanism involves generation of a melt from a source zone within the asthenosphere or lower lithosphere and migration of the magma to the surface where it erupts."). Again, if a petitioner alleges that the applicant omits information, but the allegedly missing information is indeed there, then the contention does not raise a genuine dispute. *See e.g. Florida Power & Light Co. (Turkey Point Nuclear Generating Plant, Units 3 & 4)*, LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990).

**(3) Data and Conceptual Models Developed Since the Completion of the PVHA Have No Significant Effect on the Estimates of the Frequency of Igneous Events**

In the basis for the contention, Nevada also states that:

SAR Subsection 2.2.2.3 and related subsections indicate that the license application relies on the results of the 1996 report of [the PVHA] expert panel report released in 1996 as the basis for hazard assessment. Except for new work on the tectonics of the Crater Flat area and a brief mention of buried basalt, DOE has not updated the PVHA findings, but still bases its conclusions on this out-dated report."

Petition at 823. This statement ignores the information that is provided in the SAR that identifies and evaluates the information that has become available since the conclusion of the PVHA and the findings that this information confirms the conclusions of the PVHA.

Nevada is factually incorrect because DOE did consider post-1996 information. The evaluation of information developed after the completion of the PVHA is plainly identified in the SAR and supporting documents. For example:

- Following the completion of the PVHA in 1996, DOE identified and evaluated additional conceptual models for volcanism in the Yucca Mountain Region. BSC, *Characterize Framework for Igneous Activity at Yucca Mountain, Nevada*, ANL-MGR-GS-000001 REV 02, Table 6-4, at 6-16 to 6-17 (LSN: DN2001632124; DN2002077196; DEN001580092) (2004).
- Published estimates from 1982 to 2000 of the probability of a volcanic event intersecting the repository footprint are summarized in SAR Table 2.3.11-4 (SAR at 2.3.11-96). As evident from that Table, the estimates, including the mean intersection probability estimated in the PVHA, “cluster at slightly greater than  $10^{-8}$  per year, providing confidence that the PVHA probability estimate is robust.” SAR at 2.3.11-24.
- In addition, DOE evaluated the potential significance of aeromagnetic data gathered after the PVHA was completed for its potential significance to the hazard estimate. SAR at 2.3.11-25. The SAR identifies three separate sensitivity studies, completed following the PVHA, which included evaluations of the sensitivity of the intersection probability to the presence of postulated buried volcanoes. *Id.* Even if all aeromagnetic anomalies identified in a 1999 aeromagnetic survey and beneath Crater Flat, Jackass Flats, and northern Amargosa Desert were assumed to be buried basalts of Pliocene and younger

age, the SAR concludes that the hazard estimate would be  $2.2 \times 10^{-8}$ . *Id.* Each of the sensitivity studies described in SAR Section 2.3.11.2.2.6 shows that effects of information developed following completion of the PVHA are similarly insignificant.

Finally, an update to the PVHA (PVHA-U) was performed. The PVHA-U was conducted using a panel of eight experts, whose evaluations included data that had become available since the conclusion of the PVHA, including high-resolution aeromagnetic data, drilling, geochemical, and geochronological analyses conducted specifically to support the PVHA-U. "Probabilistic Volcanic Hazard Analysis Update (PVHA-U) for Yucca Mountain, Nevada Rev. 01" (09/02/2008) (LSN# DEN001601965) (cited in Petition at 833). As summarized in DOE's letter to NRC dated October 17, 2008:

The differences between the PVHA-96 and PVHA-U distributions would not significantly affect the estimates of repository performance for either 10,000 years or 1,000,000 years, demonstrating that the PVHA-U results are confirmatory of the PVHA-96 technical basis. As a result, the volcanic hazard results presented in the License Application (LA) are robust and suitable for evaluating the expected performance of the repository, and no change to the technical basis presented in the LA is necessary.

Boyle, W.J., "Transmittal of Report: [PVHA-U] for Yucca Mountain, Nevada, to NRC (Oct. 17, 2008) (LSN# DEN001606520). Nevada is simply incorrect that DOE ignored post-1996 information.

Nevada's allegation that DOE did not consider alternative conceptual models is not correct. Because Nevada has failed to controvert a position taken by the applicant, the contention must be dismissed. *See Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_\_ (slip op. at 18, 29, 39-40, 42) (Sept. 12, 2008); *Texas Utilities Electric Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

**157. NEV-SAFETY-157 - Igneous Event Data In The TSPA**

DOE's assessment of the frequency of igneous events in the LA ignores information and analyses since 1996 which would, if considered, have required a significant change in the total systems performance assessment, and as a result, the LA is not complete and accurate in all material respects.

**RESPONSE**

This contention appears to raise two separate issues. First, Nevada alleges that DOE has not submitted an application that is complete and accurate, in violation of 10 C.F.R. §§ 63.10 and 63.21(a), because "the LA ignores information and analyses [generated] since 1996." Petition at 831. Nevada separately claims that, if these information and analyses had been considered, it would "have required a significant change in the [TSPA]." *Id.* As discussed below, these issues are not material, lack appropriate expert support, and/or fail to raise a genuine dispute of material fact because DOE did consider post-1996 information.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada's challenge that the Application violates 10 C.F.R. § 63.10 is not material. Section 63.10 requires that "[i]nformation provided to the Commission by an applicant for a license . . . must be complete and accurate in all material respects." This is not one of the standards for which the NRC must make a positive finding before issuing construction authorization. 10 C.F.R. § 63.41. Moreover, the NRC Staff need not, and never has, made a finding of completeness and accuracy as part of its licensing review. Rather, whether an applicant has been complete and accurate is purely a matter for NRC's inspection and enforcement process, which is a matter entirely reserved and committed to agency discretion. *See generally Bellotti v. NRC*, 725 F.2d 1380, 1382 (D.C. Cir. 1983) (affirming NRC's rejection of Massachusetts Attorney General's Petition to Intervene which sought to impose a greater sanction against a licensee than NRC sought to impose through enforcement). Neither the Board nor a petitioner can require the Staff to take enforcement action. Therefore, Nevada's allegation does not raise a material issue.

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies only two regulations: 10 C.F.R. §§ 63.10 and 63.21(a). Petition at 831. Nevada concludes its general description of these regulations with the mere assertion that "this contention alleges violations of these provisions." *Id.* at 832. But 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . .," not merely a citation to regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7.), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the potential impacts to the repository from an igneous event is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a "reasonable expectation": (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and

reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. See 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not "make a difference in the outcome of the licensing proceeding." *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

In Nevada's other igneous contentions, the last paragraph of the contention explains that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Petitioner has not attempted to determine what effect, if any, acceptance of their contention would have on doses. *See e.g.*, Petition at 792 (NEV-SAFETY-150), 798 (NEV-SAFETY-151), and 806 (NEV-SAFETY-152). We have explained in response to those contentions why such a statement is inadequate to demonstrate an issue material to the findings that the NRC must make. But NEV-SAFETY-157 does not even include this language in its last paragraph. All the more reason why this contention does not demonstrate that Petitioner has not met its burden under 10 C.F.R. § 2.309(f)(1)(iv).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because the contention does not reference any expert opinion. Nevada's Petition attaches one affidavit (Petition, Attachment 11 (Dr. Eugene Smith)), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavit simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada concludes that "[o]mission of all this work results in an underestimate of the probability of repository disruption and of the related uncertainties, which in turn leads to an erroneous total systems performance assessment." Petition at 833. Nevada provides no support for this conclusion. Nevada provides no modeling results or evaluations, nor does it state that its experts performed any such evaluations. There is no evidence in the Petition or its attachments as to how Nevada arrived at this conclusion. Accordingly, the Board must treat this conclusory statement as speculation that is inadequate to support admissibility of a contention. Conclusory statements cannot provide "sufficient" support for a contention, even when proffered by an alleged expert. *See USEC, CLI-06-10, 63 NRC at 472.*

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

DOE demonstrates why neither of the two claims raised in this contention raise a genuine dispute on a material issue of law or fact.

**(1) No Genuine Dispute about complying with 10 C.F.R. §§ 63.10 or 63.21(a).**

As clearly set forth in 10 C.F.R. § 2.209(f)(1)(vi), Nevada—as the Petitioner—has the burden to demonstrate how its contention raises a genuine dispute. Nevada first relies upon Section 63.10, which requires that “[i]nformation provided to the Commission by an applicant for a license . . . must be complete and accurate in all material respects,” and 10 C.F.R. § 63.21(a), which states that the “application must be as complete as possible in the light of information that is reasonably available at the time of docketing.” To support its claim that the Application is not complete and accurate, Nevada states that “[s]ince 1996, DOE, NRC, the State of Nevada and Clark County have done *much work that is pertinent* to volcanic hazard analysis at Yucca Mountain but is not considered in the license application.” Petition at 832 (emphasis added). To support this statement, in turn, Nevada lists 13 LSN documents. Petition at 832-33.

But merely listing 13 documents that might be “pertinent” is clearly insufficient to demonstrate that the Application violates 10 C.F.R. § 63.10. Nevada provides the list of the 13 documents, without citations to specific pages, and without any further explanation. And Nevada makes no attempt to explain the materiality of the post-1996 references it cites.<sup>87</sup> Even assuming that “much work” has been done in this scientific area, and that this work is “pertinent to volcanic hazards analysis at Yucca Mountain,” these statements, without further explanation, in no way create a genuine dispute that the information in the Application is not complete and accurate in all material respects (Section 63.10), or that the application was not complete as

---

87 Nevada does provide a brief explanation for one of the LSN documents—the update to DOE’s PVHA (known as the PVHA-U). Petition at 833. But that explanation suggests that including the PVHA-U would not change DOE’s analyses in a material way, contrary to what would need to be shown for a violation of Section 63.10 (“must be complete and accurate in all material respects”). *Id.* (“Despite the possibility that changes in hazard assessment models and calculations [in the PVHA-U] are modest, it is critical that this report be included in the license application”).

possible in the light of information that was reasonably available at the time of docketing (Section 63.21(a)).

**(2) No genuine dispute regarding considering the new information and analyses.**

The contention also states that “DOE’s assessment of the frequency of igneous events in the LA ignores information and analyses since 1996 which would, if considered, have required a significant change in the [TSPA].” Petition at 831. Nevada cites 13 LSN documents and then alleges that “[o]mission” of the studies contained in these documents “results in an underestimate of the probability of repository disruption and of the related uncertainties, which in turn leads to an erroneous [TSPA].” Petition at 833.

The Licensing Board also must dismiss this contention because these statements ignore the Application and supporting documents that identify and evaluate information that has become available since the conclusion of the PVHA, and DOE’s finding that this information confirms the conclusions of the PVHA. For background, DOE estimates that the probability of igneous activity disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year. SAR at 2.3.11-21. This probability "was developed from the results of an expert elicitation that was completed in 1996." SAR at 2.3.11-9. This expert elicitation process was the basis for DOE's Probabilistic Volcanic Hazards Assessment (PVHA) which culminated in a publicly-available PVHA Report. SAR at 2.3.11-14 (referencing CRWMS M&O 1996 (LSN# DEN000861156)). The PVHA Report documents the judgments of the ten experts who participated in the elicitation process on various aspects of the PVHA, including the volcanic/tectonic setting, event definition, region of interest, and event counts. PVHA Report, Appendix E (Elicitation Interview Summaries).

First, Nevada points to no legal requirement—other than Sections 63.10 and 63.21(a)—that DOE must mention or incorporate the results of studies performed, and papers published,

after issuance of the PVHA in 1996. As demonstrated above, there is no genuine dispute to be litigated in this proceeding that the information in the Application is not complete and accurate in all material respects (Section 63.10), or that the application was not complete as possible in the light of information that was reasonably available at the time of docketing (Section 63.21(a)). And there are, in fact, no regulations requiring DOE to mention or incorporate the results of those studies.

Second, although Nevada alleges that there is new information and analyses that have been developed or published since 1996 that DOE did not consider, Nevada is factually incorrect because DOE did consider post-1996 information and analyses. The evaluation of information and analyses developed after the completion of the PVHA is plainly identified in the SAR and supporting documents. For example:

- Following the completion of the PVHA in 1996, DOE identified and evaluated additional conceptual models for volcanism in the Yucca Mountain Region. BSC, “Characterize Framework for Igneous Activity at Yucca Mountain, Nevada,” ANL-MGR-GS-000001 REV 02, Table 6-4, at 6-16 to 6-17 (LSN: DN2001632124; DN2002077196; DEN001580092) (2004).
- Published estimates from 1982 to 2000 of the probability of a volcanic event intersecting the repository footprint are summarized in SAR Table 2.3.11-4 (SAR at 2.3.11-96). As evident from that Table, the estimates, including the mean intersection probability estimated in the PVHA, “cluster at slightly greater than  $10^{-8}$  per year, providing confidence that the PVHA probability estimate is robust.” SAR at 2.3.11-24.
- In addition, DOE evaluated the potential significance of aeromagnetic data gathered after the PVHA was completed for its potential significance to the hazard estimate. SAR at

2.3.11-25. The SAR identifies three separate sensitivity studies, completed following the PVHA, which included evaluations of the sensitivity of the intersection probability to the presence of postulated buried volcanoes. *Id.* Even if all aeromagnetic anomalies identified in a 1999 aeromagnetic survey and beneath Crater Flat, Jackass Flats, and northern Amargosa Desert were assumed to be buried basalts of Pliocene and younger age, the SAR concludes that the hazard estimate would be  $2.2 \times 10^{-8}$ . *Id.* Each of the sensitivity studies described in SAR Section 2.3.11.2.2.6 shows that effects of information developed following completion of the PVHA are similarly insignificant.

Finally, the PVHA-U was conducted using a panel of eight experts, whose evaluations included data that had become available since the conclusion of the PVHA, including high-resolution aeromagnetic data, drilling, geochemical, and geochronological analyses conducted specifically to support the PVHA-U. "Probabilistic Volcanic Hazard Analysis Update (PVHA-U) for Yucca Mountain, Nevada Rev. 01" (09/02/2008), (LSN# DEN001601965) (cited in Petition at 833). As summarized in DOE's letter to NRC dated October 17, 2008:

The differences between the PVHA-96 and PVHA-U distributions would not significantly affect the estimates of repository performance for either 10,000 years or 1,000,000 years, demonstrating that the PVHA-U results are confirmatory of the PVHA-96 technical basis. As a result, the volcanic hazard results presented in the License Application (LA) are robust and suitable for evaluating the expected performance of the repository, and no change to the technical basis presented in the LA is necessary.

Letter from W. Boyle (DOE) to NRC, "Transmittal of Report: Probabilistic Volcanic Hazard Analysis Update (PVHA-U) for Yucca Mountain, Nevada" (October 17, 2008) (LSN# DEN001606520). Thus, Nevada is simply incorrect that DOE ignored post-1996 information and analyses.

In sum, Nevada has failed to demonstrate that DOE violated Sections 63.10 and 63.21(a), as alleged. Nevada has also failed to demonstrate that the information and analyses generated after the PVHA was completed in 1996 would result in a significant change in the TSPA, and that even if there was a significant change, that it would result in an exceedance of the repository performance standards. Because Nevada has failed to controvert a position taken by the applicant in the Application, the contention must be dismissed. *See Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_ (slip op. at 18, 29, 39-40, 42) (Sept. 12, 2008); *Texas Utilities Electric Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

### **158. NEV-SAFETY-158 - Geophysical Data In Doe's Volcanic Model**

High-quality geophysical data is necessary to answer the fundamental question as to whether volcanoes are primarily controlled by upper crustal structure or mantle. DOE's approach to predicting the location and frequency of future eruptions, as reflected in SAR Subsection 2.2.2.2.3.1 and related subsections, relies heavily on upper crustal structures and the local stress field, but does not provide sufficient geophysical data to support this model. This is inadequate because high-quality geophysical data are necessary to confirm or rule out the proposition, supported by the currently available data, that the primary control of the location of a basaltic field near Yucca Mountain is asthenospheric mantle processes.

#### **RESPONSE**

This contention is another attempt by Nevada to litigate its expert's controversial theory that the asthenosphere is the source of basaltic magma in the Yucca Mountain region. Specifically, Nevada alleges that the Application is "inadequate" because it "does not provide sufficient geophysical data" to support DOE's alleged position about the origin of volcanic events. Petition at 835. Even more specifically, Nevada alleges that DOE was required to generate "high-quality geophysical data" to "confirm or rule out" Nevada's theory "that the primary control of the location of a basaltic field near Yucca Mountain is asthenospheric mantle processes." *Id.* As discussed below, this issue is not material, lacks appropriate expert support, and fails to raise a genuine dispute of material fact because DOE did consider high-quality geophysical data.

#### **a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada sets forth and describes a number of regulations. Petition at 836 (citing 10 C.F.R. §§ 63.31(a)(2) and (a)(3), 63.21(c)(9) and (c)(15), 63.113, 63.114, and Subpart E). Nevada concludes its general description of these regulations with the mere assertion that "this contention alleges [violations of] these . . . provisions and therefore raises a material issue within the scope of the licensing proceeding." *Id.* But 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . .," not merely a citation to regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, (Oconee Nuclear Station), CLI-99-11, 49 NRC at 328, 333 (1999).

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (*U.S. Department of Energy* (High-Level Waste Repository: Pre-Application Matters Advisory PAPO Board), LBP-08-10, 67 NRC \_\_\_ (slip op. at 7) (June 20, 2008) (Case Management Order)), this direction cannot be read to dispense with

the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the Case Management Order focused exclusively on "format" and "procedural matters." *Id.* at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the potential impacts to the repository from an igneous event is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a "reasonable expectation": (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

However, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. See 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not "make a difference in the outcome of the licensing proceeding." *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

In many of Nevada's other igneous contentions, the last paragraph of the contention explains that, because of the "burden and complexity of showing the dose effects of acceptance of Nevada's contentions," Nevada has not attempted to determine what effect, if any, acceptance of their contention would have on doses. See *e.g.*, Petition at 792 (NEV-SAFETY-150), 798 (NEV-SAFETY-151), and 806 (NEV-SAFETY-152). We have explained in response to those contentions why such a statement is inadequate to demonstrate an issue material to the findings that the NRC must make. But NEV-SAFETY-158 does not even include this language in its last paragraph. All the more reason why this contention does not demonstrate that Nevada has not met its burden under 10 C.F.R. § 2.309(f)(1)(iv).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because the contention does not reference any expert opinion. Nevada's Petition attaches one affidavit (Petition, Attachment 11 (Dr. Eugene Smith)), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavit simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention does not raise a genuine dispute because Nevada misreads the SAR and its supporting documents.

For background, DOE estimates that the mean probability of igneous activity disrupting a repository drift is  $1.7 \times 10^{-8}$  events/year. SAR at 2.3.11-21. This probability "was developed from the results of an expert elicitation that was completed in 1996." SAR at 2.3.11-9. This expert elicitation process was the basis for DOE's Probabilistic Volcanic Hazards Assessment (PVHA) which culminated in a publicly-available PVHA Report. SAR at 2.3.11-14 (referencing CRWMS M&O 1996 (LSN# DEN000861156)). The PVHA Report documents the judgments of the ten experts who participated in the elicitation process on various aspects of the PVHA, including the volcanic/tectonic setting, event definition, region of interest, and event counts. PVHA Report, Appendix E (Elicitation Interview Summaries).

### (1) Use of Geophysical Data in the Igneous Hazard Assessment

Although the contention asserts that “the fundamental question as to whether volcanoes are primarily controlled by upper crustal structure or mantle” must be addressed with high-quality geophysical data (Petition at 835), no clear definition is given for what “high-quality” geophysical data is, nor is a connection made between these data and the associated implications to the PVHA that might result, and the associated implications to the TSPA. Nor does Nevada explain where in the regulations DOE is required to generate “high-quality geophysical data” to “confirm or rule out” Nevada’s controversial theory<sup>88</sup> “that the primary control of the location of a basaltic field near Yucca Mountain is asthenospheric mantle.” Petition at 835. These flaws in Nevada’s argument fail to create a genuine dispute.

Also, Nevada states that “Without geophysical data to determine the subsurface geometry of faults, the thickness and geometry of the crust and lithospheric mantle, and the identification of low velocity zones (hot areas) in the crust and mantle, conclusions that relate volcano location to upper crustal structure and the local stress state are not supportable.” Petition at 837. The implication is that the PVHA experts were not provided with, and/or did not consider, high-quality geophysical data. This is not true. A simple review of the list of references distributed to the PVHA expert panel members indicates the following types of geophysical data were provided to the experts can specifically be used for the purposes alleged by Nevada:

- Paleomagnetic data
- Seismic tomography
- Teleseismic tomography
- Ground magnetic

---

88 Clark County’s expert acknowledges that his own interpretation is controversial: “We realize that our observations and conclusions are controversial and anticipate that many questions will be asked about both temporal and mantle melting models.” Smith, E.I., Keenan, D.L., and Plank, T., 2002, *Episodic Volcanism and Hot Mantle: Implications for Volcanic Hazard Studies at the Proposed Nuclear Waste Repository at Yucca Mountain, Nevada*: GSA Today, v. 12, no. 4, at 7.”

- Geochronologic data
- Seismic reflection profiles
- Bouguer gravity map
- Total intensity gravity
- Aeromagnetic data
- Isostatic gravity map

PVHA Report, Appendix B, at B-1 – B-7. This list indicates that the expert panel was provided with a significant quantity of geophysical data and these data were evaluated, along with other types of data such as geologic and geochemical data, to develop their interpretations for the PVHA.

## (2) No Reliance on Assumptions

Nevada also states that “DOE relies heavily on an *assumption* of control exerted by upper crustal structures and the local stress field to predict the location of future eruptions.” Petition at 837 (referencing SAR at 2.2-97) (emphasis added). An assumption is something that is taken for granted as true or a supposition arrived at without the benefit of due consideration or evaluation. *See generally* American Heritage Dictionary (2nd ed.). Nevada implies that DOE (or the experts on the PVHA panel) began their assessments with a supposition of upper crustal structures and the local stress field controlling the location of future eruptions.

But no such assumption was made by the PVHA experts nor was it imposed by DOE: consistent with an expert elicitation process, all experts were exposed through workshops and field trips to a wide range of technical viewpoints and alternative conceptual models. PVHA Report at 2-25 to -29. In making their technical evaluations, they were encouraged to act as evaluators and consider all viewpoints as well as their own experience in making their assessments and in quantifying their uncertainties. *Id.* at 2-10 to -12 (describing roles of the PVHA participants).

Because Nevada does not contest DOE's analysis and has failed to controvert a position taken by the applicant in the Application, the contention must be dismissed. *See Tenn. Valley Auth.* (Bellefonte Nuclear Power Plants Units 3 and 4), LBP-08-16, 68 NRC \_\_\_ (slip op. at 18, 29, 39-40, 42), (Sept. 12, 2008); *Texas Utilities Electric Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

**159. NEV-SAFETY-159 - Propagation of Conceptual And Parametric Uncertainties Through the Safety Assessment**

SAR Subsection 2.4.1.1 and similar subsections, which claim that the TSPA approach combines the underlying model abstractions in such a way that it incorporates the estimated ranges of uncertainty in the parameter distributions, model abstractions, and disruptive events and then propagates this uncertainty into estimates of the annual dose, fail to propagate a full range of uncertainties and doing so would require the performance of a substantial number of additional modeling cases.”

**RESPONSE**

This contention asserts that the TSPA, as described in “SAR Subsection 2.4.1.1 and similar subsections,” fail to propagate a full range of uncertainties through the analysis and, therefore, do not meet the requirements of 10 C.F.R. §§ 63.114(b) and (c). Petition at 845.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Nevada asserts that “a full appreciation of the potential overall bias in [DOE’s] assessment can only be achieved by propagating the alternatives separately through the assessment and determining their overall effect on the compliance results set out in 10 C.F.R. § 63.303.” Nevada Pet. at 847. In other words, Nevada is claiming that in order to satisfy the requirements of 10 C.F.R. §§ 63.114(b) and (c), DOE was required to quantitatively include

alternative conceptual models and uncertainties in those models in the estimates of repository performance. To that extent, the contention represents an impermissible collateral attack on NRC regulation §§ 63.114 (c) which requires only that DOE consider and evaluate the effects of those models on performance. It is well settled that, absent a waiver, “no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding.” 10 C.F.R. § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission’s regulations. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff’d*, CLI-01-17, 54 NRC 3 (2001).

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7.), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would

make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in the contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a "reasonable expectation": (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

In making its "reasonable expectation" determination, the NRC must evaluate DOE's compliance with the applicable provisions of Part 63, including, among other things, whether DOE has described the proposed geologic repository as specified in § 63.21, and whether the site

and design comply with the Part 63 performance objectives and requirements. Proposed safety contentions that fail to raise issues that are material to these findings are inadmissible. Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. As stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded.

Instead, Nevada merely asserts that by using what Nevada considers to be a small number of scenario classes and taking only limited account of alternative ways of partitioning the calculations, selecting alternative models or selecting parameter value distributions, DOE has limited “the range of uncertainty included in the results of the performance assessment.” Petition at 845. Nevada’s contention asserts no link whatsoever between the claimed lack of required detail in the SAR and an issue that is material to a finding the NRC must make.

Nevada asserts that the applicable regulations require that DOE’s TSPA should have considered a broader range of modeling and parameter alternatives in order to comply with the regulatory requirements for accounting for uncertainties and variabilities and for alternative conceptual models. Petition at 846. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository.

Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach one affidavit (Michael C. Thorne), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in this contention, the affidavit simply "adopts" Paragraph 5 of the otherwise unsupported assertions made in the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed above, DOE has already demonstrated that Nevada's claims are outside the scope of the proceeding and are also not material. Accordingly, Nevada's claims also do not raise a genuine dispute of material fact or law. But the contention also contains other arguments which, as DOE demonstrates below, also do not raise a genuine dispute.

Nevada asserts that the applicable regulations require that DOE's TSPA must propagate a full range of uncertainties into estimates of the annual dose through alternative scenarios, alternative partitioning of the scenarios into modeling cases, alternative choices of model

abstractions, and alternative parameter value distributions. Petition at 846. For the reasons discussed below, these arguments do not raise a genuine dispute of material fact or law and must be dismissed.

First, although this contention asserts that DOE should have considered “alternative possibilities” for scenario identification and steps in the modeling process, the contention does not allege that doing so would have produced results that are significantly different than the results of the TSPA. In fact, the strongest statement that Nevada makes about the impact of its allegations is that “the range of uncertainty in the assessment is *reduced*.” Petition at 846 (emphasis added). As discussed in Section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches, without specifying the ramifications or results of such alleged deficiencies, fail to raise a genuine dispute of material fact.

Second, Nevada’s assertion that “alternative possibilities” exist for the identification of scenarios and steps in the modeling process is a general statement that is so broad as to be virtually meaningless. *Id.* at 846. Nevada does not provide any indication as to which specific scenarios should have been identified, nor do its counsel’s unsupported musings about theoretical alternatives to elements of the TSPA modeling process establish the existence of a genuine dispute of material fact.

Third, in its assertion that DOE should have considered “alternative possibilities for the identification of scenarios,” Nevada fails to directly controvert DOE’s process for identifying and screening scenarios. *See Tex. Utils. Electric Co. (Comanche Peak Steam Electric Station, Unit 2)*, LBP-92-37, 36 NRC 370, 384 (1992). The contention does not address DOE’s FEP identification and screening process or provide any indication that Nevada’s assertion about “alternative possibilities” for the scenarios is anything more than a vague, undeveloped concept

which Nevada cannot yet articulate or describe in sufficient specificity to raise a genuine dispute of material fact.

Similarly, with respect to each of the other claims by Nevada that DOE has taken “limited account” of alternative ways of partitioning the calculations, selecting alternative models, or selecting parameter distributions, Nevada has presented only vague, unsupported theories and has failed to directly controvert DOE’s position as presented in the SAR. A brief summary of the SAR descriptions of each of the claims follows:

- With regard to the partitioning of scenarios into modeling cases, included FEPs are grouped into scenario classes (SAR § 2.2.1.4), which are further partitioned into modeling cases to enable quantitative evaluation (SAR § 2.4.1.2). DOE considered combinations of modeling cases (SAR § 2.4.1.7), and demonstrated that the results are a conservative overestimate of consequences from the repository system. For each modeling case, DOE also considered a wide range of future conditions (SAR Table 2.4-5). Thus, DOE considered the effects on performance assessment of the partitioning of scenario classes into modeling cases and of the variability inherent in each modeling case.
- With regard to alternate model abstractions, conceptual and numerical models for the included FEPs (SAR Table 2.2-5) are developed that describe the evolution of the repository system. In model development, DOE considered alternative conceptual models and evaluated the effects of alternative conceptual models on the performance of the repository system. Alternative conceptual model details and the results of DOE’s evaluation of each model are provided in the subsection of the SAR applicable to each model topic, and the details of the corresponding evaluations are in the referenced

analysis/model reports (AMRs) referenced in each SAR section. Thus, DOE considered alternate model abstractions in the TSPA.

- With regard to parameter value distributions, categories of epistemic uncertain parameters in the TSPA are listed in SAR Table 2.4-6. The selection of a probability distribution for each epistemic uncertain parameter is guided by the principle of maximum entropy. See “Total System Performance Assessment Model/Analysis for the License Application”, LSN# DEN001579005, at ES-33 and “Guidelines for Developing and Documenting Alternative Conceptual Models, Model Abstractions, and Parameter Uncertainty in the Total System Performance Assessment for the License Application”, LSN# DN2002011095 at 45. Because the selected distribution represents the broadest range of uncertainty in the parameter consistent with available information, DOE determined that no sensitivity studies on distribution shapes were appropriate.

Nevada has failed to directly controvert DOE’s position in each of the above areas, and therefore, the contention is subject to dismissal. See *Tex. Utils. Electric Co. (Comanche Peak Steam Electric Station, Unit 2)*, LBP-92-37, 36 NRC 370, 384 (1992).

Fourth, although the contention fails to directly controvert any of DOE’s documented positions on its treatment of uncertainties in its TSPA and makes only the most general statements about the theoretical possibilities that might be available to further evaluate uncertainties, Nevada attempts to cure these defects by citing to “other contentions.” Petition at 847. Apparently, Nevada is pointing the Board to the balance of its 228 contentions to ferret out more specific assertions of “these various conceptual uncertainties...that have not been addressed by DOE.” *Id.* at 847. This attempt to sweep into this contention unspecified material

from the balance of its petition in order to bootstrap its otherwise unsupported and overly general assertions into a litigable contention must necessarily fail. *See* Section V.A.3 above.

Fifth, even if Nevada's general theories about uncertainty analysis could be construed to be an argument for use of alternative models and codes, its contention still fails to meet admissibility standards. Although it would have been permissible for DOE to use alternative codes to satisfy 10 C.F.R. § 63.114(b) and (c), those regulations do not require DOE to do so. Instead, DOE assessed alternative conceptual models and considered and accounted for uncertainties as summarized above. As stated by the licensing board in *Duke Energy Corp.* (McGuire Nuclear Station, Units 1 and 2; Catawba Nuclear Station Units 1 and 2), LBP-03-017, 58 NRC 221, 240 (2003):

The Board views this proposed contention or subpart as an attempt to challenge the use by Duke of various models used in its calculation of accident consequences. But the Intervenors have made no showing either that the models used by Duke are defective or incorrect for the purpose used or that those models were used incorrectly by Duke. Nor have the Intervenors demonstrated that the models they are recommending are superior in any way to those employed by Duke. The Intervenors merely point out that, by using their models in the manner they are recommending, a different result would be achieved. That is an insufficient basis to formulate a valid contention.

Finally, paragraph 6 of the contention, in addition to not having been "adopted" by any of Nevada's experts, essentially admits that Nevada does not know whether this contention is material. That paragraph indicates that "Implementation of this strategy would require the performance of a substantial number of additional modeling cases." Petition at 848. Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel

Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises an issue that is material to this proceeding. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

**160. NEV-SAFETY-160 - Probability Density Functions Used In The TSPA**

SAR Subsection 2.4 and similar subsections, which describe and rely upon results from the TSPA, fail to recognize that the probability density functions used in the modeling rely on arbitrary and implicit assumptions, and hence do not fully account for uncertainties and variabilities in parameter values and do not provide for the technical basis for parameter ranges, probability distributions, or bounding values used in the performance assessment.

**RESPONSE**

This contention asserts that the TSPA, as described in “SAR Section 2.4 and similar subsections,” uses probability density functions that are not justified or well constrained by the available information, and that DOE should have performed sensitivity studies of the TSPA to the shapes chosen for the probability density functions. Petition at 849.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. Nevada concludes this

general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in the contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

In making its “reasonable expectation” determination, the NRC must evaluate DOE’s compliance with the applicable provisions of Part 63, including, among other things, whether DOE has described the proposed geologic repository as specified in § 63.21, and whether the site and design comply with the Part 63 performance objectives and requirements. Proposed safety contentions that fail to raise issues that are material to these findings are inadmissible. For example, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. As stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Nevada asserts that the applicable regulations require that DOE justify the shapes of the probability density functions used in the TSPA, ensure that each selected distribution was constrained by the available information, and systematically explore the sensitivity of the model to the selected shapes. Petition at 853. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding. Petition at 849-50.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention contains unsupported assertions of counsel; and (2) the contention does not reference any expert opinion. Nevada's Petition does attach one affidavit (Michael C. Thorne), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in this contention, the affidavit simply "adopts" Paragraphs 5 and 6 of the otherwise unsupported assertions made in the contention. That approach falls far short of the requirement in 10 C.F.R. § 2.309(f)(1)(v) to provide conclusions supported by reasoned bases or explanation.

The only document the contention does reference other than the SAR and its references is a 350 page compilation of screenshots from the TSPA model (LSN# NEV000005505), but it makes no attempt to point the Board to the specific portions of the document on which it relies. As discussed in Section V.A.3 above, vague references to voluminous documents of this nature

are not permissible. Therefore, the contention is not supported by adequate factual information or expert opinion under 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed above, DOE has already demonstrated that Nevada's claims are not material. Accordingly, Nevada's claims also do not raise a genuine dispute of material fact or law. But the contention also contains other arguments which, as DOE demonstrates below, also do not raise a genuine dispute.

In particular, Nevada asserts that the probability density functions used in the TSPA modeling are based on arbitrary and implicit assumptions. Therefore, it asserts that the selected probability density functions do not fully account for uncertainties and variabilities in parameter values. Petition at 849. For the reasons discussed below, these arguments do not raise a genuine dispute of material fact or law and must be dismissed.

First, although this contention asserts that DOE should have better justified the shapes of the probability density functions, chosen distribution shapes less arbitrarily, and explored the sensitivity of the model to the chosen shapes, the contention does not allege that doing so would have produced results that are significantly different than the results of the TSPA. In fact, the strongest statements that Nevada makes about the impact of its allegations are that "a significant source of uncertainty in the assessment has not been quantified or reported," Petition at 849, and "the results of the assessment are *likely* to be biased." Petition at 854 (emphasis added).

In addition in alleging that DOE's justification of shapes of probability density functions does not adequately consider uncertainties, Nevada fails to identify alternatives that Nevada believes would more accurately characterize the properties. Accordingly, it is impossible to assess what effect, if at all, Nevada's claims would have on radiological dose results.

Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990). Furthermore, as stated above in Section d, because 10 C.F.R. Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses and to report those doses as mean doses, contentions failing to allege an increase in the mean dose above regulatory limits are inadmissible. Thus, as discussed in Section V.A.3 above, contentions, such as this, that allege errors, omissions, uncertainties or alternative approaches, without specifying the ramifications or results of such alleged deficiencies, fail to raise a genuine dispute of material fact.

Second, in its assertion that DOE does not justify the shapes of the probability density functions used in the TSPA, Nevada asserts that “the justification for selecting one distribution shape over another is not provided by DOE either in the LA or in the documentation incorporated within the TSPA model.” Petition at 851. This statement is incorrect, as DOE has provided in the LA and its supporting documentation the justification for the shapes of the probability density functions used in the TSPA. Basically, the specific information for each uncertain parameter in Appendix K of “Total System Performance Assessment Model/Analysis for the License Application” (LSN# DOC.20080312.0001), the primary reference for SAR Section 2.4, includes references to documentation that discusses the basis for characterizing uncertainty in each parameter. As explained in Section V.A.3 above, Nevada has had full access to these documents through the LSN. Since Nevada’s imprecise reading of a document cannot be the basis for a litigable contention, *Ga. Inst. of Tech.* (Georgia Tech Research Reactor), LBP-

95-6, 41 NRC 281, 300 (1995), this contention does not establish a genuine issue of material fact.

The contention also presents several examples that purport to demonstrate that DOE has not justified the shape of certain probability density functions. However, Nevada fails to direct the Board to any references or documentation whatsoever. Even if the contention is read to direct the Board to Nevada's compilation of screenshots from the TSPA (LSN# NEV000005505), Nevada has failed to specify any particular portions of the 350-page document as its basis for its assertions. *See e* above. Furthermore, because the document provides only screenshots of distributions for certain TSPA variables, without any description or discussion of the distributions, it contains no information about DOE's rationale for selecting a particular distribution for any of the variables, nor could it be expected to do so. Therefore, the assertion that DOE has not justified its selection of the shape of probability density functions is unsupported, in addition to being erroneous.

Third, with respect to Nevada's assertions that DOE has arbitrarily chosen the shapes of the probability density functions and has not conducted sensitivity analyses of the model to the selected shapes, Nevada fails to directly controvert DOE's documented position in the SAR and its supporting documents. As explained in "Guidelines for Developing and Documenting Alternative Conceptual Models, Model Abstractions, and Parameter Uncertainty in the Total System Performance Assessment for the License Application" (LSN# DN2002011095) at 45, the principle of maximum entropy is applied to the selection of the chosen distribution. This results in a distribution that encompasses the widest range of uncertainty that is consistent with available information. DOE's approach is not "arbitrary," but is a standard technique for characterizing

uncertainty for probabilistic risk assessment of nuclear power plants. *See* NUREG/CR-6823, Appendix B.

Application of the principle of maximum entropy also means that no sensitivity studies on distribution shape are appropriate, since capturing the broadest range of uncertainty in the parameter consistent with the available information already accounts for all available information that would otherwise form the basis for the sensitivity study. Nevada's failure to address DOE's basis for selection of the probability density functions, including its use of the maximum entropy principle, means that Nevada has failed to directly controvert DOE's position, and therefore, the contention is subject to dismissal. *See Tex. Utils. Electric Co. (Comanche Peak Steam Electric Station, Unit 2)*, LBP-92037, 36 NRC 370, 384 (1992).

Finally, paragraph 6 of the contention essentially admits that Nevada does not know whether this contention raises a genuine and material dispute. That paragraph indicates that "a determination whether acceptance of this contention would necessarily lead to calculated doses in excess of EPA's dose standards would require DOE to perform a substantial number of additional modeling cases that are not included in the LA and that are beyond the practical ability of anyone else to perform." Petition at 854. Nevada has not attempted to determine what effect, if any, acceptance of its contention would have on doses. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster (Savannah River Mixed Oxide Fuel Fabrication Facility)*, LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada's burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected.

In summary, this contention does not establish a genuine issue on a material issue of fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected.

**161. NEV-SAFETY-161 - Critical Role Of Drip Shield**

The LA violates the requirements that there be “multiple barriers,” because its safety depends dispositively upon a single element of the engineered barrier system – the drip shield.

**RESPONSE**

In this contention, Nevada alleges that the Application violates statutory and regulatory requirements “that there be multiple barriers, because its safety depends dispositively upon a single element of the engineered barrier system – the drip shield.” Petition at 857. SAR § 2.1, however, provides for “multiple barriers,” as that term is defined in law and regulation, so Nevada’s contention fails as a matter of law. As explained further below, this contention is inadmissible because it is outside the scope of this proceeding, is immaterial to the NRC’s findings, lacks support in fact or expert opinion, and fails to raise a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of this contention.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention misinterprets the NWPA, and does so in the face of clear NRC and judicial precedent. Nevada construes the requirement, in NWPA § 121(b)(1)(B), 42 U.S.C. § 10141(b)(1)(B)), that the repository use a “system of multiple barriers,” to mean that “the safety

of the repository does not rest upon a single barrier.” Petition at 857.<sup>89</sup> Nevada offers no legal authority in support of its interpretation of the NWPA. The NRC and the United States Court of Appeals, however, have already rejected Nevada’s prior attempt to advance this faulty interpretation. Thus, as explained in the Legal Standards section above, this contention is an impermissible collateral attack on both statute and regulation and is outside the scope of this proceeding.

In 10 C.F.R. § 63.115, the NRC implements the “multiple barriers” requirement of NWPA § 121(b)(1)(B). In promulgating this rule, the NRC considered the multiple barrier provision in the NWPA, and interpreted it to provide the NRC with the flexibility to promulgate regulations that addressed this issue in a *qualitative* rather than a *quantitative* manner. In its comments on the proposed rule, the Commission explained that, “Although it is relatively easy to identify multiple, diverse barriers that comprise the engineered and geologic systems, the performance of these systems cannot and should not be considered either truly independent or totally redundant.” Proposed Rule, Disposal of High-Level Radioactive Waste in a Proposed Geologic Repository at Yucca Mountain, Nevada, 64 Fed. Reg. 8,640, 8,649 (Feb. 22, 1999). During the 1990s, both the National Academy of Sciences and the Commission’s Advisory Committee on Nuclear Waste (“ACNW”) advised against the implementation of quantitative subsystem performance requirements for Yucca Mountain, and based on the current state of research, recommended only an overall quantitative performance standard for the repository. *See id.* As a result, the Commission expressed concern that “for the Yucca Mountain site, the application of the subsystem performance criteria [that had been earlier promulgated for Part 60]

---

89 Nevada also provides a “back of the envelope” calculation purportedly showing that, without the drip shields, the regulatory dose limits will be exceeded. *See* Petition at 858-59. As explained in Section e, below, this calculation contains incurable flaws.

may impose significant additional expenditure of resources on the nation's HLW program, without producing any commensurate increase in the protection of the public health and safety.”

*Id.*

The Commission adopted the same approach in the final rule. In response to comments suggesting that the NRC should set quantitative requirements for specific barriers, such as the drip shields, the Commission reaffirmed its previous approach. Final Rule, Disposal of High-Level Wastes in a Proposed Geologic Repository at Yucca Mountain, Nevada, 66 Fed. Reg. 55,773, 55,783 (Nov. 2, 2001). Specifically, advancements in techniques of performance assessment “obviate, in the Commission’s view, the need to prescribe arbitrary, minimum performance standards for subsystems to build confidence in the system’s overall performance.” *Id.* Thus, the Commission rejected a quantitative assessment of each barrier’s capability in favor of a qualitative assessment, in part because, “[i]t gives the Commission the flexibility to consider the nature and extent of conservatism in the evaluations used for compliance demonstration . . . .” *Id.* at 55,759.<sup>90</sup>

In summary, under the Commission’s rules, DOE must identify and describe the natural and engineered barriers that are important to waste isolation. 10 C.F.R. § 63.115; *see also* 66 Fed. Reg. at 55,783. DOE must address uncertainties in barrier performance, but need not do so in a quantitative manner. *See* 10 C.F.R. § 63.115(b); 66 Fed. Reg. at 55,759. Nowhere in Section 63.115 is there any requirement, as Nevada assumes, for a quantitative demonstration of the performance of any individual barrier. *See* 10 C.F.R. § 63.115.

Nevada challenged the NRC’s Part 63 rulemaking on this point, but the U.S. Court of Appeals for the D.C. Circuit upheld the NRC’s rule. In its appeal, Nevada claimed that the

---

<sup>90</sup> As explained in Section e, below, it is precisely such “conservatisms” that Nevada misapplies to purportedly show that without drip shields, regulatory dose requirements are not met.

NRC's rule "violated the NWPA's requirement that a repository incorporate a multiple barriers system by failing to include any specific requirement for any barrier to provide any degree of protection that is substantially independent of the others." *Nuclear Energy Inst. v. EPA*, 373 F.3d 1251, 1294-95 (D.C. Cir. 2004) (internal quotations omitted). The court upheld the NRC's interpretation of the NWPA, and rejected Nevada's claim, however, because:

Section 121 does not, as Nevada contends, require that each barrier type provide a quantified amount of protection or, indeed, independent protection. Its silence instead gives NRC flexibility in determining how best to "provid[e] for the use of a system of multiple barriers in the design of the repository." We think that NRC, in implementing this requirement in the manner discussed above, acted reasonably and permissibly.

Id. at 1295 (citing *Chevron U.S.A. Inc. v. Natural Resources Def. Council, Inc.*, 467 U.S. 837, 843 (1984) (internal citations omitted))

Thus, by seeking to require a quantitative demonstration of repository performance without drip shields, this contention attempts to overturn 10 C.F.R. § 63.115 and the Commission's interpretation of NWPA § 121(b)(1)(B) in the Part 63 rulemaking, as upheld by the D.C. Circuit. As such, it is an impermissible collateral attack on both statute and regulation and is outside the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Because Nevada raises issues that, as explained in Section c, above, are outside the scope of this proceeding, it also raises issues that are not material to the findings that the NRC must make.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

This contention lacks adequate support in facts or expert opinion for three reasons. First, Nevada's affidavit impermissibly adopts the arguments of counsel. Second, the contention is based on unsupported speculation about the absence of drip shields. Third, the contention is based on a calculation that reaches unsupportable results by misapplying significant conservative assumptions in DOE's analysis.

**(1) Adoption of Assertions of Counsel**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the Application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach an affidavit (by Michael C. Thorne), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavit simply "adopts" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**(2) Baseless Speculation About the Absence of Drip Shields**

Tellingly, this contention rests solely upon speculation that the drip shield "*may*" not be there. Petition at 859 (emphasis added). Nevada states six vague and completely unsupported

reasons why it believes that drip shields will not be present. *Id.* None of these reasons withstand the most rudimentary scrutiny:

(a) “the over \$4 billion of titanium and palladium required for the drip shield to be procured”

- Even if we assume this unsupported assertion to be true, Nevada ignores the fact that drip shields need not be procured for a century. In any case, as explained in Section f below, the allegation that drip shields will not be installed due to cost is not litigable in this proceeding.

(b) “the drip shield cannot be fabricated on the schedule necessary to install it”

- This is a bare assertion with no supporting evidence.

(c) “the integrity of the drip shields cannot be sufficiently maintained in transportation”

- This is a bare assertion with no supporting evidence.

(d) “the technology to construct them does not exist”

- This is a bare assertion that fails to address or refute the information in SAR § 1.3.4.7.

(e) “errors, cave-ins, or even rocks on the ground of the drifts prevent the nearly 11,500 pieces of the drip shield from interlocking flush”

- This is a bare assertion that fails to address or refute the information in SAR § 1.3.4.4 (“Ground Support System”).

(f) “any of a number of technical problems prevent installation of all or any significant portion of the drip shield”

- This is a bare assertion that is also exceptionally vague. DOE addresses all of the specific “technical problems” associated with drip shield installation that Nevada raises in its other contentions, but does not raise here. *See, e.g.*, DOE’s responses to NEV-SAFETY-130, -131, -133, -140, -143.

In sum, Nevada provides absolutely no evidence to support its speculation that the drip shields “may” not be installed.

### (3) Flawed Mathematical “Analysis”

With respect to the consequences of omitting the drip shields, Nevada’s “recalculation” is equally flawed. Petition at 858. Instead of providing a credible technical analysis in support of its claim Nevada instead relies upon a rudimentary, “back-of-the-envelope” calculation. As explained below, Nevada’s calculation reaches unjustifiable results by misapplying significant conservative assumptions in DOE’s analysis. Therefore, it fails to provide the requisite factual or expert opinion support for this contention. *See USEC, Inc., CLI-06-10, 63 NRC at 472* (requiring expert opinions to be supported by a reasoned basis or explanation).

Nevada begins with DOE’s early drip shield failure analysis. Notably, this analysis includes the “bounding assumption” that “the waste package under an early-failed drip shield is assumed to experience localized corrosion over its entire surface as soon as seepage contacts the waste package. Because the drip shield early failure modeling case contributes only negligibly to the total dose . . . this bounding assumption is justified.” SAR at 2.4-16. In other words, the early drip shield failure analysis includes the conservative assumption that the waste package underneath the failed drip shield fails as well.

Nevada then assumes that, instead of a small number of drip shields experiencing early failure, no drip shields are present. Petition at 859. Crucially, Nevada retains the assumption of complete waste package failure underneath the absent drip shields—an assumption that, as the Application explains, is unjustified under the scenario Nevada posits. SAR at 2.4-16 (“Because the drip shield early failure modeling case contributes only negligibly to total dose . . . this bounding assumption is justified.”). *Nevada provides no explanation or basis for its assumption that all waste packages in the entire repository fail.* Nevada then “rescales” DOE’s dose curves to reach a value that exceeds the regulatory standards. *Id.* The unrealistic and unjustifiable

nature of this approach is clear: Nevada's calculation is not an analysis of the engineered barrier system without drip shields; it is an "analysis" of the repository without an engineered barrier system, contrary to NWPA § 121(b)(1)(B) (42 U.S.C. § 10141(b)(1)(B)) and 10 C.F.R. § 63.115. Nevada's contention is therefore unsupported by sufficient facts or expert opinion.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Because Nevada raises issues that, as explained in Section c, d, and e above, are outside the scope of this proceeding, not material to the NRC's findings, and are unsupported by facts or expert opinion, it also fails to raise a genuine dispute on a material issue of law or fact.

Finally, as explained in Section e, above, this contention rests solely upon speculation that the drip shield "may" not be installed. Petition at 859. Not only is this speculation unsupported, it also fails to raise a genuine dispute because the repository design, as described in the Application, contains drip shields. *See, e.g.*, SAR § 1.3.4.7. Nevada asks the Board, however, to assume that DOE will violate the terms of its license and not install drip shields.

The Commission has rejected this kind of contention before. In *Private Fuel Storage*, the State of Utah argued that, after operation commenced, the applicant might fail to generate sufficient revenue, and so might attempt to cut operating costs by reducing the number of trained firefighting personnel, contrary to the licensee's commitments. *Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), CLI-01-9, 53 NRC 232, 234 (2001). The Commission rejected this argument on appeal, stating that "we will neither assume that PFS will operate without sufficient financing, nor will we assume that an unexpected funding shortfall will induce PFS to ignore its responsibility to train and employ a sufficient number of firefighters." *Id.* at 235; *see also Curators of the Univ. of Mo.*, CLI-95-8, 41 NRC 386, 400 (1995) (rejecting intervenor's request "to base our findings on the assumption that the University

will violate an explicit and unambiguous condition of the license”). Here, Nevada presents similar speculation that DOE will be unable or unwilling to implement the repository design as described in the Application. This contention therefore fails to raise a genuine dispute and is inadmissible.

## **162. NEV-SAFETY-162 - Drip Shield Installation Schedule**

From SAR Subsections 1.1.3.1 and 1.1.3.2, and related subsections, it is clear that DOE plans to install the drip shields about one-hundred years from now, after all of the wastes are emplaced in the tunnels and just prior to repository closure, but this cannot be justified as safe because if installation of the drip shields proves to be defective or impossible it will be too late to assure safety by alternative means.

### **RESPONSE**

Nevada argues that DOE fails to provide an adequate plan for retrieval and alternate storage of radioactive wastes, and consequently has not provided reasonable assurance that retrieval can be performed safely in the event retrieval becomes necessary, specifically due to installation of drip shields becoming either defective or impossible.

#### **a. Statement of Issue of Law or Fact to be Controverted**

In this contention at paragraph 1, Nevada states that “from SAR Subsections 1.1.3.1 and 1.1.3.2, and related subsections, it is clear that DOE plans to install the drip shields about one-hundred years from now,” and that if installation cannot be performed, “it will be too late to assure safety by alternative means.” Petition at 861. Nevada then, however, raises for the first time at paragraph 5, SAR Subsection 1.11, in the context of attacking DOE’s proposed plans for retrieval of radioactive waste. Nevada cites to four other contentions (NEV-SAFETY-130, 134, 161, and 168) in paragraph 5 as well. Petition at 862. Nevada’s reference to this litany of sources is precisely what the Advisory PAPO Board sought to avoid in the June 20, 2008 Case Management Order’s requirement that petitioners submit single-issue contentions. *See U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 6).

Indeed, it is impossible to discern precisely what the focus of this contention is and which section of the LA it is that Nevada seeks to challenge. 10 C.F.R. § 2.309(f)(1)(i) requires that “a specific statement of the issue of law or fact to be raised or controverted.” The June 20, 2008 Case Management Order further notes that “this [§ 2.309(f)(1)(i)] statement shall set forth petitioner’s contention in precisely the form it wishes the contention to be considered.” *U.S. Dep’t of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 6). Nevada’s ambiguous statements regarding the specific SAR sections and various other contentions that it wishes to challenge or reference make it clear that Nevada has not met the pleading specificity requirements of 10 CFR § 2.309(f)(1)(i) and its related obligations specified in the June 20, 2008 Case Management Order.

Accordingly, this contention should be dismissed.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is outside the scope of this proceeding and must be dismissed. Nevada argues that “the absence of any plans or detailed information about retrieval makes it impossible now to find reasonable assurance that retrieval will be a feasible option.” Petition at 862. This contention challenges 10 C.F.R. Part 63 and amounts to a collateral attack on NRC regulations. 10 C.F.R. § 63.21(c)(7) requires that the SAR include “a description of plans for retrieval and alternate storage of the radioactive wastes, should retrieval be necessary,” and does not require a “plan or detailed information about retrieval,” as Nevada contends. Petition at 862. To the extent that Nevada alleges that DOE must submit a retrieval plan, this is an improper challenge

to NRC regulations and should be dismissed. *See* 10 C.F.R. § 2.335(a) and (b) (“no rule or regulation of the Commission . . . is subject to attack . . . in any adjudicatory proceeding”). Furthermore, by alleging that DOE must include a “plan or detailed information” rather than “a description of plans” as § 63.21(c)(7) provides, Nevada impermissibly advocates a stricter requirement than is required. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff’d*, CLI-01-17, 54 NRC 3 (2001). Accordingly, because this contention challenges NRC regulations, it is outside the scope of this proceeding and must be dismissed.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations in Part 63, and concludes this litany with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

Furthermore, the legal citations provided by Nevada are not only vague, but also immaterial to this contention. Nevada claims that the LA does not comply with 10 C.F.R. § 63.31(a)(2), 10 C.F.R. § 63.113(b), and Section 121(b)(1)(B) of the Nuclear Waste Policy Act. But Nevada fails to demonstrate how any of these provisions are relevant to its contention.

Indeed, Nevada fails to even cite 10 C.F.R. § 63.21(c)(7), the provision requiring that DOE describe its plans for retrieval.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

Moreover, Nevada claims that if drip shields are impossible to install or are defective, "it will obviously be too late to assure safety by alternative methods short of retrieving the wastes from the tunnels." Petition at 862. Nevada claims that these concerns are "not speculative but well founded," and cites to paragraph 5 of two other safety contentions. This aspect of this contention also fails to raise an issue that is material to this proceeding.

As explained more fully in our answers to NEV-SAFETY-130 and NEV-SAFETY-161, referenced by Nevada in paragraph 5 of its contention, Nevada's speculation that installation of drip shields may be defective or impossible cannot provide the basis for a litigable contention because it is vague and unsupported, and because the repository design, as described in the LA, contains drip shields. *See, e.g.*, SAR § 1.3.4.7. In this contention, Nevada asks the Board to assume that DOE will violate the terms of its license in not installing drip shields after waste emplacement. An admissible contention cannot rely on the premise that an applicant will not implement the licensed design. DOE, as the applicant and ultimate licensee, is entitled to a presumption that it will construct and operate the repository as analyzed in the LA and ultimately authorized by the license. Thus, Nevada may not base its contention on the premise that DOE, as

the applicant and ultimate licensee, will not do so. Accordingly, this contention must be dismissed.

Nevada also alleges that DOE has failed to provide “any plans or detailed information about retrieval,” and fails to demonstrate that retrieval can be conducted safely in the future in the event drip shields cannot be installed. Petition at 862. This contention is immaterial to the proceeding, and must be dismissed.

As discussed above, Section 63.21(c)(7) requires that the SAR include “a description of plans for retrieval and alternate storage of the radioactive wastes, should retrieval be necessary.” That description need only contain information that was reasonably available *at the time of docketing*. See 10 C.F.R. § 63.21(a) (requiring that the LA “be as complete as possible in light of information that is reasonably available at the time of docketing”)

Because DOE is not required to submit a retrieval plan at the time of LA submittal, Nevada’s allegation attacking the adequacy of DOE’s description of its retrieval plan is immaterial to the findings that the NRC must make to authorize construction of the repository. Because a contention is material only if its resolution would make a difference in the outcome of the proceeding, this contention must be dismissed. *Nuclear Management Company, LLC* (Palisades Nuclear Plant), LBP 06-10, 63 NRC 314, 353 (2006), *aff’d*, CLI-06-17, 63 NRC 727; Final Rules of Practice for Domestic Licensing Proceedings – Procedural Changes in the Meaning Processing, 54 Fed. Reg. 33,168, 33,172 (Aug. 11, 1989).

For the reasons stated above, this contention is not material to the findings that the NRC must make in this proceeding, and must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3. above and the specific response below: (1) the contention does not reference any documents, other than the LA and DOE's supporting documents, and portions of other Nevada contentions (NEV-SAFETY-130, paragraph 5, NEV-SAFETY-161, paragraph 5, NEV-SAFETY-134 (no specific reference), NEV-SAFETY-168 (no specific reference)); (2) the contention contains unsupported assertions of counsel; and (3) the contention does not reference any expert opinion.

Nevada's Petition does attach an affidavit (by Stephen A. Frishman), which purportedly provides expert opinions in support of its admission. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavit simply "adopt[s]" the otherwise unsupported assertions made in paragraph 5 of the contention. That circular approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nor can the multiple references to other Nevada contentions be allowed to provide bases for this contention. Not only do they plainly violate the rule of the Case Management Order requiring each contention to raise a single issue that stands on its own, but they also, as a matter of logic, postulate as fact that which would need to be proven, should the other contentions be admitted. This cart-before-horse logic cannot serve to hypothecate a basis for a contention which, on its own as pleaded, has none. Accordingly, this contention must be dismissed.

Accordingly, this contention does not meet the pleading requirements of 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada violates the June 20, 2008 Case Management Order with its failure to comply with the requirement that petitioners separately explain the criteria of 10 C.F.R. § 2.309(f)(1). In paragraph 6 of this contention, addressing the criterion of Section 2.309(f)(1)(vi), Nevada makes a lone, vague, unsubstantiated assertion: “This contention challenges SAR Subsections 1.1.3.1 and 1.1.3.2 and related subsections, from which it is clear that that [sic] DOE plans to install the drip shields about one-hundred years from now, after all of the wastes are emplaced in the tunnels and just prior to repository closure, and therefore raises a material issue.” Petition at 862-63. In addition to this disregard of the June 20, 2008 Case Management Order, Nevada has plainly failed to raise a genuine dispute of material fact with this terse, unsupported and ambiguous claim. For this reason alone, this contention should be dismissed.

In other sections of this contention, Nevada claims that if drip shields are impossible to install or are defective, then DOE will have to retrieve the radioactive waste from the repository because no other options will be available. This aspect of this contention fails to raise a genuine dispute on a material fact or law.

As explained above, this contention must be dismissed because Nevada provides no facts or reasoned explanation supporting its allegation that installation of drip shields may be impossible or defective. Furthermore, this contention rests on impermissible speculation that DOE will not implement the repository design as submitted in the LA. Accordingly, this contention fails to raise a genuine dispute of material fact, and must be dismissed.

Nevada also alleges that DOE's description of its retrieval plan is insufficient, "making it impossible now to find reasonable assurance that retrieval will be a feasible protective option" if the need for retrieval arises, specifically by reason of drip shields not being installed or if they are defective. Petition at 862. This contention does not give rise to a genuine dispute for several reasons.

First, the contention is unsupported by facts or a reasoned analysis as to why the plan provided is deficient. SAR § 1.11, "Plans for Retrieval and Alternate Storage of Radioactive Wastes," describes the plan DOE will follow in the event it determines retrieval to be necessary. Among other things, SAR § 1.11 explains the following:

- Retrieval operations would be conducted using mobile transportation and emplacement (TEV) equipment used for emplacement, unless equipment is later designed specifically for retrieval and described in a license amendment.
- Retrieval operations will begin with cooling of the emplacement drifts using subsurface ventilation systems. Once the emplacement drifts are sufficiently cool, the TEV would begin waste package retrieval with removal of the packages emplaced nearest drift entrances. Waste packages would be removed in reverse sequence to emplacement. The TEV would load waste packages, transport packages to the surface, and move waste packages to an alternate storage facility. Detailed procedures would be prepared and approved prior to commencement of retrieval operations. Operational events with the potential to impact the TEV are analyzed in SAR § 1.6.
- Various conditions beyond the licensing bases possibly affecting retrieval are considered and accounted for, including draft collapse, backfill removal, and loose surface contamination.
- Methodologies have been provided for recovery from off-normal events and other potential retrieval problems.
- Although occupational dose estimates for retrieval have yet to be developed, ALARA principles will be accounted for through the use of engineering features, administrative controls, and radiation safety considerations. Remote technology will be used to avoid worker presence in high-radiation areas, and the ventilation system is designed to reduce the spread of radiation into occupied areas.

Because DOE has submitted a description of its retrieval plan, the only issue for consideration is whether the description provided is sufficient. Nevada argues that the description of retrieval plans in SAR §1.11 “makes it impossible” to find reasonable assurance that retrieval can be conducted safely. Petition at 862. Nevada, however, fails to provide any reason whatsoever why the description contained in this section is inadequate, alleging only that the description is presented in a “scant sixteen pages, and provides only limited information about basic retrieval concepts.” *Id.* As explained above, it is beyond dispute that the description of the retrieval and alternate storage plan is more than adequate to comply with Section 63.21(c)(7). Accordingly, this contention fails to raise a genuine dispute of material fact or law and must be dismissed.

Furthermore, Nevada’s allegation that it is “impossible now” to find reasonable assurance that retrieval will be feasible, (Petition at 862) fails to recognize that “development of detailed plans for the retrieval of waste packages would be driven by the reason for retrieval” and accordingly will not be developed until the need for retrieval arises in the future, if at all. SAR § 1.11 at 1.11-2. Accordingly, “the repository design preserves the ability to retrieve any or all of the emplaced waste prior to closure based on a reasonable schedule. The design approach to address this requirement is to ensure that the repository design and emplacement processes do not preclude the retrieval of any or all waste packages during that period.” SAR § 1.11.1 at 1.11-3. This design complies with 10 C.F.R. 63.111(e), which requires that the GROA “be designed to preserve the option of waste retrieval.” Accordingly, DOE’s compliance with this design criterion is what the NRC will consider when deciding whether the requisite determinations for construction authorization can be made under 10 C.F.R. § 63.31(a). At the time the need for retrieval is determined, safety analyses will be performed, which will “include the specific

details about how retrieval operations would be performed and will include material control and accounting, and physical protection considerations.” SAR § 1.11.1 at 1.11-2.

This approach is consistent with Part 63, which provides DOE with flexibility in the amount of detail that it provides at the time of LA submittal, requiring only that the LA “be as complete as possible in light of information that is reasonably available at the time of docketing.” 10 C.F.R. § 63.21(a). The Statements of Consideration accompanying the Commission’s final rule on “Disposal of High-Level Radioactive Wastes in a Proposed Geological Repository at Yucca Mountain, Nevada” state that:

[P]art 63 provides for a multi-staged licensing process that affords the Commission the flexibility to make decisions in a logical time sequence that accounts for DOE collecting and analyzing additional information over the construction and operational phases of the repository. The multi-staged approach comprises four major decisions by the Commission: (1) Construction authorization; (2) license to receive and emplace waste; (3) license amendment for permanent closure; (4) termination of license. The time required to complete the stages of this process . . . is extensive and will allow for the generation of additional information. Clearly, the knowledge available at the time of construction authorization will be less than at the subsequent stages.

Final Rule, Disposal of High-Level Radioactive Wastes in a Proposed Geological Repository at Yucca Mountain, Nevada, 66 Fed. Reg. 55,732, 55,738-39 (Nov. 2, 2001).

For all of the reasons discussed above this contention must be dismissed in its entirety.

**163. NEV-SAFETY-163 - Screening Of Near-Field Criticality**

SAR Subsection 2.2.1.4.1.3.3 and similar subsections estimate an unreasonably low probability of the occurrence of advective seepage onto a waste package for nominal scenarios, which leads to near-field criticality being inappropriately screened from consideration.

**RESPONSE**

This contention asserts that the estimate of the probability of advective seepage onto a waste package for nominal scenarios as documented in SAR Subsection 2.2.1.4.1.3.3, is unreasonably low, which leads to near-field criticality being inappropriately screened from consideration. As support for this assertion, Nevada claims that DOE's estimate of the occurrence of improper drip shield installation is erroneous because the human error probabilities (HEPs) used do not relate closely to the activities involved (NEV-SAFETY-147) and the approach to the calculation is erroneous (NEV-SAFETY-148).

**a. Statement of Issue of Law or Fact to be Controverted**

This contention repeats verbatim the entire statement of the facts from both NEV-SAFETY-147-148, Petition at 775-76, 779-81 thereby attempting to raise all of the issues from both prior contentions. Consequently, this contention does not comply with the direction of the June 20, 2008, Case Management Order for this proceeding that contentions be "narrow, single-issue contentions" that are "sufficiently specific as to define the relevant issues for eventual rulings on the merits, and do not require" extensive narrowing or clarification by the parties or boards. *U.S. Dep't of Energy*, LBP-08-10, 67 NRC \_\_ (slip op. at 6). For this reason, this contention should be dismissed.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies a number of regulations in the contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a “reasonable expectation” that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in the contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

In making its “reasonable expectation” determination, the NRC must evaluate DOE’s compliance with the applicable provisions of Part 63, including, among other things, whether DOE has described the proposed geologic repository as specified in § 63.21, and whether the site and design comply with the Part 63 performance objectives and requirements. Proposed safety contentions that fail to raise issues that are material to these findings are inadmissible. For

example, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. As stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Nevada asserts that because DOE has erred in its estimate of the occurrence of a drip shield being improperly installed in the repository, DOE has inappropriately screened near-field criticality from consideration. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains unsupported assertions of counsel;

and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Michael C. Thorne and Douglas F. Hambley), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada references no documents which support its claim that DOE's approach to the calculation is erroneous. As discussed in DOE's Response to NEV-SAFETY-148, the one document, other than the SAR and its references, that Nevada cites for a single general statement in the contention is a book entitled, *The Psychology of Risk*, by G.M. Breakwell, Cambridge Univ. Press (2007), which is inapplicable and provides no support for the contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The contention criticizes DOE for having inappropriately screened near-field criticality from consideration because of errors in the calculated probability of occurrence of improperly placed drip shields. Nevada claims that because the probability of improperly installed drip shields is likely to be several orders of magnitude too low, "the frequency of occurrence of improperly installed drip shields is also likely to be several orders of magnitude larger than the screening criterion of one in 10,000." Petition at 870. Nevada goes on to assert that "early entry of water into waste packages and rapid leaching of fissile materials to the near field can occur, potentially resulting in criticality in the first 10,000 years." *Id.* For the reasons discussed below, these arguments do not raise a genuine dispute of material fact or law and must be dismissed.

Nevada's contention that criticality can potentially result in the first 10,000 years does not properly characterize the license application and supporting documents. Its statement that

“rapid leaching of fissile materials to the near field can occur, potentially resulting in criticality in the first 10,000 years” is based on an incorrect reading of the SAR. The probability of near-field criticality is not solely dependent upon the probability of improperly-placed drip shields. Rather, a number of events must occur to create a potential for near-field criticality in addition to a waste package breach.

Although Nevada is correct that DOE applies a bounding assumption that “the waste package under an early failed drip shield is assumed to experience localized corrosion over its entire surface as soon as seepage contacts the waste package,” Nevada’s unsupported conclusion that “rapid leaching of fissile materials to the near field can occur, potentially resulting in criticality in the first 10,000 years” is incorrect. Petition at 870. As DOE explains in the SAR, sufficient fissile material to achieve criticality external to the waste packages in either the seismic or igneous scenarios (which are bounding) would not accumulate over 10,000 years. SAR 2.2.1.4.1.3.3, citing *Geochemistry Model Validation Report: External Accumulation Model*, (SNL 2007a, Section 8.1.4[a]), LSN# DN2002501514. The actual masses of fissile material that would be necessary to achieve criticality are far greater than the mass of material that would accumulate or be released from the waste package, as shown in SAR at 2.2-292 (Table 2.2-14). As a result, the probability of near-field criticality is insignificant. Even if the probability of advective seepage were to change, as is asserted by Nevada, near-field criticality would still be screened out. Therefore, Nevada’s claim that near-field criticality was inappropriately screened from consideration is incorrect. Since Nevada’s imprecise reading of a document cannot be the basis for a litigable contention, *Ga. Inst. of Tech.* (Georgia Tech Research Reactor), LBP-95-6, 41 NRC 281, 300 (1995), this contention does not establish a genuine issue of material fact. Furthermore, because DOE’s position in SAR Section

2.2.1.4.1.3.3 that insufficient fissile material would accumulate to achieve near-field criticality over 10,000 years is the primary basis for screening out near-field criticality, and Nevada fails to directly controvert that position, the contention is subject to dismissal. *See Tex. Utils. Electric Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

Nevada's sole basis for the contention is alleged errors in the calculated probability of improperly placed drip shields. The contention repeats verbatim in its statement of facts, paragraph 5, the corresponding sections from NEV-SAFETY-147 and -148. Therefore, the reasons that NEV-SAFETY-147 and -148 do not establish a genuine dispute of material fact are equally applicable here and are summarized below. Nevada fails to identify any HEPs that relate more closely to the drip shield installation activities than those used by DOE, and the one HEP challenged by Nevada is in fact based on an appropriate model of the drip shield inspection process. The HEPs used in the analysis were determined to be relevant to activities that will occur at Yucca Mountain. Nevada has not claimed that use of other HEPs would increase the rate or extent of degradation of the EBS, nor that DOE's estimates of EBS degradation are not conservative. Even if significantly higher HEPs were used, a material impact on the final dose results is unlikely. Inclusion of mechanical or equipment reliability considerations in DOE's probability calculation for improper drip shield installation, produces an immaterial change in the results. Nevada's speculation that DOE's personnel will violate procedures, thereby increasing the probability of improper drip shield installation, is unsupported and therefore, insufficient to overcome the strong presumption that the personnel will comply with required procedures. Since Nevada has failed to directly and specifically challenge the calculated frequency of improper drip shield installation, the contention fails to raise a genuine dispute of material fact. Finally, Nevada has not demonstrated that the resolution of this contention would

significantly affect any finding the NRC must make to authorize construction. See DOE's Responses to NEV-SAFETY-147 and -148.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

#### **164. NEV-SAFETY-164 - Aggregation Of Probability Distributions**

The process described for the conduct of expert elicitation in SAR Subsections 5.4.1 for probabilistic volcanic hazard analysis (PVHA), 5.4.2 for probabilistic seismic hazard analysis (PSHA), and 5.4.3 for saturated zone flow and transport (SZFT) and similar subsections was realized by using only one method for aggregating probability distributions from groups of experts, so failing to demonstrate the results of other equally valid aggregations that could have been less favorable to the safety case.

#### **RESPONSE**

In this contention Nevada challenges DOE's method of aggregating probability distributions from multiple experts in the expert elicitation process described in SAR Section 5.4, covering the probabilistic volcanic hazard analysis, probabilistic seismic hazard analysis, and saturated zone flow and transport analysis. Petition at 873. This contention is based on Nevada's incorrect legal interpretation of 10 C.F.R. § 63.114(c), which requires consideration of alternative conceptual models of features and processes that may affect repository performance. Relying on its faulty interpretation, Nevada incorrectly treats the "method" DOE used to aggregate probability in its expert elicitation as itself a "model" of a feature or process under Section 63.114(c) and concludes that DOE therefore must consider alternative methodologies that Nevada proffers. The Board must reject this contention because such methodologies for conducting expert elicitation are not "models" subject to Section 63.114(c). Instead, the only relevant and material question is whether the method described by the applicant is sufficiently transparent and accounts for disparate views. Nevada fails to show that DOE's method departed from this standard. Having failed to show that DOE's aggregation methodology fails to account for uncertainties, this contention fails to raise a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of NEV-SAFETY-164, as set forth in Section 1 of the contention.

**b. Brief Explanation of Basis**

Section 2 of NEV-Safety-164 does not satisfy 10 C.F.R. § 2.309(f)(1)(ii) because it does not identify what, if any, regulatory requirement(s) the Application allegedly fails to satisfy. Petition at 873. Nevada suggests that DOE's method for aggregating probability distributions should have reflected the "central tendency" or a "consensus" of the experts' probability distributions, but Nevada offers no foundation for this statement. In fact, Section 2 of this contention fails to cite any legal requirement whatsoever.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of NEV-SAFETY-164.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention is not material because Nevada fails to identify any regulation that would not be satisfied by reason of the alleged deficiency in the elicitation process. Nevada confuses its objection to DOE's method for conducting expert elicitation (which is governed by section 63.21(c)(19)) with the question whether DOE properly considered the output – alternative conceptual models – of that process. Section 63.114(c) requires consideration of alternative conceptual models of "features and processes" of the geologic site that affect repository performance; the method for aggregating expert opinions simply is not a model of geologic features and processes that is addressed by section 63.114(c). An aggregation methodology –

essentially the tool for combining the output (the conceptual models) from the elicitation process – cannot be equated with the conceptual models themselves. Absent identifying any “alternative conceptual models” of features and process that DOE should have evaluated, this contention cannot stand.

Even if DOE should have considered alternative aggregation methods in the expert elicitation process – which DOE denies – Nevada does not show that it would make a material difference. Although Nevada suggests that different aggregation methodologies can lead to different results (Petition at 877), it fails to show that DOE’s methodology is unreliable. A contention is material only if its resolution would make a difference in the outcome of the proceeding. *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999). Nevada has not shown that resolution of this issue would prevent the NRC from finding that there is a reasonable expectation that radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). In short, this contention is not material because Nevada has not demonstrated that resolution of this contention would significantly affect any findings that the NRC must make to authorize construction of a repository.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v) and the specific response below: (1) for the most part, the contention does not reference any documents, other than the license application and DOE’s supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does

not reference any expert opinion. Nevada's Petition does attach the affidavits of Michael C. Thorne and Lawrence D. Phillips, which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Although Nevada suggests that different aggregation methodologies may yield different results, it has not shown that DOE's methodology is materially insufficient or falls short of any regulatory requirement. As discussed in the applicable Legal Standards section above, contentions expressing only generalized "uncertainties" in DOE models or analysis represent an improper challenge to 10 C.F.R. Part 63, which recognizes that uncertainties exist and cannot be eliminated.

Furthermore, Nevada essentially admits that it does not know whether this contention is material – ambiguity that renders the contention inadmissible. Specifically, Nevada admits that "more research is needed to provide solid empirical evidence" for its assertion that its preferred aggregation methodology is superior to DOE's approach. Petition at 878. Accordingly, it is impossible to assess what effect, if any, Nevada's claims would have on radiological dose results. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the material ramifications or results of such alleged deficiencies – fail to raise a material issue of fact or law and are, therefore, inadmissible. *See Fla. Power & Light Co. (Turkey Point Plant, Unit Nos. 3 and 4)*, LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990).

This contention suffers from this deficiency. Nevada states that, because of the “burden and complexity of showing the dose effects of acceptance of Nevada’s contentions,” it has not even attempted to determine what effect, if any, acceptance of the contention would have on doses. Petition at 879. The petitioner has the burden of showing that its proposed contention meets the requirements in 10 C.F.R. § 2.309(f). *Duke Cogema Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-01-35, 54 NRC 403, 422 (2001). Therefore, it is Nevada’s burden to show that its contention raises a genuine material dispute. In contrast, paragraph 6 essentially argues that DOE must demonstrate that no such genuine dispute exists. This argument constitutes an improper attempt by Nevada to shift its burden to DOE, and should be rejected. Moreover, from a substantive perspective, NEV-SAFETY-164 also fails to raise a genuine dispute because Nevada relies on a mistaken premise to challenge DOE’s method for aggregating expert judgments in the expert elicitation process. In short, Nevada confuses its objection to DOE’s method for conducting expert elicitation (which is governed by Section 63.21(c)(19)) with the question whether DOE properly considered the output – alternative conceptual models – of that process (which is governed by Section 63.114(c)). By conflating these two regulations, Nevada tries to impose a de facto new requirement for expert elicitation that simply does not exist.

Nevada in effect ignores Section 63.21(c)(19), which governs expert elicitation. That section requires only an explanation of how the applicant used expert elicitation. It does not prescribe any specific methodology for aggregating expert judgments (or for any other aspect of the elicitation). DOE properly explained its use of expert elicitation process in SAR Section 5.4, which is based on NRC guidance contained in NUREG-1563. *See* Kotra, J.P.; Lee, M.P.; Eisenberg, N.A.; and DeWispelare, A.R., “Branch Technical Position on the Use of Expert

Elicitation in the High-Level Radioactive Waste Program,” NUREG-1563, U.S. Nuclear Regulatory Commission, TIC: 226832 (1996). Nevada has not challenged that explanation and thus cannot show non-compliance with Section 63.21(c)(19).

Instead, Nevada tries to shoehorn its objection into the requirement in Section 63.114(c) that the applicant evaluate the effects that alternative conceptual models of the site’s geologic “features and processes” have on the repository’s performance. The *method* for aggregating expert opinions, however, is not addressed by Section 63.114(c)’s requirements for evaluating *models* of geologic features and processes.

Nevada’s faulty interpretation of Section 63.114(c) is betrayed by Nevada’s own citation to NUREG-1563, which provides detailed guidelines for using expert elicitation. Nevada incorrectly asserts that NUREG-1563 “does not provide guidelines” for aggregating expert judgments. Petition at 874. To the contrary, NUREG-1563 (at 28-29) discusses three approaches to aggregation (behavioral, mechanical, and blended approaches) and discusses the pros and cons associated with each. One of the approaches discussed is the “SSHAC” approach,<sup>91</sup> a blended, “stepwise” approach (*id.* at 29) that was used by DOE for the expert elicitations at issue here. NUREG-1563 does not prescribe or recommend any particular aggregation methodology, nor does it prescribe or recommend that multiple aggregation methodologies be considered and exercised: “It is not the intent of the NRC staff to prescribe any particular algorithm or aggregation technique, or require aggregation itself. Choice of an appropriate method or methods of aggregation may be highly issue-specific.” NUREG-1563 at 29.

---

91 *See Id.* (citing SSHAC (1995), which was published as NUREG/CR-6372, Budnitz et al. 1997 [DIRS 103635])

Significantly, the NRC Staff concluded that a stepwise approach (like the SSHAC approach used by DOE here) “will tend to foster conditions where equal weighting of individual judgments may be most appropriate. *Id.* By contrast, NUREG-1563 specifically discourages using a consensus approach like the one Nevada recommends. *Id.* Whereas Nevada favors a consensus approach where “no individual assessments would be carried out (Petition at 876), NUREG-1563 cautions that “the professional judgment of each subject-matter expert must be explicitly documented . . . [and a] unanimous, consensus, or summary opinion without such documentation will generally not be suitable to support a compliance demonstration, for purposes of licensing.” NUREG-1563 at 29.

In any event, NUREG-1563 contemplates applicants using any number of aggregation methods as long as the process is transparent: “Whatever aggregation method is employed, the individual expert’s opinions must be preserved, documented, and provided to the NRC staff.” NUREG-1563 at 17. In addition, NUREG-1563 provides that the applicant should supply a rationale for the aggregation method selected. As reflected in SAR Section 5.4, DOE has done just that.

Despite the fact that neither Section 63.114(c) nor NUREG-1563 prescribe any particular aggregation methodology – and notwithstanding NUREG-1563 accepting the applicant’s use of “whatever aggregation method,” provided there is transparency – Nevada concludes that the supposed lack of clear guidelines somehow requires DOE to “report” alternative aggregation approaches. Petition at 874. Nevada reasons that this is necessary because alternative methodologies “might” result in different impacts on the repository’s performance assessment. *Id.* But that is pure, impermissible speculation, as Nevada offers no facts or expert opinion to support what “might” happen. *Fansteel*, CLI-03-13, 58 NRC at 203. Nevada concedes as

much, admitting that “more research is needed to provide solid empirical evidence” in support of its assertion that an alternative methodology should be used. Petition at 878.

Having failed to articulate any deficiency with respect to the expert elicitation requirements, Nevada then suggests that DOE’s expert elicitation process also does not comply with Section 63.114(b), which requires a performance assessment to “account for uncertainties and variabilities in parameter values and provide for the technical basis for parameter ranges, probability distributions, or bounding values used in the performance assessment.” This argument is beside the point. The very purpose of elicitation is to account for significant uncertainties that are difficult to quantify. SAR at 5.4-2. Nevada’s argument therefore does nothing more than state the case for using expert elicitation, which DOE has done. As discussed in the applicable Legal Standards section above, contentions expressing only generalized “uncertainties” in DOE models or analyses represent an improper challenge to Part 63, which recognizes that uncertainties exist and cannot be eliminated. This contention suffers from that deficiency.

DOE’s expert elicitations also provide a technical basis for the probability distributions. Nevada again confuses methods for aggregation with the resulting models that the aggregation produces. “Whatever aggregation method is employed” (NUREG-1563 at 17), the question is whether that method is sufficiently transparent and accounts for disparate views. Nevada fails to show that DOE’s method departed from that standard. In fact, DOE’s equal weighting method has been explicitly endorsed. *See, e.g.*, NUREG/CR-6607 at 10 (noting that the Senior Seismic Hazard Analysis Committee designed its process “to allow the equal-weights strategy to be implemented in a defensible manner”). Nor does Nevada even show that its alternative aggregation methodology – which Nevada concedes lacks “solid empirical evidence” to

commend it (Petition at 878) – would do a better job of satisfying Section 63.114(b). Indeed, as discussed above, the NRC Staff discourages using the consensus approach. NUREG-1563 at 29. Having failed to show that DOE’s aggregation methodology fails to account for uncertainties or otherwise fails to meet a regulatory requirement, this contention fails to raise a genuine dispute on a material issue of law or fact.

**165. NEV-SAFETY-165 - Saturated Zone Expert Elicitation**

SAR Section 5, Subsections 5.1, 5.4, 5.4.3, and similar subsections, and QARD 2.2.9 and 2.2.13.B.7, and similar subsections, which describe DOE's conduct of an expert elicitation relating to saturated zone flow and transport (SZEE) that is directly relied upon by DOE in its License Application (as well as the expert elicitation itself, DEN000672365), disclose a methodology so contrary to that which is required and that which DOE committed to employ as to render the SZEE inadequate and unusable in support of DOE's License Application.

**RESPONSE**

In this contention Nevada challenges DOE's methodology for expert elicitation relating to saturated zone flow and transport as described in SAR Sections 5.1, 5.4, and 5.4.3, and QARD Subsections 2.2.9 and 2.2.13.B.7, and "similar subsections." Petition at 880. Nevada essentially complains that the elicitation methodology was "biased" and "predetermined" to elicit findings in support of DOE's application. *Id.* This contention is deficient for failing to articulate a basis, demonstrate it is within the scope of the proceedings, and show a genuine dispute as required by section 2.309(f)(1)'s minimum pleading standards. The contention provides no extrinsic support or sponsoring expert to substantiate any of the alleged bias or to show that the supposed bias rendered DOE's elicitation process unreliable. Furthermore, the expert elicitation is entirely consistent with the NRC's NUREG-1563 guidance. For all these reasons, the Board must reject this contention as unfounded.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement to the extent the contention states that it challenges SAR Sections 5.1, 5.4, and 5.4.3, and QARD Subsections 2.2.9 and 2.2.13.B.7.

**b. Brief Explanation of Basis**

Section 2 of NEV-Safety-165 fails to articulate any basis for this contention. It merely alleges that DOE's expert elicitation methodology is "calculated to be biased" to result in "predetermined" outcomes, but it offers no hint of reason for that conclusion. The bare citation to 10 C.F.R. § 63.21(c)(19) and NUREG-1804 does not explain how DOE allegedly violated those provisions and therefore is inadequate for satisfying Nevada's burden, as petitioner, to provide a brief explanation of the basis for its contention as required by section 2.309(f)(1)(ii).

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations and guidelines in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 and NUREG guidance with the mere assertion that "this contention alleges noncompliance with these regulatory provisions (and DOE's own commitments) and therefore raises a material issue within the scope of the licensing proceeding." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ," not merely a citation of the relevant regulations and guidelines. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The elicitation method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304 and the NUREG guidance, which recognizes that determining that there is a "reasonable expectation": (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and

reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Here, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

This contention amounts to nothing more than unsubstantiated criticism and legal argument. Nevada’s fundamental argument is that the expert elicitation was allegedly “biased” and prone to an “unreliable outcome.” Petition at 882. Nevada goes so far as to accuse DOE of “disregard[ing]” expert opinions “until those opinions were deemed acceptable fodder for elicitation.” Petition at 888. But Nevada provides no substantial facts or expert opinion to show that the elicitation process in fact was biased, as distinguished from being a process that

attempted to identify and select from the acknowledged experts in a relatively rarefied field. It identifies no experts of its own who have a substantially different view of the analysis of saturated zone flow and transport. Nor does it point to any analysis that suggests that DOE's elicitation process in fact was flawed or resulted in an unreliable outcome. It does not even hint how the elicitation would have come out differently if DOE had changed its elicitation methodology. In sum, this contention presents only unsupported arguments of counsel and speculation and therefore should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Section 6 of NEV-Safety-165 does not satisfy section 2.309(f)(1)(vi) because it does not describe any dispute, let alone a genuine dispute on a material issue. The mere conclusory statement that the Application relies on a "methodology so contrary to that which is required" (Nevada Petition at 888) does not satisfy Nevada's obligation to articulate the contours of the alleged dispute.

Nevada fares no better when considering the balance of assertions made in other Sections of NEV-Safety-165. Nevada contends that DOE deviated from NUREG-1563's guidelines for conducting expert elicitation, resulting in a biased process that is a "recipe for an improperly conducted elicitation and an unreliable outcome." Petition at 882. Nevada's argument fails, however, because, as is shown below, DOE in fact complied with the applicable guidelines for conducting expert elicitation. Moreover, Nevada fails to demonstrate that the elicitation was biased or unreliable, and thus the contention fails to raise a genuine dispute on any material issue.

The majority of Nevada's lengthy discussion reflects its editorial comments blended into a loose collection of imprecise quotations from NUREG-1563's guidelines for conducting expert

elicitation. While Nevada infers that DOE's process was somehow "biased," it never explains how DOE in fact materially deviated from NUREG-1563's guidelines. Nevada's argument seems to boil down to two key allegations: (1) DOE's elicitation team is composed of DOE insiders who have supposed conflicts of interest, and (2) the elicitation process was designed to steer the experts' opinions into conformity with DOE's preferred outcomes. As discussed in detail below, both of these arguments are unfounded. Whatever alleged conflicts exist, those conflicts were properly disclosed. Furthermore, DOE's process closely followed NUREG-1563's guidelines, and the entirety of that process was thoroughly and transparently documented precisely as contemplated by the guidelines. At bottom, however, Nevada never shows that the process was in fact biased, never specifies any actual error or unreliability in the process, and never shows any material deviations from NUREG-1563. This contention thus amounts to nothing more than unsubstantiated allegations that lack any merit.

Nevada's argument depends on several mistaken assertions. First, Nevada contends that DOE failed to supply a rationale, as required by NUREG-1804, for any departures from the procedures for expert elicitation set forth in NUREG-1563. Petition at 883. Specifically, Nevada complains that DOE omitted "documentation of experts' rationale for revising their elicitations after receiving feedback," which Nevada suggests was part of a scheme "calculated to prevent exposing the degree to which the DOE process (aimed at pressuring the subject-matter experts into conformity with DOE's views) was successful or not." *Id.*

This argument does not raise a genuine dispute on a material issue. Seizing only on DOE's statement in the QARD that "OCRWM does not require documentation of the rationale for revisions to an expert's initial assessment," (Petition at 883), Nevada ignores the actual rationale, which DOE made explicit in the SAR. As explained in SAR Subsection 5.4.3, DOE

did not require individual experts to document revisions to their evaluations because it “has the potential to anchor experts to their initial evaluations, making experts reluctant to revise an evaluation after the feedback process.” SAR at 5.4-12. This also is consistent with guidance contained in NUREG/CR-6372 used for probabilistic seismic hazard expert elicitation. Budnitz, R.J.; Apostolakis, G.; Boore, D.M.; Cluff, L.S.; Coppersmith, K.J.; Cornell, C.A.; and Morris, P.A. 1997. Recommendations for Probabilistic Seismic Hazard Analysis: Guidance on the Uncertainty and Use of Experts. NUREG/CR-6372. Two volumes. Washington, D.C.: U.S. Nuclear Regulatory Commission. TIC: 235076, 235074, LSN# DN2001909102.<sup>92</sup> That guidance emphasizes that experts should be encouraged to revise their assessments in light of feedback from their preliminary assessments, and “it should be emphasized by the TFI [technical facilitator/integrator] that there is no need nor any desire for the experts to agree with each other after having seen where their assessments stand relative to the other experts' assessments.” NUREG/CR-6372 at 76. NUREG/CR-6372 elaborates that experts will have greater buy-in to the process and will be more willing to revise their opinions based on information from different points of view if they do not feel that they are being personally attacked, *id.* at J-9, which could result if experts are made to document a justification for their change of opinion. Thus, this process was designed to encourage experts to keep an open mind, not to pressure them into adopting a particular point of view. Nevada simply ignores this inconvenient fact.

Second, Nevada contends that DOE failed to explain why its expert selection criteria did not require experts to disclose conflicts of interest. Petition at 884. Nevada then insists that DOE “literally invited” conflicts by permitting experts with a major role in the site

---

92 The saturated zone expert elicitation is modeled upon the procedural guidance established for eliciting expert judgment for seismic hazards (which is set forth in NUREG/CR-6372). See CRWMS M&O (Jan. 1998). Saturated Zone Flow and Transport Expert Elicitation Project. Deliverable SL5X4AM3. Las Vegas, Nevada: CRWMS M&O. ACC: MOL.19980825.0008, LSN# DEN000672365, at 2-3 (hereinafter, “SZEE”).

characterization project (and thus presumably biased in DOE's favor) to be included on the expert panel. *Id.*

This argument is as specious as the first. Again, DOE plainly set forth its rationale in SAR Section 5.4.3: "While the expert selection criteria did not specifically include this criterion [to disclose conflicts], the experts themselves did not oppose this obligation. This is evidenced by the fact that the experts disclosed their experience and then-current affiliations during the elicitation, as well as in their biographies provided in the final report." SAR at 5.4-10. In fact, DOE set forth the experts' affiliations and biographies in the SZEE report. *See* SZEE at 1-6 and Appendix A. Nevada's charge that DOE "squirreled away in unpublished files" evidence of conflicts (Petition at 884), which apparently amounts to no more than the experts' professional affiliations, is belied by the fact that Nevada apparently had no difficulty identifying the supposed conflicts (*see* Petition at 886-87). More fundamentally, Nevada makes no showing, or even a proffer of a showing, as to any biasing effect from the affiliations of the experts chosen within this quite specialized field.

Nevada also misses the mark when it complains that DOE "literally invited" conflicted subject-matter experts to join the elicitation panel. *See* Petition at 884. DOE established detailed guidelines for selecting experts. At minimum, proposed experts were required to have a "good professional reputation and widely recognized competence based on academic training and relevant experience." SZEE at 2-5. Naturally, experts were required to have relevant experience, but (contrary to Nevada's suggestion that the selection criteria were tilted fatally toward inbreeding) they were *not* required to have experience with the Yucca Mountain Site Characterization Project. *Id.* at 2-6. Furthermore, the selection criteria described in the SZEE report addresses this issue directly: "Individuals will be asked specifically not to act as

representative of technical positions taken by their organizations, but rather to provide their individual interpretations and assessments of uncertainties” *Id.*

The methodology development team conducted a broad search for nominations, which led to 59 peer nominations, of which 17 received extensive consideration. *Id.* After thorough vetting, only five agreed to participate and commit to devoting the necessary time and effort to the project. *Id.* at 2-7. The resulting panel “consisted not only of experts of considerable stature and prominence in the professional community, but of individuals with reputations as independent thinkers.” *Id.*

As discussed in the SZEE report (at 2-1), the Generalists and Normative Expert on the SZEE have significant experience in expert elicitations conducted using accepted methodologies and meet the required attributes described in NUREG-1563. For example, Generalist Dr. Kevin J. Coppersmith and Normative expert Dr. Peter A. Morris were members of the committee that developed guidance in NUREG/CR-6372 on expert elicitations. In sum, these individuals are acknowledged experts who have the skills that meet the selection criteria discussed in NUREG-1563 and the significant experience in expert elicitations. Although several of the experts are affiliated with DOE and its contractors (*see* Petition at 886-7), that is not a disqualifying factor. To the contrary, NUREG-1563 makes clear that the guidelines are “not intended to preclude the ability of DOE to use its own staff or its contractor's staff in any elicitation panel. NRC has traditionally considered, for review, the technical analyses prepared by the licensee (and its contractors) and will continue to do so.” NUREG-1563 at 25.

Furthermore, the NRC Staff has recognized, there are relatively few experts with relevant knowledge and experience in the HLW program, thus conflicts may be “unavoidable” given that the “population of known experts has probably been involved with one or more of the

interested/affected parties.” NUREG-1563 at 24. Indeed, the NRC Staff “does not assume” that any proposed expert with a “perceived or real conflict of interest will permit this conflict to influence his or her professional judgments.” *Id.* To that end, NUREG-1563 counsels transparency and documentation. *Id.* DOE did just that. “Information on potential sources of conflict of interest was provided by each expert and documented in SZEE administrative files.” SZEE at 2-7. The experts also disclosed “their experience and then-current affiliations during the elicitation, as well as in their biographies provided in the final report.” SAR at 5.4-10. The five panelists were asked to document any potential conflicts of interest, which is part of the public project record: MOL.19990428.0233 (LSN#: DEN000223137), MOL.19990429.0123 (LSN#: DEN000223152), MOL.19990429.0124, (LSN#: DEN000227356), MOL.19990429.0125, (LSN#: DEN000216962), MOL.19990429.0126 (LSN#: DEN000229691).

In a series of bullet points (Petition at 885-86), Nevada purports to enumerate several other criteria from NUREG-1563 for conducting unbiased expert elicitations. This enumeration focuses as much on Nevada’s views as it does on the extensive guidance found in NUREG-1563. For example, Nevada asserts that “one of the stated purposes of NUREG-1563 is to describe acceptable procedures for conducting expert elicitation” (Petition at 885), but it fails to note that in the very next sentence the NRC Staff cautioned that “rigid adherence to the specific steps proposed” is “not sought so much as the use of a consistent process that produces an accurate and properly documented assessment of the state of scientific uncertainty.” NUREG-1563 at 4 n.5. Thus, Nevada’s selective (and often mistaken) citation to this regulatory guidance reflects Nevada’s view rather than the considered judgment of the NRC Staff.

More importantly, Nevada consistently fails to demonstrate that DOE's elicitation materially deviated from the NRC Staff's guidance. The substantive arguments that can be discerned from Nevada's bullet points all suffer this deficiency. Nevada repeatedly recites the NRC Staff's concern that "care should be taken" in selecting normative experts, and that both generalist and normative experts should be screened using the same selection criteria as subject-matter experts. Petition at 885-86. Beyond identifying potential conflicts among the selected experts, however, Nevada fails to demonstrate any dispute of material fact regarding the selection of experts. As discussed above, and as evidenced by Nevada's recitation of organizational affiliations, DOE ensured proper transparency, and Nevada does not even attempt to show that any of these supposed potential conflicts have *in fact* tainted the elicitation.

Nevada observes that NUREG-1563 requires individually documenting each expert's judgments. Petition at 885. Contrary to Nevada's suggestion, DOE did precisely that and included the individual experts' elicitation summaries in the SZEE report. *See* SZEE at 2-10-11 and Appendix D.

Nevada asserts (in an imprecisely excerpted quote from NUREG-1563) that "[w]hen expert judgments are used to support a demonstration of compliance, sufficient documentation should exist to allow external examination of why the judgments were used instead of obtaining objective information." Petition at 886. But that assertion merely states the reason for using a formal elicitation process. There is no dispute that the SZEE report reflects the formal elicitation process, and it details the reasons for conducting the elicitation, namely, to "capture the uncertainties involved in assessing the saturated flow processes, including uncertainty in both the *models* used to represent the physical process controlling saturated zone flow and transport, and the *parameter values* used in the models." SZEE at 1-1; *see also* SAR 5.4-10.

Nevada criticizes the age of this particular elicitation (Petition at 886), but it does not demonstrate any flaw in the process or the resulting output. In effect, Nevada merely speculates that a newer study would provide different data, but it has not met its burden, as petitioner, to demonstrate that there is any material flaw with DOE's elicitation. *Cf. Duke COGEMA Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-05-4, 61 N.R.C. 71, 94-96 (2005) (holding on motion for summary disposition that contention challenging probabilistic seismic hazards analyses as being outdated raised no genuine issue of material fact where intervenor did not identify any previously unknown or uncharacterized potential hazards that would significantly increase the site's seismic hazard).

To the same effect, Nevada seems to question whether DOE could rely on the SZEE in support of its Application when, by Nevada's reckoning, that current use differs somewhat from the original stated purpose of the SZEE to "support the TSPA-VA (a much earlier version of DOE's TSPA) by providing an expression of uncertainties regarding key issues for the saturated zone." Petition at 886. Once again, however, Nevada does not explain how any supposed difference in purpose undercuts the utility of the data for supporting the Application. Nevada does not suggest that the original SZEE failed to capture any uncertainties that are relevant to the Application.

Nevada also makes the self-evident point that elicitation can be influenced by the data provided to the experts (Petition at 886), but once again it fails to aver, much less demonstrate, any genuine dispute following from that proposition. DOE uniformly distributed literature and technical data sets to all the experts, and that data is described in the SZEE report. SAR at 5.4-11; SZEE at Appendix B. Nevada presents no evidence that DOE failed to distribute a suitably broad range of materials and data, and it certainly does not show that the elicitation as conducted

produced an inaccurate result as a result of the data sample provided to the experts or otherwise fell short of the regulatory requirements.

In its closest approach to a substantive argument, Nevada recites the undisputed organizational affiliations and experience of the experts chosen, and its own version of the interactive deliberative process followed to develop consensus views as well as fully considered individual ones. Petition, 886-87. This reflects Nevada's fundamental misreading of NUREG-1563. For example, Nevada mistakenly contends that NUREG-1563 requires eliciting expert opinion before expert training, workshops, and field trips. Petition at 887. But DOE in fact followed the elicitation guidelines. Both NUREG-1563 and NUREG/CR-6372 make clear that elicitation training should occur in advance of the elicitations in order for the experts to take advantage of the information provided. NUREG 1563 at 17; NUREG/CR-6372 at 44-45. Likewise, both guidelines recommend that expert interactions such as workshops and field trips be conducted in advance of the final elicitation interviews in order for the experts to receive the information and feedback prior to the finalization of their assessments. NUREG-1563 at 27; NUREG/CR-6372 at 45-46. Thus, contrary to Nevada's unsupported accusation that DOE's process was "calculated to have the effect of revising and orchestrating the 'independent' thinking of the subject-matter experts" (Petition at 887), this process is specifically encouraged by the relevant guidelines.

Moreover, out of all this, Nevada comes up only with the unsupported concern that this process "creates the risk of introducing error into the LA and its analyses," which in turn, according to Nevada, "could lead to adverse health and safety consequences for workers and the public." Petition at 888. However, not a single independent basis is advanced in support of this concern, not a single concrete allegation is made about the supposed results of these alleged

biases, and not a single expert is listed in Nevada's table of experts in support of it. Thus, this contention is legally insufficient. As discussed in the applicable Legal Standards section above (Section V.A.3), contentions, like this one, that allege errors, omissions, uncertainties or alternative approaches – without specifying the deficiencies and making a prima facie demonstration of the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible.

Nevada has clearly stated its unhappiness with several aspects of DOE's expert elicitation process. However, it has neither made a prima facie case that DOE's process violated specific regulatory requirements, nor demonstrated that the alleged defects have produced (as distinguished from unsupported speculation that they might have tended to produce) distorted results. As the petitioner, Nevada has the burden of showing that its issues raise a genuine dispute worthy of litigating in this proceeding. An allegation that some aspect of the Application is inadequate or deficient does not give rise to a genuine dispute, unless it is supported by facts and a reasoned statement of why the Application is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990). Nevada has not met this burden, and the contention should be dismissed.

**166. NEV-SAFETY-166 - Probabilistic Seismic Hazard Analysis Expert Elicitation**

SAR Section 5, Subsections 5.4 and 5.4.2, and similar subsections, and QARD 2.2.9, 2.2.13.B.7, and similar subsections, which describe DOE's conduct of an expert elicitation relating to Probabilistic Seismic Hazard Analysis (PSHA) that is directly relied upon in its License Application (as well as the expert elicitation itself, DEN000866273), disclose a methodology so contrary to that which is required and that which DOE committed to employ, as to render the PSHA inadequate and unusable in support of DOE's License Application.

**RESPONSE**

In this contention Nevada challenges DOE's methodology for expert elicitation relating to probabilistic seismic hazard analysis (PSHA) as described in SAR Sections 5.4, and 5.4.2, and QARD Subsections 2.2.9 and 2.2.13.B.7, and "similar subsections." Petition at 889. Nevada essentially complains that the elicitation methodology was "biased" and "predetermined" to elicit findings in support of DOE's application. *Id.* This contention is deficient for failing to articulate a basis, demonstrate it is within the scope of the proceedings, and show a genuine dispute as required by section 2.309(f)(1)'s minimum pleading standards. The contention provides no extrinsic support or sponsoring expert to substantiate any of the alleged bias or to show that the supposed bias rendered DOE's elicitation process unreliable. Furthermore, the expert elicitation is entirely consistent with the NRC's NUREG-1563 guidance. For all these reasons, the Board must reject this contention as unfounded.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement to the extent the contention states that it challenges SAR Sections 5.1, 5.4, and 5.4.2, and QARD Subsections 2.2.9 and 2.2.13.B.7.

**b. Brief Explanation of Basis**

Section 2 of NEV-Safety-166 fails to articulate any basis for this contention. It declares that DOE's expert elicitation methodology is "calculated to be biased" to result in "predetermined" outcomes (Petition at 889), but it offers no hint of reason for that conclusion. The bare citation to 10 C.F.R. § 63.21(c)(19) and NUREG-1804 (*id.*) does not explain how DOE allegedly violated those provisions and therefore is wholly inadequate for satisfying Nevada's burden, as petitioner, to provide a brief explanation of the basis for its contention as required by section 2.309(f)(1)(ii).

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement with respect to the admissibility of NEV-SAFETY-166.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations and guidelines in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 and NUREG guidance with the mere assertion that "this contention alleges noncompliance with these regulatory provisions (and DOE's own commitments) and therefore raises a material issue within the scope of the licensing proceeding." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ," not merely a citation of the relevant regulations and guidelines. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The elicitation method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304 and the NUREG guidance, which recognizes that determining that there is a "reasonable expectation": (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and

reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Here, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

This contention amounts to nothing more than unsubstantiated criticism and legal argument. Nevada’s fundamental argument is that the expert elicitation was allegedly “biased” and prone to an “unreliable outcome.” Petition at 891. Nevada goes so far as to accuse DOE of “disregard[ing]” expert opinions “until those opinions were deemed acceptable fodder for elicitation.” Petition at 897. But Nevada provides no substantial facts or expert opinion to show that the elicitation process in fact was biased, as distinguished from being a process that

attempted to identify and select from the acknowledged experts in a relatively rarefied field. It identifies no experts of its own who have a substantially different view of the analysis of probabilistic seismic hazards. Nor does it point to any analysis that suggests that DOE's elicitation process in fact was flawed or resulted in an unreliable outcome. It does not even hint how the elicitation would have come out differently if DOE had changed its elicitation methodology. In sum, this contention presents only unsupported arguments of counsel and speculation and therefore should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Section 6 of NEV-Safety-166 does not satisfy section 2.309(f)(1)(vi) because it does not describe any dispute, let alone a genuine dispute on a material issue. The mere conclusory statement that the Application relies on a "methodology so contrary to that which is required" (Nevada Petition at 897) does not satisfy Nevada's obligation to articulate the contours of the alleged dispute.

Nevada fares no better when considering the balance of assertions made in other Sections of NEV-Safety-166. Nevada contends that DOE deviated from NUREG-1563's guidelines for conducting expert elicitation, resulting in a biased process that is a "recipe for an improperly conducted elicitation and an unreliable outcome." Petition at 891. Nevada's argument fails, however, because, as is shown below, DOE in fact complied with the applicable guidelines for conducting expert elicitation. Moreover, Nevada fails to demonstrate that the elicitation was biased or unreliable, and thus the contention fails to raise a genuine dispute on any material issue.

The majority of Nevada's lengthy discussion reflects its editorial comments blended into a loose collection of imprecise quotations from NUREG-1563's guidelines for conducting expert

elicitation. While Nevada infers that DOE's process was somehow "biased," it never explains how DOE in fact materially deviated from NUREG-1563's guidelines. Nevada's argument seems to boil down to two key allegations: (1) DOE's elicitation team is composed of DOE insiders who have supposed conflicts of interest, and (2) the elicitation process was designed to steer the experts' opinions into conformity with DOE's preferred outcomes. As discussed in detail below, both of these arguments are unfounded. Whatever alleged conflicts exist, those conflicts were properly disclosed. Furthermore, DOE's process closely followed NUREG-1563's guidelines, and the entirety of that process was thoroughly and transparently documented precisely as contemplated by the guidelines. At bottom, Nevada never shows that the process was in fact biased, never specifies any actual error or unreliability in the process, and never shows any material deviations from NUREG-1563. This contention thus amounts to nothing more than unsubstantiated allegations that lack any merit.

Nevada's argument depends on several mistaken assertions. First, Nevada contends that DOE failed to supply a rationale, as required by NUREG-1804, for any departures from the procedures for expert elicitation set forth in NUREG-1563. Petition at 892. Specifically, Nevada complains that DOE omitted "documentation of experts' rationale for revising their elicitations after receiving feedback," which Nevada suggests was part of a scheme "calculated to prevent exposing the degree to which the DOE process (aimed at pressuring the subject-matter experts into conformity with DOE's views) was successful or not." *Id.*

This argument does not raise a genuine dispute on a material issue. Seizing only on DOE's statement in the QARD that "OCRWM does not require documentation of the rationale for revisions to an expert's initial assessment," (Petition at 892), Nevada ignores the actual rationale, which DOE made explicit in the SAR. As explained in SAR Subsection 5.4.2, DOE

did not require individual experts to document revisions to their evaluations because it “has the potential to anchor experts to their initial evaluations, making experts reluctant to revise an evaluation after the feedback process.” SAR at 5.4-9; *see also* CRWMS M&O 1998.

Probabilistic Seismic Hazard Analyses for Fault Displacement and Vibratory Ground Motion at Yucca Mountain, Nevada. Milestone SP32IM3, September 23, 1998. Three volumes. Las Vegas, Nevada: CRWMS M&O. ACC: MOL.19981207.0393. LSN#: DEN000866273 [hereinafter, “PSHA”] at 1-18.

This rationale also is consistent with guidance contained in NUREG/CR-6372 used for probabilistic seismic hazard expert elicitation. Budnitz, R.J.; Apostolakis, G.; Boore, D.M.; Cluff, L.S.; Coppersmith, K.J.; Cornell, C.A.; and Morris, P.A. 1997. Recommendations for Probabilistic Seismic Hazard Analysis: Guidance on the Uncertainty and Use of Experts. NUREG/CR-6372. Two volumes. Washington, D.C.: U.S. Nuclear Regulatory Commission. TIC: 235076, 235074, LSN# DN2001909102. That guidance emphasizes that experts should be encouraged to revise their assessments in light of feedback from their preliminary assessments, and “it should be emphasized by the TFI [technical facilitator/integrator] that there is no need nor any desire for the experts to agree with each other after having seen where their assessments stand relative to the other experts' assessments.” NUREG/CR-6372 at 76. NUREG/CR-6372 elaborates that experts will have greater buy-in to the process and will be more willing to revise their opinions based on information from different points of view if they do not feel that they are being personally attacked, *id.* at J-9, which could result if experts are made to document a justification for their change of opinion. Thus, this process was designed to encourage experts to keep an open mind, not to pressure them into adopting a particular point of view. Nevada simply ignores this inconvenient fact.

Second, Nevada contends that DOE failed to explain why its expert selection criteria did not require experts to disclose conflicts of interest. Petition at 893. Nevada then insists that DOE “literally invited” conflicts by permitting experts with a major role in the site characterization project (and thus presumably biased in DOE’s favor) to be included on the expert panel. *Id.*

This argument is as specious as the first. Again, DOE plainly set forth its rationale in SAR Section 5.4.2: “While the expert selection criteria did not specifically include this criterion [to disclose conflicts], the experts themselves did not oppose this obligation. This is evidenced by the fact that the experts disclosed their experience and then-current affiliations during the elicitation, as well as in their biographies provided in the final report prepared for the PSHA.” SAR at 5.4-7. The PSHA experts also completed conflict of interest forms modeled after those used by the National Academy of Science to document potential conflicts. *Id.* In fact, DOE set forth the experts’ affiliations and biographies in the PSHA report. *See* PSHA at Tables 1-1, 1-2, 1-3, and 1-4 and Appendix A. Nevada’s charge that DOE “squirreled away in unpublished files” evidence of conflicts (Petition at 893), which apparently amounts to no more than the experts’ professional affiliations, is belied by the fact that Nevada apparently had no difficulty identifying the supposed conflicts (*see* Petition at 895-96). More fundamentally, Nevada makes no showing, or even proffer of a showing, as to any biasing effect from the affiliations of the experts chosen within this quite specialized field.

Nevada also misses the mark when it complains that DOE “literally invited” conflicted subject-matter experts to join the elicitation panel. *See* Petition at 884. As discussed in the PSHA report (Section 2.3 at 2-5 – 2-7), six selection criteria were defined that are consistent with the recommended criteria in NUREG-1563 (at 15). Among other things, the selection criteria

specifically required proposed experts to demonstrate the “[w]illingness to forsake the role of proponent of any model, hypothesis, or theory and to perform as an impartial expert who considers all hypotheses and theories and evaluates their relative credibility as indicated by the data.” PSHA at 2-6.

Naturally, the experts were required to have “strong relevant expertise.” PSHA at 2-6. But the experts were not required to have specific knowledge of the Yucca Mountain area, contrary to Nevada’s suggestion that the selection criteria were tilted fatally toward inbreeding. *See* Petition at 893. The selection criteria explicitly sought persons with “specific knowledge of the Yucca Mountain area, the Basin and Range Province, *or* ground motion characterization.” PSHA at 2-7 (emphasis added). Candidates were “nominated to capture the needed breadth of scientific expertise and technical knowledge and to obtain a *range of organizational representations.*” *Id.* (emphasis added).

The six selection criteria were applied in a stepwise fashion to narrow a total pool of candidate seismic source characterization and fault displacement (SSFD) and ground motion (GM) experts nominated by their peers to eighteen SSFD and seven GM finalists for participation on the panel. Each of the experts on the panels completed a conflicts of interest statement, which was included as part of the public record. PSHA at 2-8 to 2-9.<sup>93</sup> Several of those initially invited to become experts in fact declined on the basis of “perceived conflicts of interest.” PSHA at 2-7.

---

93 Conflicts are documented in Murray, M. (1999), “Potential Sources of Conflict of Interest Forms for Seismic Experts and Ground Motion Experts.” Tracking Nos: SCP: 8.3.1.17.3.6.2. Las Vegas, Nevada: U.S. Geological Survey. ACC: MOL.19990527.0043; MOL.19990527.0044; MOL.19990527.0045; MOL.19990527.0046; MOL.19990527.0047; MOL.19990527.0048; MOL.19990527.0049; MOL.19990527.0050; MOL.19990527.0051; MOL.19990527.0052; MOL.19990527.0053; MOL.19990527.0054; MOL.19990527.0055; MOL.19990527.0056; MOL.19990527.0057; MOL.19990527.0058; MOL.19990527.0059; MOL.19990527.0060; MOL.19990527.0061; MOL.19990527.0062; MOL.19990527.0063; MOL.19990527.0064; MOL.19990527.0065; MOL.19990527.0066; MOL.19990527.0067; MOL.19990527.0068.

The Generalists and Normative Expert on the PSHA also have significant experience in expert elicitations conducted using accepted methodologies and meet the required attributes described in NUREG-1563 (at 23). For example, Generalist Dr. Kevin J. Coppersmith and Normative expert Dr. Peter A. Morris were members of the committee that developed guidance in NUREG/CR-6372 on expert elicitations. Thus, these individuals are acknowledged experts who have the skills that meet the selection criteria discussed in NUREG-1563.

Although several of the experts are affiliated with DOE and its contractors (*see* Petition at 895-96), that is not a disqualifying factor. To the contrary, NUREG-1563 makes clear that the guidelines are “not intended to preclude the ability of DOE to use its own staff or its contractor's staff in any elicitation panel. NRC has traditionally considered, for review, the technical analyses prepared by the licensee (and its contractors) and will continue to do so.” NUREG-1563 at 25.

Furthermore, the NRC Staff has recognized, there are relatively few experts with relevant knowledge and experience in the HLW program, thus conflicts may be “unavoidable” given that the “population of known experts has probably been involved with one or more of the interested/affected parties.” NUREG-1563 at 24. Indeed, the NRC Staff “does not assume” that any proposed expert with a “perceived or real conflict of interest will permit this conflict to influence his or her professional judgments.” *Id.* To that end, NUREG-1563 counsels transparency and documentation. *Id.* DOE did just that. As discussed above, each of the elicitation panel experts completed a conflicts of interest statement, which was included as part of the public record. PSHA at 2-8 to 2-9.

In a series of bullet points (Petition at 894-95), Nevada purports to enumerate several other criteria from NUREG-1563 for conducting unbiased expert elicitations. In reality, this

enumeration is so loaded with Nevada's own views that it is only casually representative of the extensive guidance found in NUREG-1563. For example, Nevada asserts that "one of the stated purposes of NUREG-1563 is to describe acceptable procedures for conducting expert elicitation" (Petition at 894), but it fails to note that in the very next sentence the NRC Staff cautioned that "rigid adherence to the specific steps proposed" is "not sought so much as the use of a consistent process that produces an accurate and properly documented assessment of the state of scientific uncertainty." NUREG-1563 at 4 n.5. Thus, Nevada's selective (and often mistaken) citation to this regulatory guidance often reflects Nevada's pure editorial view rather than the considered judgment of the NRC Staff.

More importantly, Nevada consistently fails to demonstrate that DOE's elicitation materially deviated from the NRC Staff's guidance. The substantive arguments that can be discerned from Nevada's bullet points all suffer this deficiency. Nevada repeatedly recites the NRC Staff's concern that "care should be taken" in selecting normative experts, and that both generalist and normative experts should be screened using the same selection criteria as subject-matter experts. Petition at 894-95. Beyond identifying potential conflicts among the selected experts, however, Nevada fails to demonstrate any dispute of material fact regarding the selection of experts. As discussed above, and as evidenced by Nevada's recitation of organizational affiliations, DOE ensured proper transparency, and Nevada does not even attempt to show that any of these supposed potential conflicts have *in fact* tainted the elicitation.

Nevada observes that NUREG-1563 requires individually documenting each expert's judgments. Petition at 894. Contrary to Nevada's suggestion, DOE did precisely that and included detailed summaries of various expert teams' conclusions and elicitation summaries in the PSHA report. *See* PSHA at 1-18, 3-9 to 3-12, 4-28 to 4-46, 5-3 to 5-6, and Appendices C-F.

Nevada asserts (in an imprecisely excerpted quote from NUREG-1563) that “[w]hen expert judgments are used to support a demonstration of compliance, sufficient documentation should exist to allow external examination of why the judgments were used instead of obtaining objective information.” Petition at 895. But that assertion merely states the reason for using a formal elicitation process. There is no dispute that the PSHA report reflects the formal elicitation process, and it details the reasons for conducting the elicitation, namely, to “(1) evaluate the fault displacement and vibratory ground motion hazards and their uncertainty at the Yucca Mountain site and (2) provide documentation of the technical basis for determining these hazards.” PSHA at 1-2; *see also* SAR 5.4-7.

Nevada seems to further criticize the age of this particular elicitation (Petition at 895), but it does not demonstrate any flaw in the process or the resulting output. In effect, Nevada merely speculates that a newer study would provide different data, but it has not met its burden, as petitioner, to demonstrate that there is any material flaw with DOE’s elicitation. *Cf. Duke COGEMA Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-05-4, 61 N.R.C. 71, 94-96 (2005) (holding on motion for summary disposition that contention challenging probabilistic seismic hazards analyses as being outdated raised no genuine issue of material fact where intervenor did not identify any previously unknown or uncharacterized potential hazards that would significantly increase the site’s seismic hazard).

To the same effect, Nevada seems to question whether DOE could rely on the PSHA in support of its Application when, by Nevada’s reckoning, that current use differs somewhat from the original stated purpose of the PSHA to use the results of that analysis “directly together with the refined component model response analyses, in subsequent TSPA-VA.” Petition at 895. Once again, however, Nevada does not explain how any supposed difference in purpose

undercuts the utility of the data for supporting the Application. Nevada does not suggest that the original PSHA failed to capture any uncertainties that are relevant to the Application.

Nevada also makes the self-evident point that elicitation can be influenced by the data provided to the experts (Petition at 895), but once again it fails to aver, much less demonstrate, any genuine dispute following from that proposition. DOE uniformly distributed literature and technical data sets to all the experts, and that data is described in the PSHA report. SAR at 5.4-11; PSHA at 1-11, 3-1, 5-2, 5-7 to 5-11, and Appendix B. Nevada presents no evidence that DOE failed to distribute a suitably broad range of materials and data, and it certainly does not show that the elicitation as conducted produced an inaccurate result as a result of the data sample provided to the experts or otherwise fell short of the regulatory requirements.

In its closest approach to a substantive argument, Nevada recites the undisputed organizational affiliations and experience of the experts chosen, and its own version of the interactive deliberative process followed to develop consensus views as well as fully considered individual ones. Petition at 895-96. This reflects Nevada's fundamental misreading of NUREG-1563. For example, Nevada mistakenly contends that NUREG-1563 requires eliciting expert opinion before expert training, workshops, and field trips. Petition at 896. But DOE in fact followed the elicitation guidelines. Both NUREG-1563 and NUREG/CR-6372 make clear that elicitation training should occur in advance of the elicitation in order for the experts to take advantage of the information provided. NUREG 1563 at 17; NUREG/CR-6372 at 44-45. Likewise, both guidelines recommend that expert interactions such as workshops and field trips be conducted in advance of the final elicitation interviews in order for the experts to receive the information and feedback prior to the finalization of their assessments. NUREG-1563 at 27; NUREG/CR-6372 at 45-46. Thus, contrary to Nevada's unsupported accusation that DOE's

process was “calculated to have the effect of revising and orchestrating the ‘independent’ thinking of the subject-matter experts” (Petition at 896), this process is specifically encouraged by the relevant guidelines.

Moreover, out of all this, Nevada comes up only with the unsupported concern that this process “creates the risk of introducing error into the LA and its analyses,” which in turn, according to Nevada, “could lead to adverse health and safety consequences for workers and the public.” Petition at 897. However, not a single independent basis is advanced in support of this concern, not a single concrete allegation is made about the supposed results of these alleged biases, and not a single expert is listed in Nevada’s table of experts in support of it. Thus, this contention is legally insufficient. As discussed in the applicable Legal Standards section above (Section V.A.3), contentions, like this one, that allege errors, omissions, uncertainties or alternative approaches – without specifying the and making a prima facie demonstration of the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible.

Nevada has clearly stated its unhappiness with several aspects of DOE’s expert elicitation process. However, it has neither made a prima facie case that DOE’s process violated specific regulatory requirements, nor demonstrated that the alleged defects have produced (as distinguished from unsupported speculation that they might have tended to produce) distorted results. As the petitioner, Nevada has the burden of showing that its issues raise a genuine dispute worthy of litigating in this proceeding. An allegation that some aspect of the Application is inadequate or deficient does not give rise to a genuine dispute, unless it is supported by facts and a reasoned statement of why the Application is unacceptable in some material respect. *See*

*Fla. Power & Light Co.* (Turkey Point Plan, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990). Nevada has not met this burden, and the contention should be dismissed.

**167. NEV-SAFETY-167 - Probabilistic Volcanic Hazard Analysis Expert Elicitation**

SAR Section 5, Subsections 5.1, 5.4, 5.4.1, and similar subsections, and QARD 2.2.9, 2.2.13.B.7, and similar subsections, which describe DOE's conduct of an expert elicitation relating to Probabilistic Volcanic Hazard Analysis (PVHA) that is directly relied upon in its License Application (as well as the expert elicitation itself, DEN000861156), disclose a methodology so contrary to that which is required and that which DOE committed to employ, as to render the PVHA inadequate and unusable in support of DOE's License Application.

**RESPONSE**

Nevada challenges DOE's methodology for expert elicitation relating to its probabilistic volcanic hazard analysis (PVHA) as described in SAR Sections 5.1, 5.4, and 5.4.1, and QARD Subsections 2.2.9 and 2.2.13.B.7, and "similar subsections." Petition at 898. Nevada essentially complains that the elicitation methodology was "biased" and "predetermined" to elicit findings in support of DOE's Application. *Id.* This contention is deficient for failing to articulate a basis, demonstrate it is within the scope of the proceeding, and show a genuine dispute as required by section 2.309(f)(1)'s minimum pleading standards. The contention provides no extrinsic support or sponsoring expert to substantiate any of the alleged bias or to show that the supposed bias rendered DOE's elicitation process unreliable. Furthermore, the expert elicitation is entirely consistent with the NRC's NUREG-1563 guidance. For all these reasons, the Board must reject this contention as unfounded.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement to the extent the contention states that it challenges SAR Sections 5.1, 5.4, and 5.4.1, and QARD Subsections 2.2.9 and 2.2.13.B.7.

**b. Brief Explanation of Basis**

Section 2 of NEV-Safety-167 fails to articulate any basis for this contention. It declares that DOE's expert elicitation methodology is "calculated to be biased" to result in "predetermined" outcomes (Petition at 898), but it offers no hint of a reason for that conclusion. The bare citation to 10 C.F.R. § 63.21(c)(19) and NUREG-1804 does not explain how DOE allegedly violated those provisions and therefore is wholly inadequate for satisfying Nevada's burden, as petitioner, to provide a brief explanation of the basis for its contention as required by section 2.309(f)(1)(ii).

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada lists various regulations and guidelines in section (e) of this contention. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 and NUREG guidance with the mere assertion that "this contention alleges noncompliance with these regulatory provisions (and DOE's own commitments) and therefore raises a material issue within the scope of the licensing proceeding." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . , " not merely a citation of the relevant regulations and guidelines. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3, *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The elicitation method the DOE used in addressing the issue in this contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304 and the NUREG guidance, which recognizes that determining that there is a "reasonable expectation": (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and

reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

Here, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

This contention amounts to nothing more than unsubstantiated criticism and legal argument. Nevada’s fundamental argument is that the expert elicitation was allegedly “biased” and prone to an “unreliable outcome.” Petition at 900. Nevada goes so far as to accuse DOE of “disregard[ing]” expert opinions “until those opinions were deemed acceptable fodder for elicitation.” Petition at 906. But Nevada provides no substantial facts or expert opinion to show that the elicitation process in fact was biased, as distinguished from being a process that

attempted to identify and select from the acknowledged experts in a relatively rarefied field. It identifies no experts of its own who have a substantially different view of the analysis of probabilistic volcanic hazards. Nor does it point to any analysis that suggests that DOE's elicitation process in fact was flawed or resulted in an unreliable outcome. It does not even hint how the elicitation would have come out differently if DOE had changed its elicitation methodology. In sum, this contention presents only unsupported arguments of counsel and speculation and therefore should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Section 6 of NEV-Safety-167 does not satisfy section 2.309(f)(1)(vi) because it does not describe any dispute, let alone a genuine dispute on a material issue. The mere conclusory statement that the Application relies on a "methodology so contrary to that which is required" (Nevada Petition at 906) does not satisfy Nevada's obligation to articulate the contours of the alleged dispute.

Nevada fares no better when considering the balance of assertions made in other Sections of NEV-Safety-167. Nevada contends that DOE deviated from NUREG-1563's guidelines for conducting expert elicitation, resulting in a biased process that is a "recipe for an improperly conducted elicitation and an unreliable outcome." Petition at 900. Nevada's argument fails, however, because, as is shown below, DOE in fact complied with the applicable guidelines for conducting expert elicitation. Moreover, Nevada fails to demonstrate that the elicitation was biased or unreliable, and thus the contention fails to raise a genuine dispute on any material issue.

The majority of Nevada's lengthy discussion reflects its editorial comments blended into a loose collection of imprecise quotations from NUREG-1563's guidelines for conducting expert

elicitation. While Nevada infers that DOE's process was somehow "biased," it never explains how DOE in fact materially deviated from NUREG-1563's guidelines. Nevada's argument seems to boil down to two key allegations: (1) the elicitation process was designed to steer the experts' opinions into conformity with DOE's preferred outcomes, and (2) DOE's elicitation team is composed of DOE insiders who have supposed conflicts of interest. As discussed in detail below, both of these arguments are unfounded. Whatever alleged conflicts exist, those conflicts were properly disclosed. Furthermore, DOE's process closely followed NUREG-1563's guidelines, and the entirety of that process was thoroughly and transparently documented precisely as contemplated by the guidelines. At bottom, Nevada never shows that the process was in fact biased, never specifies any actual error or unreliability in the process, and never shows any material deviations from NUREG-1563. This contention thus amounts to nothing more than unsubstantiated allegations that lack any merit.

Nevada's argument depends on several mistaken assertions. First, Nevada contends that DOE failed to supply a rationale, as required by NUREG-1804, for any departures from the procedures for expert elicitation set forth in NUREG-1563. Petition at 901. Specifically, Nevada complains that DOE omitted "documentation of experts' rationale for revising their elicitations after receiving feedback," which Nevada suggests was part of a scheme "calculated to prevent exposing the degree to which the DOE process (aimed at pressuring the subject-matter experts into conformity with DOE's views) was successful or not." *Id.*

This argument does not raise a genuine dispute on a material issue. Seizing only on DOE's statement in the QARD that "OCRWM does not require documentation of the rationale for revisions to an expert's initial assessment" (Petition at 901), Nevada ignores the actual rationale, which DOE made explicit in the SAR. As explained in SAR Subsection 5.4.1, DOE

did not require individual experts to document revisions to their evaluations because it “can anchor the experts to their initial evaluations, making them reluctant to revise an evaluation after the feedback process.” SAR at 5.4-6.

This rationale also is consistent with guidance contained in NUREG/CR-6372,<sup>94</sup> used for probabilistic seismic hazard expert elicitation, on which the PVHA elicitation was modeled. See CRWMS M&O 1996. Probabilistic Volcanic Hazard Analysis for Yucca Mountain, Nevada. BA0000000-01717-2200-00082 REV 0. Las Vegas, Nevada: CRWMS M&O. ACC: MOL.19971201.0221. LSN# DEN000861156 [hereinafter, “PVHA Report”] at 2-2 to 2-5. That guidance emphasizes that experts should be encouraged to revise their assessments in light of feedback from their preliminary assessments, and “it should be emphasized by the TFI [technical facilitator/integrator] that there is no need nor any desire for the experts to agree with each other after having seen where their assessments stand relative to the other experts' assessments.” NUREG/CR-6372 at 76. NUREG/CR-6372 elaborates that experts will have greater buy-in to the process and will be more willing to revise their opinions based on information from different points of view if they do not feel that they are being personally attacked, *id.* at J-9, which could result if experts are made to document a justification for their change of opinion. Thus, this process was designed to encourage experts to keep an open mind, not to pressure them into adopting a particular point of view. Nevada simply ignores this inconvenient fact.

Second, Nevada contends that DOE failed to explain why its expert selection criteria did not require experts to disclose conflicts of interest. Petition at 902. Nevada then insists that DOE “literally invited” conflicts by permitting experts with a major role in the site

---

94 NUREG/CR-6372, Budnitz, R.J.; Apostolakis, G.; Boore, D.M.; Cluff, L.S.; Coppersmith, K.J.; Cornell, C.A.; and Morris, P.A. 1997. Recommendations for Probabilistic Seismic Hazard Analysis: Guidance on the Uncertainty and Use of Experts. Two volumes. Washington, D.C.: U.S. Nuclear Regulatory Commission. TIC: 235076, 235074, LSN# DN2001909102.

characterization project (and thus presumably biased in DOE's favor) to be included on the expert panel. *Id.*

This argument is as specious as the first. Again, DOE plainly set forth its rationale in SAR Section 5.4.1: "While the expert selection criteria did not specifically include this criterion [to disclose conflicts], the experts themselves did not oppose this obligation. This is evidenced by the fact that the experts disclosed their experience and then-current affiliations during the elicitation, as well as in their biographies provided in the final report prepared for the PVHA." SAR at 5.4-4; PVHA Report Appendix A. Nevada apparently had no difficulty identifying the supposed conflicts – which apparently amounts to no more than the experts' professional affiliations. *See* Petition at 904-05 (citing PVHA biographies and discussing one expert's affiliations). More fundamentally, Nevada makes no showing, or even proffer of a showing, as to any biasing effect from the affiliations of the experts chosen within this quite specialized field.

Nevada also misses the mark when it complains that DOE "literally invited" conflicted subject-matter experts to join the elicitation panel. Petition at 902. As discussed in the PVHA Report at 2-22 to 2-24), five selection criteria were defined that are consistent with the recommended criteria in NUREG-1563 (at 15). At minimum, proposed experts were required to have a "good professional reputation and widely recognized competence based on academic training and relevant experience." PVHA Report at 2-22. Experts were required to have relevant experience, including "experience collecting and analyzing research data for relevant volcanic studies in the southern Great Basin or similar extensional tectonic environments." *Id.* Although experience with the Yucca Mountain site was considered an asset in that regard, it explicitly was "not a requirement" (*id.*), contrary to Nevada's suggestion that the selection criteria were tilted fatally toward inbreeding. *See* Petition at 902. Furthermore, the selection

criteria described in the PVHA Report addressed this issue directly: “Individuals will be asked specifically not to act as representative of technical positions taken by their organizations, but rather to provide their own technical interpretations and uncertainties.” PVHA Report at 2-23.

In fact, candidates were sought to provide a panel “balanced to include experts with diverse opinions, areas of technical expertise and institutional backgrounds (e.g., from government agencies, academic institutions, and private industry). The panel should include some researchers who have worked in the YMR and some who have not.” *Id.* To that end, and considering the “importance of process issues” when conducting a multi-expert elicitation, DOE established a Methodology Development Team (MDT), including Generalists and Normative Experts, to identify experts for the panel and to oversee the elicitation process. PVHA Report at 2-1, 2-23.

Using the selection criteria discussed above, the MDT sought nominations of qualified experts for the expert panel, giving “careful consideration” to selecting individuals “to obtain a balance with respect to areas of technical expertise . . . as well as to include individuals from varied institutional backgrounds . . . .” PVHA Report at 2-23. In light of this requirement, seventeen individuals were invited to join the expert panel from a pool of seventy nominations. *Id.* Ten accepted and agreed to the extensive time commitment; three declined citing “potential conflicts of interest.” *Id.* The resulting panel consisted “not only of experts of considerable stature and prominence in the volcanological community, but individuals with reputations for being independent thinkers capable of coming to conclusions after evaluating all of the available data.” *Id.* at 2-24. The panel was selected to be “representative of the larger informed technical community,” which was intended to expose the experts to a “variety of views purposely designed to promote a broadening of the perspectives of each expert.” *Id.* at 2-16.

Although several of the experts are affiliated with DOE and its contractors (*see* Petition at 904-05), that is not a disqualifying factor. The NRC Staff recognizes there are relatively few experts with relevant knowledge and experience in the HLW program, thus conflicts may be “unavoidable” given that the “population of known experts has probably been involved with one or more of the interested/affected parties.” NUREG-1563 at 24. Nevertheless, the NRC Staff “does not assume” that any proposed expert with a “perceived or real conflict of interest will permit this conflict to influence his or her professional judgments.” *Id.* To that end, NUREG-1563 counsels transparency and documentation. *Id.* DOE did just that. As discussed above, the experts in fact disclosed their experience and affiliations, which is reflected in their biographies that are appended to the PVHA Report. PVHA Report Appendix A; SAR at 5.4-4. In sum, DOE developed a well-balanced panel and transparently documented the selection process, all in accordance with well established elicitation guidelines, including NUREG-1563.

In a series of bullet points (Petition at 903-04), Nevada purports to enumerate several other criteria from NUREG-1563 for conducting unbiased expert elicitations. Nevada’s enumeration contains mostly Nevada’s own views and is not representative of the extensive guidance found in NUREG-1563. For example, Nevada asserts that “one of the stated purposes of NUREG-1563 is to describe acceptable procedures for conducting expert elicitation” (Petition at 903), but it fails to note that in the very next sentence the NRC Staff cautioned that “rigid adherence to the specific steps proposed” is “not sought so much as the use of a consistent process that produces an accurate and properly documented assessment of the state of scientific uncertainty.” NUREG-1563 at 4 n.5. Thus, Nevada’s selective (and often mistaken) citation to this regulatory guidance often reflects Nevada’s editorial view rather than the considered judgment of the NRC Staff.

More importantly, Nevada fails to demonstrate that DOE's elicitation materially deviated from the NRC Staff's guidance. The substantive arguments that can be discerned from Nevada's bullet points all suffer this deficiency. Nevada repeatedly recites the NRC Staff's concern that "care should be taken" in selecting normative experts, and that both generalist and normative experts should be screened using the same selection criteria as subject-matter experts. Petition at 903-04. Generalist Dr. Kevin J. Coppersmith and Normative experts Dr. Peter A. Morris and Dr. Allin A. Cornell were members of the committee that developed guidance in NUREG/CR-6372 on expert elicitations. Thus, these individuals are acknowledged experts who have the skills that meet the selection criteria discussed in NUREG-1563. Furthermore, beyond identifying potential conflicts among the selected experts, however, Nevada fails to demonstrate any dispute of material fact regarding the selection of experts. As discussed above, and as evidenced by Nevada's recitation of organizational affiliations, DOE ensured proper transparency, and Nevada does not even attempt to show that any of these supposed potential conflicts have *in fact* tainted the elicitation.

Nevada observes that NUREG-1563 requires individually documenting each expert's judgments. Petition at 903. DOE did precisely that and included the individual experts' elicitation summaries in the PVHA Report. *See* PVHA Report at 2-16 to 2-17, 2-31 to 2-33, and Appendix E.

Nevada asserts (in an imprecisely excerpted quote from NUREG-1563) that "[w]hen expert judgments are used to support a demonstration of compliance, sufficient documentation should exist to allow external examination of why the judgments were used instead of obtaining objective information." Petition at 903. But that assertion merely states the reason for using a

formal elicitation process. There is no dispute that the PVHA report reflects the formal elicitation process, and it details the reasons for conducting the elicitation, namely, to

assess the probability of disruption by a volcanic event of the proposed high level waste repository at Yucca Mountain and to quantify the uncertainties associated with this assessment. . . . A major goal of the project was to capture uncertainties that are involved in the assessment of the volcanic hazard including uncertainty in both the *models* used to represent the key physical controls on volcanism and the *parameter values* used in the models. To ensure that a wide range of perspectives was considered in the hazard analysis, individual judgments were elicited from members of an expert panel.

PVHA Report at 1-1; *see also* SAR at 5.4-4.

Nevada seems to further criticize the age of this particular elicitation (Petition at 903-04), but it does not demonstrate any flaw in the process or the resulting output. In effect, Nevada merely speculates that a newer study would provide a different annual frequency of intersection of a repository drift by a volcanic event, but it has not met its burden, as petitioner, to demonstrate that there is any material flaw with DOE's elicitation. *Cf. Duke COGEMA Stone & Webster* (Savannah River Mixed Oxide Fuel Fabrication Facility), LBP-05-4, 61 N.R.C. 71, 94-96 (2005) (holding on motion for summary disposition that contention challenging probabilistic seismic hazards analyses as being outdated raised no genuine issue of material fact where intervenor did not identify any previously unknown or uncharacterized potential hazards that would significantly increase the site's seismic hazard).

Nevada questions DOE's reliance on the 1996 PVHA in support of its Application when, by Nevada's reckoning, there is new information (including allegedly new "aeromagnetic information") developed since the 1996 PVHA that DOE allegedly did not consider. Petition at 904. Nevada is factually incorrect because DOE did consider post-1996 information and analyses.

As discussed in DOE's response to contention NEV-Safety-157, the evaluation of information and analyses developed after the completion of the PVHA is plainly identified in the SAR and supporting documents. *See, e.g.*, SAR Section 2.3.11; BSC, *Characterize Framework for Igneous Activity at Yucca Mountain, Nevada*, ANL-MGR-GS-000001 REV 02, Table 6-4, at 6-16 to 6-17 (LSN: DEN2001632124; DEN2002077196; DEN001580092) (2004). After analyzing published estimates from 1982 to 2000 of the probability of a volcanic event intersecting the repository footprint, DOE concluded that the estimates, including the mean intersection probability estimated in the PVHA, "cluster at slightly greater than  $10^{-8}$  per year, providing confidence that the PVHA probability estimate is robust." SAR at 2.3.11-24. In addition, DOE evaluated the potential significance of aeromagnetic data gathered after the PVHA was completed for its potential significance to the hazard estimate. SAR at 2.3.11-25. The SAR identifies three separate sensitivity studies, completed following the PVHA, which show that effects of information developed following completion of the PVHA is insignificant. *Id.*

Most significantly, DOE's update to the PVHA (i.e., PVHA-U) was conducted using a panel of eight experts, whose evaluations included data that had become available since the conclusion of the PVHA, including high-resolution aeromagnetic data, drilling, geochemical, and geochronological analyses conducted specifically to support the PVHA-U. "Probabilistic Volcanic Hazard Analysis Update (PVHA-U) for Yucca Mountain, Nevada Rev. 01" (09/02/2008), (LSN# DEN001601965) (cited in Petition at 833). As summarized in DOE's letter to NRC dated October 17, 2008, "The differences between the PVHA-96 and PVHA-U distributions would not significantly affect the estimates of repository performance for either 10,000 years or 1,000,000 years, demonstrating that the PVHA-U results are confirmatory of the

PVHA-96 technical basis. As a result, the volcanic hazard results presented in the License Application (LA) are robust and suitable for evaluating the expected performance of the repository, and no change to the technical basis presented in the LA is necessary.” Letter from W. Boyle (DOE) to NRC, “Transmittal of Report: Probabilistic Volcanic Hazard Analysis Update (PVHA-U) for Yucca Mountain, Nevada.” October 17, 2008, Project No. WM-00011, Docket Number 63-001, with enclosures. BSC Correspondence Log # 1021084046, CCU.20081021.0009 LSN# DEN001606520.

Thus, Nevada is simply incorrect that DOE ignored post-1996 information and analyses. It fails to show that the original PVHA failed to capture any uncertainties that are relevant to the Application, and consequently it fails to raise a genuine dispute on a material issues.

Nevada also makes the self-evident point that elicitation can be influenced by the data provided to the experts (Petition at 904), but once again it fails to aver, much less demonstrate, any genuine dispute following from that proposition. DOE uniformly distributed literature and technical data sets to all the experts, and that data is described in the PVHA report. SAR at 5.4-5; PVHA Report at 2-13 and Appendix B. Nevada presents no evidence that DOE failed to distribute a suitably broad range of materials and data, and it certainly does not show that the elicitation as conducted produced an inaccurate result as a result of the data sample provided to the experts or otherwise fell short of the regulatory requirements.

In its closest approach to a substantive argument, Nevada recites the undisputed organizational affiliations and experience of the experts chosen, and its own version of the interactive deliberative process followed to develop consensus views as well as fully considered individual ones. Petition at 904-05. This reflects Nevada’s fundamental misreading of NUREG-1563. For example, Nevada mistakenly contends that NUREG-1563 requires eliciting expert

opinion before expert training, workshops, and field trips. Petition at 905. But DOE in fact followed the elicitation guidelines. Both NUREG-1563 and NUREG/CR-6372 make clear that elicitation training should occur in advance of the elicitations in order for the experts to take advantage of the information provided. NUREG-1563 at 17; NUREG/CR-6372 at 44-45. Likewise, both guidelines recommend that expert interactions such as workshops and field trips be conducted in advance of the final elicitation interviews in order for the experts to receive the information and feedback prior to the finalization of their assessments. NUREG-1563 at 27; NUREG/CR-6372 at 45-46. Thus, contrary to Nevada's unsupported accusation that DOE's process was "calculated to have the effect of revising and orchestrating the 'independent' thinking of the subject-matter experts" (Petition at 905), this process is specifically encouraged by the relevant guidelines.

Moreover, out of all this, Nevada comes up only with the unsupported concern that this process "creates the risk of introducing error into the LA and its analyses," which in turn, according to Nevada, "could lead to adverse health and safety consequences for workers and the public." Petition at 906. However, not a single independent basis is advanced in support of this concern, not a single concrete allegation is made about the supposed results of these alleged biases, and not a single expert is listed in Nevada's table of experts in support of it. Thus, this contention is legally insufficient. As discussed in the applicable Legal Standards section above (Section V.A.3), contentions, like this one, that allege errors, omissions, uncertainties or alternative approaches – without specifying the and making a prima facie demonstration of the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible.

Nevada has clearly stated its unhappiness with several aspects of DOE's expert elicitation process. However, it has neither made a prima facie case that DOE's process violated specific regulatory requirements, nor demonstrated that the alleged defects have produced (as distinguished from unsupported speculation that they might have tended to produce) distorted results. As the petitioner, Nevada has the burden of showing that its issues raise a genuine dispute worthy of litigating in this proceeding. An allegation that some aspect of the Application is inadequate or deficient does not give rise to a genuine dispute, unless it is supported by facts and a reasoned statement of why the Application is unacceptable in some material respect. *See Fla. Power & Light Co. (Turkey Point Plan, Unit Nos. 3 and 4)*, LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990). Nevada has not met this burden, and the contention should be dismissed.

**168. NEV-SAFETY-168 - Retrieval Practicality**

The descriptions of plans provided in SAR Subsection 1.11 and similar subsections are not sufficiently detailed to demonstrate waste packages can be retrieved.

**RESPONSE**

In this contention, Nevada alleges that the description of DOE's retrieval plans in SAR Subsection 1.11 and similar subsections lacks sufficient detail, because it does not address certain events that may occur, or other information regarding the Transportation and Emplacement Vehicle (TEV) and drift inspection and maintenance. Nevada alleges, therefore, that DOE has not "demonstrate[d] waste packages can be retrieved." Petition at 908.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada does not demonstrate that DOE's alleged failure to include completed retrieval plans in an application for a construction authorization would in any way prevent the NRC from making the requisite findings under 10 C.F.R. § 63.31(a)(1)-(2). In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding,

Nevada identifies various NRC regulations and the NWSA, as these provisions relate to the subject of waste retrieval, including 10 CFR § 63.21(c)(7) and 10 CFR § 63.31(a)(3). *See* Petition at 908-09. Nevada then asserts that, “This contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of this proceeding.” *Id.* at 908-09.

10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding,” not merely a citation of relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied,” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that a petitioner must demonstrate that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

As noted, this contention alleges non-compliance with various NRC regulations, Petition at 908-09; however, Nevada fails to demonstrate that any of the alleged deficiencies it identifies would preclude the NRC from finding that DOE has designed the facility in such a way as to allow for the retrieval of waste. Indeed, as shown in section f, below, in some cases the alleged deficiency is DOE’s alleged failure to consider certain events, when, in fact, DOE has considered the events and how to deal with them. In other cases, Nevada alleges that certain design details

are missing, but they are not. Finally, Nevada suggests that DOE has no plans for inspections and monitoring to support retrieval activities. This also is contradicted by the Application.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the Application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (by Doug F. Hambley and Allen Messenger) which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

As noted, Nevada argues that the description of DOE's retrieval plans are "not sufficiently detailed to demonstrate waste packages can be retrieved." Petition at 908. As support for this argument, Nevada identified three primary deficiencies: (1) that DOE does not describe how it will "overcome" certain events that may potentially impact retrieval operations; (2) that the TEV and "other equipment" are "incomplete concepts"; and (3) that plans to inspect drifts and maintenance plans, to address ground support failures and other conditions, are lacking. *Id.* at 909-10. Nevertheless, not one of these deficiencies is supported by any facts or

opinion, much less a demonstration that, even if true, any of them would prevent DOE from being able to retrieve waste from the repository.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention also fails to demonstrate the existence of a genuine issue of material fact. In the contention, Nevada implicitly admits that 10 C.F.R. § 63.21(c)(7) only requires that DOE submit a description of its retrieval plans and acknowledges that DOE provided a description in SAR Section 1.11. Nevertheless, Nevada challenges the sufficiency of the description and argues that, among other things, it does not include certain topics or demonstrate that DOE has “designed, prototyped, tested, or demonstrated in any practical manner [that] the equipment . . . [DOE] proposes to use . . . [can] retrieve waste packages.” Petition 908. The three primary deficiencies Nevada identifies to support this argument, however, fail to question the practicability or possibility of retrieval or to support its claimed noncompliance with 10 C.F.R. § 63.21(c)(7).

Nevada’s suggestion that DOE is required to “prototype” the equipment it proposes to use to retrieve waste packages has been considered and rejected by the NRC. In its comments on the final rulemaking for 10 C.F.R. Part 63, the NRC stated that “the Commission *does not* envision that DOE will need to build full-scale prototypes of its retrieval systems to demonstrate that its retrieval plans are practicable at the time of construction authorization.” 66 Fed. Reg. 55743, 55732 (Nov. 2, 2001) (emphasis added). Thus, the NRC already has stated its position on the absence of prototyped retrieval equipment, and as such, Nevada’s resurrection of that issue does not legitimately place the issue into any dispute. To the contrary, the following examples merely show the absence of any challenge to the content of the Application. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), CLI-01-24, 54 NRC 349,

358 (2001), *recons. denied*, CLI-02-1, 55 NRC 1 (2002) (demonstrating that a petitioner must “read the pertinent portions of the license application . . . state the applicant’s position and the petitioner’s opposing view,” and explain why it disagrees with the applicant).

Nevada first argues that there are a number of operational events identified in SAR subsection 1.11.1.2-2 “that may potentially impact retrieval operations” and that DOE provides “[n]o descriptions of plans to overcome these events.” Petition at 910. Nevada ignores, however, that DOE addresses these events in the next subsection. As stated in SAR subsection 1.11.1.2.3, at p. 1.11-7, “[p]otential solutions have been considered that might be implemented for the potential retrieval operational events listed in Section 1.11.1.2.2.” DOE then cites to a reference document, “Concepts for Waste Retrieval and Alternate Storage of Radioactive Waste” §§ 6.3, 6.4, at 15-17, 800-30R-HER0-01100-000-007, ACC: ENG.20080109.0010, LSN#: DEN001570516, which discusses conceptual approaches to recovery from the events identified by Nevada.<sup>95</sup> DOE states, and Nevada acknowledges that DOE states, that development of more detailed plans for waste package retrieval will be driven by the reason for retrieval. Petition at 909.

Nevada also argues that the TEV and “other equipment” that may be necessary for retrieval are “no more than idealized incomplete concepts.” Petition at 910. But this statement is easily refuted, again, by the Application itself. SAR subsection 1.3.3.5.1.1, alone, provides an extensive, specific, and detailed description of the TEV design. That description includes:

- Power supply;

---

<sup>95</sup> Indeed, just a few paragraphs later, at SAR subsection 1.11.1.2.3 (p. 1.11-8), DOE references yet another document, “Strategies for Recovery After an Off-Normal Event to the Waste Package Transport and Emplacement Vehicle” §§ 3.2 through 3.5 (pp. 7-17), 800-30R-HE00-01800-000-000, ACC: ENG.20070531.0043, LSN#: DN20022399654, which provides an even more detailed description of the strategies for recovering from the events that are identified by DOE in the SAR and that Nevada expresses concern about in this contention.

- Pallet and lifting operational processes;
- Frame structure;
- Specific electronic control features designed to permit operation in high-radiation environments;
- Braking process and specific procedural controls to ensure proper braking system operation;
- Collision and speed control design features;
- Analysis of the potential for TEV tipover and derailment and a description of specific safety features designed to minimize the consequences of derailment;
- Seismic restraint features included in the TEV design;
- Analysis of the efficiency of the shielded enclosure with respect to personnel radiation protection and potential rockfall; and
- Analysis of required thermal performance characteristics.

Nevada attempts to bolster its argument about the sufficiency of TEV design details by referencing a technical report prepared by the Swedish Nuclear Fuel and Waste Management Company, which allegedly performed field testing on certain waste retrieval equipment.

Nevertheless, Nevada does not discuss the content of the report or the content of the Application, let alone use the report as a basis to challenge any specific content of the Application.<sup>96</sup>

Nevada’s final attempt to call into question the description of DOE’s retrieval plans is as flawed as the first two. This one relates to DOE’s “practically nonexistent drift inspection and maintenance plans to address ground support failure and associated rock fall and drift collapse.”

---

<sup>96</sup> Although Nevada also challenges the sufficiency of design detail regarding “other equipment . . . which has yet even to be identified,” Petition at 910, Nevada specifies neither the information (or type of information) that is allegedly “missing,” nor the potential significance of such information.

Petition at 911. Here, Nevada fails to address the fact that the ground support for the emplacement drifts is designed to function without planned maintenance for the duration of the preclosure period. SAR section 1.3.4.4.2 (“Operational Processes”) (p. 1.3.4-15). Nevada also appears to assume that significant rockfall or drift collapse will occur in the subsurface facility, yet it does not claim that such events would meet the definition of an event sequence that would need to be considered in the SAR—nor does Nevada provide any basis for making such a claim.

It should also be noted that Nevada ignores SAR Subsection 1.7.5.6 (“Subsurface”), which states that DOE’s analysis determined that there are no Category 1 subsurface event sequences that lead to exposure of individuals to radiation, and demonstrates that the only Category 2 subsurface event sequence does not involve rockfall in emplacement drifts or drift collapse. *See* SAR at 1.7-49 (referencing Table 1.7-18). Accordingly, Nevada does not clearly establish the extent to which there is even a need for drift inspection or maintenance plans to address ground support failure.

Notwithstanding this, DOE commits to monitor selected emplacement drifts as part of its Performance Confirmation Program, which will be accomplished using instrumentation or remotely operated vehicles for visual inspections to detect rockfall. SAR Subsection 1.11.1.2.4.1 (“Subsurface Facility”) (p. 1.11-8). As DOE explains, “[t]hese monitoring and inspection activities [will] provide the necessary information for evaluating drift degradation effects, as well as any required maintenance and repair of the ground support components that may be needed to provide continued accessibility to the emplacement drifts for possible waste retrieval

operations.” *Id.*<sup>97</sup> Nevada does not dispute that DOE has made this commitment or that it is somehow impracticable.

Accordingly, Nevada has failed to demonstrate that any of the alleged deficiencies in DOE’s description of its retrieval represent a genuine dispute of material fact.

---

<sup>97</sup> Apart from the Performance Confirmation Program, and although such events are not expected, DOE has developed strategies for recovery from rock-fall, ground support failure, and other off-normal events that could complicate operations, if such events were to occur. These strategies are described in, among other sources, the two reference documents previously cited. *See generally* Concepts for Waste Retrieval and Alternate Storage of Radioactive Waste,” 800-30R-HER0-01100-000-007, ACC: ENG.20080109.0010, LSN# : DEN001570516; Strategies for Recovery After an Off-Normal Event to the Waste Package Transport and Emplacement Vehicle,” 800-30R-HE00-01800-000-000, ACC: ENG.20070531.0043, LSN# : DN20022399654. Nevada also fails to address, let alone challenge, these strategies.

**169. NEV-SAFETY-169 - Deferred Retrieval Plans**

Legal issue: The LA cannot be granted because it includes only a conceptual discussion of retrieval plans and no actual retrieval plans are included or referenced.

**RESPONSE**

In this contention, Nevada alleges that the Application does not comply with 10 § 63.21(c)(7), because DOE has “deferred” preparing its retrieval plans; and that, as a result, the NRC cannot make the requisite “reasonable assurance” findings under 10 C.F.R. § 63.31(a).  
Petition at 912.

**a. Statement of Issue of Law or Fact to be Controverted**

In this contention, the controversy is purely legal and hinges entirely on the false premise that 10 C.F.R. § 63.21(c)(7) requires more than a description of DOE’s retrieval plans. As demonstrated below, in section f of this response, the language in 10 C.F.R. § 63.21(c)(7) is crystal clear: only a “description” of DOE’s plans is required at this time. Accordingly, this contention should be dismissed, because there is no controversy.

**b. Brief Explanation of Basis**

This contention must also be dismissed because it lacks any basis whatsoever. As demonstrated below, in section f of this answer, Nevada fails to identify any specific missing information that would render the description of its retrieval plans incomplete or would prevent the NRC from making the requisite “reasonable assurance” findings.

**c. Whether the Issue is Within the Scope of the Proceeding**

As demonstrated below, in Section f of this response, there is no dispute as to whether DOE has complied with 10 C.F.R. § 63.21(c)(7), which requires only that a description of DOE’s plans for retrieval be provided at this stage of the proceeding. Insofar as Nevada challenges the

sufficiency of providing a description in place of the plans themselves, Nevada challenges the NRC's regulations by advocating a stricter standard than the regulations require. 10 C.F.R. § 2.335(a); *see also Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant Units 3 and 4), LBP-01-6, 53 NRC 138, 159, *aff'd*, CLI-01-14, 54 NRC 3 (2001) (dismissing contention on the basis that petitioner sought "to impose requirements in addition to those set forth in the regulations").

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

As demonstrated below, in Section f of this response, Nevada does not demonstrate that DOE's failure to include completed retrieval plans would in any way prevent the NRC from making the requisite reasonable assurance findings under 10 C.F.R. § 63.31(a). In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies regulations concerning waste retrieval, including 10 CFR § 63.21(c)(7) and 10 CFR § 63.31(a). *See* Petition at 912-13. Nevada concludes this general description of these sections of 10 C.F.R. Part 63 with the mere assertion that: "The issue must be addressed and resolved in order for the NRC to find, as required by 10 C.F.R. § 63.31(a)(1) and (2), that there is reasonable assurance of safety, and to find that the application complies with 10 C.F.R. § 63.21(c)(7), as required by 10 C.F.R. § 63.31(a)(3). The issue is therefore material." Petition at 912.

10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding," not merely a citation of relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. While the Advisory PAPO Board directed

the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied,” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that a petitioner must demonstrate that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

As noted above, Nevada asserts that this contention alleges non-compliance with 10 C.F.R. §§ 63.21(c)(7) and 63.31(a)(1)-(3). Petition at 912. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the Application; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. This falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

Nevada argues that the “scant sixteen pages” that comprise SAR section 1.11 “provide[] only limited information about retrieval concepts,” and DOE’s commitment to provide more “[s]pecific plans for retrieval . . . should the need for retrieval be identified” is inadequate and

“effectively eliminates the possibility that a there will be a full and fair consideration of retrieval issues on a timely basis.” Petition at 913. Neither of these assertions provides any support for this contention, however, because Nevada fails to identify any information about retrieval that must appear in the Application, but does not.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention fails to demonstrate the existence of a genuine issue of material fact in the two following ways. First, Nevada fails to show that DOE is obligated to provide anything more than a description of its plans for retrieval. On this point, the regulations are, as noted earlier, crystal clear: DOE is required to submit a “description” at the time of license submittal; and that description need only contain all the information that was reasonably available *at the time of docketing*. See 10 C.F.R. § 63.21(c)(7) (requiring “[a] description of plans for retrieval and alternate storage of the radioactive wastes, should retrieval be necessary”); 10 C.F.R. § 63.21(a) (requiring that the Application “be as complete as possible in light of information that is reasonably available at the time of docketing”). DOE provided the requisite description of its retrieval plans in SAR section 1.11 in compliance with 10 C.F.R. § 63.21(c)(7).

Despite this, Nevada maintains that 10 C.F.R. § 63.21(c)(7) requires more than a description, because the “requirement that plans be described suggests that plans must exist or otherwise they could not be described.” Petition at 913. This ignores the accepted practice of describing plans that *will* be developed.<sup>98</sup> As further support for its theory, Nevada also cites to comments made by the NRC about giving DOE’s retrieval “plans and procedures . . . extensive, detailed review . . . as part of any construction authorization review.” *Id.* (citing 66 Fed. Reg.

---

<sup>98</sup> Here, DOE commits to developing “[s]pecific plans for retrieval should the need for retrieval be identified.” SAR at 1.11-1 to -2.

55732, 55743 (Nov. 2, 2001)). This statement, however, merely reflects NRC staff's discretion in its Application review, not what DOE is required to include with its Application. In that regard, the NRC's regulations are the final word on the subject.<sup>99</sup>

Second, even if Nevada were correct in its assertion that finalized, specific retrieval plans are required at this stage, which is not the case, Nevada has not specifically identified any deficiencies in DOE's description of its plans, SAR 1.11, or any where else in the Application with respect to this topic. Interestingly, the NRC's cited comment above, when returned to its proper context, demonstrates that the NRC's concern about the subject of retrieval is not about DOE's retrieval plans per se, but rather whether the information provided in DOE's Application demonstrates that DOE can "design (and) build) the repository in such a way that the retrieval option is not rendered impractical or impossible." 66 Fed. Reg. 55732, 55743.

This is highlighted in 10 C.F.R. 63.111(e), which requires that the GROA "be designed to preserve the option of waste retrieval." DOE's compliance with this design criterion is what the NRC will consider when deciding whether the requisite determinations can be made under 63.31(a). The description of DOE's retrieval plans in SAR section 1.11 is one of many places in the SAR where the NRC will look to determine whether it has reasonable assurance that the option of retrieval has been preserved. Notwithstanding the significance of this design criterion, Nevada never cites to 10 C.F.R. 63.111(e), or points to any deficiency in the SAR that calls into question the design of the repository. Instead, without any support, it simply asserts that DOE's

---

<sup>99</sup> Notably, the cited comment stops short of explaining what the NRC believes the level of detail in DOE's retrieval plans should be; nor does the cited comment define the term "plans." In effect, SAR section 1.11 and its associated reference documents constitute DOE's current retrieval "plans."

failure to provide completed retrieval plans prevents the NRC from finding the requisite “reasonable assurance” under 10 C.F.R. 63.31(a). Petition at 912.<sup>100</sup>

In sum, Nevada does not demonstrate that there is any dispute as to whether DOE has complied with 10 C.F.R. § 63.21(c)(7), because DOE invariably provided a description of its retrieval plans. Likewise, Nevada fails to offer any support for its belief that the NRC cannot make the requisite “reasonable assurance” findings under 10 C.F.R. § 63.33(a), because nothing in Nevada’s contention seriously questions whether the option of retrieval has been preserved in the design of the repository.

---

<sup>100</sup> Nevada also asserts that the failure to provide a complete plan “effectively eliminates the possibility that there will be full and adequate consideration of retrieval issues before wastes are emplaced.” This statement not only lacks support, it also fails to recognize that, before DOE can receive and possess radioactive materials at the GROA, DOE must separately apply for a license. *See* 10 C.F.R. § 63.41.

**170. NEV-SAFETY-170 - Conservatism And The PMA**

The PMA in Subsection 2.4.2.3.2.3.2.4 of the SAR, and referred to in related subsections, is offered to validate or provide confidence in the TSPA, but it cannot be used for these purposes, or to demonstrate net conservatism or margins in the TSPA, because the PMA (LSN# DN20023695678) assumes that certain important parts of the TSPA are conservative when, in fact, these parts are not adequately supported, are biased in favor of compliance, or are simply wrong.

**RESPONSE**

This contention asserts that the Performance Margin Analysis (PMA) in “Subsection 2.4.2.3.2.3.2.4 of the SAR, and referred to in related subsections,” cannot be used to validate or provide confidence in the TSPA because the PMA erroneously assumes that certain important parts of the TSPA are conservative. Petition at 916.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Nevada’s challenge to the PMA appears to be premised on the assumption that the PMA is a necessary element in the validation of the TSPA. However, as described in the SAR, the procedurally-defined validation level for the TSPA model requires at least two of the post-development model validation activities described in the TSPA model report. SAR 2.4.2.3.2 at

2.4-122, citing to “Total System Performance Assessment Model/Analysis for the License Application,” LSN# DEN001579005 at Section 7. The TSPA model validation analyses are summarized in SAR Table 2.4-8. In addition to the required validation activities, DOE conducted several other post-development activities to enhance confidence in the TSPA model, including the PMA. However, the additional activities were entirely optional, and not mandated by DOE’s procedures or NRC regulations. SAR 2.4.2.3.2.3.2.4 at 2.4-245.

Therefore, to the extent that Nevada’s contention is asserting that NRC regulations required DOE to conduct the PMA, this contention should be dismissed. It is well settled that, absent a waiver, “no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding.” 10 C.F.R § 2.335(a). This includes a contention that advocates stricter requirements than those imposed by the Commission’s regulations. *See Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-01-6, 53-NRC-138, 159, *aff’d*, CLI-01-17, 54-NRC-3 (2001).

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the Petition identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this issue is therefore material.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material *only* if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. See 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 supra, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method DOE used in addressing the issue in the contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a "reasonable expectation": (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and

analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

In making its “reasonable expectation” determination, the NRC must evaluate DOE’s compliance with the applicable provisions of Part 63, including, among other things, whether DOE has described the proposed geologic repository as specified in § 63.21, and whether the site and design comply with the Part 63 performance objectives and requirements. Proposed safety contentions that fail to raise issues that are material to these findings are inadmissible. For example, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. As stated in Section V.A.3 above, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

Nevada asserts that DOE’s PMA violates the applicable regulations because the fundamental premise for the PMA, that certain assumptions in the TSPA are conservative, is flawed because these assumptions are unsupported, are biased in favor of compliance, or are simply wrong. Petition at 917. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically,

Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3, above, discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any supporting documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach one affidavit (Michael C. Thorne), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in this contention, the affidavit simply "adopts" the otherwise unsupported assertions in paragraph 5 of this contention. That approach falls far short of the requirement in 10 C.F.R. § 2.309(f)(1)(v) to provide conclusions supported by reasoned bases or explanation.

Nevada's attempt to provide support for its contention by listing twenty-five other Nevada contentions must necessarily fail. Contentions do not constitute factual information that can be used to provide the necessary support for yet additional contentions.

Therefore, the contention is not supported by adequate factual information or expert opinion under 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed above, DOE has already demonstrated that Nevada's claims are outside the scope of the proceeding, are not material and are not supported by adequate factual information or expert opinion. Accordingly, Nevada's claims also do not raise a genuine dispute of material fact or law. But the contention also contains other arguments which, as DOE demonstrates below, also do not raise a genuine dispute. In particular, Nevada asserts that the PMA cannot be used to validate or provide confidence in the TSPA because the PMA erroneously assumes that certain important parts of the TSPA are conservative. Petition at 916. For the reasons discussed below, these arguments do not raise a genuine dispute of material fact or law and must be dismissed.

First, in its assertion that the assumptions in the TSPA cannot be claimed to be conservative because the assumptions are unsupported, are biased in favor of compliance, or are simply wrong, Nevada fails to directly controvert DOE's documented position to the contrary. In this regard, the contention does not address any of the conservatisms in the TSPA, documented in "Total System Performance Assessment Model/Analysis for the License Application," LSN# DEN001579005, at Sections 6.3 to 6.6, nor does it even address the technical bases for the conservatisms as documented in the conclusions of the major subsections of SAR Section 2.3. Nevada's failure to controvert any of DOE's documented statements regarding the conservatism of TSPA necessarily means the contention does not raise a genuine issue of material fact. *See Tex. Utils. Electric Co. (Comanche Peak Steam Electric Station, Unit 2)*, LBP-92037, 36 NRC 370, 384 (1992).

Second, according to Nevada's "general proposition," it is not possible to select bounding or conservative representations of uncertainty if information is lacking or the degree of

complexity exceeds the ability of suitable methodologies to provide realistic representations of uncertainty. Petition at 917. This “general proposition,” which constitutes Nevada’s only basis for its assertion that the assumptions in the TSPA are not conservative, is unsupported, incorrect, and fails to directly controvert DOE’s position on the issue of conservatism in uncertainties. As discussed above in Section e, Nevada has failed to provide any facts or expert opinion in support of this statement. In addition, the logic of the “general proposition” is flawed because the methodologies for selecting a bounding or conservative representation of uncertainty are well-established and are commonly used in the nuclear industry. *See* NUREG/CR-6823, Appendix B. For the repository, DOE’s characterizations of uncertainty for the TSPA were guided by a set of guidelines. “Guidelines for Developing and Documenting Alternative Conceptual Models, Model Abstractions, and Parameter Uncertainty in the Total System Performance Assessment for the License Application” LSN# DN2002011095. Nevada has not directly controverted DOE’s position on its methodology for selecting conservative representations of uncertainty, and therefore the contention does not establish a genuine dispute of material fact. *See Tex. Utils. Electric Co. (Comanche Peak Steam Electric Station, Unit 2)*, LBP-92037, 36 NRC 370, 384 (1992).

Third, although this contention asserts that the PMA should not have been premised on the conservatism of certain assumptions in the TSPA, the contention does not allege that the PMA results would have been significantly different. As discussed in Section V.A.3, above, contentions that allege errors, omissions, uncertainties or alternative approaches, without specifying the ramifications or results of such alleged deficiencies, fail to raise a genuine dispute of material fact.

Other than asserting that DOE's PMA was improperly based on assumptions in the TSPA that are not conservative, Nevada fails to provide anything substantive that challenges the validity of the PMA or, by extension, the TSPA. Contentions like this one that allege errors, omissions, uncertainties or alternative approaches – without specifying the ramifications or results of such alleged deficiencies – fail to raise a genuine dispute of material fact and are, therefore, inadmissible. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521 (1990). Furthermore, as stated above in Section d, because 10 C.F.R. Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses and to report those doses as mean doses, contentions failing to allege an increase in the mean dose above the regulatory limit are inadmissible.

Finally, paragraph 6 of the contention, in addition to not having been “adopted” by any of Nevada's experts, makes no attempt whatsoever to demonstrate a genuine dispute on a material fact or law. That paragraph simply repeats, for the fourth time on only three and one half pages, the mantra of this contention, that “the fundamental premise for the PMA, that certain assumptions in the TSPA are conservative, is flawed because these assumptions are unsupported, are biased in favor of compliance, or are simply wrong.” Petition at 918.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(vi) and should be rejected.

**171. NEV-SAFETY-171 - PMA And QA**

Legal issue: The PMA in Subsection 2.4.2.3.2.3.2.4 of the SAR, and referred to in related SAR subsections, is offered to validate or provide confidence in the TSPA and to demonstrate net conservatisms or margins in the TSPA, but it cannot lawfully be used for these purposes because it relies on data and models that are not qualified pursuant to DOE's quality assurance program.

**RESPONSE**

This contention challenges the use of the performance management analysis (PMA), which is included in the SAR to provide further confidence in the TSPA and to assess the conservatisms in the TSPA, because the PMA uses data and models not qualified under DOE's quality assurance (QA) program.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations in 10 C.F.R. Part 63, subpart

E and the requirement from 10 C.F.R. §63.31(a)(3)(ii) that the site and design must comply with Subpart E, and then states that “[t]he issue is therefore material.” *See* Petition at 919-20.

Nevada also states that it challenges compliance with various sections in 10 C.F.R. Part 63, Subpart G and states that 10 C.F.R. § 63.31(a)(3)(iii) requires a finding of compliance with Subpart G. *Id.* at 920. Nevada fails to specify how the PMA does not comply with subparts E or G or how the PMA causes the Application to fail to comply with subparts E or G.

10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

Nevada's assertion that the PMA relies on data and models not qualified under DOE's QA program fails both to identify a specific violation of Subpart E and fails to identify a connection with the determinations of safety, common defense and security, and environmental values that the Commission must make. *See* 10 C.F.R. § 63.31.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Nevada's challenge to the use of the PMA on the grounds that it uses data and models that are not qualified under DOE's QA program does not raise a genuine dispute on a material issue of law or fact because there is no regulatory requirement that explicitly or implicitly subjects the PMA to DOE's QA program.

First, the PMA is one of the post-development validation activities used to enhance confidence in the TSPA, but is not one of the two post-development model validation activities required by the project's modeling procedures. *See* SAR at 2.4-245. The PMA provides additional confidence in the TSPA by examining the effects of conservatisms on the outputs from the TSPA. The purposes of this exercise were to confirm that that the conservatisms remain conservative when propagated through the TSPA, to quantify the extent to which the conservatisms overestimate the projected annual dose, and to assess that the conservatisms did not introduce any risk dilution in the TSPA results. *Id.* The PMA achieved these goals by performing a separate set of TSPA calculations in parallel to those in the TSPA, but removing some of the conservatisms that exist in the TSPA. *Id.* at 2.4-245 to -246.

The Quality Assurance Requirements and Description (QARD) identifies the TSPA and qualification of its *inputs* within the category of "activities related to" systems, structures and components (SSCs) important to safety and to barriers important to waste isolation, and are therefore subject to the QA program. Quality Assurance Requirements and Description, rev. 20,

§ 2.2.2, (Oct. 1, 2008). The PMA, however, is a tool for understanding and evaluating the *outputs* of TSPA, not its *inputs*, and thereby is not subject to the QA program under § 2.2.2 of the QARD. Also, because the PMA is related to the TSPA, and is not the TSPA itself or other study of the SSCs important to safety or barriers important to waste isolation, it does not fall within the category of activities “related” to such SSCs or barriers. Nevada’s statement that “[s]ince the PMA is offered as a part of DOE’s compliance case, it is subject to quality assurance requirements” is made without legal citation because there is no such legal standard.

Second, the documents governing DOE’s QA program do not specifically include the PMA.<sup>101</sup> The QA program must apply to SSCs important to safety, to barriers important to waste isolation and to related activities. 10 C.F.R. § 63.142(a). As discussed above, the TSPA and qualification of its inputs are “activities related to” SSCs important to safety and to barriers important to waste isolation, and are thereby subject to the QA program. QARD, § 2.2.2 at 30. Neither the regulations nor the QARD, however, include the PMA in the “related activities” category that is subject to the QA program. *See* 10 C.F.R. § 63.142(a); QARD § 2.2.2 at 30. As such, Nevada fails to raise a genuine dispute on a material issue of fact or law because there is no explicit requirement that subjects the PMA to the QA program.

Finally, as discussed above, Nevada does not explain how the PMA violates requirements of 10 C.F.R. Part 63 subpart E, and thereby fails to raise a genuine dispute of a material issue of law or fact in that regard as well. The contention should be dismissed for failure to raise a genuine dispute on a material issue of law or fact.

---

101 Although not required to be subject to DOE’s QA program, the PMA exceeded regulatory requirements by following the DOE’s QA program for model development, as implemented in the procedure, Sandia National Laboratories, SCI-PRO-006, Models rev. 14 (Effective date Oct. 1, 2008) (LSN# DEN001603409), with the exception of a subset of the data that needs to be treated as not qualified in accordance with the QARD, and an excel spreadsheet that contained a simple macro that also needs to be treated as not qualified in accordance with the QARD.

**172. NEV-SAFETY-172 - Inspection And Verification Of TAD**

SAR Subsections 5.0, 5.1, 1.5, 1.5.1, 1.2.1, and similar subsections, and DOE'S QARD (incorporated by reference in the License Application in Chapter 5) Sections 7.1, 7.2, and similar subsections, demonstrate that DOE is required to, but does not intend to, require reasonable assurance with respect to the contents and the proper packaging of those contents by nuclear utilities providing waste to DOE for the proposed repository in transportation, aging, and disposal (TAD) canisters; such quality assurance failure with respect to the important-to-safety (ITS) TAD renders it unusable for emplacement and storage of waste in the proposed Yucca Mountain repository.

**RESPONSE**

This contention alleges that in SAR §§ 5.0, 5.1, 1.5.1, 1.2.1, and similar subsections, and in DOE's QARD, DOE is required to, but does not intend to, require reasonable assurance with respect to the contents and the proper packaging of those contents by nuclear utilities providing waste to the repository in transportation, aging and disposal canisters (TADs). The contention also alleges that DOE's proposed approach to accepting the TADs from utilities is a quality assurance (QA) failure that renders TADs unusable for emplacement and storage of waste in the repository.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is outside the scope of this proceeding for several reasons, not the least of which is because the contention could only fall within the scope of DOE's application for a license to receive and possess licensed materials, *not* construction authorization. The contention alleges that DOE's proposed approach to accepting TADs from utilities is a QA failure, or somehow a violation of the applicable QA regulations, but ignores the fact that the NRC already has deemed activities related to operations (i.e., activities that will occur after DOE receives its license to receive and possess licensed materials) as beyond what DOE's QA program must encompass at this time. Simply put, DOE will not perform any licensed activities involving TADs until after a construction authorization is granted and DOE receives its license to receive and possess SNF.

In response to questions regarding "which elements of DOE's QA program should be in place at the time of license application submittal," the NRC stated that:

The DOE quality assurance program and associated quality assurance program controls and implementing procedures regarding activities performed must be in place before activities begin. These activities include site characterization; acquisition, control, and analysis of samples and data; tests and experiments; scientific studies; facility and equipment design and construction; and performance confirmation.

U.S. Nuclear Regulatory Commission, Yucca Mountain Review Plan, NUREG-1804, Rev. 2, Final Report 68 Fed. Reg. 45,086, 45,103 (July 31, 2003) (quotations omitted). It is clear from this statement that the NRC does not expect to receive from DOE, at this time, detailed QA program information on activities related to the receipt and possession of TADs. Nor does Nevada cite any legal authority that, if applicable, would broaden the scope of what the NRC

declared the QA program must cover for the purposes of this proceeding.<sup>102</sup> Thus, Nevada fails to establish that DOE's QA program, as it would apply to receiving TADs, is within the scope of this proceeding.

The contention also is outside the scope of this proceeding because it seeks to introduce issues that relate to activities performed by utilities, including the preparation of TADs for shipment to the Yucca Mountain repository. Such activities are not governed by any aspect of 10 C.F.R. Part 63, but rather 10 C.F.R. Parts 50 ("Domestic Licensing of Production and Utilization Facilities"), Part 70 ("Domestic Licensing of Special Nuclear Material"), and Part 71 ("Packaging and Transportation of Radioactive Material"). 10 C.F.R. Part 63 does not govern the procedures and controls to be used at nuclear reactor sites for the loading of TADs for shipment to the repository (or for any other related activities).<sup>103</sup>

Many of the arguments that Nevada makes in this contention also relate to the Standard Contract and, for this additional reason, the contention must be dismissed as outside the scope of this proceeding. Specifically, Nevada challenges whether the Standard Contract even applies to TADs, because the contract predates DOE's decision to use them. Petition at 929. Nevada also takes issue with the scope of the activities to be performed by DOE under the contract, because, according to Nevada, it leaves much of the work related to the packaging of TADs up to the utilities. *Id.* at 928. Along these same lines, Nevada implicitly challenges the adequacy of the

---

<sup>102</sup> Notably, the portion of the Yucca Mountain Review Plan, NUREG-1804, that covers the subject of QA does not yet include guidance on activities during the operations phase. *See* U.S. Nuclear Regulatory Commission, Yucca Mountain Review Plan, Rev. 2, NUREG-1804 § 2.5.1.3 at 2.5-4 (July, 2003); 68 Fed. Reg. 45,086, 45,103 (July 31, 2003) ("The Yucca Mountain Review Plan will be modified, at the appropriate time, to include facility operation, permanent closure, and decontamination and dismantling of surface facilities.").

<sup>103</sup> The NRC's view regarding its licensing authority under 10 C.F.R. Part 63 is best summarized in the Proposed Rule for 10 C.F.R. Part 63, where the NRC stated that its authority is "limited to the licensing of *DOE* to receive and possess source, special nuclear, and byproduct material at a geological repository operations area [(GROA)] sited, constructed, or operated *at Yucca Mountain, Nevada.*" Proposed Rule, Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, Nevada, 64 Fed Reg. 8,640, 8,655 (Feb. 22, 1999)(emphasis added).

contract on the basis that it does not explicitly impose QA-related requirements on utilities. *Id.* at 929-30.

Nevertheless, a challenge to the Standard Contract among parties under the NWPA is outside the scope of this proceeding. Section 302 of the NWPA makes it clear that the acceptance of SNF by DOE for disposal at the Yucca Mountain repository is governed by the contract between DOE and the generator of the SNF, and that *DOE* is responsible for establishing the terms and conditions of that contract.<sup>104</sup> As a result, Nevada may not challenge the NWPA or the Standard Contract in this proceeding; and this contention, which is an attempt to do so, must be dismissed.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that is material in this proceeding, because it alleges an absence of QA requirements over activities – *operations* – that will not take place until after DOE receives its license to receive and possess licensed materials. In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada references the requirement that the Application describe the QA program (10 C.F.R. §63.21(c)(20)), the consideration that the NRC must give to DOE’s compliance with subpart G (10 C.F.R. § 63.31(a)(3)(iii)), and the requirement that DOE implement a QA program in compliance with 10 C.F.R. § 63.142 (10 C.F.R. § 63.143). Petition at 924.

Nevada then takes a leap of logic and states that the contention raises a material issue because it questions “whether DOE’s plan to receive TAD canisters already packed with waste at

---

<sup>104</sup> Section 302 also makes the Standard Contract a condition for the issuance or renewal by the NRC of a license for a commercial power plant. Neither section 302, nor any other statutory provision, grants the NRC authority to approve the terms and conditions of the contract or to regulate how the contract is implemented. Any questions concerning the implementation of a contract under section 302 must be resolved by DOE and the contract holder or by an appropriate court.

the site of the utility delivering it, without ensuring that the TADs have been prepared and loaded in compliance with an adequate and compliant QA program, constitutes a failure on the part of DOE to itself comply with the requisites of Sections 63.142 and 63.143.” Petition at 924-25. Nevada fails to explain, however, how the applicability of the QA program to the contents and packaging of TADs is material to the findings that the NRC must make in connection with its determinations regarding construction authorization (i.e., how the issues presented in this contention, if admitted, would make a difference in the outcome of this construction authorization proceeding). *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 333-34 (1999).<sup>105</sup>

Nevada cannot make the above showing because, at this time, the NRC is being asked to only make findings with respect to the construction of the repository. Nevada does not cite any legal authority requiring that the SAR or QARD submitted as part of the Application for construction authorization include the QA program to confirm that utilities are appropriately packing TADs because there is no such legal authority. Moreover, the applicable regulations explicitly contemplate that DOE will change its QA program following the submittal of the Application. *See generally* 10 C.F.R. § 63.144. SAR § 5.1 and the QARD, which is incorporated by reference and, therefore, also part of the Application, reflect this same concept. *See* SAR § 5.1 at 5.1-2 (“The QARD will be revised at appropriate times to address future activities related to facility operations, permanent closure of the repository, and decommissioning and dismantlement of the surface facilities.”); QARD at 19 (“This QARD will

---

<sup>105</sup> Notably, Nevada fails to cite a regulation or statute that requires DOE to apply its QA program to the utilities who will prepare TADs, or that requires DOE to obtain the referenced “reasonable assurances” in any other way. Nor is there any regulatory requirement for DOE to inspect or verify the contents of the TADs. It should also be noted that DOE has no regulatory authority at commercial nuclear reactor sites.

be revised prior to the receipt of a license to receive and possess HLW/SNF to address activities associated with facility operation.”).

Notwithstanding this specific DOE commitment, Nevada claims a deficiency in the Application exists and cites to 10 C.F.R. § 63.31(a)(3) as support for the proposition that the QA program is somehow a failure because it lacks details about activities (i.e., the receipt and possession of TADs) that DOE cannot yet perform. Nevada’s arguments are misplaced. The plain language of the regulation demonstrates that DOE’s compliance with Subpart G (including 10 C.F.R. § 63.142) is one of several issues for the Commission to “consider” in making its safety determinations. *Nothing* in either 10 C.F.R. § 63.31(a)(3) or 10 C.F.R. § 63.142 requires that DOE’s QA program cover activities beyond those activities for which authorization is sought. In sum, any other interpretation flies in the face of the NRC’s acceptance criteria and the multi-phased nature of the licensing process described by the NRC in the Statements of Consideration for 10 C.F.R. Part 63:

[P]art 63 provides for a multi-staged licensing process that affords the Commission the flexibility to make decisions in a logical time sequence that accounts for DOE collecting and analyzing additional information over the construction and operational phases of the repository. The multi-staged approach comprises four major decisions by the Commission: (1) Construction authorization; (2) license to receive and emplace waste; (3) license amendment for permanent closure; (4) termination of license. The time required to complete the stages of this process . . . is extensive and will allow for generation of additional information. Clearly, the knowledge available at the time of construction authorization will be less than at the subsequent stages.

Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, Nevada, 66 Fed. Reg. 55,732, 55738 (Nov. 2, 2001).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. In contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v)(1), the contention contains only unsupported assertions of counsel and lacks any reference to any expert opinion. That approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation. Nevada fails to provide any evidence that the assurances it claims are lacking could have any impact on the determinations that the NRC must make with respect to either the preclosure or postclosure period of the repository. Nevada also does not provide any evidence that the QA programs of the utilities or other types of assurances discussed below are in any way inadequate with respect to issues related to the contents and packaging of the TADs. Indeed, even if everything stated in this contention were accepted as true, it would still fail to draw any connection to safety, because none is articulated, let alone demonstrated with facts or expert opinion.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For reasons discussed above, this contention also fails to raise a genuine dispute on a material issue of law or fact because there is no legal requirement that the Application identify the elements of the QA program as it will apply to operations. The applicable regulations and guidance explicitly contemplate that DOE will amend its QARD to address operations sometime after receipt of construction authorization; and DOE has not yet asked the NRC to consider the appropriateness of the QA program for operations and the activities that will follow. Nor should

Nevada be allowed to somehow force that consideration upon the NRC Staff before DOE has requested NRC's approval for a license to receive and possess.

In any event, even if Nevada were able to demonstrate that DOE's QA program—as it applies to operations—was somehow at issue here, it is beyond dispute that DOE *does* have the “reasonable assurances” referenced by Nevada. In this regard, Nevada fails to address a number of such assurances that will exist (if they do not already). Indeed, as discussed below, rather than accepting waste “on the honor system” or taking a “leap of faith,” as Nevada alleges, (Petition at 927-28) DOE's acceptance of SNF will be based on a number of assurances that utilities will, among other things, properly package TADs.

First, treatment of TAD contents, TAD licensing, and packaging are activities covered by a multitude of NRC regulations (10 C.F.R. Parts 50, 70 or 71) and performed pursuant to NRC-approved QA programs. These QA programs cover such activities as the loading of the TADs and maintenance of related records. These QA programs also are comparable to DOE's QA program under 10 C.F.R. Part 63; and DOE reasonably relies on TAD activities being conducted properly by the utilities based on the results of NRC inspections, and QA program reviews of utility site activities. SAR, § 1.5.1 at 1.5.1-5.

Second, additional assurances that utilities will properly package TADs are provided by DOE's ability and future commitment to review the utilities' quality-affecting work-related documentation. DOE has committed to amend the SAR and QARD to memorialize its commitment to perform this activity. *See* Letter to Brian J. Benney from Jeffrey R. Williams, “Yucca Mountain – Request for Additional Information Re: License Application (Safety Analysis Report – Section 5.1) Quality Assurance” (Dec. 10, 2008) (LSN# DEN001606742 at 2 and Enclosure 06 (Response to RAI Vol. 4, Chapter 2-5-1, 1st set – Number 9)). Reviews that

DOE will perform and the circumstances under which such reviews will be performed will be identified in procedures to be developed in connection with DOE's request to receive and possess licensed materials. *Id.* DOE also has reserved to itself under the Standard Contract the ability to observe the preparatory activities of the utilities as they ready their waste for shipment offsite. *See* SAR, §1.5.1 at 1.5.1-5.

Third, the utilities are obligated to provide DOE with descriptions of the waste in the containers (SAR, § 1.5.1 at 1.5.1-5), along with a certification that states that “the above-named materials are properly described, classified, packaged, marked and labeled and are in proper condition for transfer.”<sup>106</sup> Thus, clearly, Nevada's statements that DOE has not addressed the issue of the certification to be completed by the utilities, Petition at 929, is wrong and does not raise a genuine issue of fact.

Fourth, DOE also has the ability to reject any TADs that do not meet waste acceptance requirements. Under the Standard Contract, DOE and the utilities have agreed that “DOE shall accept . . . *only* such SNF and/or HLW which meets the General Specifications for such fuel and waste.” *Id.* at Art VI.A.1 (emphasis added). Further, DOE accepts SNF and HLW for disposal only “when DOE has verified the SNF and/or HLW description, determined the material is properly loaded, packaged, marked, labeled and ready for transportation. *Id.* at Art. VI.B.2. DOE has reserved to itself the right “in its sole discretion to refuse to accept such SNF and/or HLW until the SNF and/or HLW have been properly described.” *Id.* at Art. VI.B.3; *see also* Office of Civilian Radioactive Waste Management, “Civilian Radioactive Waste Management

---

<sup>106</sup> *See* 10 C.F.R. § 961.11, Art. VI.B.2. Nevada's statements that DOE somehow has “failed, despite proposing to give ‘incentives,’ to secure an agreement with nuclear power plant operators,” Petition at 924, also is wrong because participation in the Standard Contract by the utilities is required if the utilities wish DOE to accept their SNF. DOE does not just “assume” that information regarding the waste will be supplied with the records for each proposed shipment of waste—such information is required and DOE can reject the proposed shipment if such information is not provided. 10 C.F.R. § 961.11, Art. VI.B.3.

System Waste Acceptance Requirements Document” Rev 5 (May 31, 2007) (LSN# DN2002409775 at 13) (indicating that commercial SNF “shall meet the requirements specified in 10 C.F.R. Part 961” if it is to be accepted for disposal).

Notwithstanding all of the above assurances (or perhaps because of them), Nevada tries to liken DOE’s acceptance of TADs packaged by utilities to a procurement activity. *See* Petition at 925-26. Nevada, however, fails to offer any legal theory as to how these QARD provisions would apply to the SNF-generating utilities (including, but not limited to, how activities covered by the Standard Contract could possibly fall within the scope of this proceeding). Nevada also fails to demonstrate how treating its contractors, suppliers and procurement relationships different from utilities would result in a violation of a specific NRC regulation. Indeed, Nevada mischaracterizes receiving SNF and HLW from utilities, which would occur after the issuance of authorizations to construct and operate the GROA, as a procurement activity in support of the licensing and construction of the GROA. In short, the logic of Nevada’s position does not withstand critical analysis and this contention should be dismissed.<sup>107</sup>

As a final point, the QARD provides that “[a]dditional QA-related requirements governing the interface between commercial nuclear utilities and the OCRWM will be addressed in greater detail in future QARD revisions when OCRWM deems such an action necessary.” QARD at 137 (“Appendix C – Waste Custodians”). Consequently, there is no genuine dispute with regard to DOE’s acceptance of TADs from utilities because, beyond the fact that the issue is

---

<sup>107</sup> The sections of the regulations cited in the contention that require application of DOE’s QA program to “procurement” refer only to materials that are “purchased” by DOE. DOE is not purchasing waste. In fact, under the terms of the Standard Contract, the utilities are the “Purchasers,” and are referred to as such, because they are purchasing SNF management. *See, e.g.*, 10 C.F.R. § 63.142(e) (“requirements necessary to assure adequate quality are suitably included or referenced in the documents for procurement of material, equipment, and services, whether purchased by the licensee or applicant”); 10 C.F.R. § 63.142(h) (“DOE shall establish measures to assure that purchased material, equipment, and services, which are purchased directly or through contractors and subcontractors, conform to the procurement documents.”).

outside the scope this proceeding, DOE already has laid the groundwork for, and committed to, further reasonable assurances to address these operational issues before DOE is granted a license to receive SNF and HLW. Litigating related issues at this stage would, at best, be premature.

**173. NEV-SAFETY-173 - Emplacement Drift Monitoring**

SAR Subsection 1.3.4.8.2.4 and similar subsections, which discuss monitoring processes for waste emplacement and the preclosure period in general, fail to include sufficient detail to determine whether these monitoring efforts will fulfill the requirements that the LA places on them, and as a result, the LA assumptions related to waste package emplacement and the effectiveness of the engineered barrier system are unfounded.

**RESPONSE**

This contention asserts that certain assumptions in the LA regarding waste packages and engineered barriers cannot be made because the LA contains insufficient information about the systems for monitoring conditions in the emplacement drifts during the preclosure period.

**a. Statement of Issue of Law or Fact to be Controverted**

This contention does not provide a specific statement of the issue of law or fact to be raised, because the contention neither specifies the monitoring processes it challenges nor the specific requirements that such processes would allegedly not meet.

Paragraphs 1 and 5 of the contention mention SAR Subsection 1.3.4.8.2.4, and paragraph 5 also mentions SAR Subsection 1.3.5.2, but Petitioner also purports to challenge other “similar subsections,” which Petitioner identifies simply as those subsections that “discuss monitoring processes for waste emplacement and the preclosure period in general.” Petition at 933. This description is unduly broad, since monitoring during the preclosure period is discussed in *many* subsections of the LA. In fact, numerous types of preclosure monitoring are mentioned in the LA, including, but not limited to: Precipitation (SAR at 4-15); seepage (SAR at 4-16); Saturated Zone Monitoring (SAR at 4-20); Thermally Accelerated Drift Near-Field Monitoring (SAR at 4-25); Dust Buildup (SAR at 4-26); Thermally Accelerated Drift In-Drift Environment Monitoring

(SAR at 4-28); Seismicity (SAR at 4-30); Construction Effects (SAR at 4-31); Waste Package Monitoring (SAR at 4-36).

There is also a wide variety of monitoring processes that specifically relate to waste emplacement. For example, Subsection 1.3.1.2.1.6, “Monitoring Activities” (at 1.3.1-10), alone, mentions monitoring of: radon; radiation; dust; airflow velocity; barometric pressure; air temperature; humidity; airborne particulates; carbon monoxide; airborne radioactive materials; emplacement access doors; ventilation fans; ground support; invert structures; rails; isolation barriers; and many other such activities. Consequently, this contention does not alert DOE to which portions of the LA are at issue. Nor does it identify the specific monitoring process descriptions that it seeks to challenge.

This contention also fails to specify the “LA assumptions related to waste package emplacement and the effectiveness of the engineered barrier system” that Petitioner seeks to challenge. Petition at 933. Petitioner asserts in paragraph 2 of the contention that waste packages and other engineered barriers will be “installed within specified tolerances and in conformance with other engineering requirements” and “the ventilation system will maintain the temperature at a level that will facilitate installation of the drip shields or retrieval of the waste packages,” but does not identify the tolerances or requirements or identify temperature requirements for these activities. *Id.*

Similarly, in paragraph 5 of the contention, Petitioner refers to transport and emplacement vehicle (TEV) cameras for remote monitoring of the placement of waste packages, and airflow volumes and temperatures in the emplacement drifts, airflow regulator damper positions, and “other features of the ventilation,” but does not identify any of the LA

assumptions that allegedly depend on or even relate to such features. *Id.* at 934. As a result, the contention does not alert DOE to the LA assumptions that it seeks to challenge.

Not only does this contention fail to give DOE sufficient notice of the issues of law or fact Petitioner seeks to dispute, but it also does not comply with the direction of the June 20, 2008, Case Management Order for this proceeding that contentions be “narrow, single-issue contentions” that are “sufficiently specific as to define the relevant issues for eventual rulings on the merits, and not require” extensive narrowing or clarification by the parties or boards. *U.S. Dep’t of Energy* (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board), LBP-08-10, 67 NRC \_\_ (slip op. at 6) (June 20, 2008). For these reasons, this contention should be dismissed.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

As discussed in e. and f. below, Nevada has failed to demonstrate that this contention raises a material issue.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

This contention also should be dismissed because it is not supported by any facts or expert opinion. To the contrary, the “facts” cited by Petitioner fail to provide any basis for

concluding that the monitoring systems cited in this contention are material to any determination that the NRC must make. Petitioner's comments on the level of detail in the LA, therefore, do not provide any basis for concluding that more detailed information is required, and do not show that such information is material. Indeed, this contention does not reference any expert opinion or documentation other than the LA. Instead, this contention appears to consist entirely of arguments of counsel and illustrates a fundamental misunderstanding of the significance of the above-referenced monitoring systems.

The legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted are discussed in Section V.A.3 above. This contention fails to meet those standards because, as noted, it presents only unsupported arguments of counsel. It should also be noted that, although not referenced in the body of this contention, attachments to two of the affidavits included with the Petition (by Doug F. Hambley and Steven A. Frishman) reference this contention, albeit broadly. Nevertheless, these references do not somehow save this contention from being dismissed for failure to provide an adequate statement of alleged facts or expert opinion. As discussed in Section V.A.3 above, the affidavit(s) fall far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in section V.A.3 above, contentions that allege errors, omissions, uncertainties or alternative approaches -- without specifying the ramifications or results of such alleged deficiencies -- fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. This contention suffers from this deficiency. Paragraph 4 of the contention discusses various regulations and then asserts that “[t]his contention alleges non-compliance with

these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” Petition at 934. But this assertion is not borne out by the actual contention or any of the statements made in connection with it. Indeed, the contention makes no attempt to show that, if true, the alleged missing information would prevent the NRC from making any material finding, or that the proposed repository would not meet any regulatory requirements. Instead, Petitioner merely alleges that “the LA assumptions related to waste package emplacement and the effectiveness of the engineered barrier system are unfounded.” *Id.* at 933. The contention does not, however, identify any specific assumptions that are alleged to be unfounded, explain how the effect of the alleged monitoring concerns on such assumptions would affect the safety of the repository, or how the NRC’s ability to make a required finding could be affected.

In Paragraph 2 of the contention, Petitioner argues that:

[t]he LA assumes that the waste packages and other engineered barriers are installed within specified tolerances and in conformance with other engineering requirements and that the ventilation system will maintain the temperature at a level that will facilitate installation of the drip shields or retrieval of the waste packages. However, the lack of information on the systems for monitoring the conditions in the emplacement drifts during the preclosure period means that there is no assurance that these assumptions can be achieved.

Petition at 933. This stops short of challenging any specific assumptions, explaining how the information in the LA regarding “the systems for monitoring the conditions in the emplacement drifts during the preclosure period” is insufficient, or indicating how the implied potential monitoring deficiencies could affect safety or prevent the NRC from being able to make the requisite safety determinations under 10 C.F.R. § 63.31(a).

Likewise, in paragraph 5 of the contention, the Petitioner references the discussion of cameras to be mounted on the TEV for monitoring waste package emplacement in SAR

Subsection 1.3.4.8.2.4, and states “no further details on the cameras or their locations on the TEV are provided.” *Id.* at 934. Petitioner does not, however, explain why any further detail should be required, or how such additional details might affect the validity of any assumptions relied upon in the LA—nor could it. Detailed information about the TEV cameras is not material to any finding the NRC must make because these cameras are *not* important to safety (non-ITS; *see* SAR Table 1.9-7 at 1.9-108, TEV safety functions do not use camera) or important to waste isolation (non-ITWI; *See* SAR Table 1.9-9 at 1.9-124, waste package emplacement (05-01) and spacing (05-02) not ITWI), and it will be readily apparent to operators if changes are needed for the camera to fulfill its design function.

The only other monitoring system mentioned in the contention concerns the ventilation system. In paragraph 2 of the contention, Petitioner asserts that the LA assumes that the ventilation system “will maintain the temperature at a level that will facilitate installation of the drip shields or retrieval of the waste packages.” Petition at 933. In paragraph 5 of the contention, Petitioner asserts that although the LA states that “instrumentation will be provided for remotely monitoring airflow volumes and temperatures in the emplacement drifts, airflow regulator damper positions, and other features of the ventilation system . . . no details are provided on the instruments . . . [and] there is no mention of monitoring of radiation levels, which could signal whether a waste package breach had occurred.” *Id.* at 934-35. But neither of these statements explains why any further detail should be required about the airflow and temperature monitoring, or how such additional details might affect the validity of any assumptions relied upon in the LA. Petitioner also ignores the extensive discussion of radiation monitoring in other subsections of the LA.

The LA discussion of the classification of ventilation systems in SAR Subsection 1.3.5.3 at 1.3.5-19 states that “[t]he subsurface ventilation system is neither ITS nor ITWI because the system does not prevent or mitigate an event sequence in the preclosure period and does not contribute to a significant barrier function in the postclosure period.” Significantly, Petitioner does not challenge these classifications either. Nor does Petitioner show that additional information about the associated monitoring equipment is material to any finding that must be made for construction authorization.

Subsection 1.9.1.4 “Means to Monitor and Control Dispersal of Radioactive Contamination,” states at page 1.9-10, that “continuous air monitors are located throughout the subsurface waste emplacement area, including the access main and alcoves.” The LA further describes radiation monitoring in various other places, including Subsection 1.4.2.2 “Radiation/Radiological Monitoring,” which includes the statement that these monitoring systems are classified as non-ITS at 1.4.2-7. Again, Nevada does not challenge these classifications.

The unchallenged non-ITS and non-ITWI classifications of the functions associated with the only monitoring systems mentioned in this contention are a clear indication that the details of these monitoring systems are not material to any finding that must be made in this proceeding. As the petitioner, Nevada has the burden of showing that the issues it seeks to raise are material to the findings that the NRC must make in this proceeding. An allegation that some aspect of the LA is inadequate or deficient does not give rise to a genuine dispute, unless it is supported by facts and a reasoned statement of why the LA is unacceptable in some material respect. *See Fla. Power & Light Co.* (Turkey Point Plant, Unit Nos. 3 and 4), LBP-90-16, 31 NRC 509, 521, 521 n.12 (1990). Petitioner has not met this burden. Neither has Nevada identified any evidence that

would support this contention. Consequently, Nevada has failed to demonstrate that there is a genuine dispute on a material issue of law or fact.

**174. NEV-SAFETY-174 - Controls And Restrictions**

SAR Subsection 1.6.3.4.1 and related subsections, which screen-out aircraft crashes at the Yucca Mountain repository, fail to provide any documentary evidence of any procedural controls for monitoring flight activity over the proposed flight restricted airspace with the United States military, and if no such controls exist then the crash of military aircraft at the repository should have been evaluated in terms of doses to the public and workers.

**RESPONSE**

This contention alleges that the SAR fails to “provide any documentary evidence of any procedural controls for monitoring flight activity over the proposed flight restricted airspace with the United States military.” Petition at 937. The contention further asserts that, in the absence of such controls, “the crash of military aircraft at the repository should have been evaluated in terms of doses to the public and workers.” *Id.*

For the reasons discussed below, contrary to 10 C.F.R. § 2.309(f)(1)(v) that requires adequate factual support or expert opinion in order for a contention to be admitted, this contention fails to explain how the alleged facts and documents upon which Nevada relies support the contention, and provides no other supporting information, including expert opinion. In addition, the contention also must be rejected because it fails to state a legitimate issue of law or fact, lacks adequate basis, and fails to establish a genuine dispute with DOE on a material issue of law or fact, contrary to 10 C.F.R. §§ 2.309(f)(1)(i), (ii), and (vi). As here, when a contention does not directly controvert a position taken by the applicant in the license application, it is subject to dismissal.

**a. Statement of Issue of Law or Fact to be Controverted**

As fully discussed below, Nevada has failed to state a legitimate issue of law or fact to be controverted in this proceeding. For instance, Nevada provides absolutely *no* legal or regulatory basis for its assertion that DOE must fully develop and/or implement air-traffic restrictions now, as part of the construction authorization process—and years before DOE is separately authorized under 10 C.F.R. § 63.41 to receive and possess licensed nuclear material at the repository.

**b. Brief Explanation of Basis**

As explained below, the proffered contention lacks adequate supporting basis in law or fact. In this regard, DOE has provided the information that is required by NRC regulations in its Application. It is Nevada—not DOE—that has failed to meet *its* burden by presenting sufficient legal and factual bases for its allegation that “SAR Subsection 1.6.3.4.1 is both materially incomplete and inaccurate.” Petition at 939. This basis for rejection is more fully discussed below.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

As fully explained below, Nevada’s contention fails to establish a genuine dispute on a material issue of fact or law. At its core, this contention seeks to challenge, albeit unsuccessfully, DOE's ability to implement the flight-restricted airspace and operational controls credited in the aircraft hazard analysis and identified in the SAR. In short, nowhere in its contention does Nevada directly and credibly challenge DOE’s authority or ability to implement

the aircraft-related PSCs listed in SAR Section 5.8.3. Thus, the contention fails to raise a material issue.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

This contention fails to meet the requirements of 10 C.F.R. § 2.309(f)(1)(v) because it lacks both a legal and factual foundation. The linchpin of Nevada’s argument is that “DOE cannot take credit for as yet unidentified procedural controls to control or monitor aircraft activity over the proposed flight restricted airspace.” Petition at 938. Nevada further asserts that “DOE has the burden not only to identify the controls with sufficient specificity, but more importantly to prove the controls are currently in effect and operating, or will be put in place and how they will operate.” *Id.* In this regard, Nevada also contends that “DOE’s commitment to implement procedural controls” is not sufficient. *Id.*

The foregoing arguments fail to pass muster under the Commission’s strict contention admissibility standards and thus do not support the admission of this contention. Nevada provides absolutely *no* legal or regulatory basis for its assertion that DOE must implement air-traffic restrictions now, as part of the construction authorization process—and years before DOE is separately authorized under 10 C.F.R. § 63.41 to receive and possess licensed nuclear material at the repository. Nor does Nevada provide any legal or factual support for its suggestion that DOE will be unable to implement these flight restrictions in the future. As shown in section f. below, DOE has clear authority to implement the flight-restricted airspace and operational controls credited in the SAR when they are needed to support repository operations.

Tellingly, Nevada’s arguments (as set forth under paragraph 5 of its contention) completely lack supporting citations to controlling statutes or regulations, or even citations to relevant NRC guidance (*e.g.*, the YMRP). Moreover, in addition to disregarding key portions of

the SAR (as discussed further below), Nevada's arguments defy logic and common sense. It would serve no purpose to institute air-traffic restrictions when the need for such restrictions does not currently exist and will not exist until the repository is actually built and DOE is subsequently authorized to receive and possess SNF and HLW. Indeed, as discussed below, the SAR explicitly recognizes and addresses this fact. The SAR also reflects DOE's authority to implement the applicable restrictions when they are actually needed to support repository operations.

By way of background, the aircraft hazard frequency analysis discussed in the SAR and supporting documentation credits a flight-restricted airspace and operational constraints over the repository, as follows:

- Flights by fixed-wing aircraft in the Nevada Test Site or Nevada Test and Training Range airspace within 4.9 nautical mi (5.6 statute mi) of the North Portal and below 14,000 ft mean sea level are prohibited.
- 1,000 overflights of this flight-restricted airspace per year are permitted above 14,000 ft mean sea level for fixed-wing aircraft.
- Maneuvering over the flight-restricted airspace is prohibited; flight is straight and level.
- Carrying ordnance over the flight-restricted airspace is prohibited.
- Electronic jamming activity over the flight-restricted airspace is prohibited.
- Helicopter flights within 0.5 mi of the surface facilities and areas that handle SNF and high-level radioactive waste are prohibited. The helipad associated with the repository is located at least 0.5 mi from the surface facilities that handle SNF and high-level radioactive waste.

SAR at 1.6-22. SAR Section 1.6.3.4.1 further indicates that these restrictions will not be needed for years to come. Reflecting both this fact and the need for DOE to retain flexibility to address any potential future modifications or additions to flight activities within the special-use airspace over the repository, SAR Section 1.6.3.4.1 states:

It should be noted, however, that because air traffic restrictions for the repository would not be required for a number of years, DOE would take into consideration any modifications or additions to flight activities within the special-use airspace over the repository during the construction period. If necessary to support repository operations, DOE would seek a special-use airspace designation from the Federal Aviation Administration. In addition, airspace restrictions could include agreements with the U.S. Air Force and other users to manage traffic in the vicinity of the repository. The accident analysis conducted assumed that such flight restrictions would occur.

*Id.*

Importantly, DOE has incorporated the flight restrictions identified above into specific Preclosure Procedural Safety Controls (PSCs), which are included in Table 1.9-10 of the SAR (*see* PSC-15 to PSC-18 at 1.9-144 to -145). The SAR states that the PSCs presented in Table 1.9-10 will “be implemented in facility operations to prevent and mitigate event sequences,” and that these PSCs will impose “interface controls on activities outside of the GROA that could potentially lead to an event sequence.” SAR at 1.9-2.

SAR Section 5.8.3 describes the implementation of the PSCs (*i.e.*, flight restrictions) enumerated above. Section 5.8.3 states, in part, as follows:

Prior to receipt of a license to receive and possess SNF and HLW, and in accordance with 10 CFR 63.121(c), controls will be implemented to ensure that the requirements of 10 CFR 63.111(a) and (b) are met. The site boundary, as shown in Figure 5.8-2, will be considered as the boundary of the preclosure controlled area under the definition of 10 CFR 20.1003. Such land use controls

will include ensuring that U.S. Air Force flight activities in the proximity of the GROA remain within the repository performance analysis considerations of existing and projected U.S. Air Force flight activity (SAR Section 1.6.3.4.1).

SAR at 5.8-7.

Thus, DOE has committed in the Application to implement appropriate PSCs. It is well-established that a docketed commitment can satisfy a licensee's regulatory obligation. *AmerGen Energy Co., LLC* (License Renewal for Oyster Creek Nuclear Generating Station), LBP-06-7, 63 NRC 188, 207 (2006) (accepting licensee commitment as satisfying regulatory obligation).

Significantly, as noted above, the flight restrictions for the airspace over the repository are not actually required until the nuclear waste forms are located at the repository, an activity that will require a separate licensing action (and an associated hearing opportunity) pursuant to 10 C.F.R. § 63.41.

Nevada offers no alleged facts, documents, or credible expert opinion to demonstrate that DOE has not complied with applicable NRC regulations. It relies instead on bare assertions that have no basis in law or fact and which ignore critical discussion in the SAR. As noted above, the flight restrictions set forth in the SAR will be implemented as PSCs, in accordance with 10 C.F.R. §§ 63.111(a)-(b) and 63.121. Neither of those regulations requires, or even suggests, that DOE must “prove [that] the [relevant] controls are currently in effect and operating,” as Nevada incorrectly claims. Petition at 938. In particular, Section 63.121(c) states that, in establishing appropriate controls outside the geologic repository operations area, “DOE shall exercise any jurisdiction or control of activities necessary to ensure the requirements at Sec. 63.111(a) and (b) are met,” and that such “[c]ontrol includes the *authority* to exclude members of the public, *if necessary*.” 10 C.F.R. § 63.121(c) (emphasis added). Nowhere does Section 63.121(c)—or any other Part 63 regulation—state that DOE must prove “that such controls exist” (Petition at 938)

or even develop complete and final procedures, now, as part of its construction authorization request.

NRC regulations require only that DOE “identify” and “describe” those controls that are necessary to ensure compliance with applicable Part 63 requirements, and which may be implemented by DOE pursuant to its applicable authorities. For example, 10 C.F.R. § 63.21(c), which prescribes the contents of the SAR, requires, among other things, “[a] *description* of the controls that DOE *will* apply to restrict access and to regulate land use at the Yucca Mountain site and adjacent areas.” 10 C.F.R. 63.21(c)(24) (emphasis added). The YMRP, which guides the NRC Staff in its review of the Application, directs the Staff to assess whether “any additional controls” are “acceptable and sufficient.” YMRP § 2.5.8.3 at 2.5-100. In the same vein, the YMRP directs the Staff to evaluate whether DOE has “identified” any “existing or proposed permissible rights or encumbrances that exist and may be continued, or that *should be established* outside the geologic repository operations area,” and whether DOE has assessed the nature of any activities that may permissibly occur under those rights. *Id.* (emphasis added) By claiming that DOE must implement flight control restrictions now, Nevada alleges noncompliance with a requirement that simply does not exist and thus, is not material to the findings to be made by the NRC Staff. The contention, therefore, fails to establish a concrete and genuine dispute suitable for litigation.

As shown above, DOE has provided the information that is required by NRC regulations in its Application. It is Nevada—not DOE—that has failed to meet *its* burden by presenting sufficient legal and factual bases for its allegation that “SAR Section 1.6.3.4.1 is both materially incomplete and inaccurate.” Petition at 939. Nevada does not challenge—with the requisite specificity and basis—the adequacy of DOE’s proposed flight restrictions. At most, Nevada

vaguely (and erroneously) claims that “DOE fails to describe in any detail the nature of the procedural controls.” *Id.* at 938. Nevada ignores relevant portions of the SAR. The SAR sections discussed above are quite explicit with respect to the aircraft-related PSCs that DOE has committed to implement.

Indeed, this contention is like numerous other Nevada contentions, in that it presents only unsupported allegations by counsel. Notably, the contention fails even to mention the Affidavit of Hugh Horstman (Attachment 12 to Petition), in which Mr. Horstman purports to “adopt as [his] own opinions” the statements contained within Paragraph 5 of the contention. That affidavit, in any case, is grossly insufficient to support the contention. As discussed in Section V.A.3 above, an expert’s attempt to reflexively rubber-stamp unsupported arguments by counsel does not suffice under 10 C.F.R. § 2.309(f)(1)(v). That regulation requires a petitioner—including its proffered expert—to set forth “the necessary technical analysis to show why the proffered bases support its contention.” *Private Fuel Storage, LLC* (Independent Spent Fuel Storage Installation), LBP-98-7, 47 NRC 142, 180 (1998) (*citing Georgia Inst. of Tech.* (Georgia Tech Research Reactor), LBP-95-6, 41 NRC 281, 305 (1995)). No such analysis is presented here by Nevada in its contention or by Nevada's proffered expert in his Affidavit.

In summary, Nevada plainly has failed to meet its burden under Section 2.309(f)(1)(v). While the ultimate burden of persuasion is on the license applicant with respect to an *admitted* contention, “the proponent of the [proposed] contention has the initial burden of coming forward with factual issues, not merely conclusory statements and vague allegations” of the type made here by Nevada. *Northeast Nuclear Energy Co.* (Millstone Nuclear Power Station, Unit No. 3), CLI-01-3, 53 NRC 22, 27 (2001). Accordingly, the contention must be rejected as lacking adequate factual and legal support.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention also fails to establish a genuine dispute with DOE on a material issue of law or fact, contrary to 10 C.F.R. § 2.309(f)(1)(vi). At its core, this contention (as well as subsequent Nevada contentions) seeks to challenge, albeit unsuccessfully, DOE's ability to implement the flight-restricted airspace and operational controls credited in the aircraft hazard analysis and identified in the SAR. In short, nowhere in its contention does Nevada directly and credibly challenge DOE's authority or ability to implement the aircraft-related PSCs listed in SAR Section 5.8.3.

In fact, the SAR amply demonstrates DOE's authority to implement the additional flight restrictions discussed therein. SAR Section 1.1.1.3.2.1 describes the NTS airspace. *See* SAR at 1.1-13 to -14. The NTS airspace is protected by restricted areas R-4808N and R-4808S, known jointly as R-4808. Restricted areas are a type of special-use airspace that separate or confine air activities that are considered dangerous or unsafe to aircraft not involved in the activity. Federal Aviation Administration (FAA) regulations prohibit flights by nonparticipating military, civilian or commercial aircraft in this special-use airspace without the controlling authority's authorization. If the area is not designated for joint use (nonjoint use), then nonparticipating aircraft are normally not permitted at any time. The repository surface facility is located in restricted area R-4808N, which is designated as nonjoint use by the FAA. DOE is the controlling authority for the airspace. SAR at 1.1-14. As the controlling authority, DOE allows military aircraft to transit R-4808N. DOE has existing avoidance areas (further flight-restricted areas) over the Device Assembly Facility and over BREN (Bare Reactor Experiment-Nevada) Tower, as well as several other areas within R-4808N. *Id.*

As discussed above, additional flight restrictions have been identified in SAR Sections 1.6.3.4.1 and 5.8.3 for the airspace above the repository surface facilities. As the controlling authority for that airspace, DOE has full authority to implement the additional restrictions when needed. Although these flight restrictions for the airspace are not needed until nuclear waste forms are actually located at the repository, DOE nonetheless has taken steps to facilitate implementation of the additional flight restrictions identified in the SAR. Specifically, interactions with the U.S. Air Force Warfare Center at Nellis Air Force Base, Nevada, have resulted in a revision to Air Force Instruction (AFI) 13-212, Volume 1, Addendum A. AFI 13-212, Vol. 1, IC2, “Summary of Changes – Interim Change to AFI 13-212” (Dec. 17, 2008) (LSN# DEN001606834) at 5. This revision includes the additional restrictions, with a future implementation date, for the airspace above the repository surface facilities consistent with the restrictions outlined in SAR Section 1.6.3.4.1. Currently, these future restrictions serve only as a reference for future use and planning purposes, given that DOE is not yet receiving SNF and HLW at the repository. When repository operations commence under an NRC-approved license, DOE (currently through the National Nuclear Security Administration Nevada Site Office) will implement the applicable flight restrictions. These restrictions will be implemented in the same manner as the current avoidance areas in R-4808N. Specifically, DOE will *require* the Air Force to revise the formal Air Force Instructions to include the restrictions. *Id.*

If necessary to support repository operations, DOE also can seek an additional special-use airspace designation from the FAA for the southwest portion of the 4.9 nautical mile radius airspace that currently is not special-use airspace. SAR at 1.6-22. The FAA publishes annually, as Order JO7400.8, a listing of all regulatory and non-regulatory special use airspace areas, as well as issued but not yet implemented amendments to those areas established by the FAA. *See*

14 C.F.R. Part 73. The Order states that its audience is Airspace and Aeronautical Operations, Air Traffic Controllers, and interested aviation parties. *Id.* The FAA also identifies special-use air space on charts, and the restriction is for all altitudes and for continuous duration. *Id.* The FAA would include the designation of any new special use airspace in its Orders and charts. Therefore, as with R-4808N, any new special-use air space would be identified for pilots as a nonjoint-use restricted airspace.

For the foregoing reasons, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected. Contrary to Nevada's suggestion, DOE has identified in sufficient detail the applicable "procedural controls" and has clear authority to implement those controls when they are needed. Petition at 938. The contention thus fails to establish a "genuine dispute of fact or law meriting an evidentiary hearing." *Northeast Nuclear Energy Co.*, CLI-01-3, 53 NRC 22 at 24.

For all of the reasons set forth above, the contention must be rejected in its entirety.

**175. NEV-SAFETY-175 - Controls On Pilot Relief**

SAR Subsection 1.6.3.4.1 and related subsections, which screens-out aircraft crashes at the Yucca Mountain repository, fails to provide any documentary evidence of any procedural controls for restricting pilots from using a pilot relief "piddle pack" when operating aircraft over the proposed flight restricted airspace, and if none exists then the crash of military aircraft at the repository should have been evaluated in terms of doses to the public and workers.

**RESPONSE**

This contention alleges that SAR Section 1.6.3.4.1 does not provide “documentary evidence of any procedural controls for restricting pilots from using a pilot relief ‘piddle pack’ when operating aircraft over the proposed flight restricted airspace.” Petition at 940. The contention further asserts that “DOE cannot take credit for as yet unidentified procedural controls to control or monitor aircraft activity over the proposed flight restricted airspace.” *Id.* at 942.

For the reasons discussed below, contrary to 10 C.F.R. § 2.309(f)(1)(v) that requires adequate factual support or expert opinion in order for a contention to be admitted, this contention fails to explain how the alleged facts and documents upon which Nevada relies support the contention, and provides no other supporting information, including expert opinion. In addition, the contention also must be rejected because it fails to state a legitimate issue of law or fact, lacks adequate basis, and fails to establish a genuine dispute with DOE on a material issue of law or fact, contrary to 10 C.F.R. § 2.309(f)(1)(i), (ii), (iv), and (vi). As here, when a contention does not directly controvert a position taken by the applicant in the license application, it is subject to dismissal.

**a. Statement of Issue of Law or Fact to be Controverted**

As fully discussed below, Nevada has failed to state a legitimate issue of law or fact to be controverted in this proceeding. It simply repeats its generic argument (as set forth in NEV-SAFETY-174) that “DOE cannot take credit for as yet unidentified procedural controls to control or monitor aircraft activity over the proposed flight restricted airspace.” Petition at 942. Here again, Nevada provides no legal or regulatory basis for its assertion that DOE must implement air-traffic restrictions now—as part of its construction authorization request—and years before DOE is separately authorized to receive and possess licensed nuclear material at the repository.

**b. Brief Explanation of Basis**

As explained below, the proffered contention lacks adequate supporting bases in law or fact. In this regard, Nevada offers no alleged facts, documents, or credible expert opinion to demonstrate that DOE has not complied with applicable NRC regulations. It relies instead on bare assertions that have no basis in law or fact and which ignore critical discussion in the SAR.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For purposes of demonstrating that this contention is material to the findings NRC must make to license Yucca Mountain, Nevada generically claims noncompliance with a litany of regulatory provisions in 10 C.F.R. Part 63, including §§ 63.31, 63.21, 63.102, 63.111, and 63.112. Petition at 940-41. In direct contradiction to the June 20, 2008, Case Management Order, however, Nevada fails to cite the “*principal* statutory or regulatory requirement or requirements” on which it relies (emphasis added). The mere recitation of regulatory provisions

does not satisfy Nevada's burden of demonstrating the issue raised in this contention is material to the findings that the NRC must make in this proceeding.

In addition, Nevada states that, in the alleged absence of "documentary evidence of any procedural controls for restricting pilots from using a pilot relief 'piddle pack' when operating aircraft over the proposed flight restricted airspace," DOE must evaluate the crash of a military aircraft at the repository "in terms of doses to the public and workers." Petition at 940. As demonstrated below, however, Nevada fails to provide any analysis to show the result that would be obtained if its position were correct and DOE's were wrong. Nevada, in other words, makes no attempt to explain *how* DOE's assumptions regarding the use of "piddle packs" by pilots would *materially* affect the results or outcome of DOE's frequency analysis of aircraft hazards.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

The legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted are discussed in Section V.A.3 above. This contention fails to meet those standards because, as discussed in that Section, it presents only unsupported arguments of counsel, and the associated expert affidavit falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Notably, the contention fails even to mention Horstman Affidavit, Attach. 12, in which Mr. Horstman purports to "adopt as [his] own opinions" the statements contained within Paragraph 5 of the contention. His Affidavit, in any case, is grossly insufficient to support the contention. An expert's attempt to reflexively rubber-stamp unsupported arguments by counsel does not suffice under 10 C.F.R. § 2.309(f)(1)(v). That regulation requires a petitioner—including its proffered expert—to set forth "the necessary technical analysis to show why the proffered bases support its contention." *Private Fuel Storage*, LBP-98-7, 47 NRC at 180 (citing *Ga. Inst. of Tech.*, LBP-95-

6, 41 NRC at 305). No such analysis is presented here. In addition, as discussed below, the sole document upon which Nevada relies as extrinsic factual support does not support its contention. These fatal deficiencies render the contention inadmissible.

Although this contention focuses on piddle pack use by military pilots, Nevada repeats its generic argument (as set forth in NEV-SAFETY-174) that “DOE cannot take credit for as yet unidentified procedural controls to control or monitor aircraft activity over the proposed flight restricted airspace.” Petition at 942. Here again, Nevada provides no legal or regulatory basis for its assertion that DOE must implement air-traffic restrictions now—as part of its construction authorization request—and years before DOE is separately authorized to receive and possess licensed nuclear material at the repository. Nor does it support its suggestion that DOE will be unable to implement the restrictions where they are actually needed to support repository operations.

By way of background, the aircraft hazard frequency analysis discussed in the SAR and supporting documentation credits a flight-restricted airspace and operational constraints over the repository, as follows:

- Flights by fixed-wing aircraft in the Nevada Test Site or Nevada Test and Training Range airspace within 4.9 nautical mi (5.6 statute mi) of the North Portal and below 14,000 ft mean sea level are prohibited.
- 1,000 overflights of this flight-restricted airspace per year are permitted above 14,000 ft mean sea level for fixed-wing aircraft.
- Maneuvering over the flight-restricted airspace is prohibited; flight is straight and level.
- Carrying ordnance over the flight-restricted airspace is prohibited.
- Electronic jamming activity over the flight-restricted airspace is prohibited.

- Helicopter flights within 0.5 mi of the surface facilities and areas that handle SNF and high-level radioactive waste are prohibited. The helipad associated with the repository is located at least 0.5 mi from the surface facilities that handle SNF and high-level radioactive waste.

SAR at 1.6-22. SAR Section 1.6.3.4.1 further indicates that these restrictions will not be needed for years to come. Reflecting both this fact and the need for DOE to retain flexibility to address any potential future modifications or additions to flight activities within the special-use airspace over the repository, SAR Section 1.6.3.4.1 states:

It should be noted, however, that because air traffic restrictions for the repository would not be required for a number of years, DOE would take into consideration any modifications or additions to flight activities within the special-use airspace over the repository during the construction period. If necessary to support repository operations, DOE would seek a special-use airspace designation from the Federal Aviation Administration. In addition, airspace restrictions could include agreements with the U.S. Air Force and other users to manage traffic in the vicinity of the repository. The accident analysis conducted assumed that such flight restrictions would occur.

*Id.*

Importantly, DOE has incorporated the flight restrictions identified above into specific Preclosure Procedural Safety Controls (“PSCs”), which are included in Table 1.9-10 of the SAR (*see* PSC-15 to PSC-18, SAR at 1.9-144 to -145 (Table 1.9-10)). The SAR states that the PSCs presented in Table 1.9-10 will “be implemented in facility operations to prevent and mitigate event sequences,” and that these PSCs will impose “interface controls on activities outside of the GROA that could potentially lead to an event sequence.” SAR at 1.9-2.

SAR Section 5.8.3 describes the implementation of the PSCs (*i.e.*, flight restrictions) enumerated above. Section 5.8.3 states, in part, as follows:

Prior to receipt of a license to receive and possess SNF and HLW, and in accordance with 10 CFR 63.121(c), controls will be implemented to ensure that the requirements of 10 CFR 63.111(a) and (b) are met. The site boundary, as shown in Figure 5.8-2, will be considered as the boundary of the preclosure controlled area under the definition of 10 CFR 20.1003. Such land use controls will include ensuring that U.S. Air Force flight activities in the proximity of the GROA remain within the repository performance analysis considerations of existing and projected U.S. Air Force flight activity (Section 1.6.3.4.1).

SAR at 5.8-7.

Thus, DOE has committed in the Application to implement appropriate PSCs. It is well-established that a docketed commitment can satisfy a licensee's regulatory obligation. *AmerGen Energy Co., LLC* (License Renewal for Oyster Creek Nuclear Generating Station), LBP-06-7, 63 NRC 188, 207 (2006) (accepting licensee commitment as satisfying regulatory obligation).

Significantly, as noted above, the flight restrictions for the airspace over the repository are not actually required until the nuclear waste forms are located at the repository, an activity that will require a separate licensing action (and an associated hearing opportunity) pursuant to 10 C.F.R. § 63.41.

Nevada offers no alleged facts, documents, or credible expert opinion to demonstrate that DOE has not complied with applicable NRC regulations. It relies instead on bare assertions that have no basis in law or fact and which ignore critical discussion in the SAR. As noted above, the flight restrictions set forth in the SAR will be implemented as PSCs, in accordance with 10 C.F.R. §§ 63.111(a)-(b) and 63.121. Neither of those regulations requires, or even suggests, that DOE must "prove [that] the [relevant] controls are currently in effect and operating," as Nevada incorrectly claims. Petition at 942. In particular, Section 63.121(c) states that, in establishing appropriate controls outside the geologic repository operations area, "DOE shall exercise any jurisdiction or control of activities necessary to ensure the requirements at § 63.111(a) and (b)

are met,” and that such “[c]ontrol includes the *authority* to exclude members of the public, *if necessary*.” 10 C.F.R. § 63.121(c) (emphasis added). Nowhere does Section 63.121(c)—or any other Part 63 regulation—state that DOE must prove “that such controls exist” (Petition at 942) or even develop complete and final procedures, now, as part of its construction authorization request.

NRC regulations require only that DOE “identify” and “describe” those controls that are necessary to ensure compliance with applicable Part 63 requirements, and which may be implemented by DOE pursuant to its applicable authorities. For example, 10 C.F.R. § 63.21(c), which prescribes the contents of the SAR, requires, among other things, “[a] *description* of the controls that DOE *will* apply to restrict access and to regulate land use at the Yucca Mountain site and adjacent areas.” 10 C.F.R. 63.21(c)(24) (emphasis added). The YMRP, which guides the NRC Staff in its review of the Application, directs the Staff to assess whether “any additional controls” are “acceptable and sufficient.” YMRP § 2.5.8.3, at 2.5-100. In the same vein, the YMRP directs the Staff to evaluate whether DOE has “identified” any “existing or proposed permissible rights or encumbrances that exist and may be continued, or that *should be established* outside the geologic repository operations area,” and whether DOE has assessed the nature of any activities that may permissibly occur under those rights. *Id* (emphasis added). By claiming that DOE must implement flight control restrictions now, Nevada alleges noncompliance with a requirement that simply does not exist and thus, is not material to the findings to be made by the NRC Staff. The contention, therefore, fails to establish a concrete and genuine dispute suitable for litigation.

As shown above, DOE has provided the information that is required by NRC regulations in its Application. It is Nevada—not DOE—that has failed to meet *its* burden by presenting

sufficient legal and factual bases for its allegation that “SAR Section 1.6.3.4.1 is both materially incomplete and inaccurate.” Petition at 942. Nevada does not challenge—with the requisite specificity and basis—the adequacy of DOE’s proposed flight restrictions. At most, Nevada vaguely (and erroneously) claims that “DOE fails to describe in any detail the nature of the procedural controls.” *Id.* Nevada ignores relevant portions of the SAR. The SAR sections discussed above are quite explicit with respect to the aircraft-related PSCs that DOE has committed to implement.

Aside from the grossly deficient Affidavit mentioned above, the only other factual support proffered by Nevada is a document entitled “U.S. Air Force Multi-Command Instruction 11-F-16 Volume 3, Virtual Pilot Operational Procedures – F16,” dated March 10, 2007 (LSN# NEV000005429). Petition at 941 - 42. Nevada, however, cites no specific sections or pages of the document, nor does it provide any meaningful explanation of the document’s significance. With regard to this document, Nevada states only that “[t]he rules that govern pilot activity while flying are not controlled by DOE, but by the military services.” *Id.* at 941. For the reasons set forth above, that argument clearly lacks merit. Furthermore, the Air Force instruction cited by Nevada applies to “virtual” flight training conducted in simulators. It does not address actual flying operations. Finally, the cited document contains no discussion of piddle pack use, the specific subject of Nevada’s proposed contention.

As discussed in the applicable Legal Standards section above, it is imperative that petitioners identify the specific portions of the documents upon which they rely and explain their significance to the contention. Nevada has not done so here. Its vague reference to the cited document is insufficient. As discussed in Section f. below, Nevada’s allegations concerning DOE’s alleged inability to “impose such rules on the military services” (Petition at 942)

regarding the use of piddle packs do not, in any event, establish a genuine *material* dispute worthy of a hearing.

In summary, Nevada plainly has failed to meet its burden under Section 2.309(f)(1)(v). While the ultimate burden of persuasion is on the license applicant with respect to an *admitted* contention, “the proponent of the [proposed] contention has the initial burden of coming forward with factual issues, not merely conclusory statements and vague allegations” of the type made here by Nevada. *Northeast Nuclear Energy Co. (Millstone Nuclear Power Station, Unit 3)*, CLI-01-03, 53 NRC 22, 27 (2001). Accordingly, the contention must be rejected as lacking adequate factual and legal support.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention also fails to establish a genuine dispute with DOE on a material issue of law or fact, contrary to 10 C.F.R. § 2.309(f)(1)(vi). At its core, this contention (as well as subsequent Nevada contentions) seeks to challenge, albeit unsuccessfully, DOE's ability to implement the flight-restricted airspace and operational controls credited in the aircraft hazard analysis and identified in the SAR. In short, nowhere in its contention does Nevada directly and credibly challenge DOE's authority or ability to implement the aircraft-related PSCs listed in SAR Section 5.8.3.

In fact, the SAR amply demonstrates DOE's authority to implement the additional flight restrictions discussed therein. SAR Section 1.1.1.3.2.1 describes the NTS airspace. *See* SAR at 1.1-13 to 1.1-14. The NTS airspace is protected by restricted areas R-4808N and R-4808S, known jointly as R-4808. Restricted areas are a type of special-use airspace that separate or confine air activities that are considered dangerous or unsafe to aircraft not involved in the activity. Federal Aviation Administration (“FAA”) regulations prohibit flights by

nonparticipating military, civilian or commercial aircraft in this special-use airspace without the controlling authority's authorization. If the area is not designated for joint use (nonjoint use), then nonparticipating aircraft are normally not permitted at any time. The repository surface facility is located in restricted area R-4808N, which is designated as nonjoint use by the FAA. DOE is the controlling authority for the airspace. SAR at 1.1-14. As the controlling authority, DOE allows military aircraft to transit R-4808N. DOE has existing avoidance areas (further flight-restricted areas) over the Device Assembly Facility and over BREN (Bare Reactor Experiment-Nevada) Tower, as well as several other areas within R-4808N. *Id.*

As discussed above, additional flight restrictions have been identified in SAR Sections 1.6.3.4.1 and 5.8.3 for the airspace above the repository surface facilities. As the controlling authority for that airspace, DOE has full authority to implement the additional restrictions when needed. Although these flight restrictions for the airspace are not needed until nuclear waste forms are actually located at the repository, DOE nonetheless has taken steps to facilitate implementation of the additional flight restrictions identified in the SAR. Specifically, interactions with the U.S. Air Force Warfare Center at Nellis Air Force Base, Nevada, have resulted in a revision to Air Force Instruction (AFI) 13-212, Volume 1, Addendum A. AFI 13-212, Vol. 1, IC2, "Summary of Changes – Interim Change to AFI 13-212" (Dec. 17, 2008) (LSN# DEN001606834) at 5. This revision includes the additional restrictions, with a future implementation date, for the airspace above the repository surface facilities consistent with the restrictions outlined in SAR Section 1.6.3.4.1. Currently, these future restrictions serve only as a reference for future use and planning purposes, given that DOE is not yet receiving SNF and HLW at the repository. When repository operations commence under an NRC-approved license, DOE (currently through the National Nuclear Security Administration Nevada Site Office) will

implement the applicable flight restrictions. These restrictions will be implemented in the same manner as the current avoidance areas in R-4808N. Specifically, DOE will *require* the Air Force to revise the formal Air Force Instructions to include the restrictions. *Id.*

Additionally, as discussed in the applicable Legal Standards section above, contentions that allege errors, omissions, uncertainties or alternative approaches—without specifying the ramifications or results of such alleged deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. The contention also suffers from this deficiency. Specifically, Nevada states that, in the alleged absence of “documentary evidence of any procedural controls for restricting pilots from using a pilot relief ‘piddle pack’ when operating aircraft over the proposed flight restricted airspace,” DOE must evaluate the crash of a military aircraft at the repository “in terms of doses to the public and workers.” Petition at 940. Nevada fails to provide, however, any analysis to show the result that would be obtained if its position were correct and DOE’s were wrong. Nevada, in other words, makes no attempt to explain *how* DOE’s assumptions regarding the use of “piddle packs” by pilots would *materially* affect the results or outcome of DOE’s frequency analysis of aircraft hazards.

Nevada’s contention completely ignores relevant discussion and analysis contained in DOE’s *Frequency Analysis of Aircraft Hazards for License Application*, Las Vegas, NV, Bechtel SAIC Company (2007) (LSN# DN2002488951 and DEN001564755), referenced in the SAR and herein as BSC 2007c. As Nevada acknowledges, the use of a piddle pack is a special activity for personal comfort for pilot urination, which includes loosening or removal of seat restraints. As indicated in Attachment III of BSC 2007c, two mishaps were attributed to the use of a piddle pack; one in 1990 and one in 1992. BSC 2007c, Attachment III at III-4 (Item No. 10), III-9 (Item No. 59). Both mishaps involved the removal of the lap belt that restrains the pilot in the

seat. *Id.* The act of removing the lap belt and preparing the cockpit for the use of the piddle pack is a special activity not consistent with straight and level flight, which is required by PSC-16 (SAR at 1.9-144 Table 1.19 -10). Thus, the initiating event does not apply to overflight of the flight-restricted airspace because straight and level flight is required of overflights. For this reason, DOE has concluded that a separate restriction on the use of piddle packs is not necessary because such a requirement is already embedded in the requirement for straight and level flight.

Even if piddle pack use were permitted (which it is not), the sensitivity analysis performed in Attachment 6 of BSC 2007c shows that the overall frequency of aircraft crashes is insensitive to the categorization of initiating events of military crashes. BSC 2007c, Attachment VI at VI-8 to VI-9. This fact indicates that, even if piddle-pack use were consistent with straight and level flight, it would not be necessary to impose restrictions on the use of piddle packs. Nevada thus has ignored the content of key supporting documentation that is explicitly referenced in the Application, something it cannot do and expect that its proposed contention will not suffer the consequences. Indeed, Nevada's own contention indicates that it has reviewed at least some portion of DOE's aircraft hazard frequency analysis. *See* Petition at 941 (citing BSC 2007c).

For the foregoing reasons, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi). By failing to controvert portions of the Application directly relevant to its contention, Nevada has failed to establish a genuine dispute of fact or law meriting an evidentiary hearing.

For all of the reasons discussed above, this contention should be rejected in its entirety.

**176. NEV-SAFETY-176 - Controls On Pilot Maneuvering**

SAR Subsection 1.6.3.4.1 and related subsections, which screen-out aircraft crashes at the Yucca Mountain repository, fail to provide any documentary evidence of any procedural controls for restricting pilots from maneuvering their aircraft when operating over the proposed flight restricted airspace, and if none exists then the crash of military aircraft at the repository should have been evaluated in terms of doses to the public and workers.

**RESPONSE**

This contention alleges that SAR Section 1.6.3.4.1 does not provide “documentary evidence of any procedural controls for restricting pilots from maneuvering their aircraft when operating over the proposed flight restricted airspace.” Petition at 943. The contention further asserts that, in the absence of such controls, “the crash of military aircraft at the repository should have been evaluated in terms of doses to the public and workers.” *Id.*

For the reasons discussed below, contrary to 10 C.F.R. § 2.309(f)(1)(v) that requires adequate factual support or expert opinion in order for a contention to be admitted, this contention fails to explain how the alleged facts and documents upon which Nevada relies support the contention, and provides no other supporting information, including expert opinion. In addition, the contention also must be rejected because it fails to establish a genuine dispute with DOE on a material issue of law or fact, contrary to 10 C.F.R. § 2.309(f)(1)(i), (ii), and (vi). As here, when a contention does not directly controvert a position taken by the applicant in the license application, it is subject to dismissal.

**a. Statement of Issue of Law or Fact to be Controverted**

As fully discussed below, Nevada has failed to state a legitimate issue of law or fact to be controverted in this proceeding. For instance, Nevada provides no legal or regulatory basis for

its assertion that DOE must implement air-traffic restrictions now—as part of its construction authorization request—and years before DOE is separately authorized to receive and possess licensed nuclear material at the repository.

**b. Brief Explanation of Basis**

As explained below, the proffered contention lacks adequate supporting bases in law or fact. In this regard, it is Nevada—not DOE—that has failed to meet *its* burden by presenting sufficient legal and factual bases for its allegation that “SAR Section 1.6.3.4.1 is both materially incomplete and inaccurate.” Petition at 946. Nevada does not challenge—with the requisite specificity and basis—the adequacy of DOE’s proposed flight restrictions. At most, Nevada vaguely (and erroneously) claims that “DOE fails to describe in any detail the nature of the procedural controls.” *Id.* at 945. Nevada ignores relevant portions of the SAR and fails to state how the SAR is materially incomplete or inaccurate.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

As fully explained below, Nevada’s contention fails to establish a genuine dispute on a material issue of fact or law. In this regard, even though Nevada cites three documents as extrinsic support for its contention, none of those documents controverts the Application and gives rise to a material issue in this proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

The legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted are discussed in Section V.A.3 above. This contention fails to meet those standards because, as discussed below and in that Section, it presents only unsupported arguments of counsel, and the associated expert affidavit falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Notably, the contention fails even to mention the Horstman Affidavit, Attach. 12, in which Mr. Horstman purports to “adopt as [his] own opinions” the statements contained within paragraph 5 of the contention. This Affidavit, in any case, is grossly insufficient to support the contention. An expert’s attempt to reflexively rubber-stamp unsupported arguments by counsel does not suffice under 10 C.F.R. § 2.309(f)(1)(v). That regulation requires a petitioner—including its proffered expert—to set forth “the necessary technical analysis to show why the proffered bases support its contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 180 (citing *Ga. Inst. of Tech.*, LBP-95-6, 41 NRC at 305). No such analysis is presented here. In addition, as discussed in Section f. of this response below, the three documents upon which Nevada relies as extrinsic factual support do not controvert the Application and thus do not support its contention. These fatal deficiencies render the contention inadmissible.

Although this contention focuses on aircraft maneuvering by military pilots, Nevada repeats its general argument (as set forth in NEV-SAFETY-174) that “DOE cannot take credit for as yet unidentified procedural controls,” this time as they pertain to “aircraft maneuvering over Yucca Mountain.” Petition at 946. In particular, this contention further asserts that “DOE has the burden of proving that there is an agreement with the U.S. military to prohibit certain operational activities of military aircraft flying anywhere near the Yucca Mountain repository.”

*Id.* at 945. The contention also states that DOE cannot “presume” that it will obtain the agreement of third parties, viz., the U.S. Air Force, to comply with such procedural controls or to modify military operations manuals to include such restrictions. *Id.* at 946. Here again, however, Nevada provides no legal or regulatory basis for its assertion that DOE must *implement* air-traffic restrictions now—as part of its construction authorization request—and years before DOE is separately authorized to receive and possess licensed nuclear material at the repository. Nor does it support its claim that DOE lacks the authority to implement those restrictions when they are needed to support repository operations.

As explained previously, the aircraft hazard frequency analysis discussed in the SAR and supporting documentation credits a flight-restricted airspace and operational constraints (which include a prohibition on maneuvering) over the repository as follows:

- Flights by fixed-wing aircraft in the Nevada Test Site or Nevada Test and Training Range airspace within 4.9 nautical mi (5.6 statute mi) of the North Portal and below 14,000 ft mean sea level are prohibited.
- 1,000 overflights of this flight-restricted airspace per year are permitted above 14,000 ft mean sea level for fixed-wing aircraft.
- Maneuvering over the flight-restricted airspace is prohibited; flight is straight and level.
- Carrying ordnance over the flight-restricted airspace is prohibited.
- Electronic jamming activity over the flight-restricted airspace is prohibited.
- Helicopter flights within 0.5 mi of the surface facilities and areas that handle SNF and high-level radioactive waste are prohibited. The helipad associated with the repository is located at least 0.5 mi from the surface facilities that handle SNF and high-level radioactive waste.

SAR at 1.6-22. SAR Section 1.6.3.4.1 further indicates that these restrictions will not be needed for years to come. Reflecting both this fact and the need for DOE to retain flexibility to address any potential future modifications or additions to flight activities within the special-use airspace over the repository, SAR Section 1.6.3.4.1 states:

It should be noted, however, that because air traffic restrictions for the repository would not be required for a number of years, DOE would take into consideration any modifications or additions to flight activities within the special-use airspace over the repository during the construction period. If necessary to support repository operations, DOE would seek a special-use airspace designation from the Federal Aviation Administration. In addition, airspace restrictions could include agreements with the U.S. Air Force and other users to manage traffic in the vicinity of the repository. The accident analysis conducted assumed that such flight restrictions would occur.

*Id.*

Importantly, DOE has incorporated the flight restrictions identified above into specific Preclosure Procedural Safety Controls (“PSCs”), which are included in Table 1.9-10 of the SAR (*see* PSC-15 to PSC-18, SAR at 1.9-144 to -145 (Table 1.9 -10)). The SAR states that the PSCs presented in Table 1.9-10 will “be implemented in facility operations to prevent and mitigate event sequences,” and that these PSCs will impose “interface controls on activities outside of the GROA that could potentially lead to an event sequence.” SAR at 1.9-2.

SAR Section 5.8.3 describes the implementation of the PSCs (*i.e.*, flight restrictions) enumerated above. Section 5.8.3 states, in part, as follows:

Prior to receipt of a license to receive and possess SNF and HLW, and in accordance with 10 CFR 63.121(c), controls will be implemented to ensure that the requirements of 10 CFR 63.111(a) and (b) are met. The site boundary, as shown in Figure 5.8-2, will be considered as the boundary of the preclosure controlled area under the definition of 10 CFR 20.1003. Such land use controls

will include ensuring that U.S. Air Force flight activities in the proximity of the GROA remain within the repository performance analysis considerations of existing and projected U.S. Air Force flight activity (Section 1.6.3.4.1).

SAR at 5.8-7.

Thus, DOE has committed in the Application to implement appropriate PSCs. It is well-established that a docketed commitment can satisfy a licensee's regulatory obligation. *AmerGen Energy Co., LLC* (Oyster Creek Nuclear Generating Station), LBP-06-7, 63 NRC 188, 207 (2006) (accepting licensee commitment as satisfying regulatory obligation). Significantly, as noted above, the flight restrictions for the airspace over the repository are not actually required until the nuclear waste forms are located at the repository, an activity that will require a separate licensing action (and an associated hearing opportunity) pursuant to 10 C.F.R. § 63.41.

Nevada offers no alleged facts, documents, or credible expert opinion to demonstrate that DOE has not complied with applicable NRC regulations. It relies instead on bare assertions that have no basis in law or fact and which ignore critical discussion in the SAR. As noted above, the flight restrictions set forth in the SAR will be implemented as PSCs, in accordance with 10 C.F.R. §§ 63.111(a)-(b) and 63.121. Neither of those regulations requires, or even suggests, that DOE must “prove that the [relevant] controls are currently in effect and operating,” as Nevada incorrectly claims. Petition at 946. In particular, Section 63.121(c) states that, in establishing appropriate controls outside the geologic repository operations area, “DOE shall exercise any jurisdiction or control of activities necessary to ensure the requirements at § 63.111(a) and (b) are met,” and that such “[c]ontrol includes the *authority* to exclude members of the public, *if necessary*.” 10 C.F.R. § 63.121(c) (emphasis added). Nowhere does Section 63.121(c)—or any other Part 63 regulation—state that DOE must prove that such controls exist or even develop complete and final procedures, now, as part of its construction authorization request.

NRC regulations require only that DOE “identify” and “describe” those controls that are necessary to ensure compliance with applicable Part 63 requirements, and which may be implemented by DOE pursuant to its applicable authorities. For example, 10 C.F.R. § 63.21(c), which prescribes the contents of the SAR, requires, among other things, “[a] *description* of the controls that DOE *will* apply to restrict access and to regulate land use at the Yucca Mountain site and adjacent areas.” 10 C.F.R. 63.21(c)(24) (emphasis added). The YMRP, which guides the NRC Staff in its review of the Application, directs the Staff to assess whether “any additional controls” are “acceptable and sufficient.” YMRP § 2.5.8.3, at 2.5-100. In the same vein, the YMRP directs the Staff to evaluate whether DOE has “identified” any “existing or proposed permissible rights or encumbrances that exist and may be continued, or that *should be established* outside the geologic repository operations area,” and whether DOE has assessed the nature of any activities that may permissibly occur under those rights. *Id.* (emphasis added). By claiming that DOE must implement flight control restrictions now, Nevada alleges noncompliance with a requirement that simply does not exist and thus, is not material to the findings to be made by the NRC Staff. The contention, therefore, fails to establish a concrete and genuine dispute suitable for litigation.

As shown above, DOE has provided the information that is required by NRC regulations in its Application. It is Nevada—not DOE—that has failed to meet *its* burden by presenting sufficient legal and factual bases for its allegation that “SAR Section 1.6.3.4.1 is both materially incomplete and inaccurate.” Petition at 946. Nevada does not challenge—with the requisite specificity and basis—the adequacy of DOE’s proposed flight restrictions. At most, Nevada vaguely (and erroneously) claims that “DOE fails to describe in any detail the nature of the procedural controls.” Petition at 945. Nevada ignores relevant portions of the SAR. The SAR

sections discussed above are quite explicit with respect to the aircraft-related PSCs that DOE has committed to implement.

In summary, Nevada plainly has failed to meet its burden under Section 2.309(f)(1)(v). While the ultimate burden of persuasion is on the license applicant with respect to an *admitted* contention, “the proponent of the [proposed] contention has the initial burden of coming forward with factual issues, not merely conclusory statements and vague allegations” of the type made here by Nevada. *Northeast Nuclear Energy Co.* (Millstone Nuclear Power Station, Unit 3), CLI-01-03, 53 NRC 22, 27 (2001). Accordingly, the contention must be rejected as lacking adequate factual and legal support.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the applicable Legal Standards Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts the Application fails to address an issue that the Application does address, is defective. Nevada’s contention also suffers from this deficiency. Specifically, the contention mistakenly suggests that DOE lacks the authority to implement the specific flight-restricted airspace and operational controls that are credited in SAR Section 1.6.3.4.1 (page 1.6-22) and SAR Section 5.8.3 (page 5.8-7) for the airspace above the repository surface facilities, insofar as it asserts that the U.S. Air Force may “decline” to abide by those controls. *See* Petition at 945-46.

DOE has clear authority to implement these additional flight restrictions. SAR Section 1.1.1.3.2.1 describes the Nevada Test Site airspace. *See* SAR at 1.1-13 to 1.1-14. The Nevada Test Site airspace is protected by restricted areas R-4808N and R-4808S, known jointly as R-4808. Restricted areas are a type of special-use airspace that separate or confine air activities that are considered dangerous or unsafe to aircraft not involved in the activity. FAA regulations

prohibit flights by nonparticipating military, civilian or commercial aircraft in this special-use airspace without the controlling authority's authorization. If the area is not designated for joint use (nonjoint use), then nonparticipating aircraft are normally not permitted at any time. R-4808N is designated as nonjoint use by the FAA, and DOE is the controlling authority for the airspace.

As discussed in SAR Section 1.1.1.3.2.1, the repository surface facility is located in restricted area R-4808N. SAR at 1.1-14. DOE, as the controlling authority, allows military aircraft to transit R-4808N. DOE has existing avoidance areas (further flight-restricted areas) over the Device Assembly Facility and over BREN (Bare Reactor Experiment-Nevada) Tower, as well as several other areas within R-4808N. *Id.* The additional flight-restrictions identified in SAR Sections 1.6.3.4.1 and 5.8.3 are for the airspace above the repository surface facilities. As discussed above, the flight restrictions for the airspace are not needed until nuclear waste forms are actually located at the repository.

DOE nonetheless has taken steps to facilitate implementation of the additional flight-restrictions identified in the SAR. Specifically, interactions with the U.S. Air Force Warfare Center at Nellis Air Force Base, Nevada, have resulted in a revision to Air Force Instruction (AFI) 13-212, Volume 1, Addendum A. AFI 13-212, Vol. 1, IC2, "Summary of Changes – Interim Change to AFI 13-212" (Dec. 17, 2008) (LSN# DEN001606834) at 5. This revision includes the additional restrictions, with a future implementation date, for the airspace above the repository surface facilities, consistent with the restrictions outlined in SAR Sections 1.6.3.4.1 and 5.8.3. Currently, these future restrictions serve only as a reference for future use and planning purposes. When repository operations commence under an NRC-approved license, DOE (currently through the National Nuclear Security Administration Nevada Site Office) will

implement the applicable flight restrictions. These restrictions will be implemented in the same manner as the current avoidance areas in R-4808N. Specifically, DOE will require the Air Force to revise the formal Air Force Instructions to include the restrictions.

Nevada has not presented any factual information or expert opinion that directly controverts the Application or information presented above and, consequently, its contention is inadmissible. As noted above, the Horstman Affidavit lacks the requisite “reasoned basis or explanation.” Furthermore, while Nevada cites three documents as extrinsic support for its contention, none of those documents controverts the Application and gives rise to a material dispute.

The first document cited by Nevada is a September 11, 2003, letter from U.S. Air Force officials to U.S. Representative Duncan Hunter, then-Chairman of the House Committee on Armed Services. Petition at 945 (citing Letter from J. Jumper, U.S. Air Force Chief of Staff, and J. Roche, Secretary of the Air Force to Hon. Duncan Hunter, Chairman, Committee on Armed Services, U.S. House of Representatives (Sept. 11, 2003), LSN# DN2001403483 at 1). This letter addresses two issues related to the Nevada Test and Training Range (“NTTR”). The first issue relates to the Air Force’s previously-stated concern that DOE might seek to transport repository-bound nuclear materials through sensitive areas of the NTTR. As such, it has no relevance to DOE’s aircraft hazard analysis, the subject of Nevada’s contention.

The second issue mentioned in the September 2003 letter involves the Air Force’s concern, as expressed in 2003, that “overflight restrictions on aircraft operating in NTTR-associated airspace will negatively impact [its] readiness activities.” LSN# DN2001403483 at 1. Nevada fails, however, to explain how the 2003 Air Force letter directly controverts the Application, particularly with respect to DOE’s authority to implement the flight-restricted

airspace and operational constraints that are credited in the SAR. Indeed, it is clear that Nevada has not carefully reviewed the SAR and its supporting documentation, which describe in detail existing operations on the NTTR and their locations relative to the repository surface facility.

SAR Section 1.1.1.3.2.2 explains that the NTTR airspace consists of the Reveille and Desert Military operations and restricted areas R-4806, R-4807, and R-4809. SAR at 1.1-14. The closest border of the Reveille military operations area is about 71 miles from the North Portal at Yucca Mountain. *Id.* The restricted areas of the NTTR are divided into the North Range and the South Range. *Id.* at 1.1-15. These two ranges are separated by the Nevada Test Site. *Id.* Within the NTTR airspace, restricted areas R-4806, R-4807, and R-4809 are joint use; within the Nevada Test Site airspace, R-4808S is joint use and R-4808N is nonjoint use. *Id.* The additional flight-restrictions identified in SAR Sections 1.6.3.4.1 and 5.8.3 are for the airspace above the repository surface facilities. Those facilities are to be located in restricted area R-4808N, a nonjoint use area for which DOE is the controlling authority. Thus, contrary to Nevada's suggestion, the Air Force cannot "decline" to abide by the additional flight restrictions identified and credited by DOE in the SAR upon their implementation.

The second document cited by Nevada in support of its contention is a September 20, 1995, letter from the Air Force to U.S. Representative Don Young, then-Chairman of the House Committee in Resources. Petition at 945 (citing Letter from Sheila Widnall, Secretary of the Air Force to Hon. Don Young, Chairman, Committee in Resources, U.S. House of Representatives (Sept. 20, 1995), LSN# DEN000357493 at 1). That letter, written in response to then-proposed legislation (H.R. 1020), expresses the Air Force's concern, at the time, that overflight restrictions implemented to support repository operations might adversely affect military operations at the Nellis range complex, including the Nellis Air Force Base. Nevada does not explain—and the

Board is left to guess—how this 1995 document is germane to the information presented in DOE’s June 2008 Application.

Based on this 13-year-old letter, Nevada concludes, quite categorically, that “there is no likelihood that the U.S. military would agree to a prohibition on carrying live ordnance or using electronic jamming when operating in the airspace above the Yucca Mountain repository.” Petition at 945. Nevada does not elaborate on the basis for this conclusion, which is patently incorrect. With respect to restricted area R-4808N, overflight with live or hung ordnance already is prohibited (except for critical in-flight emergencies). SAR at 1.1-14. Additionally, as noted above, interactions between the Air Force and DOE to date have resulted in a revision to AFI 13-212, Volume 1, Addendum A, which includes additional flight restrictions consistent with those identified in SAR Section 1.6.3.4.1 (p. 1.6-22).

Finally, in asserting that maneuvering of military aircraft is “governed by military operations manuals, not airspace considerations,” Nevada again cites a March 2006 Air Force document. Petition at 946 (citing “U.S. Air Force Multi-Command Instruction 11-F-16 Volume 3, Virtual Pilot Operational Procedures – F-16” (Mar. 16, 2006), LSN# NEV000005429). That document, however, is essentially a procedural checklist for pilots, and certainly does not speak to DOE’s authority to implement—in DOE-controlled airspace above the repository surface facilities— flight restrictions that require straight and level flight (and thus prohibit maneuvering). Furthermore, as discussed above, relevant revisions already have been made to the *applicable* Air Force document, AFI 13-212, Volume 1, Addendum A.

For the foregoing reasons, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi). By failing to controvert the LA through adequate factual support or expert opinion, Nevada has not

established a “genuine dispute of fact or law meriting an evidentiary hearing.” *Northeast Nuclear Energy Co.* CLI-01-03, 53 NRC at 24.

For all of the reasons set forth above, the contention should be dismissed in its entirety.

**177. NEV-SAFETY-177 - Controls On Helicopters**

SAR Subsection 1.6.3.4.1 and related subsections, which screen-out aircraft crashes at the Yucca Mountain repository, fail to provide any documentary evidence of any procedural controls for prohibiting helicopter flights within 0.5 miles of the surface facilities that handle spent nuclear fuel and high level radioactive waste, and if none exist then the crash of military aircraft at the repository should have been evaluated in terms of doses to the public and workers.

**RESPONSE**

This contention alleges that SAR Section 1.6.3.4.1 and “related subsections” do not “provide any documentary evidence of any procedural controls for prohibiting helicopter flights within 0.5 miles of the surface facilities that handle spent nuclear fuel and high level radioactive waste.” Petition at 948. The contention further asserts that, in the absence of such controls, “the crash of military aircraft at the repository should have been evaluated in terms of doses to the public and workers.” *Id.*

Although this contention pertains to controls on helicopter flights as opposed to pilot maneuvering, the supporting bases for this contention are nearly identical—and not materially distinguishable—from the bases proffered in support of the previous contention (NEV-SAFETY-176). Accordingly, this contention is inadmissible for the same reasons. Contrary to 10 C.F.R. § 2.309(f)(1)(v), this contention fails to explain how the alleged facts and documents upon which Nevada relies support the contention, and provides no other supporting information, including expert opinion. Contrary to 10 C.F.R. § 2.309(f)(1)(i), (ii), and (vi), this contention fails to state a legitimate issue of law or fact, lacks adequate basis, and fails to establish a genuine dispute with DOE on a material issue of law or fact. The contention does not directly controvert a position taken by DOE in the Application and, therefore, should be dismissed.

**a. Statement of Issue of Law or Fact to be Controverted**

As fully discussed below, Nevada has failed to state a legitimate issue of law or fact to be controverted in this proceeding. For instance, Nevada provides no legal or regulatory basis for its assertion that DOE must implement the specified prohibition on helicopter flights within one-half mile of the relevant surface facilities *before* DOE is even licensed to receive and possess SNF and HLW at those facilities. As shown below, DOE has met its present regulatory obligation by making an appropriate commitment in its Application for a construction authorization request to implement the specified helicopter flight restriction.

**b. Brief Explanation of Basis**

As explained below, the proffered contention lacks adequate supporting bases in law or fact. In this regard, Nevada provides no credible legal or factual bases for its claim that there is “no likelihood” (Petition at 950) that the U.S. military would agree to the flight restrictions specified by DOE in its Application. Indeed, the information presented by DOE below demonstrates otherwise.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

The legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted are discussed in Section V.A.3 above.

This contention fails to meet those standards because, as discussed in that Section, it presents only unsupported arguments of counsel, and the associated expert affidavit falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Notably, the contention fails even to mention the Horstman Affidavit, Attach. 12, in which Mr. Horstman purports to “adopt as [his] own opinions” the statements contained within Paragraph 5 of the contention. This Affidavit, in any case, is grossly insufficient to support the contention. An expert’s attempt to reflexively rubber-stamp unsupported arguments by counsel does not suffice under 10 C.F.R. § 2.309(f)(1)(v). That regulation requires a petitioner—including its proffered expert—to set forth “the necessary technical analysis to show why the proffered bases support its contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 180 (citing *Ga. Inst. of Tech.*, LBP-95-6, 41 NRC at 305). No such analysis is presented here. In addition, as discussed in Section f. of this response below, the three documents upon which Nevada relies as extrinsic factual support do not controvert the Application and thus do not support its contention. These fatal deficiencies render the contention inadmissible.

As in NEV-SAFETY-176, Nevada asserts that “DOE has the burden of proving that there is an agreement with the U.S. military to prohibit certain operational activities of military aircraft flying anywhere near the Yucca Mountain repository.” Petition at 950. This argument fails to support the admission of the contention for the reasons set forth above in DOE’s responses to Nevada’s previous aircraft hazard contentions. In short, Nevada provides no legal or regulatory basis for its assertion that DOE must *implement* flight restrictions, or enter into formal agreements with the U.S. Air Force or other federal entities, now, in order to obtain an NRC construction authorization. Moreover, as shown in section f. below, DOE has clear authority to

require implementation of the flight restrictions when they are needed to support repository operations.

As explained previously, the aircraft hazard frequency analysis discussed in the SAR and supporting documentation credits a flight-restricted airspace and operational constraints (which include a helicopter flight-related prohibition) over the repository as follows:

- Flights by fixed-wing aircraft in the Nevada Test Site or Nevada Test and Training Range airspace within 4.9 nautical mi (5.6 statute mi) of the North Portal and below 14,000 ft mean sea level are prohibited.
- 1,000 overflights of this flight-restricted airspace per year are permitted above 14,000 ft mean sea level for fixed-wing aircraft.
- Maneuvering over the flight-restricted airspace is prohibited; flight is straight and level.
- Carrying ordnance over the flight-restricted airspace is prohibited.
- Electronic jamming activity over the flight-restricted airspace is prohibited.
- Helicopter flights within 0.5 mi of the surface facilities and areas that handle SNF and high-level radioactive waste are prohibited. The helipad associated with the repository is located at least 0.5 mi from the surface facilities that handle SNF and high-level radioactive waste.

SAR at 1.6-22. SAR Section 1.6.3.4.1 further indicates that these restrictions will not be needed for years to come. Reflecting both this fact and the need for DOE to retain flexibility to address any potential future modifications or additions to flight activities within the special-use airspace over the repository, SAR Section 1.6.3.4.1 states:

It should be noted, however, that because air traffic restrictions for the repository would not be required for a number of years, DOE would take into consideration any modifications or additions to

flight activities within the special-use airspace over the repository during the construction period. If necessary to support repository operations, DOE would seek a special-use airspace designation from the Federal Aviation Administration. In addition, airspace restrictions could include agreements with the U.S. Air Force and other users to manage traffic in the vicinity of the repository. The accident analysis conducted assumed that such flight restrictions would occur.

*Id.*

Importantly, DOE has incorporated the flight restrictions identified above into specific Preclosure Procedural Safety Controls (“PSCs”), which are included in Table 1.9-10 of the SAR (see PSC-15 to PSC-18 on SAR at 1.9-144 to 1.9-145). The SAR states that the PSCs presented in Table 1.9-10 will “be implemented in facility operations to prevent and mitigate event sequences,” and that these PSCs will impose “interface controls on activities outside of the GROA that could potentially lead to an event sequence.” SAR at 1.9-2. The helicopter flight restrictions are established at 0.5 miles from surface facilities that process, stage, or age nuclear waste. Design criteria have been established, as identified in the Nuclear Safety Design Bases in SAR Section 1.9 (pp. 1.9-39, 1.9-51, 1.9-84, 1.9-96, and 1.9-100), for the helipad to be located at least 0.5 miles from the relevant surface facilities. This is indicated on the site plans in SAR Figures 1.2.1-1 and 1.2.1-2 (pp. 1.2.1-33 and 1.2.1-35). In addition, flight operating procedures will include the 0.5-mile restriction and the required flight paths to the heliport that support the 0.5-mile stand-off criteria, as required specifically by PSC-18 in SAR Table 1.9-10.

SAR Section 5.8.3 describes the implementation of the PSCs (i.e., flight restrictions) enumerated above. Section 5.8.3 states, in part, as follows:

Prior to receipt of a license to receive and possess SNF and HLW, and in accordance with 10 CFR 63.121(c), controls will be implemented to ensure that the requirements of 10 CFR 63.111(a) and (b) are met. The site boundary, as shown in Figure 5.8-2, will

be considered as the boundary of the preclosure controlled area under the definition of 10 CFR 20.1003. Such land use controls will include ensuring that U.S. Air Force flight activities in the proximity of the GROA remain within the repository performance analysis considerations of existing and projected U.S. Air Force flight activity (Section 1.6.3.4.1).

SAR at 5.8-7.

Thus, DOE has committed in the Application to implement appropriate PSCs. It is well-established that a docketed commitment can satisfy a licensee's regulatory obligation. *AmerGen Energy Co., LLC* (Oyster Creek Nuclear Generating Station), LBP-06-7, 63 NRC 188, 207 (2006) (accepting licensee commitment as satisfying regulatory obligation). Significantly, as noted above, the flight restrictions for the airspace over the repository are not actually required until the nuclear waste forms are located at the repository, an activity that will require a separate licensing action (and an associated hearing opportunity) pursuant to 10 C.F.R. § 63.41.

Nevada offers no alleged facts, documents, or credible expert opinion to demonstrate that DOE has not complied with applicable NRC regulations. It relies instead on bare assertions that have no basis in law or fact and which ignore critical discussion in the SAR. As noted above, the flight restrictions set forth in the SAR will be implemented as PSCs, in accordance with 10 C.F.R. §§ 63.111(a)-(b) and 63.121. Neither of those regulations requires, or even suggests, that DOE must "prov[e] that such controls are in place," as Nevada incorrectly claims. Petition at 948. In particular, Section 63.121(c) states that, in establishing appropriate controls outside the geologic repository operations area, "DOE shall exercise any jurisdiction or control of activities necessary to ensure the requirements at § 63.111(a) and (b) are met," and that such "[c]ontrol includes the *authority* to exclude members of the public, *if necessary*." 10 C.F.R. § 63.121(c) (emphasis added). Nowhere does Section 63.121(c)—or any other Part 63 regulation—state that

DOE must prove that such controls exist or even develop complete and final procedures, now, as part of its construction authorization request.

NRC regulations require only that DOE “identify” and “describe” those controls that are necessary to ensure compliance with applicable Part 63 requirements, and which may be implemented by DOE pursuant to its applicable authorities. For example, 10 C.F.R. § 63.21(c), which prescribes the contents of the SAR, requires, among other things, “[a] *description* of the controls that DOE *will* apply to restrict access and to regulate land use at the Yucca Mountain site and adjacent areas.” 10 C.F.R. 63.21(c)(24) (emphasis added). The YMRP, which guides the NRC Staff in its review of the Application, directs the Staff to assess whether “any additional controls” are “acceptable and sufficient.” YMRP § 2.5.8.3, at 2.5-100. In the same vein, the YMRP directs the Staff to evaluate whether DOE has “identified” any “existing or proposed permissible rights or encumbrances that exist and may be continued, or that *should be established* outside the geologic repository operations area,” and whether DOE has assessed the nature of any activities that may permissibly occur under those rights. *Id.* (emphasis added). By claiming that DOE must implement flight control restrictions now, Nevada alleges noncompliance with a requirement that simply does not exist and thus, is not material to the findings to be made by the NRC Staff. The contention, therefore, fails to establish a concrete and genuine dispute suitable for litigation.

As shown above, DOE has provided the information that is required by NRC regulations in its Application. It is Nevada—not DOE—that has failed to meet *its* burden by presenting sufficient legal and factual bases for its allegation that “SAR Section 1.6.3.4.1 is both materially incomplete and inaccurate.” Petition at 951. Nevada does not challenge—with the requisite specificity and basis—the rationale for, or adequacy of, DOE’s proposed helicopter flight

restrictions, particularly as they are applied by DOE in its aircraft hazard frequency analysis. *See, e.g.*, Section 3.3.3 (“Helicopter Flights Prohibited within One-Half Mile of the Relevant Surface Facilities”) *Frequency Analysis of Aircraft Hazards for License Application*, Las Vegas, NV, Bechtel SAIC Company (2007) (LSN# DN2002488951 at 45), identified in the SAR and herein as BSC 2007c. At most, Nevada erroneously asserts that “one of the key premises for DOE screening-out military aircraft crashes from consideration at the Yucca Mountain repository is in error.” Petition at 950. Nevada ignores relevant portions of the SAR. The SAR sections discussed above and BSC 2007c are quite explicit with respect to the aircraft-related flight-restrictions that DOE has committed to implement as Preclosure Procedural Safety Controls.

In summary, Nevada plainly has failed to meet its burden under Section 2.309(f)(1)(v). While the ultimate burden of persuasion is on the license applicant with respect to an *admitted* contention, “the proponent of the [proposed] contention has the initial burden of coming forward with factual issues, not merely conclusory statements and vague allegations” of the type made here by Nevada. *Northeast Nuclear Energy Co.* (Millstone Nuclear Power Station, Unit 3), CLI-01-03, 53 NRC 22, 27 (2001). Accordingly, the contention must be rejected as lacking adequate factual and legal support.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the applicable Legal Standards section above, a contention that fails to controvert the Application directly, or mistakenly asserts the Application fails to address an issue that the Application does address, is defective. This contention, like its immediate predecessor, also suffers from this deficiency. Specifically, the contention mistakenly suggests that DOE lacks the authority to implement the specific flight-restricted airspace and operational controls

that are credited in SAR Section 1.6.3.4.1 (page 1.6-22) and SAR Section 5.8.3 (page 5.8-7) for the airspace above the repository surface facilities, insofar as it asserts that there is "no likelihood that the U.S. military would agree to such proposed flight restrictions at the Yucca Mountain repository. *See* Petition at 950. In this instance, those restrictions pertain to helicopters.

DOE has clear authority to implement these additional flight restrictions. SAR Section 1.1.1.3.2.1 describes the Nevada Test Site airspace. *See* SAR at 1.1-13 to 1.1-14. The Nevada Test Site airspace is protected by restricted areas R-4808N and R-4808S, known jointly as R-4808. Restricted areas are a type of special-use airspace that separate or confine air activities that are considered dangerous or unsafe to aircraft not involved in the activity. FAA regulations prohibit flights by nonparticipating military, civilian or commercial aircraft in this special-use airspace without the controlling authority's authorization. If the area is not designated for joint use (nonjoint use), then non-participating aircraft are normally not permitted at any time. R-4808N is designated as nonjoint use by the FAA, and DOE is the controlling authority for the airspace.

As discussed in SAR Section 1.1.1.3.2.1, the repository surface facility is located in restricted area R-4808N. SAR at 1.1-14. DOE, as the controlling authority, allows military aircraft to transit R-4808N. DOE has existing avoidance areas (further flight-restricted areas) over the Device Assembly Facility and over BREN (Bare Reactor Experiment-Nevada) Tower, as well as several other areas within R-4808N. *Id.* The additional flight-restrictions identified in SAR Sections 1.6.3.4.1 and 5.8.3 are for the airspace above the repository surface facilities. As discussed above, the flight restrictions for the airspace are not needed until nuclear waste forms are actually located at the repository.

DOE nonetheless has taken steps to facilitate implementation of the additional flight-restrictions identified in the SAR. Specifically, interactions with the U.S. Air Force Warfare Center at Nellis Air Force Base, Nevada, have resulted in a revision to Air Force Instruction (AFI) 13-212, Volume 1, Addendum A. AFI 13-212, Vol. 1, IC2, “Summary of Changes – Interim Change to AFI 13-212” (Dec. 17, 2008) (LSN# DEN001606834) at 5. This revision includes the additional restrictions, with a future implementation date, for the airspace above the repository surface facilities, consistent with the restrictions outlined in SAR Sections 1.6.3.4.1 and 5.8.3. Currently, these future restrictions serve only as a reference for future use and planning purposes. When repository operations commence under an NRC-approved license, DOE (currently through the National Nuclear Security Administration Nevada Site Office) will implement the applicable flight restrictions. These restrictions will be implemented in the same manner as the current avoidance areas in R-4808N. Specifically, DOE will require the Air Force to revise the formal Air Force Instructions to include the restrictions.

Nevada has not presented any factual information or expert opinion that directly controverts the Application or information presented above and, consequently, its contention is inadmissible. As noted above, the Horstman Affidavit lacks the requisite “reasoned basis or explanation.” Furthermore, while Nevada cites two documents as extrinsic support for its contention, neither of which controverts the Application and gives rise to a material dispute. In brief, neither document establishes or even suggests that DOE lacks the necessary authority to implement the flight-restricted airspace and operational constraints identified in SAR Sections 1.6.3.4.1 and 5.8.3, including the prohibition on helicopter flights within 0.5 miles of the surface facilities that will handle spent nuclear fuel and high level radioactive waste. Nevada, for that

matter, fails to explain how the two documents (which it also cites in support of NEV-SAFETY-176) are even potentially relevant to helicopter flights within 0.5 miles of the surface facilities.

The first document cited by Nevada is a September 11, 2003, letter from U.S. Air Force officials to U.S. Representative Duncan Hunter, then-Chairman of the House Committee on Armed Services. Petition at 950 (citing Letter from John Jumper, USAF Chief of Staff, and James Roche, Secretary of the Air Force to Hon. Duncan Hunter, Chairman, Committee on Armed Services, U.S. House of Representatives (Sept. 11, 2003), LSN# DN2001403483 at 1). This letter addresses two issues related to the Nevada Test and Training Range (“NTTR”). The first issue relates to the Air Force’s previously-stated concern that DOE might seek to transport repository-bound nuclear materials through sensitive areas of the NTTR. As such, it has no relevance to DOE’s aircraft hazard analysis, the subject of Nevada’s contention.

The second issue mentioned in the September 2003 letter involves the Air Force’s concern, as expressed in 2003, that “overflight restrictions on aircraft operating in NTTR-associated airspace will negatively impact [its] readiness activities.” LSN# DN2001403483 at 1. Nevada fails, however, to explain how the 2003 Air Force letter directly controverts the Application, particularly with respect to DOE’s authority to implement the flight-restricted airspace and operational constraints that are credited in the SAR. Indeed, it is clear that Nevada has not carefully reviewed the SAR and its supporting documentation, which describe in detail existing operations on the NTTR and their locations relative to the repository surface facility.

SAR Section 1.1.1.3.2.2 explains that the NTTR airspace consists of the Reveille and Desert Military operations and restricted areas R-4806, R-4807, and R-4809. SAR at 1.1-14. The closest border of the Reveille military operations area is about 71 miles from the North Portal at Yucca Mountain. *Id.* The restricted areas of the NTTR are divided into the North

Range and the South Range. *Id.* at 1.1-15. These two ranges are separated by the Nevada Test Site. *Id.* Within the NTTR airspace, restricted areas R-4806, R-4807, and R-4809 are joint use; within the Nevada Test Site airspace, R-4808S is joint use and R-4808N is nonjoint use. *Id.* The additional flight restrictions identified in SAR Sections 1.6.3.4.1 and 5.8.3 are for the airspace above the repository surface facilities. Those facilities are to be located in restricted area R-4808N, a nonjoint use area for which DOE is the controlling authority. Thus, contrary to Nevada’s suggestion, the Air Force cannot “decline” to abide by the additional flight restrictions identified and credited by DOE in the SAR upon their implementation.

The second document cited by Nevada in support of its contention is a September 20, 1995, letter from Sheila Widnall, Air Force to U.S. Representative Don Young, then-Chairman of the House Committee in Resources. Petition at 950 (citing Letter from Sheila Widnall, Secretary of the Air Force to Hon. Don Young, Chairman, Committee in Resources, U.S. House of Representatives (Sept. 20, 1995)), LSN# DEN000357493 at 1). That letter, written in response to then-proposed legislation (H.R. 1020), expresses the Air Force’s concern, at the time, that overflight restrictions implemented to support repository operations might adversely affect military operations at the Nellis range complex, including the Nellis Air Force Base. Nevada does not explain—and the Board is left to guess—how this 1995 document is germane to the information presented in DOE’s June 2008 Application, particularly as it pertains to the prohibition on helicopter flights.

Based on this 13-year-old letter, Nevada concludes, quite categorically, that “there is no likelihood that the U.S. military would agree to such proposed flight restrictions at the Yucca Mountain repository.” Petition at 950. Nevada does not elaborate on the basis for this conclusion, which is patently incorrect. With respect to restricted area R-4808N, overflight with

live or hung ordnance already is prohibited (except for critical in-flight emergencies). SAR at 1.1-14. Additionally, as noted above, interactions between the Air Force and DOE to date have resulted in a revision to AFI 13-212, Volume 1, Addendum A, which includes additional flight restrictions consistent with those identified in SAR Section 1.6.3.4.1 (p. 1.6-22).

For the foregoing reasons, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi). By failing to controvert Application through adequate factual support or expert opinion, Nevada has not established a “genuine dispute of fact or law meriting an evidentiary hearing.” *Northeast Nuclear Energy Co.*, CLI-01-03, 53 NRC at 24. The contention accordingly should be dismissed.

**178. NEV-SAFETY-178 - Basis For Aircraft Exclusions**

SAR Subsection 1.6.3.4.1 and related subsections erroneously screen-out aircraft crashes at the Yucca Mountain repository because they inappropriately exclude numerous relevant aircraft crashes from consideration when performing aircraft crash frequency calculations.

**RESPONSE**

This contention alleges that SAR Subsection 1.6.3.4.1 and “related subsections” erroneously screen-out aircraft crashes at the Yucca Mountain repository because they “inappropriately exclude numerous relevant aircraft crashes” from consideration when performing aircraft crash frequency calculations. Petition at 952. The contention claims that, as a result, “the crash factor as determined by DOE substantially underestimates the aircraft crash frequency.” *Id.* at 954.

For the reasons discussed below, contrary to 10 C.F.R. § 2.309(f)(1)(v) that requires adequate factual support or expert opinion in order for a contention to be admitted, this contention fails to explain how the alleged facts and documents upon which Nevada relies support the contention, and provides no other supporting information, including expert opinion. In addition, the contention also must be rejected because it fails to state a legitimate issue of law or fact, lacks adequate legal or factual basis, and fails to establish a genuine dispute with DOE on a material issue of law or fact, contrary to 10 C.F.R. § 2.309(f)(1)(i), (ii) and (vi). As here, when a contention does not directly controvert a position taken by the applicant in the license application, it is subject to dismissal.

**a. Statement of Issue of Law or Fact to be Controverted**

As fully discussed below, DOE has not "inappropriately exclude[d]" relevant aircraft crash events or data from its Application so as to render it "materially incomplete and

inaccurate." Petition at 952, 954. Thus, Petitioner has failed to state a legitimate issue of law or fact to be controverted in this proceeding.

**b. Brief Explanation of Basis**

As fully explained below, this contention lacks adequate factual or legal basis. Contrary to Nevada's assertion, none of the relevant crash information was excluded from consideration in DOE's aircraft hazard frequency analysis. All available information from the comprehensive list of aircraft crash events is presented in supporting documentation explicitly referenced in the LA and available in the LSN, and has been considered by DOE in its analyses. In addition, Nevada makes no attempt to explain how the *alleged* exclusion of aircraft crash events purportedly results in a "substantia[l] underestim[at]ion" of the aircraft crash frequency. Petition at 954. Thus, the contention does not demonstrate "that there has been sufficient foundation assigned for it to warrant further exploration." *Public Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-942, 32 NRC at 428.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For purposes of demonstrating that this contention is material to the findings NRC must make to license Yucca Mountain, Nevada generically claims noncompliance with a litany of regulatory provisions in 10 C.F.R. Part 63, including §§ 63.31, 63.21, 63.102, 63.111, and 63.112. Petition at 952-53. In direct contradiction to the June 20, 2008, Case Management Order, however, Nevada fails to cite the "*principal* statutory or regulatory requirement or requirements" on which it relies (emphasis added). The mere recitation of regulatory provisions

does not satisfy Nevada’s burden of demonstrating the issue raised in this contention is material to the findings that the NRC must make in this proceeding.

In addition, as fully explained below, Nevada makes no effort whatsoever to explain how the unavailability of certain information for a particular crash event, as reflected in Table III-I of the *Frequency Analysis of Aircraft Hazards for License Application Las Vegas, NV*, Bechtel SAIC Company, (2007) (LSN# DN2002488951 at III-3 and DEN001564755), identified in SAR Section 1.6.5 and referred to herein as BSC 2007c, allegedly results in a “substantial underestimation” of the aircraft crash frequency. As discussed in the applicable Legal Standards Section V.A.3 above, contentions that allege errors, omission, uncertainties or alternative approaches—without indicating the specific ramifications or result of such deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

The legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted are discussed in Section V.A.3 above. This contention fails to meet those standards because, as discussed in that Section, it presents only unsupported arguments of counsel, and the associated expert affidavit falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Notably, the contention fails even to mention the Hortsman Affidavit, Attach. 12, in which Mr. Horstman purports to “adopt as [his] own opinions” the statements contained within Paragraph 5 of the contention. This Affidavit, in any case, is grossly insufficient to support the contention. An expert’s attempt to reflexively rubber-stamp unsupported arguments by counsel does not suffice under 10 C.F.R. § 2.309(f)(1)(v). That regulation requires a petitioner—including its proffered expert—to set forth “the necessary technical analysis to show why the proffered bases support its

contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 180 (citing *Ga. Inst. of Tech.*, LBP-95-6, 41 NRC at 305). No such analysis is presented here.

Indeed, Nevada’s concise statement of alleged “facts or expert opinion” under paragraph 5 of its contention is a series of vague and unsupported allegations. Petition at 953. Nevada merely asserts, without any particularized references to the Application or associated documentation, that “numerous aircraft crashes” in the “underlying database” are missing “valuable information” concerning “aircraft altitude, speed, flight path angle, and glide distance.” Petition at 953. Nevada further alleges that, by ignoring this “missing” information, DOE has not performed a “conservative” analysis and therefore “substantially underestimates the aircraft crash frequency.” *Id.* at 953-54.

Such unduly vague assertions do not meet the Commission’s strict contention admissibility requirements. Despite the gravity of these allegations, Nevada fails to provide a single, concrete example of the alleged “missing” information. Indeed, the Board is left to guess from which “underlying database” the information is missing, given Nevada’s complete omission of any supporting references to the Application or the analyses cited therein. In short, NEV-SAFETY-178 lacks “a reasoned basis or explanation” and, therefore, “deprives the Board of the ability to make the necessary, reflective assessment” of the alleged deficiencies in the Application. *Private Fuel Storage*, LBP-98-7, 47 NRC at 181.

Although Nevada discusses a DOE guidance document on page 953 of its Petition, that discussion does nothing to bolster the admissibility of its contention. Specifically, Nevada cites “DOE Standard Accident Analysis for Aircraft Crash into Hazardous Facilities,” DOE-STD-3014-96 (Oct. 1, 1996) (LSN# DN2002431791) at 5. Nevada asserts that this DOE document

adopts the use of the so-called “ACRAM” model, and that “NRC applicants, including DOE, are required to consider all aircraft activity in or near any nuclear facility.” Petition at 953.

As an initial matter, the referenced DOE document is a guidance document. As such, while it may assist in complying with applicable requirements, it does not have the force of legally binding regulations. *See, e.g., Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), CLI-01-22, 54 NRC 255, 264 (2001) (citations omitted). In any case, this standard was referenced and used in the identification and analysis of aircraft hazards. Specifically, the *Identification of Aircraft Hazards*, Las Vegas, NV, Bechtel SAIC Company (2007) LSN# DN2002406192, cited in the SAR and herein as BSC 2007b, states in Section 1 that the scope of the report “includes the evaluation of military, private, and commercial use of airspace in the 100-mile regional setting of the repository at Yucca Mountain.” BSC 2007b at 1. Thus, by evaluating aircraft activity within 100 miles of the repository, DOE, in fact, met the ACRAM standard of “including all aircraft activity that could imply a risk.” DOE-STD-3014-96 also was used in establishing the criteria for evaluating the air activity. BSC 2007b at 24, 30. The screening criteria established in BSC 2007b (page 24) for evaluating the distance from an airport is greater than the distance used in DOE-STD-3014-96 and thus “provides an additional conservative margin.” BSC 2007b at 24. Finally, DOE-STD-3014-96 also is used in BSC 2007c. *See* BSC 2007c at 29, 45, 63, and 68. These facts wholly undercut Nevada’s allegation that “DOE failed to fulfill its obligation to use the relevant data and instead screened out many accidents from consideration during their analysis.” Petition at 954.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the applicable Legal Standards Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts the Application fails to address

an issue that the Application does address, is defective. Nevada's contention also suffers from this deficiency. Nevada completely ignores the relevant portions of the Application and fails to explain how the alleged defects in the Application have caused DOE to "substantially underestimate" the aircraft crash frequency. Petition at 954. In short, this contention is inadmissible because "the Petitioner's assertion that the application[] [is] deficient is simply based upon a failure to read or perform any meaningful analysis of the application[]." *Dominion Nuclear Conn., Inc.*, LBP-04-15, 60 NRC at 95 (2004) *aff'd*, CLI-04-6, 60 NRC 631 (2004).

As reflected in Table III-1 of BSC 2007c, DOE compiled a comprehensive list of 282 U.S. Air Force aircraft crash events. As discussed in BSC 2007c, these events include aircraft crashes that occurred between May 1990 and December 2006, and which involved F-16, F-15, F-22 and A-10 aircraft. BSC 2007c at 66; Attachment III at III-1. DOE compiled the list from safety reports, accident investigation reports, and executive summaries gathered through multiple visits to the Air Force Safety Center located at Kirkland Air Force Base in Albuquerque, New Mexico. *Id.* DOE also obtained data from publicly available reports posted on the U.S. Air Force Accident Investigation Board and the NRC's ADAMS websites. *Id.*

Contrary to Nevada's assertion, none of the relevant crash information was excluded from consideration in DOE's aircraft hazard frequency analysis. All available information from the comprehensive list of 282 aircraft crash events is presented in Table III-1 of BSC 2007c and has been considered by DOE in its analyses. BSC 2007c, Table III-1 at III-3 to -38. Table III-1 includes the following types or categories of information: (1) the source document for the event; (2) description of the initiating event, such as engine failure or midair collision; (3) type of aircraft involved; (4) aircraft serial number; (5) date of the event; (6) ejection altitude; (7) distance traveled from actual or inferred ejection point to the crash site; (8) method used to

estimate the ejection to crash distance; (9) comments that provide additional relevant information; (10) glide ratio; and (11) initiating event type. *Id.*

Given the manifold sources from which the information in Table III was obtained, certain types of information (e.g., distance to crash, glide ratio) were not available for particular events. In other words, the individual sources that DOE used to develop Table III-1 did not contain equal levels of information. Accordingly, for some of the crash events in Table III-1, all the entries contain a value, whereas for other events, the values of some entries are designated as “Unknown.” In particular, it is not possible to calculate a glide ratio if either the distance to crash or the ejection altitude is unavailable from the source document. Thus, contrary to Nevada’s misleading claim, DOE did not “exclude” or “screen-out” relevant information. Petition at 952.

Moreover, Nevada makes no effort whatsoever to explain how the unavailability of certain information for a particular crash event, as reflected in Table III, allegedly results in a “substantia[l] underestim[ation]” of the aircraft crash frequency. Petition at 954. As discussed in the applicable Legal Standards Section V.A.3 above, contentions that allege errors, omission, uncertainties or alternative approaches—without indicating the specific ramifications or result of such deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. Nevada’s contention falls squarely into this category of inadmissible contentions.

As Nevada fails to explain, in BSC 2007c, the information in Table III-1 is used for several purposes, including:

- The evaluation of distances to crash after ejection. Specifically, this information is used in Section 4.3.3 of BSC 2007c in the form of a cumulative distribution function, which,

in turn, is used to calculate the frequency of aircraft crash into relevant facilities, for flights outside the flight-restricted airspace.

- The evaluation of annual crash frequency density for crashes that occurred in the Nevada Test and Training Range and adjacent military operations areas. This information is used to calculate the frequency of aircraft crash into relevant facilities for flights outside of the flight-restricted airspace. The relevant crash events are extracted from Table III-1 and presented in Table 8 of BSC 2007c.
- The evaluation of glide ratios after ejection. As indicated in Footnote “e” of Table III-1, the glide ratio is the dimensionless ratio of the distance to crash after ejection over the ejection altitude. Glide ratios are used in Section 4.3.2 to calculate the frequency of aircraft crash into relevant facilities for overflights of the flight-restricted airspace.

Based on the information presented in Table III-1 of BSC 2007c, DOE was able to calculate a distance to crash for 155 of the identified events. Using this information, DOE developed a cumulative distribution function, as presented in Figure 5 of BSC 2007c. BSC 2007c at 59. Based on the available data, DOE then calculated the glide ratio, which requires both knowledge of the ejection altitude and distance to crash, for 88 events.

As reflected in Section 4.3.2 of BSC 2007c, DOE used the glide ratios to calculate the frequency of aircraft crashes into relevant facilities for overflights of the flight-restricted airspace. As indicated in the SAR (Sections 1.6.3.4.1 and 5.8.3) and BSC 2007C, Section 7, such overflights are required to be straight and level (*i.e.*, maneuvering is prohibited). Of the 88 events for which DOE was able to calculate glide ratios, 58 events were determined to be compatible with such overflight restrictions. Therefore, the frequency of aircraft crash into relevant facilities described in Section 4.3.2 is based on these 58 applicable events.

In performing the sensitivity study described in BSC 2007c, Attachment VI (specifically, the Section entitled “Categorizing Events”), DOE included all 88 events for which glide ratios were calculated. BSC 2007c, Attach. VI at VI-9. Significantly, the sensitivity study concludes that the frequency of aircraft crash is insensitive to the categorization of military crashes, even when using all events with known glide ratios. *Id.* Therefore, the frequency of aircraft crash is not affected by the unavailability of information in Table III. Nevada fails even to reference these calculations, and certainly presents no information—quantitative or qualitative—to controvert the associated results and conclusions.

For the foregoing reasons, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi). Nevada has not directly controverted *any* portion of the Application, as it must do to gain admission of the contention. As shown above, there is no basis for Nevada’s conclusory allegations that DOE has “excluded numerous crashes on subjective grounds,” “failed to fulfill its obligation to use the relevant data,” or “underestimate[d] the aircraft crash frequency.” Petition at 953-54. Nor is SAR Subsection 1.6.3.4.1 “materially incomplete and inaccurate.” Petition at 954. Accordingly, the contention should be dismissed.

For all of the reasons discussed above, this contention must be dismissed in its entirety.

**179. NEV-SAFETY-179 - Controls On Aircraft Operations (Mid-Air)**

SAR Subsection 1.6.3.4.1 and related subsections erroneously screen out aircraft crashes at the Yucca Mountain repository using an analysis that is based on the claim that all mid-air collisions and controlled flight into terrain occur during maneuvering, which is not supported by any documentary evidence. Since DOE further claims that maneuvering is prohibited in the airspace over the proposed flight restricted area, these types of accidents have been improperly excluded from the crash frequency analysis.

**RESPONSE**

This contention alleges that DOE “erroneously screen[s] out aircraft crashes at the Yucca Mountain repository using an analysis that is based on the claim that all mid-air collisions and controlled flight into terrain occur during maneuvering, which is not supported by any documentary evidence.” Petition at 955. In support of this contention, Nevada advances three primary arguments. Specifically, it alleges that DOE: (1) falsely assumes that the flight-restricted area is a non-maneuvering area; (2) does not specify the flights parameters that characterize maneuvering; and (3) ignores midair collisions that did not involve “high-performance maneuvering.” *Id.* at 956-57.

For the reasons discussed below, Nevada’s first two arguments fail to meet the requirements of 10 C.F.R. § 2.309(f)(1)(v) and (vi) and thus do not support admission of the contention. In this regard, the contention fails to explain how the alleged facts upon which Nevada relies support the contention, and provides no other supporting information, including expert opinion. Furthermore, the contention ignores, and thus does not directly controvert, information presented in the Application. Finally, while Nevada references specific sources in support of its third argument, the information contained in those documents was explicitly

considered by DOE in its Application and does not establish a genuine dispute with DOE on a material issue of law or fact. Accordingly, the contention must be dismissed.

**a. Statement of Issue of Law or Fact to be Controverted**

Because, as explained below, Nevada has ignored the content of the application and misinterpreted the underlying regulatory requirements in Part 63, it has failed to state a legitimate issue of law or fact to be controverted in this proceeding.

**b. Brief Explanation of Basis**

As fully discussed below, Nevada has proffered no legal or factual support for its assertion that “DOE assumes that the flight restricted airspace is a non-maneuvering area, which is false.” Petition at 957. This assertion simply is another iteration of Nevada’s argument in NEV-SAFETY-174 (and subsequent contentions) that DOE “fails to provide documentary evidence of any procedural controls for monitoring flight activity over the proposed flight-restricted airspace with the United States military.” *Id.* at 937. This argument must be rejected for the same reasons detailed in DOE’s response to NEV-SAFETY-174, *supra*. Similarly, as fully discussed below, Nevada presents no factual support for its claim that DOE does not specify “the flights parameters that characterize maneuvering.” Petition at 957.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

As discussed below, Nevada does not accurately describe the information contained in the six references it cites in support of this contention, and therefore, does not directly controvert DOE’s classification of three events as Type 0 events that are not applicable to overflight

(straight and level flight) of the flight-restricted airspace. Even *assuming* DOE’s classification of the three events were incorrect, Nevada does not explain how the alleged errors would materially affect the results of DOE’s aircraft hazard frequency analysis.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

The legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted are discussed in Section V.A.3 above. This contention fails to meet those standards with respect to the first two arguments or bases identified above. First, Nevada has proffered no legal or factual support for its assertion that “DOE assumes that the flight restricted airspace is a non-maneuvering area, which is false.” Petition at 957. This assertion simply is another iteration of Nevada’s argument in NEV-SAFETY-174 (and subsequent contentions) that DOE “fails to provide documentary evidence of any procedural controls for monitoring flight activity over the proposed flight-restricted airspace with the United States military.” *Id.* at 937. This argument must be rejected for the same reasons detailed in DOE’s response to NEV-SAFETY-174, *supra*.

Specifically, DOE has identified additional flight restrictions in SAR Sections 1.6.3.4.1 and 5.8.3 for the airspace above the repository surface facilities. DOE’s aircraft hazard frequency analysis credits these flight-restricted airspace and operational constraints over the repository. *See Frequency Analysis of Aircraft Hazards for License Application* (2007) (LSN# DN2002488951 and #DEN001564755), Section 7 at 75-76 (identified in SAR Section 1.6 and herein as BSC 2007c). Those restrictions include, among others, the following: “Maneuvering over the flight-restricted airspace is prohibited; flight is straight and level.” SAR at 1.6-22, 5.8-7. DOE has incorporated these flight restrictions into specific Preclosure Procedural Safety Controls (“PSCs”), which are included in Table 1.9-10 of the SAR (see PSC-15 to PSC-18 on

SAR at 1.9-144 to 1.9-145). The requirement for straight and level flight is specifically contained in PSC-16. *Id.* 1.9-144. The SAR states that the PSCs presented in Table 1.9-10 will “be implemented in facility operations to prevent and mitigate event sequences,” and that these PSCs will impose “interface controls on activities outside of the GROA that could potentially lead to an event sequence.” *Id.* at 1.9-2.

DOE is the “controlling authority” for the airspace above the repository surface facilities and, as such, has full authority to implement the additional restrictions when needed. SAR Section 1.1.1.3.2.1 describes the NTS airspace. *See* SAR at 1.1-13 to 1.1-14. The NTS airspace is protected by restricted areas R-4808N and R-4808S, known jointly as R-4808. Restricted areas are a type of special-use airspace that separate or confine air activities that are considered dangerous or unsafe to aircraft not involved in the activity. Federal Aviation Administration (“FAA”) regulations prohibit flights by nonparticipating military, civilian or commercial aircraft in this special-use airspace without the controlling authority’s authorization. If the area is not designated for joint use (nonjoint use), then nonparticipating aircraft are normally not permitted at any time. The repository surface facility is located in restricted area R-4808N, which is designated as nonjoint use by the FAA. DOE is the controlling authority for the airspace. SAR at 1.1-14. As the controlling authority, DOE allows military aircraft to transit R-4808N. DOE has existing avoidance areas (further flight-restricted areas) over the Device Assembly Facility and over BREN (Bare Reactor Experiment-Nevada) Tower, as well as several other areas within R-4808N. *Id.*

Although the specified additional flight restrictions for the airspace are not needed until nuclear waste forms are actually located at the repository, DOE, pursuant to its authority, nonetheless has taken steps to facilitate implementation of the additional flight-restrictions

identified in the SAR. Specifically, interactions with the U.S. Air Force Warfare Center at Nellis Air Force Base, Nevada, have resulted in a revision to Air Force Instruction (AFI) 13-212, Volume 1, Addendum A. AFI 13-212, Vol. 1, IC2, “Summary of Changes – Interim Change to AFI 13-212” (Dec. 17, 2008) (LSN# DEN001606834) at 5. This revision includes the additional restrictions, with a future implementation date, for the airspace above the repository surface facilities consistent with the restrictions outlined in SAR Section 1.6.3.4.1. Currently, these future restrictions serve only as a reference for future use and planning purposes, given that DOE is not yet receiving SNF and HLW at the repository. When repository operations commence under an NRC-approved license, DOE (currently through the National Nuclear Security Administration Nevada Site Office) will implement the applicable flight restrictions. These restrictions will be implemented in the same manner as the current avoidance areas in R-4808N. Specifically, DOE will *require* the Air Force to revise the formal Air Force Instructions to include the restrictions. *Id.* Thus, Nevada presents no legal or factual support for its assertion that DOE “falsely” assumes that “the flight restricted airspace is a non-maneuvering area.” Petition at 957.

Second, Nevada presents no factual support for its claim that DOE does not specify “the flight parameters that characterize maneuvering.” *Id.* Nevada points to no relevant portion of the Application or supporting documentation that is purportedly deficient in this respect. Nor does it supply its own “definition of maneuvering.” *Id.* Nevada’s allegation, in fact, reflects a failure to read and address the information presented in the Application.

Section 3.2.17 of DOE’s *Frequency Analysis of Aircraft Hazards for License Application* (BSC 2007c, as cited above) specifically discusses the criteria that DOE used to sort and evaluate the military aircraft crash data it collected for the period May 1990 to December 2006. BSC

2007c at 41-43. As explained therein, DOE assigned an initiating-event type code (Type 0 and Type 1) to each aircraft crash. *Id.* at 41. Type 0 events are *not* applicable to overflight (i.e., straight and level or cruising-type flight) of the flight-restricted airspace. *Id.* Type 1 events *are* applicable to overflight of the flight-restricted airspace. *Id.* As Section 3.2.17 makes clear, Type 0 events include, among others, midair collisions (because “midair collision is much more likely during simulated combat maneuvers”), take-off mishaps, landing mishaps, abandoned aircraft during maneuvering, loss of control during testing or maneuvering, and spatial disorientation during maneuvering. *Id.* at 42. Type 1 events, in contrast, are consistent with cruise-type flight, and include, for example, simple engine failure or airframe failure, or events that may lead to immediate ejection. *Id.* at 43. Nevada totally ignores DOE’s explicit discussion of these criteria in BSC 2007c.

The Commission’s rules require “a clear statement as to the basis for the contention and the submission of . . . supporting information and references to specific documents and sources that establish the validity of the contention.” *AmerGen Energy Co., LLC* (Oyster Creek Nuclear Generating Station), CLI-06-24, 64 NRC 111, 118-19 (2006) (emphasis added; citations omitted). The two Nevada arguments discussed above fall far short of meeting this requirement, as they reference neither the Application nor extrinsic sources of information. Accordingly, insofar as it relies on these arguments, the contention does not meet 10 C.F.R. § 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the applicable Legal Standards Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts the Application fails to address an issue that the Application does address, is defective under 10 C.F.R. § 2.309(f)(1)(vi). Thus, because Nevada’s first two arguments fail to make particularized references to the Application

and supporting DOE aircraft hazard frequency analysis, or any other supporting information, they also fail to meet this criterion.

With respect to the third argument discussed above (i.e., that DOE overlooks midair collisions that did not involve maneuvering), Nevada provides specific references to six documents in the LSN. See Petition at 956-57 (citing LSN#'s DEN001605889, NEV000005461, DEN001605244, NEV000005482, DEN001605232 and NEV000005483). Collectively, these documents relate to three separate midair collision events, which occurred on June 23, 1993; September 16, 1997; and October 22, 1998, respectively. As explained below, however, none of the cited documents establishes a genuine dispute with DOE on a material issue of fact or law.

As indicated above, DOE collected data on documented historical aircraft crash events involving military aircraft for the 16.5-year period from May 1990 to December 2006. Each of the 282 events is listed in Table III-1 of Attachment III to BSC 2007c (pp. III-3 to III-37). Table III-1 includes the three specific events identified above and discussed in the six documents cited by Nevada in its contention. These three events are listed in Table III-1 as event numbers 77, 156, and 175/176, respectively. See BSC 2007c, Attachment III at III-12, -21, and -23. As indicated in Table III-1, based on its review of the relevant source documents (e.g., safety and accident investigation reports), DOE classified each of these three events as Type 0 events, with the first two events involving midair collisions and the third event involving a take-off mishap.

Nevada's contention, including the six documents referenced therein, in no way establishes a genuine material dispute with DOE. First, Nevada ignores the fact that DOE's Application (as supported by BSC 2007c) explicitly addresses the three events cited by Nevada as midair collisions purportedly not involving maneuvering but "typical," "routine," or "normal" flight. Petition at 955-56. Second, Nevada does not accurately describe the information

contained in the six references and, therefore, does not directly controvert DOE's classification of three events as Type 0 events that are not applicable to overflight (straight and level flight) of the flight-restricted airspace. Finally, even *assuming* DOE's classification of the three events were incorrect, Nevada does not explain how the alleged errors would materially affect the results of DOE's aircraft hazard frequency analysis.

Nevada's claim that the cited incidents involved "one aircraft simply [running] over another flight member during a routine in-flight visual rejoin when both aircraft were in normal flight" is misleading and not supported by the referenced documents. Petition at 956. With respect to the June 23, 1993 mishap event, the documents cited by Nevada indicate that the midair collision occurred during basic fighting maneuvers. One of the documents states that "[t]he purpose of the flight was to conduct a Basic Fighter Maneuver (BFM) training mission," and that BFM's "consist of training which stresses *maneuvering* one airplane against another emphasizing employment necessary to kill the adversary." AFR 110-14 USAF Aircraft Accident Investigation (Sept. 1, 1993), LSN# NEV000005482 at 2 (emphasis added). Thus, consistent with DOE's conclusion in Table III-1 of BSC 2007c, this event is not consistent with straight and level flight.

With respect to the September 16, 1997, mishap event, the documents cited by Nevada unequivocally indicate that the midair collision occurred during a "recurrency and requalification program" training mission. AFI 51-503 Accident Investigation Board (Nov. 11, 1997), LSN# NEV000005461 at 1-2. Specifically, the collision occurred while two F-16 aircraft were climbing from 7,000 feet above mean sea level (ft MSL) to 14,000 ft MSL during a night-vision goggle climb to cruise elevation. *Id.* at 2-3. Thus, consistent with DOE's conclusion in Table III-1 of BSC 2007c, this event also is not consistent with straight and level flight.

Finally, with respect to the October 22, 1998, mishap event, the documents cited by Nevada clearly indicate that the midair collision occurred during an Air Combat Tactics-1 training sortie. According to the documents cited by Nevada, the collision between two F-16C aircraft occurred only two minutes after take-off while the planes were still climbing. *See* Aircraft Accident Investigation Report F-16C6, Serial Number 88-0414 (Dec. 12, 1998) LSN# NEV000005483 at 1-3. Thus, consistent with DOE's conclusion in Table III-1 of BSC 2007c, this event also is not consistent with straight and level flight.

In summary, as explained in Legal Standards Section V.A.3 above, any supporting material provided by a petitioner is subject to Board scrutiny both for what it does and does not show. Nevada's imprecise reading of the very documents it offers as support for its contention simply cannot be the basis for a litigable contention. Furthermore, as also discussed in Section V.A.3 above, contentions that allege errors, omission, uncertainties or alternative approaches—without indicating the specific ramifications or result of such deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. Nevada's contention fails in this respect too.

For all of the reasons discussed above, this contention must be dismissed in its entirety.

**180. NEV-SAFETY-180 - Crash Frequency Of Fixed-Wing Aircraft**

SAR Subsection 1.6.3.4 and similar subsections, which state that aircraft impact was screened out as an external initiating event, refer to inappropriate calculations as a basis for the screening, making the associated screening decision unjustified.

**RESPONSE**

This contention alleges that SAR Subsection 1.6.3.4 and “similar subsections” refer to “inappropriate calculations” as a basis for the screening out aircraft impacts as an external initiating event, thereby making the associated screening decision “unjustified.” Petition at 958. In equally vague fashion, the contention further asserts that the methodology used by DOE to characterize the frequency of impacts of fixed-wing aircraft on the repository is “inadequately described, has not been demonstrated to be mathematically correct, and uses an unnecessary and unjustified approximation in the calculations.” *Id.*

**a. Statement of Issue of Law or Fact to be Controverted**

As fully discussed below, Nevada has not explained with any specificity the particular safety or legal reasons requiring rejection of the Application. Its specific grievances are unclear and certainly not substantiated. Thus, Nevada has failed to state a legitimate issue of law or fact to be controverted in this proceeding.

**b. Brief Explanation of Basis**

As fully explained below, this contention lacks adequate factual or legal basis. Contrary to Nevada’s assertion, the computational approach Nevada seeks to challenge is not “obscure” or “unjustified.” The analysis supporting DOE’s Application discusses in detail the methodology used to calculate the annual frequency of crashes into the relevant surface facilities when the initiating event leading to the crash occurs during an overflight of the flight-restricted airspace.

Thus, the contention fails to demonstrate “that there has been sufficient foundation assigned for it to warrant further exploration.” *Public Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-942, 32 NRC at 428.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. *See* Petition at 958-59. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) for the most part, the contention does not reference, *with the requisite specificity*, any documents other

than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not clearly reference any credible expert opinion. Nevada's Petition does attach two affidavits (by Michael C. Thorne and Hugh Horstman, Attachments 3 and 12, respectively), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in paragraphs 5 and 6 of this contention, the affidavits simply "adopt" the otherwise unsupported assertions made in paragraph 5 and 6 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Finally, while the contention refers to a "full analysis" prepared by Mr. Thorne, it fails to describe the nature of that analysis or explain its relevance and significance to the claims made in the contention.

Nevada's contention purports to challenge "aspects of the computational approach" (Petition at 959) set forth in DOE's *Frequency Analysis of Aircraft Hazards for License Application* (2007) (LSN# DN2002488951 and #DEN001564755), identified in SAR Section 1.6 and referred to herein as BSC 2007c. Specifically, the contention claims that the description of the methodology contained in Subsection 4.3.2 ("Allowing for Overflights of the Flight-Restricted Airspace by Fixed-Wing Aircraft") of BSC 2007c "is extremely obscure and has not been justified mathematically." Petition at 960. The contention further asserts that DOE's methodology "involves an approximation of the calculations" as illustrated in Figure 4 on page 55 of BSC 2007c, "which has not been demonstrated to be accurate." *Id.*

This contention, without question, is deficient for want of adequate factual support or expert opinion. The assertions made in the contention are exceedingly vague and do not satisfy Nevada's obligation to "explain, with specificity, particular safety or legal reasons requiring rejection of the contested [application]." *Dominion Nuclear Conn., Inc.*, CLI-01-24, 54 NRC at

359-60. Nevada states that the methodology described in Section 4.3.2 of BSC 2007c is “incomplete and inadequate,” because it allegedly lacks “an appropriate basis for the calculations of frequencies of crashes of fixed-wing aircraft.” Petition at 960. It also claims that “a comprehensive analysis of the problem” would eliminate the need for the purported “approximation” contained in Figure 4 of BSC 2007c. *Id.* Nowhere in its contention, however, does Nevada even begin to explain how or why the methodology in question is “incomplete” or “inadequate.” *Id.* Nor does it furnish the suggested “comprehensive analysis.” *Id.* Thus, the contention rests solely on conclusory assertions which, as explained in Section V.A.3 above, cannot provide the basis for the admission of a contention.

In this respect, neither the “expert” affidavits nor the supposed “full analysis” prepared by Mr. Thorne serve to remedy this defect in Nevada’s contention. The contention fails even to mention the Affidavits of Mr. Horstman and Mr. Thorne, in which those individuals merely “adopt as [their] own opinions” the statements contained in Paragraphs 5 and 6 of the contention. Those Affidavits thus are grossly insufficient to support the contention and does not pass muster under 10 C.F.R. § 2.309(f)(1)(v).

With respect to Mr. Thorne’s “analysis,” the contention states only that it considers “an appropriate probability density function for glide ratios.” Petition at 960. Nothing more is said of that analysis or the “supplementary information” supposedly provided by Mr. Thorne. Nevada fails to explain why *any* aspect of DOE’s analysis—including its treatment of glide ratios—is “incomplete” or “inadequate.” *Id.* Such general allegations, even if “adopted” or otherwise endorsed by an alleged expert, are insufficient, particularly where, as here, there is no accompanying “reasoned basis or explanation.” *USEC, Inc., CLI-06-10, 63 NRC at 472.* Indeed, the other litigants—and this Board—can only surmise what Nevada’s *specific* grievances

*might* be relative to DOE's analysis. As noted above, the Board may not accept uncritically the assertion that a document or expert opinion supplies the basis for a contention, or makes factual or technical inferences on behalf of a petitioner. This is precisely what Nevada asks the Board to do here, to the detriment of its proposed contention.

Furthermore, review of the documents prepared by Mr. Thorne and cited in the contention confirms that they lend no support to the contention. Indeed, the documents appear to be more in the vein of an academic exercise than a cogent evaluation of the adequacy of the methodology described and applied in Section 4.3.2 of BSC 2007c. In fact, Mr. Thorne's papers make few and only oblique references to DOE's aircraft hazard frequency analysis (BSC 2007c). His statements, moreover, are entirely inconclusive, if not inscrutable. For example, in Part 1 of his analysis, Mr. Thorne opines that "what DOE has done . . . leads to a very crude approach that *may* not even be internally incorrect." LSN# NEV000005506 at 1 (emphasis added). Similarly, Mr. Thorne concludes the final part of his analysis by suggesting that DOE's analysis is "biased because mishaps with small glide angles are preferentially excluded," and that "I think that we will need to look at these other mishaps to see whether we can estimate the glide ratios from collateral data." LSN# NEV000005509 at 2.

Significantly, Mr. Thorne never clearly or conclusively states in his analysis—which apparently was never completed or is still a work in progress—that any aspect of DOE's analysis is inadequate or incomplete. Nonetheless, this is the conclusion that he purportedly "adopts" in his cursory affidavit. Moreover, Mr. Thorne never opines that DOE has failed to meet applicable NRC requirements, and thereby fails to support Nevada's claim that this contention raises a genuine dispute on a material issue of law or fact.

Finally, it is unclear from the information presented whether Mr. Thorne is sufficiently qualified as an expert to challenge DOE's aircraft hazard analysis. The burden of demonstrating that a witness is qualified to be an expert falls on the party offering the witness. *Duke Energy Corp.* (Catawba Nuclear Station, Units 1 and 2), CLI-04-21, 60 NRC 21, 27-28 (2004). Experts must be qualified in the field in which they seek to provide expert testimony. *Duke Power Co.* (William B. McGuire Nuclear Station, Units 1 and 2), ALAB-669, 15 NRC 453, 475 (1982). Nevada has not discharged its burden. The fact that Nevada has proffered Mr. Thorne as a putative expert for literally dozens of contentions—spanning a very broad array of technical subjects—strongly suggests that Mr. Thorne, whatever his level of erudition and experience, is straying far beyond the proper bounds of his professional expertise.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the applicable Legal Standards Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts the Application fails to address an issue that the Application does address, is defective. Nevada's contention also suffers from this deficiency. The contention does not identify any concrete and specific disputes with the Application, and explain the supporting reasons for those disputes, such that this Board could possibly conclude that an inquiry in depth is warranted.

As a threshold matter, Nevada's contention contains significant factual errors and misstatements relative to the Application. First, Subsection 4.3.2 is contained on pages 52 through 56 of BSC 2007c, not on pages 52 through 59, as Nevada incorrectly states. The bottom of page 56 and pages 57 through 59 contain Subsection 4.3.3, "Flights Beyond the Radius of the Flight-Restricted Airspace," which concerns an entirely different analysis than the one ostensibly challenged by Nevada in this contention.

Second, Figure 4 on page 55 of BSC 2007c is not an “approximation” of the calculations. Rather, Figure 4 depicts an overhead view of the flight-restricted airspace 5.6-mile radius (equivalent to a 4.9-nautical mile radius), and the 1.0-mile radius of the inner circle that encompasses the surface facilities where HLW could be located. Figure 4 is an illustration that depicts the 10 discrete and equal line segments of a flight path through the center of the flight-restricted airspace. Although this flight path can originate from any direction, Figure 4 reflects DOE’s assumption that it goes through the center of the airspace, to ensure a conservative approach that focuses on the longest trip that an aircraft could make in traversing the flight-restricted airspace. Thus, DOE determined the fraction of aircraft overflights that pose a threat to the facilities by determining the fraction of aircraft that have a glide ratio large enough for the aircraft to reach the 1.0 mi radius inner circle where surface facilities are located but less than the glide ratio required to carry the aircraft past the facilities or beyond the 1.0 mi radius circle.

Third, contrary to Nevada claim, the “computational approach” applied in Section 4.3.2 of BSC 2007c is not an “extremely obscure” and “unjustified” theoretical mathematical formulation. Petition at 960. Subsection 4.3.2 describes in detail the methodology used by DOE to calculate the annual frequency of crashes into the relevant surface facilities when the initiating event leading to a crash occurs during an overflight of the flight-restricted airspace. As discussed therein, it utilizes actual aircraft crash data compiled from FAA and U.S. Air Force sources.

Finally, contrary to Nevada's unfounded claim, the analysis in Section 4.3.2 is not unjustified. Section 4.3.2 includes the specific inputs and assumptions used by DOE, the sources of those inputs and assumptions, and the actual calculations performed by DOE using that information. DOE does not duplicate the Section 4.3.2 calculations here, through which it

determined that 10.5% of the flights that suffer crash-initiating events during overflight of the flight-restricted airspace at 14,000 ft MSL could pose a risk to repository surface facilities. BSC 2007c at 56. It suffices to say that Nevada, as demonstrated above, has not directly controverted any specific aspect of that analysis or demonstrated a material deficiency in the analysis. As discussed in the applicable Legal Standards Section V.A.3 above, contentions that allege errors, omission, uncertainties or alternative approaches—without indicating the specific ramifications or result of such deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible. Here, Nevada only makes unsupported assertions that DOE’s calculations are inadequate or incomplete. Although it purports to present an alternative “analysis” by Mr. Thorne, the nature, relevance, and significance of that analysis are not explained in the contention, contrary to the requirements of both Section 2.309(f)(1)(v) and (vi).

For all of the reasons discussed above, this contention must be dismissed in its entirety.

**181. NEV-SAFETY-181 - Basis For Crash Density Calculations**

SAR Subsection 1.6.3.4.1 and related subsections incorrectly assumes that the crash initiation density of military aircraft outside the proposed flight restricted airspace is independent of the number of sorties flown each year and will not change if the number of sorties increases, and therefore incorrectly calculates the crash initiation frequency resulting in an understatement of risk of a military aircraft crash at the repository and an inappropriate screening of aircraft crashes from consideration.

**RESPONSE**

This contention alleges that SAR Subsection 1.6.3.4.1 and related subsections “incorrectly assumes [sic] that the crash initiation density of military aircraft outside the proposed flight restricted airspace is independent of the number of sorties flown each year and will not change if the number of sorties increases, and therefore incorrectly calculates the crash initiation frequency.” Petition at 962. The result, Nevada argues, is “an understatement of risk of a military aircraft crash at the repository and an inappropriate screening of aircraft crashes from consideration.” *Id.*

For the reasons discussed below, contrary to 10 C.F.R. § 2.309(f)(1)(v) that requires adequate factual support or expert opinion in order for a contention to be admitted, this contention fails to explain how the alleged facts upon which Nevada relies support the contention, and provides no other supporting information, including expert opinion. In addition, the contention also must be rejected because it fails to state a legitimate issue of law or fact, lacks adequate legal or factual basis, and fails to establish a genuine dispute with DOE on a material issue of law or fact, contrary to 10 C.F.R. § 2.309(f)(1)(i), (ii), (iv), and (vi). As here,

when a contention does not directly controvert a position taken by the applicant in the license application, it is subject to dismissal.

**a. Statement of Issue of Law or Fact to be Controverted**

As fully discussed below, DOE has not made incorrect assumptions regarding crash frequency density so as to render the Application “materially incomplete and inaccurate.” Petition at 964. Thus, Petitioner has failed to state a legitimate issue of law or fact to be controverted in this proceeding.

**b. Brief Explanation of Basis**

As fully explained below, this contention lacks adequate factual or legal basis. Contrary to Nevada’s assertion, DOE does not assume in its analysis that the crash frequency density outside the flight-restricted airspace is independent of the annual number of sorties flown. The crash-frequency density used in DOE’s analysis reflects the historical number of crashes that have occurred in the recent past over a large regional setting near the repository site, including any dependence on number of sorties flown. Thus, the contention does not demonstrate “that there has been sufficient foundation assigned for it to warrant further exploration.” *Public Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-942, 32 NRC at 428.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For purposes of demonstrating that this contention is material to the findings NRC must make to license Yucca Mountain, Nevada generically claims noncompliance with a litany of regulatory provisions in 10 C.F.R. Part 63, including §§ 63.31, 63.21, 63.102, 63.111, and

63.112. Petition at 962-63. In direct contradiction to the June 20, 2008, Case Management Order, however, Nevada fails to cite the “*principal* statutory or regulatory requirement or requirements” on which it relies (emphasis added). The mere recitation of regulatory provisions does not satisfy Nevada’s burden of demonstrating the issue raised in this contention is material to the findings that the NRC must make in this proceeding.

In essence, as demonstrated below, Nevada asks the Board to accept as true or self-evident *its* own assumption that “[t]he calculated crash density is directly proportional to the number of flights in the airspace in question.” Petition at 964. But Nevada does not explain exactly where in its analysis DOE has made an incorrect assumption, why that assumption is incorrect, and how it materially affects the outcome of DOE’s analysis.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

The legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted are discussed in Section V.A.3 above. This contention fails to meet those standards because, as discussed in that Section, it presents only unsupported arguments of counsel, and the associated expert affidavit falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Notably, the contention fails even to mention the Horstman Affidavit, Attach. 12, in which Mr. Horstman purports to “adopt as [his] own opinions” the statements contained within Paragraph 5 of the contention. This Affidavit, in any case, is grossly insufficient to support the contention. An expert’s attempt to reflexively rubber-stamp unsupported arguments by counsel does not suffice under 10 C.F.R. § 2.309(f)(1)(v). That regulation requires a petitioner—including its proffered expert—to set forth “the necessary technical analysis to show why the proffered bases support its

contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 180 (citing *Ga. Inst. of Tech.*, LBP-95-6, 41 NRC at 305). No such analysis is presented here.

Indeed, Nevada’s “concise statement of facts and expert opinions” is as vague and unsupported as it is concise. Nevada argues that DOE assumes, without any justification, that “the crash density outside the proposed flight-restricted airspace is independent of the number of sorties flown annually.” Petition at 964. Nevada’s argument is based solely on the following syllogism:

The crash initiation rates outside the proposed flight restricted airspace are based on data provided by the United States Air Force and are based on the historical crash rates of each type of aircraft that will fly over or near the repository. The crash rates provided by the military are presented as a rate of crashes per flight. The crash rates provided by the Air Force are just that, crash *rates*. The calculated crash density is directly proportional to the number of flights in the airspace in question. Thus, if the number of flights doubles then the number of crashes is expected to double.

*Id.* at 963-64 (emphasis in original).

Nevada again seeks, improperly, to avoid its obligations as a petitioner by simply averring that DOE “has the burden of proving their assumption is true and until this is accomplished, [DOE] cannot take credit for it in [its] crash frequency analysis.” *Id.* at 964. The Commission has made clear, however, that “the *proponent* of a contention has the initial burden of coming forward with factual issues, not merely conclusory statements and vague allegations.” *Northeast Nuclear Energy Co.* (Millstone Nuclear Power Station, Unit No. 3), CLI-01-03, 53 NRC 22, 27 (2001) (emphasis added). Nevada does not meet its initial burden. It offers no reasoned explanation or technical analysis—either in its contention or in an expert affidavit—to bolster its claim that DOE erroneously has assumed that crash density outside the proposed flight restricted airspace is independent of the number of sorties flown annually. In short, Nevada asks

the Board to accept as true or self-evident *its* own assumption that “the calculated crash density is directly proportional to the number of flights in the airspace in question.” Petition at 964. But Nevada does not explain exactly where in its analysis DOE has made an incorrect assumption, why that assumption is incorrect, and how it materially affects the outcome of DOE’s analysis. This does not suffice under the Commission’s strict pleading standards, particularly in this proceeding where, as discussed in Section V.A.1 above, Nevada has a heightened burden to proffer well-pled and adequately supported contentions.

Notably, the only document referenced by Nevada with any specificity is the SAR. Nevada refers to page 1.6-22 of the SAR, but only in its prefatory discussion. Although Nevada mentions DOE’s *Frequency Analysis of Aircraft Hazards for License Application (2007)* (LSN# DN2002488951 and #DEN001564755), identified in the SAR and referred to herein as BSC 2007c, it does not identify any particular section or page of that document. Yet BSC 2007c, as discussed in Section f. of this response below, contains the very analyses and assumptions which Nevada claims are deficient. Furthermore, Nevada cites no other documents as extrinsic sources of information to support its contention. Accordingly, by virtue of its vagueness and failure to adduce any supporting analysis or information, Nevada again “deprives the Board of the ability to make the necessary, reflective assessment” of the alleged deficiencies in the Application. *Private Fuel Storage*, LBP-98-7, 47 NRC at 181. Indeed, from the face of its contention alone, it is not clear what specific portion of DOE’s aircraft hazard frequency analysis Nevada seeks to challenge. Accordingly, because the contention is not supported by facts and a reasoned statement of why the Application is unacceptable in some material respect, it does not meet 10 C.F.R. § 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the applicable Legal Standards Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts the Application fails to address an issue that the Application does address, is defective. As the foregoing discussion indicates, Nevada's contention also suffers from this deficiency. Nevada completely ignores the relevant portions of the Application and fails to explain how the alleged defects in the Application have caused DOE allegedly to "understate[]" the risk of a military aircraft crash at the repository. Petitioner at 962. As such, this contention is inadmissible because "the Petitioner's assertion that the application[ ] [is] deficient is simply based upon a failure to read or perform any meaningful analysis of the application[ ]." *Millstone*, LBP-04-15, 60 NRC at 95.

By failing to engage the particulars of DOE's analysis, Nevada fails to controvert the Application directly, as required by 10 C.F.R. § 2.309(f)(1)(vi). Contrary to Nevada's claim, DOE does *not* assume in its analysis that the crash frequency density outside the flight-restricted airspace is independent of the annual number of sorties flown. Section 4.3.3 of BSC 2007c describes in detail the methodology used for evaluating the annual frequency of aircraft crashes into the relevant surface facilities from flights outside the flight-restricted airspace. *See Frequency Analysis of Aircraft Hazards for License Application*, Las Vegas, NV, Bechtel SAIC Company (2007), LSN# DN2002488951 at 56-59 (2007c). The frequency is based on the crash frequency density, which is expressed as an annual number of crashes per unit area. This approach is consistent with NRC guidance set forth in NUREG-0800, Section 3.5.1.6, Item III ("Review Procedures"), Subsection 4 ("Designated Airspaces") (Reference 2.2.31 of BSC 2007c), which states that "[t]he results of the model should be the total probability (C) of an aircraft crash per unit area and time in the vicinity of the proposed site."

The approach detailed in Section 4.3.3 of BSC 2007c is an empirical approach that is designed to account for the Air Force’s recent historical use of the airspace, *including the number of sorties flown*, the mix of aircraft flown, the missions assigned, and other variables that affect the observed number of crashes. By using a multiyear observation period, the analysis accounts for historical variations in the annual number of sorties. Thus, it ensures that the crash frequency density used in the analysis reflects the historical number of crashes that have occurred in the recent past over a large regional setting near the repository site, including any dependence on number of sorties flown. Thus, the calculation of the crash frequency density implicitly accounts for the number of sorties that took place over the observation period, and does not assume—as Nevada incorrectly suggests—that the crash frequency density outside the flight-restricted airspace is independent of the number of sorties flown in a year.

In addition, while Nevada makes an unsupported assertion that unidentified DOE calculations are “incorrect[]” and “understate[]” the risk of an aircraft crash at the repository, it does not address the relative magnitude or significance of the alleged errors. Petition at 962. Nor does it assert that the alleged errors result in a failure to comply with NRC requirements. As discussed in the applicable Legal Standards Section V.A.3 above, contentions that allege errors, omission, uncertainties or alternative approaches—without indicating the specific ramifications or result of such deficiencies—fail to raise a genuine dispute of material fact or law and are, therefore, inadmissible.

On this point, it warrants mention that DOE examined the implications of increases in the average annual number of aircraft crashes. BSC 2007c Attachment VI at VI-14 to VI-15 includes a sensitivity study (titled “Military Crash Density”) exploring a wide spectrum of trends in the annual number of crashes. The sensitivity study includes a significant increase in crash

frequency density (implying increases in the annual number of sorties or changes in other pertinent variables) and demonstrates that the frequency of crashes into relevant repository facilities remains significantly less than the Category 2 threshold frequency of  $2 \times 10^{-6}$  per year. Nevada overlooks this sensitivity analysis and fails to provide any facts or reasoned analysis to support a contrary finding or conclusion. Therefore, Nevada fails to controvert the Application in another significant respect, also contrary to 10 C.F.R. § 2.309(f)(1)(vi).

For all of the reasons discussed above, this contention must be dismissed in its entirety.

## **182. NEV-SAFETY-182 - Glide Distance**

SAR Subsection 1.6.3.4.1 and related subsections depends on the assumption that for flights that are outside the flight restricted airspace the ejection as a result of a crash initiating event that results in a crash occurs before the aircraft enters the flight restricted airspace, but fails to provide any documentary evidence justifying the assumption and fails to consider the frequency of impacts on the facility from aircraft accidents that are initiated outside the flight restricted airspace, leading to an inappropriate screening of aircraft crashes from consideration.

### **RESPONSE**

This contention alleges that DOE incorrectly “assumes that aircraft cannot glide into the proposed flight-restricted airspace with the pilot in the aircraft, and that the pilot will eject before entering that airspace.” Petition at 965. It further asserts that “DOE incorrectly uses the distance that aircraft travels after ejection for risk calculations, instead of the distance traveled after the initiating event of the crash.” *Id.* The contention claims that, as a result, DOE “effectively screen[s] out *the majority* of aircraft crashes outside the flight restricted airspace without documentary evidence or justification.” *Id.* (emphasis in original).

For the reasons discussed below, contrary to 10 C.F.R. § 2.309(f)(1)(v) that requires adequate factual support or expert opinion in order for a contention to be admitted, this contention fails to explain how the alleged facts upon which Nevada relies support the contention, and provides no other supporting information, including expert opinion. In addition, the contention also must be rejected because it fails to establish a genuine dispute with DOE on a material issue of law or fact, contrary to 10 C.F.R. § 2.309(f)(1)(i), (ii), (iv) and (vi). As here, when a contention does not directly controvert a position taken by the applicant in the license application, it is subject to dismissal.

**a. Statement of Issue of Law or Fact to be Controverted**

For the reasons discussed below, Nevada has failed to state an issue of law or fact to be controverted in this proceeding.

**b. Brief Explanation of Basis**

For the reasons explained below, there are no valid factual or legal bases supporting this contention and warranting its admission in this proceeding. Review of the relevant DOE documentation demonstrates that Nevada's allegations are simply not true. For example, the contention's principal claim—*i.e.*, that DOE provides no "documentary evidence" to support the exclusion of pilot ejections within the flight-restricted airspace—is false. Petition at 965. On the contrary, adequate documentation is provided in the *Frequency Analysis of Aircraft Hazards for License Application* (2007) (LSN# DN2002488951 and #DEN001564755), identified in the SAR and herein as BSC 2007c. This, and other reasons, are fully discussed below.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies a litany of subsections in Part 63. See Petition at 965-66. Nevada concludes this general description with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." *Id.* at 966. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In

this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO at 7), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3. This Nevada has not done, as explained below, because while making various unsupported assertions, Nevada does not directly controvert the methodology used—or results obtained—by DOE to determine the annual frequency of aircraft crashes. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

The legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted are discussed in Section V.A.3 above. This contention fails to meet those standards because, as discussed in that Section, it presents only unsupported arguments of counsel, and the associated expert affidavit falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. Notably, the contention fails even to mention the Affidavit of Hugh Horstman (Attachment 12 to Petition), in which Mr. Horstman purports to "adopt as [his] own opinions" the statements contained within Paragraph 5 of the contention. This Affidavit, in any case, is grossly insufficient to support the contention. An expert's attempt to reflexively rubber-stamp unsupported arguments by counsel does not suffice under 10 C.F.R. § 2.309(f)(1)(v). That regulation requires a petitioner—

including its proffered expert—to set forth “the necessary technical analysis to show why the proffered bases support its contention.” *Private Fuel Storage*, LBP-98-7, 47 NRC at 180 (citing *Ga. Inst. of Tech.*, LBP-95-6, 41 NRC at 305). No such analysis is presented here.

As in previous contentions, Nevada, contrary to the NRC’s contention admissibility rules, presents the Board with a string of unsupported and uncorroborated assertions as the bases for its contention. For example, with regard to DOE’s aircraft hazard frequency analysis, Nevada claims that DOE incorrectly assumes that:

- In aircraft crashes that are initiated outside the proposed flight-restricted airspace, the pilot will eject from the aircraft before entering the flight restricted airspace;
- The crash initiating event is the pilot ejection;
- Aircraft cannot glide into the proposed flight restricted airspace with the pilot in the aircraft and that the pilot will eject before entering the same airspace; and
- The distance that an aircraft travels is the distance traveled after ejection rather than the distance traveled after the initiating event of the crash.

Petition at 966-67.

Although Nevada relies on these statements as factual predicates for its contention, Nevada fails to specify where in its analysis DOE uses the alleged erroneous assumptions. The most specific reference Nevada provides is “SAR Subsection 1.6.3.4.1 and related subsections.” *Id.* Nevada apparently presumes that the Board will take its statements at face value and assume their veracity, notwithstanding Nevada’s failure to provide any corroborating references. Clearly, the NRC’s strict pleading rules do not permit such a practice, which would be particularly perilous here given that Nevada’s assertions, as shown below, are fallacious.

Similarly, Nevada’s own “factual” assertions lack any supporting or corroborating references. Nevada states that:

- The crash initiating event is defined as the event that ultimately causes an aircraft to crash, not the pilot ejection. Petition at 966.
- In the case of an F-16, the majority of crashes are caused by engine failure. When an F-16 engine fails, by procedure, the pilot performs emergency checklists and, time permitting, attempts to restart the engine. *Id.* at 966-67.
- Depending on the aircraft speed and altitude, the time and distance covered between the initiating event and the pilot ejection can be in excess of several minutes and over 20 miles. *Id.* at 967.
- When the pilot subsequently ejects from the aircraft, it will fly a very small distance to ground impact relative to the total distance flown from the initiating event. *Id.* at 966-67.

Significantly, Nevada provides no references in support of these statements. As noted above, the Affidavit of Hugh Horstman—which the contention does not even reference—contains no technical corroboration (rather, only a perfunctory “adoption”) of these statements.

The Commission’s rules require “a clear statement as to the basis for the contention and the submission of . . . supporting information and references to specific documents and sources that establish the validity of the contention.” *AmerGen Energy Co., LLC* (Oyster Creek Nuclear Generating Station), CLI-06-24, 64 NRC 111, 118-19 (2006) (citations omitted) (emphasis added). Nevada’s contention falls far short of meeting this requirement and, accordingly, does not meet 10 C.F.R. § 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the applicable Legal Standards Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts the Application fails to address an issue that the Application does address, is defective. The contention's complete lack of any particularized references to the Application and supporting DOE aircraft hazard frequency analysis makes undeniable Nevada's failure to controvert those documents directly. This alone is grounds for dismissal of the contention.

Moreover, review of the relevant DOE documentation demonstrates that Nevada's allegations are simply not true. For example, the contention's principal claim—i.e., that DOE provides no “documentary evidence” to support the exclusion of pilot ejections within the flight-restricted airspace—is false. On the contrary, adequate documentation is provided in the *Frequency Analysis of Aircraft Hazards for License Application (2007)* (LSN# DN2002488951 and #DEN001564755), identified in the SAR and herein as BSC 2007c. Section 3.2.18 of BSC 2007c states on page 43 as follows:

Table 8 [of BSC 2007c] identifies crashes that have occurred on the NTTR [Nevada Test and Training Range] and Military Operations Areas from May 1990. *However, none of these crashes have occurred in the NTS [Nevada Test Site] or NTTR within a 30-mile radius of the North Portal.* Cross-referencing Table 8 with Table III-1 shows that over 80% of the crashes in Table 8 are a direct result of aggressive maneuvering; specifically, controlled flight into terrain, abandoned aircraft during maneuvering, loss of control during maneuvering, and midair collision. Maneuvering is unlikely to occur near the repository because the repository is located on the edge of the NTTR and NTS and less than 10 miles from the Beatty Corridor (Figure 2). Aggressive maneuvering could be a hazard for the commercial and general aviation flights in the Beatty Corridor. *In addition, as stated in Section 3.2.14, flights over the NTS are limited to overflights. Therefore, crashes due to maneuvering would occur at distances far from the*

*repository*. Note that the crash frequency density determined from the Table 8 crashes is conservatively applied to the area within a 30-mile radius of the North Portal (Assumption 3.2.14). (emphasis added)

Thus, the non-occurrence of aircraft crashes on the Nevada Test and Training Range or adjacent Military Operations Areas within 30 miles of the North Portal, combined with the stated prohibition on maneuvering (*i.e.*, straight and level flight is required) in the airspace above the Nevada Test Site, provides explicit justification for excluding contribution from pilot ejections from aircraft not intentionally overflying the restricted airspace within a much smaller distance, *i.e.*, 5.6 miles, of the North Portal. *See also* BSC 2007c at 38 (stating that “no aggressive maneuvering would be expected in the vicinity of Yucca Mountain”).

Furthermore, it warrants emphasis that DOE’s aircraft hazard frequency analysis does include intentional aircraft overflights of the restricted airspace. In fact, the analysis is highly conservative in this regard because, as indicated in BSC 2007c and above, zero crashes have occurred within a 30-mile radius of the North Portal. The lack of any crashes during the 16.5-year period (May 1990 to December 2006) is strong statistical evidence that the probability of such a future occurrence is extremely small. Nonetheless, for purposes of its analysis, DOE used aircraft crash data that apply to distances *greater* than 30 miles within the 30-mile radius, thereby artificially (and conservatively) increasing the number of projected crashes and ejections within 30 miles of the repository. As Section 3.2.14 of BSC 2007c explains: “Thus, to be conservative and to allow for future changes in airspace use, a crash-frequency density derived from crashes in the NTTR [Nevada Test and Training Range] and MOAs [Military Operations Areas], where aggressive flight and training exercises occur, is applied to flights within the 30-mile boundary in the NTS and NTTR.” BSC 2007c at 38. Nevada neither acknowledges nor controverts this information in its proposed contention.

Also incorrect is Nevada's claim that DOE assumes that "the pilot will eject from the aircraft before entering the flight restricted airspace." Petition at 966. As indicated above, of all of the crashes included in DOE's comprehensive analysis, none has occurred within 30 miles of the North Portal, irrespective of when or if pilot ejection occurred. DOE's analysis does not assume that ejection within the 5.6-mile radius is impossible; rather the relevant data support DOE's conclusion that the likelihood of pilot ejection within the 5.6-mile flight-restricted airspace is negligible in comparison to the incidence of ejection outside that radius and subsequent entry. Moreover, because DOE's analysis is based on actual crash data conservatively applied within 30 miles of the North Portal and not a simulation of postulated events, potentially long flights resulting in a crash are implicitly included in the database. Thus, the data relied upon by DOE—and not controverted by Nevada—directly contradict Nevada's unfounded allegation that DOE is "effectively screening out the majority of aircraft crashes outside the flight-restricted airspace without documentary evidence or justification." Petition at 967. Indeed, as discussed above, DOE took a very conservative approach by applying a crash-frequency density derived from crashes that occurred beyond 30 miles to the area within the 30-mile radius of the North Portal.

As explained in DOE's response to NEV-SAFETY-181, the methodology used by DOE determines the annual frequency of aircraft crashes into the relevant surface facilities from flights outside the flight-restricted airspace. *See* BSC 2007c at 56-59. The frequency is based on the crash frequency density, which is expressed as an annual number of crashes per unit area. *Id.* at 57. The crash frequency density includes a large area of interest and considers crashes *regardless of their point of origin, cause of mishap, or location of mishap initiation*. Therefore, long distances associated with engine mishaps that allow continued flight without pilot ejection

or delayed pilot ejection are either not crashes because of a successful landing, or are in the database used as the basis for this analysis and, therefore, taken into account. This crash frequency density is multiplied by a reduction factor based on the probability that, after the pilot ejects, the plane can travel from outside the flight-restricted airspace and still impact the surface facilities. *Id.* at 58. This reduction factor, however, does not depend on where the mishap originates, only where the pilot ejects. Nevada, while making various unsupported assertions, does not directly controvert the methodology used by DOE to determine the annual frequency of aircraft crashes.

Finally, Nevada ignores another key portion of DOE's aircraft hazard frequency analysis that is relevant to its contention. Although the historical data discussed above indicate no crashes for which pilot ejection occurs inside the flight-restricted airspace, DOE considered this possibility in its analysis. For example, an engine mishap could occur outside the flight-restricted airspace, with the pilot remaining in the aircraft, attempting to resolve the failure, eventually crossing the flight-restricted airspace, inside which the pilot finally ejects at low altitude (i.e., lower than 14,000 feet MSL). This scenario crash is analyzed through a sensitivity study titled "Honoring the Flight-Restricted Airspace," in Attachment VI of BSC 2007c (pp. VI-12 to VI-13).

Significantly, the sensitivity study found that more than 2,000 additional annual flights entering in the flight-restricted zone at an altitude of just 500 ft above the mountains surrounding the repository facilities would be needed for the total crash frequency into relevant surface facilities to reach  $2 \times 10^{-6} \text{ yr}^{-1}$  (i.e., the Beyond Category 2 event sequence screening threshold). *See* BSC 2007c at p. VI-13. This number bounds, with a significant margin, the number of emergency flight-restricted-airspace entries that could reasonably occur during a given year over

the preclosure period (especially given that there have not been any crashes within 5.6 miles of the repository or within 30 miles of the repository in the 16.5-year observation period).

Accordingly, Nevada's contention fails to meet the requirements of criterion (v) and criterion (vi) of 10 C.F.R. § 2.309(f)(1), both of which apply a fundamental precept of administrative law. Specifically, "a protestant does not become entitled to an evidentiary hearing merely on request, or on a bald or conclusory allegation that . . . a dispute exists. The protestant must make a minimal showing that material facts are in dispute, thereby demonstrating that an "inquiry in depth is appropriate." *Conn. Bankers Ass'n v. Bd. of Governors*, 627 F.2d 245, 251 (D.C. Cir. 1980) (internal quotation marks and citation omitted). Nevada has made no such showing in its contention.

For all of the reasons discussed above, this contention must be dismissed in its entirety.

### **183. NEV-SAFETY-183 - Crash Rates**

SAR Subsection 1.6.3.4.1 relies on an analysis that assumes that the crash rate of  $2.74 \times 10^{-8}$  for military overflights of the flight restricted airspace is the updated F-16 accident rate for normal in-flight mode, but fails to provide any documentary evidence that this crash rate is appropriate, meaning that the associated screening decision cannot be justified. Petition at 969.

#### **RESPONSE**

This contention alleges that the crash rate of  $2.74 \times 10^{-8}$  for military overflights of the flight-restricted airspace reflected in SAR Subsection 1.6.3.4.1 “is defined as the updated F-16 accident rate for normal in-flight mode, but the failure to provide any documentary evidence that this crash rate is justified means that the higher crash rate for ‘special’ flight mode for F-16 aircraft must be used.” *Id.* at 969.

#### **a. Statement of Issue of Law or Fact to be Controverted**

As fully discussed below, Nevada has not explained with any specificity the particular safety or legal reasons requiring rejection of the Application. As shown below, Nevada entirely ignores or misapprehends DOE’s derivation and use of the “normal” and “special operations” flight mode crash rates in its aircraft hazard frequency analysis. Thus, Nevada has failed to state a legitimate issue of law or fact to be controverted in this proceeding.

#### **b. Brief Explanation of Basis**

As fully explained below, this contention lacks adequate factual or legal basis. Contrary to Nevada’s unsupported assertion, DOE has not assumed, “without any evidence or justification,” that aircraft cannot enter the flight-restricted airspace “from the side or above.” Petition at 970. Thus, the contention fails to demonstrate “that there has been sufficient

foundation assigned for it to warrant further exploration.” *Public Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-942, 32 NRC at 428.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. See Petition at 958-59. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. See *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Nevada’s bare assertion that DOE’s “screening decision cannot be justified” does not suffice in demonstrating how its apparent concern involves an issue which is material to a finding that the NRC must make.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. §

2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference, *with the requisite specificity*, any documents other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any credible expert opinion. Nevada's Petition does attach the affidavit of Hugh Horstman (Attachment 12), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in paragraphs 5 of this contention, the affidavit simply "adopts" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

This contention contains two main arguments. The first argument is that DOE has not justified "the assumption that maneuvering aircraft are not permitted in the airspace directly above the proposed flight-restricted airspace." Petition at 970. The second argument is that DOE "assumes that any aircraft experiencing a crash initiating event outside of the [flight-restricted] airspace will not enter the airspace, from above or from the side of the airspace again without any justification." *Id.* at 971. For the reasons discussed below, the contention fails to provide adequate legal or factual support for either argument.

Nevada's first argument merely repeats a claim made by Nevada in several previous contentions. *See* NEV-SAFETY-174, -176, and -179. In fact, Nevada's claim in NEV-SAFETY-179 that DOE falsely "assumes that the flight restricted airspace is a non-maneuvering area" (Petition at 957) is not materially distinguishable from its first argument here. Accordingly, this argument should be rejected for the same reasons set forth above.

Specifically, DOE has identified additional flight restrictions in SAR Sections 1.6.3.4.1 and 5.8.3 for the airspace above the repository surface facilities. DOE's aircraft hazard frequency analysis credits these flight-restricted airspace and operational constraints over the repository. *See Frequency Analysis of Aircraft Hazards for License Application (2007) (LSN# DN2002488951 and #DEN001564755), Section 7 at 75-76 (identified in SAR Section 1.6 and herein as BSC 2007c).* Those restrictions include, among others, the following: "Maneuvering over the flight-restricted airspace is prohibited; flight is straight and level." SAR at 1.6-22, 5.8-7. DOE has incorporated these flight restrictions into specific Preclosure Procedural Safety Controls ("PSCs"), which are included in Table 1.9-10 of the SAR (see PSC-15 to PSC-18 on SAR at 1.9-144 to 1.9-145). The requirement for straight and level flight is specifically contained in PSC-16. *Id.* 1.9-144. The SAR states that the PSCs presented in Table 1.9-10 will "be implemented in facility operations to prevent and mitigate event sequences," and that these PSCs will impose "interface controls on activities outside of the GROA that could potentially lead to an event sequence." *Id.* at 1.9-2.

DOE is the "controlling authority" for the airspace above the repository surface facilities and, as such, has full authority to implement the additional restrictions when needed. SAR Section 1.1.1.3.2.1 describes the NTS airspace. *See* SAR at 1.1-13 to 1.1-14. The NTS airspace is protected by restricted areas R-4808N and R-4808S, known jointly as R-4808. Restricted areas are a type of special-use airspace that separate or confine air activities that are considered dangerous or unsafe to aircraft not involved in the activity. Federal Aviation Administration ("FAA") regulations prohibit flights by nonparticipating military, civilian or commercial aircraft in this special-use airspace without the controlling authority's authorization. If the area is not designated for joint use (nonjoint use), then nonparticipating aircraft are normally not permitted

at any time. The repository surface facility is located in restricted area R-4808N, which is designated as nonjoint use by the FAA. DOE is the controlling authority for the airspace. SAR at 1.1-14. As the controlling authority, DOE allows military aircraft to transit R-4808N. DOE has existing avoidance areas (further flight-restricted areas) over the Device Assembly Facility and over BREN (Bare Reactor Experiment-Nevada) Tower, as well as several other areas within R-4808N. *Id.*

Although the specified additional flight restrictions for the airspace are not needed until nuclear waste forms are actually located at the repository, DOE, pursuant to its authority, nonetheless has taken steps to facilitate implementation of the additional flight-restrictions identified in the SAR. Specifically, interactions with the U.S. Air Force Warfare Center at Nellis Air Force Base, Nevada, have resulted in a revision to Air Force Instruction (AFI) 13-212, Volume 1, Addendum A. AFI 13-212, Vol. 1, IC2, “Summary of Changes – Interim Change to AFI 13-212” (Dec. 17, 2008) (LSN# DEN001606834) at 5. This revision includes the additional restrictions, with a future implementation date, for the airspace above the repository surface facilities consistent with the restrictions outlined in SAR Section 1.6.3.4.1. Currently, these future restrictions serve only as a reference for future use and planning purposes, given that DOE is not yet receiving SNF and HLW at the repository. When repository operations commence under an NRC-approved license, DOE (currently through the National Nuclear Security Administration Nevada Site Office) will implement the applicable flight restrictions. These restrictions will be implemented in the same manner as the current avoidance areas in R-4808N. Specifically, DOE will *require* the Air Force to revise the formal Air Force Instructions to include the restrictions. *Id.* Thus, Nevada presents no legal or factual support for its assertion

that DOE falsely assumes that maneuvering aircraft are not permitted in the airspace directly above the flight-restricted airspace. Petition at 970.

Nevada also fails to provide adequate legal or factual support for its second argument; i.e., that DOE assumes without justification that injured aircraft cannot enter the restricted airspace from the side or above. Petition at 970-71. In so asserting, however, the contention fails to cite any specific sections or pages of DOE's Application or supporting aircraft hazard frequency analysis. The contention further states that DOE's assumption "ignores the existing rules of flight for aircraft experiencing emergencies and also ignores the longstanding F-16 operating procedures," particularly "U.S. Air Force Multi-Command Instruction 11-F-16 Volume 3, Virtual Pilot Operational Procedures – F-16" (Mar. 10, 2006) (LSN# NEV000005429). *Id.* at 971. It is not clear, however, to what "existing rules of flight" Nevada refers in its contention. Nor is it clear what specific portions of U.S. Air Force Multi-Command Instruction 11-F-16 DOE allegedly ignores, as Nevada provides no supporting page citations or explanation of the applicability and import of that document to DOE's aircraft hazard frequency analysis. In any case, the Air Force instruction cited by Nevada applies to "virtual" flight training conducted in simulators. It does not address actual flying operations. Finally, the Affidavit of Hugh Horstman, as attached to Nevada's Petition, offers no further insight into the basis for Nevada's claims.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As discussed in the applicable Legal Standards Section V.A.3 above, a contention that fails to controvert the Application directly, or mistakenly asserts the Application fails to address an issue that the Application does address, is defective. The contention also should be dismissed for this reason. It does not identify any concrete and specific disputes with the Application, and

then explain the supporting reasons for those disputes, such that this Board could possibly conclude that an inquiry in depth is warranted.

Although it is not clear from the contention (which, as stated above, lacks any pinpoint citations to the Application or relevant supporting analyses), Nevada appears to be suggesting that DOE improperly used a crash rate for F-16s in “normal” flight mode of  $2.74 \times 10^{-8}$  per mile. Nevada further contends that DOE must use “special” rather than “normal” crash rates unless it can justify the use of “normal” crash rates. Petition at 970-71. No further explanation is provided by Nevada.

Accordingly, this contention falls far short of directly controverting the Application. As reflected in BSC 2007c, DOE determined the total aircraft crash frequency to be  $5.9 \times 10^{-7}$  per year. BSC 2007c, Section 7, at 75. This is rounded up to  $6 \times 10^{-7}$  per year in SAR Section 1.6.3.4.1. SAR at 6-22. As indicated in SAR Section 1.6.3.4.1 and BSC 2007c Section 7, there are three contributors to the total crash frequency: (1) commercial, private, and military flights in the Beatty Corridor ( $2.9 \times 10^{-8}$  per year); (2) military overflights of the flight-restricted airspace ( $8.5 \times 10^{-8}$  per year); and (3) military flights in combat training exercises that take place outside of the flight-restricted airspace ( $4.8 \times 10^{-7}$  per year). BSC 2007c at 75; SAR at 1.6-22. The derivation of the crash frequencies for these three contributors is discussed in Sections 6.5.1.8 (and Attachment V), 6.5.2, and 6.5.3 of BSC 2007c, respectively. BSC 2007c at 70-71.

As relevant to the particular analysis, the analyses for the individual contributors to the total aircraft crash frequency use a crash rate of  $2.74 \times 10^{-8}$  per mile, which is the updated F-16 accident rate in normal in-flight mode. The derivation of this crash rate is detailed in Attachment IV to BSC 2007c. Section 3.2.13 of BSC 2007c summarizes as follows:

The crash rate for the F-16 has been updated from crash data from 1989 to 1998 ( $2.736 \times 10^{-8} \text{ mi}^{-1}$ ) using methodology that has been deemed acceptable by the US Nuclear Regulatory Commission in *Safety Evaluation Report Concerning the Private Fuel Storage Facility, Docket No. 72-22* (Reference 2.2.30 [DIRS 154930], Section 15.1.2.11). Attachment IV presents the derivation of the crash rates for F-15s and F-16s for the date range used in this analysis, 1990 to 2006, using the same methodology employed to derive the  $2.736 \times 10^{-8} \text{ mi}^{-1}$  crash rate used in Reference 2.2.30. As seen in Attachment IV, the 10-year average crash rate increases slightly for the first three 10-year periods, decreases for three years and then increases slightly. To be conservative and to avoid the possibility of statistical aberrations that might occur from year to year, the 17-year average from 1990 to 2006 is used in this analysis. Thus, the updated crash rate for F-16 normal flight mode of  $2.74 \times 10^{-8} \text{ mi}^{-1}$ , which better represents the contemporary flight operations experience, is used in lieu of the value given in Table 14.

BSC 2007c at 37. Thus, DOE has, in fact, provided “documentary evidence” of the F-16 normal flight mode crash rate, contrary to Nevada’s claim. Nevada’s contention presents no information suggesting that the updated crash rate for F-16 “normal” flight mode of  $2.74 \times 10^{-8} \text{ mi}^{-1}$  is invalid or inadequate.

As stated above, Nevada’s contention suggests that “the historically justified crash rate for ‘special’ flight mode for F-16 aircraft must be used.” Petition at 970. It is unclear from the contention, however, what “special” flight mode crash rate Nevada is alluding to and what “historically justified” crash rate value it believes DOE should adopt. To the extent DOE can discern, Nevada appears to be alluding to the 17-year adjusted F-16 accident rate for “special operations” flight derived in Attachment IV to BSC 2007c, which reflects crash events that occurred during maneuvering and other special operations. BSC 2007c, Attachment IV at IV-2.

DOE uses the special operations crash rate in one of the sensitivity analyses contained in Attachment VI to BSC 2007c. Specifically, Attachment VI to BSC 2007c contains a sensitivity study titled “Honoring the Flight-Restricted Airspace.” Attachment VI at VI-12 to VI-13. This

analysis considers the sensitivity of DOE's calculations to the possibility of emergency flight-restricted airspace entries, whereby pilot ejection occurs inside the flight-restricted airspace. For example, this sensitivity analysis assumes an engine mishap could occur outside the flight-restricted airspace, with the pilot remaining in the aircraft, attempting to resolve the failure, eventually crossing the flight-restricted airspace, inside which the pilot finally ejects at low altitude (i.e., lower than 14,000 feet MSL). Significantly, as indicated in BSC 2007c and DOE's response to NEV-SAFETY-182, there have not been any such crashes within 5.6 miles of the repository or even within 30 miles of the repository in the 16.5-year observation period.

The method used in the sensitivity analysis to assess these potential crashes is similar to that used for overflights of the flight-restricted airspace outlined in Section 4.3.2 of BSC 2007c, with the following adjustments:

- It is assumed that pilot ejection occurs at low altitude, reflecting the loss of altitude over the trajectory that brings the aircraft from the mishap location to the flight-restricted airspace.
- For added conservatism, a more severe crash rate than the normal operation crash rate is used, specifically, the special operations flight crash rate mentioned above is used.

BSC 2007c, Attachment VI at VI-13.

For the purpose of investigating sensitivity to the model used, DOE calculated an upper value for the number of annual violations of the flight-restricted airspace that would be needed to force the total aircraft crash annual frequency to reach the Category 2 event sequence threshold of  $2 \times 10^{-6} \text{ yr}^{-1}$ . *Id.* at VI-12. In addition to the crash contributions of (1) flights in the Beatty Corridor, (2) authorized flights over the flight-restricted zone, and (3) flights for which mishap and ejection occur outside the flight-restricted airspace, the sensitivity study found that more

than 2,000 annual flights entering in the flight-restricted zone—at an altitude of just 500 feet above the mountains surrounding the repository facilities using the “special operations” crash rate (in addition to the 1,000 overflights permitted per year)—would be needed for the total crash frequency into relevant surface facilities to reach  $2 \times 10^{-6} \text{ yr}^{-1}$ . *Id.* at VI-13. This number bounds with significant margin the number of emergency flight-restricted-airspace entries that could reasonably occur during a given year over the preclosure period (especially given that there have not been any crashes within 5.6 miles of the repository or within 30 miles of the repository in the 16.5-year observation period).

In view of the above, Nevada’s contention clearly fails to controvert the Application and supporting aircraft hazard frequency analysis contained in BSC 2007c. Instead, it merely avers that “DOE must use the higher ‘special’ flight mode crash rate of the F-16 aircraft and add these types of flight activities into the crash rate calculations.” Petition at 971. As demonstrated above, Nevada has not presented any information to directly controvert DOE’s derivation and use of the updated normal flight mode crash rate in its analyses. In addition, Nevada completely overlooks, and thus fails to controvert, the sensitivity analysis performed by DOE that considers the possibility of emergency flight-restricted-airspace entries into the flight-restricted airspace and uses a “special operations” flight crash rate for added conservatism.

For all of the reasons discussed above, this contention must be dismissed in its entirety.

**184. NEV-SAFETY-184 - Right-Of-Way N-48602**

Legal issue: SAR Subsection 5.8.1.1, which states that DOE right-of-way N-48602 (expiring in 2014) has been withdrawn from all forms of appropriation under the public laws including mining and geothermal leasing laws, does not properly account for the facts that (a) the right-of-way only provides DOE with the right to perform Yucca Mountain site characterization studies until December 31, 2014, (b) the land associated with the right-of-way is not under the jurisdiction and control of DOE, (c) the land has not been permanently reserved for DOE to construct and operate the Yucca Mountain repository, and (d) the land is not held free and clear of all significant encumbrances.

**RESPONSE**

This contention raises two distinct allegations regarding DOE's efforts to permanently withdraw lands to construct and operate the proposed geologic repository at Yucca Mountain. First, Nevada argues that DOE has failed to comply with 10 C.F.R. §§ 63.21(c)(24), 63.31(a)(3), 63.121(a)(1), and 63.121(a)(2) because the land on which the GROA will be located has not been permanently withdrawn and reserved for DOE's use. Petition at 976–77. And, second, Nevada argues that the Application is “materially incomplete because it fails to acknowledge that right-of-way N-48602 is limited in both duration and scope.” *Id.*<sup>108</sup>

This contention is inadmissible for two reasons, as further explained below. First, it is inadmissible because the regulations that Nevada relies upon do not require that DOE complete land withdrawal activities at this point of the proceeding. In this case, DOE has been pursuing federal legislation. Second, this contention fails to raise a genuine dispute on a material issue of

---

<sup>108</sup> Nevada raises similar claims in NEV-SAFETY-185; NEV-SAFETY-186; NEV-SAFETY-187; NEV-SAFETY-188; and NEV-SAFETY-193.

fact or law because the information that Nevada alleges is missing from the Application is, in fact, there.

**a. Statement of Issue of Law or Fact to be Controverted**

As discussed below, this contention lacks adequate legal foundation because DOE need not complete land withdrawal activities at this point of the licensing process. Therefore, this contention fails to raise an admissible issue of law subject to adjudication in this proceeding.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

In accordance with 10 C.F.R. § 63.31(a)(3)(ii), the NRC must determine whether the “site” complies with the requirements set forth in 10 C.F.R. Subpart E, specifically, as applicable here, 10 C.F.R. § 63.121(a):

(a) Ownership of Land

(1) The [GROA] must be located in and on lands that are either acquired lands under the jurisdiction and control of DOE, or lands permanently withdrawn and reserved for its use.

(2) These lands must be held free and clear of all encumbrances, if significant, such as: (i) Rights arising under the general mining laws; (ii) Easements for right-of-way; and (iii) All other rights arising under lease, rights of entry, deed, patent, mortgage, appropriation, prescription, or otherwise.

10 C.F.R. § 63.121(a)(1)–(2). To meet these requirements, DOE has been pursuing federal legislation to, among other things, permanently withdraw the requisite lands for use by DOE to construct and operate the GROA.<sup>109</sup>

In essence, this contention seeks to impermissibly litigate DOE’s efforts to obtain land withdrawal and clear all other encumbrances from lands that make up the GROA. Specifically, Nevada argues that DOE has violated 10 C.F.R. § 63.31(a) and § 63.121 because Congress has not yet permanently withdrawn and reserved the requisite land for DOE’s use. Petition at 975. In short, this is not the appropriate time to consider this issue. As discussed under paragraph (f) below, the applicable NRC regulations do not require that DOE complete land withdrawal activities at this early point of the licensing process.

Moreover, Licensing Boards should reject, as a matter of policy and practicality, any contention that attempts to litigate an issue that is, or clearly is about to become, the subject of federal legislation. We note that Licensing Boards reject contentions that attempt to litigate an issue that is “primarily the responsibility of other federal or state/local regulatory agencies.” See *PPL Susquehanna LLC* (Susquehanna Steam Electric Station, Units 1 and 2), LBP-07-10, 66 NRC 1, 27 (2007). Such contentions expand the scope of the proceeding and significantly divert limited NRC resources. Contentions addressing pending or future federal legislation would similarly expand the scope of this proceeding.

Accordingly, the Licensing Board must dismiss this contention.

---

109 As the Application explains, in March 2007, DOE submitted to Congress a bill entitled the “Nuclear Fuel Management and Disposal Act.” SAR at 5.8-2. This bill sought to permanently withdraw the requisite lands for use by DOE to construct and operate the GROA. *Id.*

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the contention identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by Nevada that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolving the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize repository construction. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As mentioned at the outset, this contention relies upon two distinct bases. For the reasons discussed below, these bases fail to create a genuine dispute on a material issue of law or fact.

**(1) DOE Does Not Need to Obtain Land Withdrawal at This Stage of the Proceeding**

Nevada argues that DOE has violated NRC regulations because the land on which the GROA will be located has not yet been permanently withdrawn and reserved for DOE’s use. Petition at 975–77. This basis of the contention is inadmissible because DOE is not required to complete land withdrawal activities at this early phase of the licensing process.

The guidance set forth in the YMRP confirms that DOE may continue to pursue land withdrawal activities while the NRC Staff reviews the Application:

**Review Method 1—Ownership of Land**

Verify that steps within the U.S. Department of Energy purview to establish effective jurisdiction and control and legislative or other transfer activities underway *will be completed before the completion of the U.S. Nuclear Regulatory Commission review and decision on the license application.*

YMRP, Controls to Restrict Access and Regulate Land Uses § 2.5.8.1 (emphasis added). An applicant’s compliance with relevant NRC guidance documents demonstrates compliance with the applicable regulations. *See AmerGen Energy Co., LLC* (Oyster Creek Nuclear Generating Station), CLI-08-23, 68 NRC \_\_ (slip op. at 6) (2008) (“the license renewal applicant’s use of an

aging management program identified in the GALL Report [i.e., a Staff guidance document for nuclear power plant license renewal safety reviews] constitutes reasonable assurance” of compliance with regulatory requirements).

At this early stage of the proceeding, therefore, NRC regulations require only that the Application include a “description of the controls that DOE *will* apply to restrict access and to regulate land use at the Yucca Mountain site,” and that the Application “be as complete as possible in the light of information that is reasonably available at the time of docketing.” 10 C.F.R. § 63.21(a), (c)(24) (emphasis added). SAR Section 5.8 provides a sufficient description of these land controls—specifically, this SAR section discusses ownership of land; controls for permanent closure; additional controls through permanent closure; water rights; conceptual design of monuments and markers; and records storage.

In short, there is no dispute that the federal government has not withdrawn the requisite land for DOE use to construct and operate a GROA. DOE has been pursuing legislation for a land withdrawal, and DOE will update its application after the land is withdrawn. The NRC does not require that DOE complete these activities until later stages of the licensing process. Accordingly, this basis of the contention fails to create a genuine dispute on a material issue of law or fact.

**(2) The Application Sufficiently Describes Right-of-Way N-48602**

Nevada also argues that “SAR Subsection 5.8.1.1 is materially incomplete because it fails to acknowledge that right-of-way N-48602 is limited in both duration and scope.” Petition at 976. The contention notes that this right-of-way (1) does not fall under DOE’s jurisdiction and control; (2) does not authorize repository construction or operations; and (3) expires in 2014. *Id.*

at 974. This allegation misses the mark entirely because SAR Section 5.8.1.1 explicitly acknowledges each of these “missing” items. That section provides in relevant part:

DOE already holds legal interests in much of the subject land depicted in Figure 5.8-1. The land on which the GROA will be located is covered by these legal interests, which take the form of two rights-of-way, an administrative land withdrawal, and a public land order. . . . *Currently, these legal interests do not authorize the construction and operation of the repository*[.]

Right-of-way N-48602 was granted to the DOE by the Bureau of Land Management subject to concurrence by the United States Air Force on October 10, 1989, and renewed on June 28, 1994; January 5, 2001; and April 8, 2004. *The most recent renewal of this right-of-way expires in 2014.*

SAR at 5.8-2 to -3 (emphasis added) (citation omitted).

Put simply, this basis for the contention fails to demonstrate a genuine dispute because the Application acknowledges this right-of-way’s scope and duration. As such, the Licensing Board must dismiss this contention to the extent it argues that the Application’s description is “materially incomplete.”

For all the reasons discussed above, this contention must be dismissed in its entirety.

**185. NEV-SAFETY-185 - Right-Of-Way N-47748**

Legal issue: SAR Subsection 5.8.1.1, which states that DOE right-of-way N-47748 (expiring on December 31, 2014) covers public land administered by the Bureau of Land Management, does not properly account for the facts that (a) the right-of-way only provides DOE with the right to perform Yucca Mountain site characterization studies until December 31, 2014, (b) the land associated with the right-of-way is not under the jurisdiction and control of DOE, (c) the land has not been permanently withdrawn from public use, (d) the land has not been permanently reserved for DOE to construct and operate the Yucca Mountain repository, and (e) the land is not held free and clear of all significant encumbrances.

**RESPONSE**

This contention raises two distinct allegations regarding DOE's efforts to permanently withdraw lands to construct and operate the proposed geologic repository at Yucca Mountain. First, Nevada argues that DOE has failed to comply with 10 C.F.R. §§ 63.21(c)(24), 63.31(a)(3), 63.121(a)(1), and 63.121(a)(2) because the land on which the GROA will be located has not been permanently withdrawn and reserved for DOE's use. Petition at 978–79. And, second, Nevada argues that the Application is “materially incomplete because it fails to acknowledge that right-of-way N-47748 is limited in both duration and scope.” *Id.* at 980.<sup>110</sup>

This contention is inadmissible for two reasons, as further explained below. First, it is inadmissible because the regulations that Nevada relies upon do not require that DOE complete land withdrawal activities at this point of the proceeding. In this case, DOE has been pursuing federal legislation. Second, this contention fails to raise a genuine dispute on a material issue of

---

<sup>110</sup> Nevada raises similar claims in NEV-SAFETY-184; NEV-SAFETY-186; NEV-SAFETY-187; NEV-SAFETY-188; and NEV-SAFETY-193.

fact or law because the information that Nevada alleges is missing from the Application is, in fact, there.

**a. Statement of Issue of Law or Fact to be Controverted**

As discussed below, this contention lacks adequate legal foundation because DOE need not complete land withdrawal activities at this point of the licensing process. Therefore, this contention fails to raise an admissible issue of law subject to adjudication in this proceeding.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

In accordance with 10 C.F.R. § 63.31(a)(3)(ii), the NRC must determine whether the “site” complies with the requirements set forth in 10 C.F.R. Subpart E, specifically, as applicable here, 10 C.F.R. § 63.121(a):

(a) Ownership of Land

(1) The [GROA] must be located in and on lands that are either acquired lands under the jurisdiction and control of DOE, or lands permanently withdrawn and reserved for its use.

(2) These lands must be held free and clear of all encumbrances, if significant, such as: (i) Rights arising under the general mining laws; (ii) Easements for right-of-way; and (iii) All other rights arising under lease, rights of entry, deed, patent, mortgage, appropriation, prescription, or otherwise.

10 C.F.R. § 63.121(a)(1)–(2). To meet these requirements, DOE has been pursuing federal legislation to, among other things, permanently withdraw the requisite lands for use by DOE to construct and operate the GROA.<sup>111</sup>

In essence, this contention seeks to impermissibly litigate DOE’s efforts to obtain land withdrawal and clear all other encumbrances from lands that make up the GROA. Specifically, Nevada argues that DOE has violated 10 C.F.R. § 63.31(a) and § 63.121 because Congress has not yet permanently withdrawn and reserved the requisite land for DOE’s use. Petition at 979. In short, this is not the appropriate time to consider this issue. As discussed under paragraph (f) below, the applicable NRC regulations do not require that DOE complete land withdrawal activities at this early point of the licensing process.

Moreover, Licensing Boards should reject, as a matter of policy and practicality, any contention that attempts to litigate an issue that is, or clearly is about to become, the subject of federal legislation. We note that Licensing Boards reject contentions that attempt to litigate an issue that is “primarily the responsibility of other federal or state/local regulatory agencies.” *See PPL Susquehanna LLC* (Susquehanna Steam Electric Station, Units 1 and 2), LBP-07-10, 66 NRC 1, 27 (2007). Such contentions expand the scope of the proceeding and significantly divert limited NRC resources. Contentions addressing pending or future federal legislation would similarly expand the scope of this proceeding.

Accordingly, the Licensing Board must dismiss this contention.

---

<sup>111</sup> As the Application explains, in March 2007, DOE submitted to Congress a bill entitled the “Nuclear Fuel Management and Disposal Act.” SAR at 5.8-2. This bill sought to permanently withdraw the requisite lands for use by DOE to construct and operate the GROA. *Id.*

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the contention identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by Nevada that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolving the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As mentioned at the outset, this contention relies upon two distinct bases. For the reasons discussed below, these bases fail to create a genuine dispute on a material issue of law or fact.

**(1) DOE Does Not Need to Obtain Land Withdrawal at This Stage of the Proceeding**

Nevada argues that DOE has violated NRC regulations because the land on which the GROA will be located has not yet been permanently withdrawn and reserved for DOE's use. Petition at 979-80. This basis of the contention is inadmissible because DOE is not required to complete land withdrawal activities at this early phase of the licensing process.

The guidance set forth in the YMRP confirms that DOE may continue to pursue land withdrawal activities while the NRC Staff reviews the Application:

**Review Method 1—Ownership of Land**

Verify that steps within the U.S. Department of Energy purview to establish effective jurisdiction and control and legislative or other transfer activities underway *will be completed before the completion of the U.S. Nuclear Regulatory Commission review and decision on the license application.*

Final Report, Yucca Mountain Review Plan, NUREG-L804, § 2.5.8.2 at 2.5-96 (emphasis added). An applicant's compliance with relevant NRC guidance documents demonstrates compliance with the applicable regulations. *See AmerGen Energy Co., LLC* (Oyster Creek Nuclear Generating Station), CLI-08-23, 68 NRC\_\_ (slip op. at 6) (October 6, 2008) ("the

license renewal applicant's use of an aging management program identified in the GALL Report [that is, a Staff guidance document for nuclear power plant license renewal safety reviews] constitutes reasonable assurance" of compliance with regulatory requirements).

At this early stage of the proceeding, therefore, NRC regulations require only that the Application include a "description of the controls that DOE *will* apply to restrict access and to regulate land use at the Yucca Mountain site," and that the Application "be as complete as possible in light of information that is reasonably available at the time of docketing." 10 C.F.R. § 63.21(a), (c)(24) (emphasis added). SAR § 5.8 provides a sufficient description of these land controls—specifically, this SAR section discusses ownership of land; controls for permanent closure; additional controls through permanent closure; water rights; conceptual design of monuments and markers; and records storage.

In short, there is no dispute that the federal government has not withdrawn the requisite land for DOE use to construct and operate a GROA. DOE has been pursuing legislation for a land withdrawal, and DOE will update its application after the land is withdrawn. The NRC does not require that DOE complete these activities until later stages of the licensing process. Accordingly, this basis of the contention fails to create a genuine dispute on a material issue of law or fact.

**(2) The Application Sufficiently Describes Right-of-Way N-47748**

Nevada also argues that "SAR Subsection 5.8.1.1 is materially incomplete because it fails to acknowledge that right-of-way N-47748 is limited in both duration and scope." Petition at 980. The contention notes that this right-of-way (1) does not fall under DOE's jurisdiction and control; (2) does not authorize repository construction or operations; and (3) expires in 2014. *Id.*

at 978. This allegation misses the mark entirely because SAR Section 5.8.1.1 explicitly acknowledges each of these “missing” items. That section provides in relevant part:

. . . DOE already holds legal interests in much of the subject land depicted in Figure 5.8-1. The land on which the GROA will be located is covered by these legal interests, which take the form of two rights-of-way, an administrative land withdrawal, and a public land order. . . . *Currently, these legal interests do not authorize the construction and operation of the repository*[.]

. . .

Right-of-way N-47748 was granted to the DOE by the Bureau of Land Management on January 6, 1988, and renewed on January 5, 2001 and December 20, 2007. The right-of-way expires on December 31, 2014.

SAR at 5.8-2 to -3 (emphasis added).

Put simply, this basis for the contention fails to demonstrate a genuine dispute because the Application acknowledges this right-of-way’s scope and duration. As such, the Licensing Board must dismiss this contention to the extent it argues that the Application’s description is “materially incomplete.”

For all the reasons discussed above, this contention must be dismissed in its entirety.

## **186. NEV-SAFETY-186 - "Ranch Boundary" Land**

Legal issue: SAR Subsection 5.8.1.1, which states that a Memorandum of Agreement governs Yucca Mountain project activities on 58,000 acres of non-public land on the Nevada Test Site (referred to as the Ranch Boundary), does not properly account for the facts that (a) the agreement only provides DOE with the right to perform Yucca Mountain site characterization studies until that right is terminated upon 90 days' written notice, (b) the land associated with the agreement has not been permanently reserved for DOE to construct and operate the Yucca Mountain repository, and (c) the land is not held free and clear of all significant encumbrances.

### **RESPONSE**

This contention impermissibly challenges DOE's efforts to permanently withdraw lands to construct and operate the proposed geologic repository at Yucca Mountain. Nevada argues that DOE has failed to comply with 10 C.F.R. §§ 63.21(c)(24), 63.31(a)(3), 63.121(a)(1), and 63.121(a)(2) because the land on which the GROA will be located has not been permanently withdrawn and reserved for DOE's use. Petition at 982–84. Nevada also claims that SAR Section 5.8 “is both inaccurate and materially incomplete” because it allegedly fails to acknowledge that DOE's land interests, including the Ranch Boundary land, are limited in duration and scope. *Id.* at 984–85.<sup>112</sup>

This contention is inadmissible for two reasons, as further explained below. First, it is inadmissible because the regulations that Nevada relies upon do not require that DOE complete land withdrawal activities at this point of the proceeding. In this case, DOE has been pursuing federal legislation. Second, this contention fails to raise a genuine dispute on a material issue of

---

<sup>112</sup> Nevada raises similar claims in NEV-SAFETY-184; NEV-SAFETY-185; NEV-SAFETY-187; NEV-SAFETY-188; and NEV-SAFETY-193.

fact or law because the Application expressly acknowledges that DOE's land interests do not authorize repository construction and operation.

**a. Statement of Issue of Law or Fact to be Controverted**

As discussed below, this contention lacks adequate legal foundation because DOE need not complete land withdrawal activities at this point of the licensing process. Therefore, this contention fails to raise an admissible issue of law subject to adjudication in this proceeding.

**b. Brief Explanation of Basis**

Because, as explained below, the issue proffered in this contention resides outside the scope of the proceeding, it fails to provide an adequate basis for admissibility.

**c. Whether the Issue is Within the Scope of the Proceeding**

In accordance with 10 C.F.R. § 63.31(a)(3)(ii), the NRC must determine whether the "site" complies with the requirements set forth in 10 C.F.R. Subpart E, specifically, as applicable here, 10 C.F.R. § 63.121(a):

(a) Ownership of Land

(1) The [GROA] must be located in and on lands that are either acquired lands under the jurisdiction and control of DOE, or lands permanently withdrawn and reserved for its use.

(2) These lands must be held free and clear of all encumbrances, if significant, such as: (i) Rights arising under the general mining laws; (ii) Easements for right-of-way; and (iii) All other rights arising under lease, rights of entry, deed, patent, mortgage, appropriation, prescription, or otherwise.

10 C.F.R. § 63.121(a)(1)–(2). To meet these requirements, DOE has been pursuing federal legislation to, among other things, permanently withdraw the requisite lands for use by DOE to construct and operate the GROA.<sup>113</sup>

In essence, this contention seeks to impermissibly litigate DOE’s efforts to obtain land withdrawal and clear all other encumbrances from lands that make up the GROA. Specifically, Nevada argues that DOE has violated 10 C.F.R. § 63.31(a) and § 63.121 because Congress has not yet permanently withdrawn and reserved the requisite land for DOE’s use. Petition at 982–83. In short, this is not the appropriate time to consider this issue. As discussed under paragraph (f) below, the applicable NRC regulations do not require that DOE complete land withdrawal activities at this point in the licensing process.

Moreover, Licensing Boards should reject, as a matter of policy and practicality, any contention that attempts to litigate an issue that is, or clearly is about to become, the subject of federal legislation. We note that Licensing Boards reject contentions that attempt to litigate an issue that is “primarily the responsibility of other federal or state/local regulatory agencies.” *See PPL Susquehanna LLC* (Susquehanna Steam Electric Station, Units 1 and 2), LBP-07-10, 66 NRC 1, 27 (2007). Such contentions expand the scope of the proceeding and significantly divert limited NRC resources. Contentions addressing pending or future federal legislation would similarly expand the scope of this proceeding.

Accordingly, the Licensing Board must dismiss this contention.

---

113 As the Application explains, in March 2007, DOE submitted to Congress a bill entitled the “Nuclear Fuel Management and Disposal Act.” SAR at 5.8-2. This bill sought to permanently withdraw the requisite lands for use by DOE to construct and operate the GROA. *Id.*

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the contention identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by Nevada that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolving the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As mentioned at the outset, this contention relies upon two distinct bases. For the reasons discussed below, these bases fail to create a genuine dispute on a material issue of law or fact.

**(1) DOE Does Not Need to Obtain Land Withdrawal at This Stage of the Proceeding**

Nevada argues that DOE has violated NRC regulations because the land on which the GROA will be located has not yet been permanently withdrawn and reserved for DOE’s use. Petition at 982–83. This basis of the contention is inadmissible because DOE is not required to complete land withdrawal activities at this phase of the licensing process.

The guidance set forth in the YMRP confirms that DOE may continue to pursue land withdrawal activities while the NRC Staff reviews the Application:

**Review Method 1—Ownership of Land**

Verify that steps within the U.S. Department of Energy purview to establish effective jurisdiction and control and legislative or other transfer activities underway *will be completed before the completion of the U.S. Nuclear Regulatory Commission review and decision on the license application.*

YMRP, *Controls to Restrict Access and Regulate Land Uses* § 2.5.8.1 at 2.5-96 (emphasis added). An applicant’s compliance with relevant NRC guidance documents demonstrates compliance with the applicable regulations. *See AmerGen Energy Co., LLC* (Oyster Creek Nuclear Generating Station), CLI-08-23, 68 NRC \_\_, \_\_ (slip op. at 6) (2008) (“the license

renewal applicant's use of an aging management program identified in the GALL Report [that is, a Staff guidance document for nuclear power plant license renewal safety reviews] constitutes reasonable assurance" of compliance with regulatory requirements).

At this stage of the proceeding, therefore, NRC regulations require only that the Application include a "description of the controls that DOE *will* apply to restrict access and to regulate land use at the Yucca Mountain site," and that the Application "be as complete as possible in light of information that is reasonably available at the time of docketing." 10 C.F.R. § 63.21(a), (c)(24) (emphasis added). SAR Section 5.8 provides a sufficient description of these land controls—specifically, this SAR section discusses ownership of land; controls for permanent closure; additional controls through permanent closure; water rights; conceptual design of monuments and markers; and records storage.

In short, there is no dispute that the federal government has not withdrawn the requisite land for DOE use to construct and operate a GROA. DOE has been pursuing legislation for a land withdrawal, and DOE will update its application after the land is withdrawn. The NRC does not require that DOE complete these activities until later stages of the licensing process. Accordingly, this basis of the contention fails to create a genuine dispute on a material issue of law or fact.

**(2) SAR Section 5.8 Expressly Acknowledges the Scope of DOE's Land Interests**

Nevada also argues that SAR Section 5.8 is inaccurate and materially incomplete. Petition at 984. The contention claims that the SAR fails to acknowledge that DOE's land interests—including the "Ranch Boundary"—do not permit repository construction and operation.

This allegation misses the mark. As noted above, NRC regulations require only that the Application include a “description of the controls that DOE *will* apply to restrict access and to regulate land use at the Yucca Mountain site.” 10 C.F.R. § 63.21(c)(24). SAR Section 5.8 meets this standard. Furthermore, the Application explicitly acknowledges the “missing” information. SAR Section 5.8 provides in relevant part:

. . . DOE already holds legal interests in much of the subject land depicted in Figure 5.8-1. The land on which the GROA will be located is covered by these legal interests, which take the form of two rights-of-way, an administrative land withdrawal, and a public land order. . . . *Currently, these legal interests do not authorize the construction and operation of the repository*[.]

. . .

In addition, a Memorandum of Agreement between the predecessor offices of the DOE National Nuclear Security Agency Nevada Site Office and the DOE Office of Civilian Radioactive Waste Management (Aquilina and Nelson 1994) allows the use of about 58,000 acres on Nevada Test Site land for Yucca Mountain project activities. Figure 5.8-1 shows the agreement area, which is known as the “ranch boundary.”

SAR at 5.8-2 to -3 (emphasis added).<sup>114</sup>

Put simply, this basis for the contention fails to demonstrate a genuine dispute. The Application provides a sufficient description of the controls that DOE *will* apply to restrict access and to regulate land use at the Yucca Mountain site. Moreover, the Application acknowledges that its current land interests do not authorize construction or operations activities. As such, the Licensing Board must dismiss this contention to the extent it argues that the Application’s description is inaccurate or materially incomplete.

---

114 The Memorandum of Agreement is on the LSN (#DEN001585704) and is cited in the Petition. See Petition at 984.

For all the reasons discussed above, this contention must be dismissed in its entirety.

**187. NEV-SAFETY-187 - Public Land Order 7653**

Legal issue: SAR Subsection 5.8.1.1, which states that Public Land Order 7653 has withdrawn (for ten years) lands for the evaluation of the potential construction, operation and maintenance of a rail line in the Caliente Rail Corridor, does not properly account for the facts that the land associated with the order (a) is not under the jurisdiction and control of DOE, (b) has not been permanently withdrawn from public use, (c) has not been permanently reserved for DOE to construct and operate the Yucca Mountain repository, and (d) is not held free and clear of all significant encumbrances.

**RESPONSE**

This contention raises two distinct allegations regarding DOE's efforts to permanently withdraw lands to construct and operate the proposed geologic repository at Yucca Mountain. First, Nevada argues that DOE has failed to comply with 10 C.F.R. §§ 63.21(c)(24), 63.31(a)(3), 63.121(a)(1), and 63.121(a)(2) because the land on which the GROA will be located has not been permanently withdrawn and reserved for DOE's use. Petition at 986-87. And, second, Nevada argues that the Application "does not properly account for" Public Land Order 7653's duration and scope. *Id.* at 986, 988.<sup>115</sup>

This contention is inadmissible for two reasons, as further explained below. First, it is inadmissible because the regulations that Nevada relies upon do not require that DOE complete land withdrawal activities at this point of the proceeding. In this case, DOE has been pursuing federal legislation. Second, this contention fails to raise a genuine dispute on a material issue of fact or law because the information that Nevada alleges is missing from the Application is, in fact, there.

---

<sup>115</sup> Nevada raises similar claims in NEV-SAFETY-184; NEV-SAFETY-185; NEV-SAFETY-186; NEV-SAFETY-188; and NEV-SAFETY-193.

**a. Statement of Issue of Law or Fact to be Controverted**

As discussed below, this contention lacks adequate legal foundation because DOE need not complete land withdrawal activities at this point of the licensing process. Therefore, this contention fails to raise an admissible issue of law subject to adjudication in this proceeding.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

In accordance with 10 C.F.R. § 63.31(a)(3)(ii), the NRC must determine whether the “site” complies with the requirements set forth in 10 C.F.R. Subpart E, specifically, as applicable here, 10 C.F.R. § 63.121(a):

(a) Ownership of Land

(1) The [GROA] must be located in and on lands that are either acquired lands under the jurisdiction and control of DOE, or lands permanently withdrawn and reserved for its use.

(2) These lands must be held free and clear of all encumbrances, if significant, such as: (i) Rights arising under the general mining laws; (ii) Easements for right-of-way; and (iii) All other rights arising under lease, rights of entry, deed, patent, mortgage, appropriation, prescription, or otherwise.

10 C.F.R. § 63.121(a)(1)–(2). To meet these requirements, DOE has been pursuing federal legislation to, among other things, permanently withdraw the requisite lands for use by DOE to construct and operate the GROA.<sup>116</sup>

---

116 As the Application explains, in March 2007, DOE submitted to Congress a bill entitled the “Nuclear Fuel Management and Disposal Act.” SAR at 5.8-2. This bill sought to permanently withdraw the requisite lands for use by DOE to construct and operate the GROA. *Id.*

In essence, this contention seeks to impermissibly litigate DOE's efforts to obtain land withdrawal and clear all other encumbrances from lands that make up the GROA. Specifically, Nevada argues that DOE has violated 10 C.F.R. § 63.31(a) and § 63.121 because Congress has not yet permanently withdrawn and reserved the requisite land for DOE's use. Petition at 987. In short, this is not the appropriate time to consider this issue. As discussed under paragraph (f) below, the applicable NRC regulations do not require that DOE complete land withdrawal activities at this early point of the licensing process.

Moreover, Licensing Boards should reject, as a matter of policy and practicality, any contention that attempts to litigate an issue that is, or clearly is about to become, the subject of federal legislation. We note that Licensing Boards reject contentions that attempt to litigate an issue that is "primarily the responsibility of other federal or state/local regulatory agencies." *See PPL Susquehanna LLC* (Susquehanna Steam Electric Station, Units 1 and 2), LBP-07-10, 66 NRC 1, 27 (2007). Such contentions expand the scope of the proceeding and significantly divert limited NRC resources. Contentions addressing pending or future federal legislation would similarly expand the scope of this proceeding.

Accordingly, the Licensing Board must dismiss this contention.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the contention identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by Nevada that "the issue raised in the contention is material

to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolving the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As mentioned at the outset, this contention relies upon two distinct bases. For the reasons discussed below, these bases fail to create a genuine dispute on a material issue of law or fact.

**(1) DOE Does Not Need to Obtain Land Withdrawal at This Stage of the Proceeding**

Nevada argues that DOE has violated NRC regulations because the land on which the GROA will be located has not yet been permanently withdrawn and reserved for DOE’s use.

Petition at 986-87. This basis of the contention is inadmissible because DOE is not required to complete land withdrawal activities at this early phase of the licensing process.

The guidance set forth in the YMRP confirms that DOE may continue to pursue land withdrawal activities while the NRC Staff reviews the Application:

#### Review Method 1—Ownership of Land

Verify that steps within the U.S. Department of Energy purview to establish effective jurisdiction and control and legislative or other transfer activities underway *will be completed before the completion of the U.S. Nuclear Regulatory Commission review and decision on the license application.*

Final Report, Yucca Mountain Review Plan, NUREG-1804, § 2.5.8.2 at 2.5-96 (emphasis added). An applicant's compliance with relevant NRC guidance documents demonstrates compliance with the applicable regulations. *See AmerGen Energy Co., LLC* (Oyster Creek Nuclear Generating Station), CLI-08-23, 68 NRC \_\_ (slip op. at 6) (October 6, 2008) (“the license renewal applicant’s use of an aging management program identified in the GALL Report [that is, a Staff guidance document for nuclear power plant license renewal safety reviews] constitutes reasonable assurance” of compliance with regulatory requirements).

At this early stage of the proceeding, therefore, NRC regulations require only that the Application include a “description of the controls that DOE *will* apply to restrict access and to regulate land use at the Yucca Mountain site,” and that the Application “be as complete as possible in light of information that is reasonably available at the time of docketing.” 10 C.F.R. § 63.21(a), (c)(24) (emphasis added). SAR § 5.8 provides a sufficient description of these land controls—specifically, this SAR section discusses ownership of land; controls for permanent

closure; additional controls through permanent closure; water rights; conceptual design of monuments and markers; and records storage.

In short, there is no dispute that the federal government has not withdrawn the requisite land for DOE use to construct and operate a GROA. DOE has been pursuing legislation for a land withdrawal, and DOE will update its application after the land is withdrawn. The NRC does not require that DOE complete these activities until later stages of the licensing process. Accordingly, this basis of the contention fails to create a genuine dispute on a material issue of law or fact.

**(2) The Application Sufficiently Describes Public Land Order 7653**

Nevada also argues that SAR Subsection 5.8.1.1 is inadequate because it "does not properly account for the facts that" Public Land Order 7653 is limited in both duration and scope. Petition at 986, 988. The contention notes that the land associated with this order (1) does not fall under DOE's jurisdiction and control; (2) does not authorize repository construction or operations; and (3) has not been permanently reserved for DOE's use. *Id.* at 986. This allegation misses the mark entirely because SAR Subsection 5.8.1.1 explicitly acknowledges each of these "missing" items. That section provides in relevant part:

. . . DOE already holds legal interests in much of the subject land depicted in Figure 5.8-1. The land on which the GROA will be located is covered by these legal interests, which take the form of two rights-of-way, an administrative land withdrawal, and a public land order. . . . *Currently, these legal interests do not authorize the construction and operation of the repository[.]*

. . .

Public Land Order 7653 is a land withdrawal *for a period of 10 years* to evaluate the lands for the potential construction, operation,

and maintenance of a rail line (Caliente Rail Corridor) for transportation of spent nuclear fuel (SNF) and high-level radioactive waste (HLW) to a geologic repository at Yucca Mountain (70 FR 76854).

SAR at 5.8-2 to -3 (emphasis added).

Put simply, this basis for the contention fails to demonstrate a genuine dispute because the Application acknowledges this public land order's scope and duration. As such, the Licensing Board must dismiss this contention to the extent it argues that the Application's description is inadequate.

For all the reasons discussed above, this contention must be dismissed in its entirety.

**188. NEV-SAFETY-188 - Public Land Order 6802/7534**

Legal issue: SAR Subsection 5.8.1.1, which states that Public Land Order 6802 (as extended through January 31, 2010 by Public Land Order 7534) withdraws land from the operation of the mining and mineral leasing laws, does not properly account for the facts that the land associated with the orders (a) is not under the jurisdiction and control of DOE, (b) has not been permanently withdrawn from public use, (c) has not been permanently reserved for DOE to construct and operate the Yucca Mountain repository, and (d) is not held free and clear of all significant encumbrances.

**RESPONSE**

This contention raises two distinct allegations regarding DOE's efforts to permanently withdraw lands to construct and operate the proposed geologic repository at Yucca Mountain. First, Nevada argues that DOE has failed to comply with 10 C.F.R. §§ 63.21(c)(24), 63.31(a)(3), 63.121(a)(1), and 63.121(a)(2) because the land on which the GROA will be located has not been permanently withdrawn and reserved for DOE's use. Petition at 990-91. And, second, Nevada argues that the Application "does not properly account for" the duration and scope of Public Land Orders 6802/7534. *Id.* at 990.<sup>117</sup>

This contention is inadmissible for two reasons, as further explained below. First, it is inadmissible because the regulations that Nevada relies upon do not require that DOE complete land withdrawal activities at this point of the proceeding. In this case, DOE has been pursuing federal legislation. Second, this contention fails to raise a genuine dispute on a material issue of fact or law because the information that Nevada alleges is missing from the Application is, in fact, there.

---

<sup>117</sup> Nevada raises similar claims in NEV-SAFETY-184; NEV-SAFETY-185; NEV-SAFETY-186; NEV-SAFETY-187; and NEV-SAFETY-193.

**a. Statement of Issue of Law or Fact to be Controverted**

As discussed below, this contention lacks adequate legal foundation because DOE need not complete land withdrawal activities at this point of the licensing process. Therefore, this contention fails to raise an admissible issue of law subject to adjudication in this proceeding.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

In accordance with 10 C.F.R. § 63.31(a)(3)(ii), the NRC must determine whether the “site” complies with the requirements set forth in 10 C.F.R. Subpart E, specifically, as applicable here, 10 C.F.R. § 63.121(a):

(a) Ownership of Land

(1) The [GROA] must be located in and on lands that are either acquired lands under the jurisdiction and control of DOE, or lands permanently withdrawn and reserved for its use.

(2) These lands must be held free and clear of all encumbrances, if significant, such as: (i) Rights arising under the general mining laws; (ii) Easements for right-of-way; and (iii) All other rights arising under lease, rights of entry, deed, patent, mortgage, appropriation, prescription, or otherwise.

10 C.F.R. § 63.121(a)(1)–(2). To meet these requirements, DOE has been pursuing federal legislation to, among other things, permanently withdraw the requisite lands for use by DOE to construct and operate the GROA.<sup>118</sup>

---

118 As the Application explains, in March 2007, DOE submitted to Congress a bill entitled the “Nuclear Fuel Management and Disposal Act.” SAR at 5.8-2. This bill sought to permanently withdraw the requisite lands for use by DOE to construct and operate the GROA. *Id.*

In essence, this contention seeks to impermissibly litigate DOE's efforts to obtain land withdrawal and clear all other encumbrances from lands that make up the GROA. Specifically, Nevada argues that DOE has violated 10 C.F.R. § 63.31(a) and § 63.121 because Congress has not yet permanently withdrawn and reserved the requisite land for DOE's use. Petition at 990-91. In short, this is not the appropriate time to consider this issue. As discussed under paragraph (f) below, the applicable NRC regulations do not require that DOE complete land withdrawal activities at this early point of the licensing process.

Moreover, Licensing Boards should reject, as a matter of policy and practicality, any contention that attempts to litigate an issue that is, or clearly is about to become, the subject of federal legislation. We note that Licensing Boards reject contentions that attempt to litigate an issue that is "primarily the responsibility of other federal or state/local regulatory agencies." *See PPL Susquehanna LLC* (Susquehanna Steam Electric Station, Units 1 and 2), LBP-07-10, 66 NRC 1, 27 (2007). Such contentions expand the scope of the proceeding and significantly divert limited NRC resources. Contentions addressing pending or future federal legislation would similarly expand the scope of this proceeding.

Accordingly, the Licensing Board must dismiss this contention.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the contention identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding." 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by Nevada that "the issue raised in the contention is material

to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolving the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As mentioned at the outset, this contention relies upon two distinct bases. For the reasons discussed below, these bases fail to create a genuine dispute on a material issue of law or fact.

**(1) DOE Does Not Need to Obtain a Land Withdrawal at This Stage of the Proceeding**

Nevada argues that DOE has violated NRC regulations because the land on which the GROA will be located has not yet been permanently withdrawn and reserved for DOE’s use.

Petition at 990-91. This basis of the contention is inadmissible because DOE is not required to complete land withdrawal activities at this early phase of the licensing process.

The guidance set forth in the YMRP confirms that DOE may continue to pursue land withdrawal activities while the NRC Staff reviews the Application:

Review Method 1—Ownership of Land

Verify that steps within the U.S. Department of Energy purview to establish effective jurisdiction and control and legislative or other transfer activities underway *will be completed before the completion of the U.S. Nuclear Regulatory Commission review and decision on the license application.*

Final Report, Yucca Mountain Review Plan, NUREG-1804, § 2.5.8.2 at 2.5-96 (emphasis added). An applicant's compliance with relevant NRC guidance documents demonstrates compliance with the applicable regulations. *See AmerGen Energy Co., LLC* (Oyster Creek Nuclear Generating Station), CLI-08-23, 68 NRC \_\_ (slip op. at 6) (October 6, 2008) (“the license renewal applicant’s use of an aging management program identified in the GALL Report [that is, a Staff guidance document for nuclear power plant license renewal safety reviews] constitutes reasonable assurance” of compliance with regulatory requirements).

At this early stage of the proceeding, therefore, NRC regulations require only that the Application include a “description of the controls that DOE *will* apply to restrict access and to regulate land use at the Yucca Mountain site,” and that the Application “be as complete as possible in light of information that is reasonably available at the time of docketing.” 10 C.F.R. § 63.21(a), (c)(24) (emphasis added). SAR § 5.8 provides a sufficient description of these land controls—specifically, this SAR section discusses ownership of land; controls for permanent

closure; additional controls through permanent closure; water rights; conceptual design of monuments and markers; and records storage.

In short, there is no dispute that the federal government has not withdrawn the requisite land for DOE use to construct and operate a GROA. DOE has been pursuing legislation for a land withdrawal, and DOE will update its application after the land is withdrawn. The NRC does not require that DOE complete these activities until later stages of the licensing process. Accordingly, this basis of the contention fails to create a genuine dispute on a material issue of law or fact.

**(2) The Application Sufficiently Describes Public Land Orders 6802/7534**

Nevada also argues that SAR Subsection 5.8.1.1 is inadequate because it "does not properly account for the facts that" Public Land Orders 6802/7534 are limited in both duration and scope. Petition at 990, 992. The contention notes that the land associated with these orders (1) does not fall under DOE's jurisdiction and control; (2) does not authorize repository construction or operations; and (3) has not been permanently reserved for DOE's use. *Id.* at 990. This allegation misses the mark entirely because SAR Subsection 5.8.1.1 explicitly acknowledges each of these "missing" items. That section provides in relevant part:

. . . DOE already holds legal interests in much of the subject land depicted in Figure 5.8-1. The land on which the GROA will be located is covered by these legal interests, which take the form of two rights-of-way, an administrative land withdrawal, and a public land order. . . . *Currently, these legal interests do not authorize the construction and operation of the repository[.]*

...

Public Land Order 6802 (55 FR 39152) was executed by the U.S. Department of the Interior on September 25, 1990, and extended

by Public Land Order 7534 (67 FR 53359) on July 31, 2002. It expires on January 31, 2010. These public land orders cover 4,255.5 acres and withdraw the land from the operation of the mining and mineral leasing laws and overlay a part of right-of-way N-47748 (BLM 2007). While these public land orders do not grant the DOE additional land-use rights above those specified in the right-of-way, they do preclude the staking and filing of mining claims.

SAR at 5.8-2 to -3 (emphasis added).

Put simply, this basis for the contention fails to demonstrate a genuine dispute because the Application acknowledges these public land orders' scope and duration. As such, the Licensing Board must dismiss this contention to the extent it argues that the Application's description is inadequate.

For all the reasons discussed above, this contention must be dismissed in its entirety.

**189. NEV-SAFETY-189 - Patent 27-83-0002**

Legal issue: SAR Subsection 5.8.2.2.1, which concludes that Patent 27-83-0002 and the associated rights-of-way N-43366 and NEV 066289 do not present an adverse human action that reduces the ability of the Yucca Mountain repository to isolate waste, does not properly account for the fact that DOE does not exercise any jurisdiction or control over the land on which the patent and rights-of-way have been granted even though the land lies wholly within the Yucca Mountain land withdrawal area boundary and the preclosure controlled area boundary.

**RESPONSE**

This contention concerns areas of land and rights-of-way associated with Patent 27-83-0002, a patented mining claim “located approximately 10 miles south of Yucca Mountain[,]” which is outside not only the GROA but also outside the proposed land withdrawal area boundary. SAR at 5.8-5. SAR Figure 5.8-1 shows the location of Patent 27-83-0002 relative to the proposed GROA.

This contention argues that the Application is fatally deficient because DOE does not have legal jurisdiction or control over land and rights-of-way associated with Patent 27-83-0002. Petition at 994, 996. As discussed below, this contention falls outside the scope of the proceeding, lacks adequate factual support or expert opinion, and fails in several respects to raise a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

As discussed below, the contention depends totally on an incorrect statement of the pertinent regulation, 10 C.F.R § 63.121, in asserting that DOE must exercise “jurisdiction and control” over land outside the GROA, based on ownership of land or its permanent withdrawal from public use. It thus depends on a faulty legal premise and unavoidably raises legal issues that are irrelevant to those pertinent to examining lands outside the GROA.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the contention identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by Nevada that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be

read to dispense with the well-recognized requirement that resolving the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion before a Licensing Board will admit a contention. As explained below, Nevada fails to provide factual support or expert opinion to substantiate its concern that DOE must control land associated with Patent 27-83-0002. Instead, Nevada offers only unadorned assertions of counsel. This approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation. For this reason, the Licensing Board must dismiss this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention argues that the Application is in “non-compliance” with various NRC regulations because DOE does not exercise adequate jurisdiction or control over lands associated with Patent 27-83-0002. Nevada’s claim fails to demonstrate a genuine dispute on a material issue of law or fact.

In accordance with 10 C.F.R. § 63.31(a)(3)(ii), the NRC must determine whether the site complies with the requirements set forth in 10 C.F.R. Part 63, Subpart E, specifically, as applicable here, 10 C.F.R. § 63.121(a), (b) and (c):

§ 63.121—Requirements for Ownership and Control of Interests in Land

(a) *Ownership of land.*

(1) The geologic repository operations area [GROA] must be located in and on lands that are either acquired lands under the jurisdiction and control of DOE, or lands permanently withdrawn and reserved for its use.

(2) These lands must be held free and clear of all encumbrances, if significant, such as: (1) Rights arising under the general mining laws; (ii) Easements for right-of-way; and (iii) All other rights arising under lease, rights of entry, deed, patent, mortgage, appropriation, prescription, or otherwise.

(b) *Additional controls for permanent closure.* Appropriate controls must be established *outside* of the [GROA]. DOE shall exercise any jurisdiction and control over surface and subsurface estates necessary to prevent adverse human actions that could significantly reduce the geologic repository's ability to achieve isolation. The rights of DOE may take the form of appropriate possessory interests, servitudes, or withdrawals from location or patent under the general mining laws.

(c) *Additional controls through permanent closure.* Appropriate controls must be established *outside* the [GROA]. DOE shall exercise any jurisdiction or control of activities necessary to ensure the requirements at § 63.111(a) and (b) are met. Control includes the authority to exclude members of the public, if necessary.

10 C.F.R. § 63.121(a)–(c) (emphasis added).

The structure of § 63.121 is critical to evaluating this contention. Subsection (a), entitled “Ownership of land,” is limited by its terms to the GROA—the inner part of the proposed land withdrawal area, where actual repository operations are conducted. Thus, the requirement for land to be either “acquired” by DOE or “permanently withdrawn” for its benefit applies only to the GROA. 10 C.F.R. § 63.121(a). Even within the GROA, only “significant” encumbrances must be cleared. Subparagraph 2 then provides examples of “significant” encumbrances. *Id.* § 63.121(a)(2). Subsections (b) and (c) relate to land *outside* the GROA. By contrast with the

requirements for the GROA stated in subsection (a), they require neither ownership nor permanent withdrawal of land. Rather, Subsections (b) and (c) require only “appropriate controls” to be established, and with them, the exercise of “any jurisdiction and control . . . necessary” to meet their stated requirements.

The contention argues that DOE’s current and intended span of control over Patent 27-83-0002 is inherently deficient because DOE does not own, and has not permanently withdrawn this land. This contention conflates the mandatory requirements for ownership or permanent withdrawal applicable only to the GROA with the inherently facts-and-circumstances evaluations involving “appropriate” controls for land outside the GROA. Thus, the contention attempts, incorrectly, to extend ownership-and-control requirements applicable to lands in the heart of the GROA, to areas of land *outside* the GROA, approximately ten miles from Yucca Mountain. Because the contention misstates the requirements of § 63.121, it must be dismissed.

Second, as a matter of fact, the contention errs factually in asserting that the lands at issue in this contention lie “wholly within the Yucca Mountain land withdrawal area boundary[.]” Petition at 994. There is no genuine dispute that these particular land interests are *not* part of the proposed land withdrawal area. The SAR, at 5.8-2, references *Land Records for the Proposed Land Withdrawal Area of the Yucca Mountain Repository*, within which DOE recognizes that the proposed land withdrawal “excludes” the area encompassing this patent. Office of Civilian Radioactive Waste Management, *Land Records for the Proposed Land Withdrawal Area of the Yucca Mountain Repository*, § 1.3, Rev. 1 (Sept. 2007) (TDR-MGR-ND-000003, LSN#

DEN001574941). And Nevada is aware of this fact because it cites this reference in its contention. Petition at 996.<sup>119</sup>

With respect to actual compliance with waste-isolation requirements, set forth in § 63.121(b), the Application reports that “activities associated with Patent 27-83-0002 have been assessed, and that assessment has determined that because the claim is physically remote and down the aquifer gradient from Yucca Mountain, the mining activities do not present an adverse human action that reduces the ability of the repository to isolate waste.” SAR at 5.8-5. The contention does not challenge this sufficient assertion of compliance with the regulation.

With respect to compliance with § 63.121(c), DOE must exercise jurisdiction or control over activities as necessary to ensure that the release and exposure requirements of § 63.111(a) and (b) are met. SAR Section 5.8.3.1 at 5.8-7, sets forth DOE’s general approach to meeting these requirements and refers to SAR Section 1.8 for more detailed discussion. As discussed in SAR Section 1.8, doses to individuals within the area of Patent 27-83-0002 did not need to be and were not specifically calculated in the SAR because that area is not a location of one of the maximum dose receptors that are discussed in SAR Section 1.8.1.4.3. The maximum dose receptors are specified at the locations of the highest annual average and 95th-percentile atmospheric dispersion factors for potential radioactive material releases from within the GROA. For the general environment, that receptor is at the SSE site boundary (*i.e.*, wind from the NNW)

---

<sup>119</sup> The contention also raises inconsistencies regarding DOE’s statement of patent ownership and associated patent area acreage, but this does not raise a genuine dispute because the patent is not within the proposed land withdrawal area. It also is not material because it is administrative in nature, and therefore would not affect the outcome of the proceeding. *See, e.g., Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2 & 3), CLI-99-11, 49 NRC 328, 333–34 (1999) (“The dispute at issue is material if its resolution would make a difference in the outcome of the licensing proceeding.”) (internal quotations and citation omitted). According to the DOE Land Records report noted above (Appendix F), the U.S. Department of Interior Bureau of Land Management Mining Claim Geographic Report indicates that although the claimant is listed as Hollie O. Allen, the claim name is given as Cind-R-Lite. SAR Section 5.8.2.2.1 incorrectly inferred that the plot was “owned” by Cind-R-Lite. SAR at 5.8-5. The acreage of the plot (stated as 203 acres) also was in error. The Patented Mining Claim was granted to Hollie O. Allen for 182.5 acres.

as shown on SAR Figure 1.8-2. SAR Table 1.8-36 summarizes preclosure performance objectives and demonstrates that calculated doses at that location are in compliance with 10 C.F.R. §§ 63.111(a) and (b).

The atmospheric dispersion factors used to calculate doses are calculated in Calculation 000-00C-MGR0-02800-000-00B, General Public Atmospheric Dispersion Factors, (LSN#: DN2002456509; DEN001579957) for each of 16 meteorological sectors along the land withdrawal area boundary. As shown in Tables 18, 19 and 20 of Calculation 000-00C-MGR0-02800-000-00B (pages 117 to 118), the highest annual average and 95th-percentile atmospheric dispersion factors in the general environment are in the SSE sector (wind from the NNW). Patent 27-83-0002 is located near the SSW site boundary (i.e., wind from the NNE) as shown on SAR Figure 5.8-1. The calculated atmospheric dispersion factors in Tables 18, 19 and 20 of Calculation 000-00C-MGR0-02800-000-00B (pages 117 to 118) are lower for that SSW sector than for the SSE sector. Thus, doses at the SSW sector would also be lower and calculated doses for the SSE in SAR Table 1.8-36 (page 1.8-112, SAR Rev 0) are conservative for the land patent area location.

That conclusion is valid even considering that Patent 27-83-0002 extends north (scaled to approximately 2000 m on SAR Figure 5.8-1) from the south site boundary. Calculation 000-00C-MGR0-02800-000-00B follows the Regulatory Guide 1.145 methodology that requires the minimum distance for each of the 16 meteorological sectors be based on a 45 degree sector centered on the direction of interest (page 29). Calculation 000-00C-MGR0-02800-000-00B, Attachment 1 (Spreadsheet Site Coordinates - GROA.xls, worksheet GROA distances, CD 3 of 3, LSN# DN20024566509) determined that the minimum distance used to calculate atmospheric dispersion factors for the SSW sector is 16,638 m and that the actual distance along the SSW

sector is 19,886 m. The difference is 3,248 m. Therefore, the atmospheric dispersion factors in the SSW direction are conservatively based on a distance less than the actual distance to Patent 27-83-0002. Again, the contention does not challenge this sufficient assertion of compliance with the regulation.

Accordingly, this contention fails to raise a genuine dispute because DOE has demonstrated compliance with 10 C.F.R. §§ 63.121(b) and (c).

For all these reasons, the Licensing Board must dismiss this contention.

### **190. NEV-SAFETY-190 - Unpatented Lode And Placer Mining Claims**

Legal issue: SAR Subsection 5.8.2.2.2, which concludes that unpatented lode and placer mining claims on land administered by the Bureau of Land Management would have no adverse impact on repository operations, does not properly account for the fact that DOE does not exercise sufficient jurisdiction or control over the land on which the claims are located even though that land lies wholly within the Yucca Mountain land withdrawal area and preclosure controlled area boundaries.

#### **RESPONSE**

This contention concerns areas of land associated with unpatented mining claims *outside*, but in the vicinity, of the GROA. SAR Figure 5.8-1 shows the location of these areas relative to the GROA. SAR at 5.8-15.

Nevada raises two distinct allegations regarding these unpatented mining claims. First, Nevada questions whether “DOE has complied with” 10 C.F.R. §§ 63.21(c)(24), 63.31(a)(3), and 63.121(b) and (c) because DOE allegedly does not have adequate legal jurisdiction or control over these unpatented mining claims for purposes of constructing and operating a geologic repository at Yucca Mountain. Petition at 998–99. And second, Nevada argues that “SAR Section 5.8.2.2.2 is both inaccurate and materially incomplete because it fails to recognize that at least 60 active unpatented mining claims lie wholly within DOE’s land withdrawal area boundary and preclosure controlled area boundary.” *Id.* at 1000.

As discussed below, this contention falls outside the scope of the proceeding, lacks adequate factual support and expert opinion, and fails in several respects to raise a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

As discussed below, the contention depends totally on an incorrect statement of the pertinent regulation, 10 C.F.R § 63.121, in asserting that DOE must exercise “jurisdiction and control” over land outside the GROA, based on ownership of land or its permanent withdrawal from public use. The contention thus depends on a faulty legal premise and unavoidably raises legal issues that are irrelevant to those pertinent to examining lands outside the GROA.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the contention identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by Nevada that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolving the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion before a Licensing Board will admit a contention. As explained in paragraph f. below, Nevada fails to provide factual support or expert opinion to substantiate its concern that DOE must control land associated with unpatented mining claims at issue here. Instead, Nevada offers only recitations from the SAR itself and supporting references, framed by mere assertions of counsel. This approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation. For this reason, the Licensing Board must dismiss this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As mentioned at the outset, this contention relies upon two distinct bases. For the reasons discussed below, these bases fail to create a genuine dispute on a material issue of law or fact.

**(1) DOE Does Not Need Ownership or Permanent Withdrawal to Exercise Adequate Jurisdiction and Control Over the Unpatented Mining Claims**

This contention argues that the Application is somehow in “non-compliance” with various NRC regulations because DOE does not exercise control over the unpatented mining claims at issue here. Nevada’s claim is incorrect as a matter of law and fails to demonstrate a genuine dispute on a material issue of law or fact.

In accordance with 10 C.F.R. § 63.31(a)(3)(ii), the NRC must determine whether the site complies with the requirements set forth in 10 C.F.R. Part 63, Subpart E, specifically, as applicable here, 10 C.F.R. § 63.121(a), (b) and (c):

§ 63.121—Requirements for Ownership and Control of Interests in Land

(a) *Ownership of land.*

(1) The geologic repository operations area must be located in and on lands that are either acquired lands under the jurisdiction and control of DOE, or lands permanently withdrawn and reserved for its use.

(2) These lands must be held free and clear of all encumbrances, if significant, such as: (1) Rights arising under the general mining laws; (ii) Easements for right-of-way; and (iii) All other rights arising under lease, rights of entry, deed, patent, mortgage, appropriation, prescription, or otherwise.

(b) *Additional controls for permanent closure.* Appropriate controls must be established *outside* of the [GROA]. DOE shall exercise any jurisdiction and control over surface and subsurface estates necessary to prevent adverse human actions that could significantly reduce the geologic repository’s ability to achieve isolation. The rights of DOE may take the form of appropriate possessory interests, servitudes, or withdrawals from location or patent under the general mining laws.

(c) *Additional controls through permanent closure.* Appropriate controls must be established *outside* the [GROA]. DOE shall exercise any jurisdiction or control of activities necessary to ensure the requirements at § 63.111(a) and (b) are met. Control includes the authority to exclude members of the public, if necessary.

10 C.F.R. § 63.121(a)–(c) (emphasis added).

The structure of Section 63.121 is critical to evaluating this contention. Subsection (a), entitled “Ownership of land,” is limited by its terms to the GROA—the inner part of the proposed land withdrawal area, where actual repository operations are conducted. Thus, the requirement that land be either “acquired” by DOE or “permanently withdrawn” for its benefit applies only to the GROA. 10 C.F.R. § 63.121(a). Even within the GROA, only “significant” encumbrances must be cleared. Subparagraph 2 then provides examples of “significant” encumbrances. *Id.* § 63.121(a)(2). Subsections (b) and (c) relate to land *outside* the GROA. By contrast with the requirements for the GROA stated in subsection (a), they require neither ownership nor permanent withdrawal of land. Rather, Subsections (b) and (c) require only “appropriate controls” to be established, and with them, the exercise of “any jurisdiction and control . . . necessary” to meet their stated requirements.

The contention argues that DOE’s current and intended span of control over the unpatented mining claims at issue is inherently deficient because DOE does not own, and has not yet permanently withdrawn this land. This contention conflates the mandatory requirements for ownership or permanent withdrawal applicable only to the GROA with the inherently facts-and-circumstances-based evaluations involving “appropriate” controls for land outside the GROA. It avers categorically, that “[s]ince any one or all of the 60 active unpatented mining claims allow for access to and use of land located within DOE’s land withdrawal area boundary and the

preclosure controlled area, DOE cannot exercise sufficient jurisdiction and control" to meet the requirements of Sections 63.121(b) and (c). Petition at 999-1000.

If the unpatented mining claims were in the GROA, rather than at the outer reach of the southern and southwest boundaries of the withdrawal area, this assertion might be valid. However, given (as the contention recognizes, Petition at p. 999) that the unpatented interests are "primarily located in the far southwestern and south-central part of the area of [BLM] land . . . as depicted on SAR Figure 5.8-1," this portion of the contention amounts to a misstatement of the requirements of Section 63.121. As noted above, the requirements of Section 63.121(b) and (c) beyond the GROA involve "appropriate controls" based on facts. The contention misstates the applicable legal test, and thus does not raise a genuine issue of legal dispute, and must be dismissed.<sup>120</sup>

In fact, the Application demonstrates DOE's compliance with the pertinent requirements governing these unpatented interests. With respect to actual compliance with waste-isolation requirements, set forth in 10 C.F.R. § 63.121(b), the Application concludes, on the facts, that, "due to their remoteness from the repository surface facilities, any activities related to these claims would have no adverse impact on repository operations." SAR at 5.8-6. The contention does not challenge this sufficient assertion of compliance with the regulation.

With respect to compliance with Section 63.121(c), DOE must exercise jurisdiction or control over activities as necessary to ensure that the release and exposure requirements of Section 63.111(a) and (b) are met. SAR Section 5.8.3.1 at 5.8-7 sets forth DOE's general approach to meeting these requirements and refers to SAR Section 1.8 for more detailed factual discussion and demonstration of compliance. Any individual allowed access to an unpatented

---

<sup>120</sup> The land on which the unpatented mining claims exist is within the area intended for permanent acquisition by DOE by legislative withdrawal. SAR at 5.8-3. DOE will update its Application after the land is withdrawn.

lode and placer mining claim would be in the category of on-site public. As such, the radiation protection requirements of 10 C.F.R. Part 20 would apply. DOE has included in SAR Section 1.8 in Table 1.8-28 dose estimates at the locations of maximum on-site dose receptors. The maximum on-site dose receptors are at work locations proximate to waste handling operations. Those estimated doses are reduced as distance from the waste handling operations increases because both direct radiation attenuation and atmospheric dispersion increase with distance. Both the attenuation and dispersion effects decrease dose. The unpatented lode and placer mining claims are shown in SAR Figure 5.8-1 and are remote from the waste handling activities. Thus, the dose to an individual at the location of an unpatented lode and placer mining claim would be less than those shown in Table 1.8-28. This demonstrates that the requirements of 10 C.F.R. § 63.111(a) and (b) are met with margin. Again, the contention fails to challenge this fact-based demonstration of compliance.

Accordingly, this basis of the contention fails to raise a genuine dispute because DOE has demonstrated compliance with 10 C.F.R. § 63.121(b) and (c).

**(2) SAR Section 5.8.2.2.2 Provides a Sufficient Description of Unpatented Mining Claims**

SAR Section 5.8.2.2.2 (“Unpatented Mining Claims”) provides a description of these claims. SAR at 5.8-5. For example, the SAR explains that there are two types of unpatented mining claims, and discusses their dimensions and locations. *Id.* SAR Section 5.8.2.2.2 also states that “[a]dditional information for these claims, including the status of surface or subsurface activities, is presented in *Land Records for the Proposed Land Withdrawal Area of the Yucca Mountain Repository* (DOE 2007).” *Id.*

Nevada argues that SAR Section 5.8.2.2.2 “is both inaccurate and materially incomplete because it fails to recognize that at least 60 active unpatented mining claims lie wholly within

DOE's land withdrawal area boundary and preclosure controlled area boundary." Petition at 1000.

This basis of the contention fails to raise a genuine dispute. There is no requirement that the Application explicitly discuss each and every active, unpatented mining claim. Nevertheless, the category has been addressed in the Application. Moreover, SAR Section 5.8.2.2.2 explicitly references the very information on specific unpatented mining claims that Nevada alleges is missing. SAR at 5.8-5 (citing Office of Civilian Radioactive Waste Management, *Land Records for the Proposed Land Withdrawal Area of the Yucca Mountain Repository*, Appendix F (Mining Claim Geographic Report) Rev. 1 (Sept. 2007) (TDR-MGR-ND-000003, LSN# DEN001574941)). Nevada must know this because the contention cites this reference to support its claim that there are at least 60 active unpatented mining claims. Petition at 999. The point is that a category of such claims exists, and the SAR has evaluated it.

The contention fails to challenge the described location of the claims or any other aspects of that evaluation. Accordingly, the Licensing Board must dismiss this contention.

For all the reasons discussed above, this contention must be dismissed in its entirety.

### **191. NEV-SAFETY-191 - Nye County Monitoring Wells**

Legal issue: SAR Subsection 5.8.2.2.3, which states that right-of-way N-62848 granted to Nye County, Nevada to drill several monitoring wells has no adverse effect on the ability of the repository to meet performance objectives, does not account for the fact that DOE does not exercise sufficient jurisdiction or control over the land on which most of the wells are located even though that land lies wholly within the Yucca Mountain land withdrawal area and the preclosure controlled area boundaries.

#### **RESPONSE**

This contention concerns areas of land associated with right-of-way N-62848, which allows Nye County to drill several monitoring wells *outside* the southern boundaries of the GROA. SAR Figure 5.8-3 shows the location of the Nye County monitoring wells relative to the GROA. SAR at 5.8-17.

Nevada raises two distinct allegations relative to these monitoring wells. First, Nevada questions whether “DOE has complied with” 10 C.F.R. § 63.21(c)(24), 63.31(a)(3), and 63.121(b) and (c) because DOE does not have legal jurisdiction or control over this right-of-way, for purposes of constructing and operating a geologic repository at Yucca Mountain. Petition at 1001–02. And second, Nevada argues that “SAR Section 5.8.2.2.3 is both inaccurate and materially incomplete because it fails to recognize that 17 of the monitoring wells lie on land wholly within the Yucca Mountain land withdrawal area and preclosure controlled area boundaries.” *Id.* at 1004.

As discussed below, this contention falls outside the scope of the proceeding and fails in several respects to raise a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

As discussed below, the contention depends totally on an incorrect statement of the pertinent regulation, 10 C.F.R § 63.121, in asserting that DOE must exercise “jurisdiction and control” over land outside the GROA, based on ownership of land or its permanent withdrawal from public use. The contention thus depends on a faulty legal premise and unavoidably raises legal issues that are irrelevant to those pertinent to examining lands outside the GROA.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the contention identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by Nevada that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolving the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion before a Licensing Board will admit a contention. As explained in paragraph f. below, Nevada fails to provide factual support or expert opinion to substantiate its concern that DOE must control land associated with the monitoring wells at issue here. Instead, Nevada offers only recitations from the SAR itself and supporting references framed by unadorned assertions of counsel. This approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation. For this reason, the Licensing Board must dismiss this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As mentioned at the outset, this contention relies upon two distinct bases. For the reasons discussed below, these bases fail to create a genuine dispute on a material issue of law or fact.

**(1) DOE Does Not Need Ownership or Permanent Withdrawal to Exercise Adequate Jurisdiction and Control over the Land on Which Monitoring Wells Are Placed**

This contention argues that the Application is in “non-compliance” with NRC regulatory provisions because DOE does not exercise control over the land at issue here. Petition at 1000. Nevada’s claim fails to demonstrate a genuine dispute on a material issue of law or fact.

In accordance with 10 C.F.R. § 63.31(a)(3)(ii), the NRC must determine whether the site complies with the requirements set forth in 10 C.F.R. Part 63, Subpart E, specifically, as applicable here, 10 C.F.R. § 63.121(a), (b) and (c):

§ 63.121—Requirements for Ownership and Control of Interests in Land

(a) *Ownership of land.*

(1) The geologic repository operations area must be located in and on lands that are either acquired lands under the jurisdiction and control of DOE, or lands permanently withdrawn and reserved for its use.

(2) These lands must be held free and clear of all encumbrances, if significant, such as: (1) Rights arising under the general mining laws; (ii) Easements for right-of-way; and (iii) All other rights arising under lease, rights of entry, deed, patent, mortgage, appropriation, prescription, or otherwise.

(b) *Additional controls for permanent closure.* Appropriate controls must be established *outside* of the [GROA]. DOE shall exercise any jurisdiction and control over surface and subsurface estates necessary to prevent adverse human actions that could significantly reduce the geologic repository’s ability to achieve isolation. The rights of DOE may take the form of appropriate possessory interests, servitudes, or withdrawals from location or patent under the general mining laws.

(c) *Additional controls through permanent closure.* Appropriate controls must be established *outside* the [GROA]. DOE shall exercise any jurisdiction or control of activities necessary to ensure the requirements at § 63.111(a) and (b) are met. Control includes the authority to exclude members of the public, if necessary.

10 C.F.R. § 63.121(a)–(c) (emphasis added).

The structure of § 63.121 is critical to evaluating this contention. Subsection (a), entitled “Ownership of land,” is limited by its terms to the GROA—the inner part of the proposed land withdrawal area, where actual repository operations are conducted. Thus, the requirement that for land to be either “acquired” by DOE or “permanently withdrawn” for its benefit applies only to the GROA. 10 C.F.R. § 63.121(a). Even within the GROA, only “significant” encumbrances must be cleared. Subparagraph 2 then provides examples of “significant” encumbrances. *Id.* § 63.121(a)(2). Subsections (b) and (c) relate to land *outside* the GROA. By contrast with the requirements for the GROA stated in subsection (a), they require neither ownership nor permanent withdrawal of land. Rather, Subsections (b) and (c) require only “appropriate controls” to be established, and with them, the exercise of “any jurisdiction and control . . . necessary” to meet their stated requirements.

The contention argues that DOE’s current and intended span of control over the wells at issue is inherently deficient because DOE does not own, and has not yet permanently withdrawn this land. This contention conflates the mandatory requirements for ownership or permanent withdrawal applicable only to the GROA with the inherently facts-and-circumstances evaluations involving “appropriate” controls for land outside the GROA. Thus, the contention attempts, incorrectly, to extend ownership-and-control requirements applicable to lands in the heart of the GROA, to areas of land *outside* the GROA. Because the contention misstates the requirements of § 63.121 — and fails to make any attempt to show that the land occupied by the wells, all of

which is outside the GROA, must be subject to the degree of control required only for the GROA — it must be dismissed.

In fact, the Application demonstrates DOE's compliance with the pertinent requirements governing the land occupied by these wells. With respect to actual compliance with waste-isolation requirements, set forth in 10 C.F.R. § 63.121(b), SAR Section 5.8.2.2.3 states that DOE has evaluated and determined that the Nye County Early Warning Drilling Program poses negligible potential test interference with existing Yucca Mountain test activities (Determination of Importance Evaluation for Surface-Based Testing Activities, Sections 6.2.4 and 10.4, LSN# DN2002174278). SAR at 5.8-6. Furthermore, FEP 1.1.01.01.0A, LSN# DEN001584824, Open Site Investigation Boreholes, has examined the potential effect of open boreholes within the repository area and excluded these from the performance assessment. Therefore, if Nye County activities do not interfere with the performance objectives of Yucca Mountain testing programs and the other boreholes located within the repository boundary have been found to not impact postclosure performance, it follows that the Nye County activities could not significantly reduce the geologic repository's ability to achieve waste isolation. The contention does not challenge this sufficient assertion of compliance with the regulation.

With respect to 10 C.F.R. § 63.121(c), DOE must exercise jurisdiction or control over activities as necessary to ensure that the release and exposure requirements of § 63.111(a) and (b) are met. SAR Section 5.8.3.1 at 5.8-7 sets forth DOE's general approach to meeting these requirements and refers to SAR Section 1.8 for more detailed factual discussion and demonstration of compliance. Nye County employees operating the monitoring wells would be in the category of on-site public. As such, the radiation protection requirements of 10 C.F.R. 20 would apply. DOE has included in SAR Section 1.8 at 1.8-28, dose estimates at the locations of

maximum on-site dose receptors. The maximum on-site dose receptors are at work locations proximate to waste handling operations. Those estimated doses are reduced as distance from the waste handling operations increase because both direct radiation attenuation and atmospheric dispersion increase with distance. Both the attenuation and dispersion effects decrease dose. The Nye County monitoring wells are shown in SAR Figure 5.8-3 and are remote from waste handling activities. Thus, the dose to an individual at the location of a monitoring well would be less than those shown in Table 1.8-28. This demonstrates that the requirements of 10 CFR § 63.111(a) and (b) are met with margin. Again, the contention fails to challenge this fact-based demonstration of compliance.

Accordingly, this basis of the contention fails to raise a genuine dispute on a material issue, and the Board must reject it.

**(2) The Application Sufficiently Describes the Nye County Monitoring Wells**

Nevada also argues that “SAR Section 5.8.2.2.3 is both inaccurate and materially incomplete because it fails to recognize that 17 of the monitoring wells lie on land wholly within the Yucca Mountain land withdrawal area and preclosure controlled area boundaries.” Petition at 1004. This allegation does not raise a genuine dispute because the SAR explicitly acknowledges the “missing” information.

SAR Section 5.8.2.2.3 states that the Nye County Early Warning monitoring wells are located within the Yucca Mountain land withdrawal area and preclosure controlled area boundaries and points to SAR Figure 5.8-3 for the locations of the individual drill sites. SAR at 5.8-6.

Put simply, this basis of the contention fails to demonstrate a genuine dispute because the Application acknowledges the location of the monitoring wells at issue. As such, the Licensing

Board must dismiss this contention to the extent it argues that the Application's description is inadequate.

For all the reasons discussed above, this contention must be dismissed in its entirety.

**192. NEV-SAFETY-192 - Land Outside DOE's Rights-Of-Way**

Legal issue: SAR Subsection 5.8.1.1, which identifies 5 areas of land in which DOE claims some type of legal interest (i.e., right-of-ways N-48602 and N-47748, Public Land Orders 7653 and 6802/7534 and the Memorandum of Agreement governing the ranch boundary), fails to address whether DOE has any type of legal interest in 3 other areas of land lying outside those 5 areas but within the Yucca Mountain land withdrawal area and preclosure controlled area boundaries and thus does not properly account for the fact that for those 3 additional areas DOE does not exercise any jurisdiction and control.

**RESPONSE**

This contention concerns three areas of land *outside*, but in the vicinity, of the GROA. These three areas, which are included in the proposed land withdrawal area boundary set forth in SAR at 5.8-15 (Figure 5.8-1), are as follows: (1) an area of land north of right-of-way N-48602; (2) an area of land southwest of right-of-way N-47748; and (3) areas of land north, northeast, and southeast of the “Ranch Boundary.” Petition at 1005. Nevada raises two distinct allegations relative to these three areas. First, Nevada argues that DOE has failed to comply with 10 C.F.R. §§ 63.21(c)(24), 63.31(a)(3), and 63.121(b) and (c) because DOE does not have legal jurisdiction or control over these areas for purposes of constructing and operating a geologic repository at Yucca Mountain. *Id.* And second, Nevada argues that SAR Section 5.8.1.1 is “materially incomplete” because it “does not properly account” for these three areas. *Id.* at 1005, 1007.

As discussed below, this contention falls outside the scope of the proceeding, lacks adequate factual support and expert opinion, and fails in several respects to raise a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

As discussed below, the contention depends totally on an incorrect statement of the pertinent regulation, 10 C.F.R § 63.121, in asserting that DOE must exercise “jurisdiction and control” over land outside the GROA, based on ownership of land or its permanent withdrawal from public use. The contention thus depends on a faulty legal premise and unavoidably raises legal issues that are irrelevant to those pertinent to examining lands outside the GROA.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the contention identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by Nevada that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolving the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion before a Licensing Board will admit a contention. As explained in paragraph f. below, Nevada fails to provide factual support or expert opinion to substantiate its concern that DOE must control the three areas of land at issue in this proceeding. Instead, Nevada offers only recitations from the SAR itself and supporting references, framed by unadorned assertions of counsel. This approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation. For this reason, the Licensing Board must dismiss this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As mentioned at the outset, this contention relies upon two distinct bases. For the reasons discussed below, these bases fail to create a genuine dispute on a material issue of law or fact.

**(1) DOE Does Not Need Ownership or Permanent Withdrawal to Exercise Adequate Jurisdiction and Control Over These Three Areas of Land**

This contention argues that the Application is in “non-compliance” with NRC regulatory provisions because DOE does not exercise control over the lands at issue here. Petition at 1005. Nevada’s claim fails to demonstrate a genuine dispute on a material issue of law or fact.

In accordance with 10 C.F.R. § 63.31(a)(3)(ii), the NRC must determine whether the site complies with the requirements set forth in 10 C.F.R. Part 63, Subpart E, specifically, as applicable here, 10 C.F.R. § 63.121(a), (b) and (c):

§ 63.121—Requirements for Ownership and Control of Interests in Land

(a) *Ownership of land.*

(1) The geologic repository operations area must be located in and on lands that are either acquired lands under the jurisdiction and control of DOE, or lands permanently withdrawn and reserved for its use.

(2) These lands must be held free and clear of all encumbrances, if significant, such as: (1) Rights arising under the general mining laws; (ii) Easements for right-of-way; and (iii) All other rights arising under lease, rights of entry, deed, patent, mortgage, appropriation, prescription, or otherwise.

(b) *Additional controls for permanent closure.* Appropriate controls must be established *outside* of the [GROA]. DOE shall exercise any jurisdiction and control over surface and subsurface estates necessary to prevent adverse human actions that could significantly reduce the geologic repository’s ability to achieve isolation. The rights of DOE may take the form of appropriate possessory interests, servitudes, or withdrawals from location or patent under the general mining laws.

(c) *Additional controls through permanent closure.* Appropriate controls must be established *outside* the [GROA]. DOE shall exercise any jurisdiction or control of activities necessary to ensure the requirements at § 63.111(a) and (b) are met. Control includes the authority to exclude members of the public, if necessary.

10 C.F.R. § 63.121(a)–(c) (emphasis added).

The structure of § 63.121 is critical to evaluating this contention. Subsection (a), entitled “Ownership of land,” is limited by its terms to the GROA—the inner part of the proposed land withdrawal area, where actual repository operations are conducted. Thus, the requirement that for land to be either “acquired” by DOE or “permanently withdrawn” for its benefit applies only to the GROA. 10 C.F.R. § 63.121(a). Even within the GROA, only “significant” encumbrances must be cleared. Subparagraph 2 then provides examples of “significant” encumbrances. *Id.* § 63.121(a)(2). Subsections (b) and (c) relate to land *outside* the GROA. By contrast with the requirements for the GROA stated in subsection (a), they require neither ownership nor permanent withdrawal of land. Rather, Subsections (b) and (c) require only “appropriate controls” to be established, and with them, the exercise of “any jurisdiction and control . . . necessary” to meet their stated requirements.

The contention argues that DOE’s current and intended span of control over the areas of land at issue is inherently deficient because DOE does not own, and has not yet permanently withdrawn this land. This contention conflates the mandatory requirements for ownership or permanent withdrawal applicable only to the GROA with the inherently facts-and-circumstances evaluations involving “appropriate” controls for land outside the GROA. Thus, the contention attempts, incorrectly, to extend ownership-and-control requirements applicable to lands in the heart of the GROA, to areas of land *outside* the GROA. Because the contention misstates the

requirements of § 63.121, it must be dismissed with respect to land outside the GROA, and since all of the land at issue is outside the GROA, the contention must be dismissed.

In fact, the Application demonstrates DOE's compliance with the pertinent requirements governing these areas. With respect to actual compliance with waste-isolation requirements, set forth in 10 C.F.R. § 63.121(b), SAR Section 5.8.2.2 states that activities associated with the land surrounding Yucca Mountain outside of, but in the vicinity of, the GROA have been assessed (*see* LSN# 2002193045) and concludes, on the facts, that they do not present an adverse human action that reduces the ability of the repository to isolate waste. The contention does not challenge this sufficient assertion of compliance with the regulation.

With respect to 10 C.F.R. § 63.121(c), DOE must exercise jurisdiction or control over activities as necessary to ensure that the release and exposure requirements of § 63.111(a) and (b) are met. SAR Section 5.8.3.1 at 5.8-7 sets forth DOE's general approach to meeting these requirements and refers to SAR Section 1.8 for a more detailed factual discussion and demonstration of compliance. Any individual allowed access to the three areas of land at issue in this contention would be in the category of on-site public. As such, the radiation protection requirements of 10 C.F.R. Part 20 would apply. DOE has included in SAR Section 1.8 in Table 1.8-28 dose estimates at the locations of maximum on-site dose receptors. The maximum on-site dose receptors are at work locations proximate to waste handling operations. Those estimated doses are reduced as distance from the waste handling operations increases because both direct radiation attenuation and atmospheric dispersion increase with distance. Both of the attenuation and dispersion effects decrease dose. The three areas of land at issue are shown in SAR Figure 5.8-1 and are located remotely from the waste handling activities. Thus, the dose to an individual at a location within those three areas of land would be less than those shown in Table

1.8-28. This demonstrates that the requirements of 10 C.F.R. § 63.111(a) and (b) are met. Again, this contention fails to challenge this fact-based demonstration of compliance.

For these reasons, this basis of the contention is inadmissible.

**(2) SAR Section 5.8.1.1 Addresses Only Land Interests in which the GROA will be Located**

Nevada also argues that SAR Section 5.8.1.1 is “materially incomplete[.]” Petition at 1007. Nevada reasons that because SAR Section 5.8.1.1 addresses other areas within the proposed land withdrawal boundary area, it also should have addressed the three areas of land at issue in this contention. *Id.* at 1005, 1007. This basis of the contention fails to raise a genuine dispute because Nevada misreads SAR Section 5.8.1.1, which concerns, and need concern, only those land interests within the GROA.

SAR Section 5.8.1 (“Ownership of Land”) addresses only the requirement provided in 10 C.F.R. § 63.121(a)—that the GROA must be located in and on lands that are either acquired lands under DOE’s jurisdiction and control or lands permanently withdrawn and reserved for its use. *See* SAR at 5.8-1 (table listing information provided in each SAR sub-section, the corresponding regulatory requirements, and noting that SAR Section 5.8.1 (“Ownership of Land”) corresponds to § 63.121(a)).

Nevada claims that SAR Section 5.8.1.1 also should have addressed three areas of land outside of the GROA: (1) an area of land north of right-of-way N-48602; (2) an area of land southwest of right-of-way N-47748; and (3) an area of land north, northeast, and southeast of the Ranch Boundary. Petition at 1005–07. Nevada’s contention, therefore, attempts to have SAR Section 5.8.1.1 include information that is not required by 10 C.F.R. § 63.121(a). This fails to demonstrate a genuine dispute. Therefore, this basis of the contention is inadmissible.

For all the reasons discussed above, this contention must be dismissed in its entirety.

### **193. NEV-SAFETY-193 - Land Withdrawal**

SAR Subsection 5.8.1.1, which identifies DOE's legal interest in land for the geologic repository operations area and the surrounding land within the Yucca Mountain land withdrawal area boundary and the preclosure controlled area boundary, admits that DOE's interests do not authorize the construction and operation of the repository and therefore Yucca Mountain cannot be licensed by the NRC.

#### **RESPONSE**

This contention impermissibly challenges DOE's efforts to permanently withdraw lands to construct and operate the proposed geologic repository at Yucca Mountain, Nevada. It claims that DOE has failed to comply with 10 C.F.R. §§ 63.21(c)(24), 63.31(a)(3), and 63.121 because the Application "admits that DOE's [land] interests do not authorize the construction and operation of the repository and therefore Yucca Mountain cannot be licensed by the NRC." Petition at 1009.<sup>121</sup>

This contention is inadmissible. The regulations that Nevada relies upon do not require that DOE complete land withdrawal activities at this point of the proceeding. In this case, DOE has been pursuing federal legislation.

#### **a. Statement of Issue of Law or Fact to be Controverted**

As discussed below, this contention lacks adequate legal foundation because DOE need not complete land withdrawal activities at this point of the licensing process. Therefore, this contention fails to raise a legitimate issue of law or fact to be controverted in this proceeding.

---

121 Nevada raises similar claims in NEV-SAFETY-184; NEV-SAFETY-185; NEV-SAFETY-186; NEV-SAFETY-187; and NEV-SAFETY-188.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

In accordance with 10 C.F.R. § 63.31(a)(3)(ii), the NRC must determine whether the “site” complies with the requirements set forth in 10 C.F.R. Subpart E, specifically, as applicable here, 10 C.F.R. § 63.121(a)–(c):

(a) Ownership of Land

(1) The [GROA] must be located in and on lands that are either acquired lands under the jurisdiction and control of DOE, or lands permanently withdrawn and reserved for its use.

(2) These lands must be held free and clear of all encumbrances, if significant, such as: (i) Rights arising under the general mining laws; (ii) Easements for right-of-way; and (iii) All other rights arising under lease, rights of entry, deed, patent, mortgage, appropriation, prescription, or otherwise.

(b) Additional Controls for Permanent Closure—Appropriate controls must be established outside of the [GROA]. DOE shall exercise any jurisdiction and control over surface and subsurface estates necessary to prevent adverse human actions that could significantly reduce the geologic repository’s ability to achieve isolation . . . .

(c) Additional Controls Through Permanent Closure—Appropriate controls must be established outside the [GROA]. DOE shall exercise any jurisdiction or control of activities necessary to ensure the requirements at § 63.111(a) and (b) are met. Control includes the authority to exclude members of the public, if necessary.

10 C.F.R. § 63.121(a)–(c). DOE has been pursuing federal legislation to, among other things, permanently withdraw the requisite lands for use by DOE to construct and operate the GROA.<sup>122</sup>

In essence, this contention seeks to impermissibly litigate DOE’s efforts to obtain land withdrawal and clear all other encumbrances from lands that make up the GROA. Specifically, Nevada argues that DOE has violated 10 C.F.R. § 63.31(a) and § 63.121 because Congress has not yet permanently withdrawn and reserved the requisite land for DOE’s use. Petition at 1009. In short, this is not the appropriate time to consider this issue. As discussed under paragraph (f) below, the applicable NRC regulations do not require that DOE complete land withdrawal activities at this point in the licensing process.

Moreover, Licensing Boards should reject, as a matter of policy and practicality, any contention that attempts to litigate an issue that is, or clearly is about to become, the subject of federal legislation. We note that Licensing Boards reject contentions that attempt to litigate an issue that is “primarily the responsibility of other federal or state/local regulatory agencies.” *See PPL Susquehanna LLC* (Susquehanna Steam Electric Station, Units 1 and 2), LBP-07-10, 66 NRC 1, 27 (2007). Such contentions expand the scope of the proceeding and significantly divert limited NRC resources. Contentions addressing pending or future federal legislation would similarly expand the scope of this proceeding.

Accordingly, the Licensing Board must dismiss this contention as outside the scope of the proceeding.

---

122 As the Application explains, in March 2007, DOE submitted to Congress a bill entitled the “Nuclear Fuel Management and Disposal Act.” SAR at 5.8-2. This bill sought to permanently withdraw the requisite lands for use by DOE to construct and operate the GROA. *Id.*

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the contention identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by Nevada that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be read to dispense with the well-recognized requirement that resolving the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

Even if this Licensing Board had the authority to address Nevada's contention, it is inadmissible because DOE is not required to complete land withdrawal activities at this early phase of the licensing process.

The guidance set forth in the YMRP confirms that DOE may continue to pursue land withdrawal activities while the NRC Staff reviews the Application:

**Review Method 1—Ownership of Land**

Verify that steps within the U.S. Department of Energy purview to establish effective jurisdiction and control and legislative or other transfer activities underway *will be completed before the completion of the U.S. Nuclear Regulatory Commission review and decision on the license application.*

YMRP, *Controls to Restrict Access and Regulate Land Uses* § 2.5.8.1 (emphasis added). An applicant's compliance with relevant NRC guidance documents demonstrates compliance with the applicable regulations. *See AmerGen Energy Co., LLC* (Oyster Creek Nuclear Generating Station), CLI-08-23, 68 NRC \_\_ (slip op. at 6) (2008) ("the license renewal applicant's use of an aging management program identified in the GALL Report [that is, a Staff guidance document for nuclear power plant license renewal safety reviews] constitutes reasonable assurance" of compliance with regulatory requirements).

At this stage of the proceeding, therefore, NRC regulations require only that the Application include a "description of the controls that DOE *will* apply to restrict access and to

regulate land use at the Yucca Mountain site,” and that the Application “be as complete as possible in light of information that is reasonably available at the time of docketing.” 10 C.F.R. § 63.21(a), (c)(24) (emphasis added). SAR Section 5.8 provides a sufficient description of these land controls—specifically, this SAR section discusses ownership of land; controls for permanent closure; additional controls through permanent closure; water rights; conceptual design of monuments and markers; and records storage.

In short, there is no dispute that the federal government has not withdrawn the requisite land for DOE use to construct and operate a GROA. DOE has been pursuing legislation for a land withdrawal, and DOE will update its application after the land is withdrawn. The NRC does not require that DOE complete these activities until later stages of the licensing process.

For all the reasons discussed above, this contention must be dismissed in its entirety.

#### **194. NEV-SAFETY-194 - VH-1 Water Rights**

Legal issue: SAR Subsection 5.8.4, which states that well VH-1 provides DOE with a permanent right to 2.3 acre-feet of water annually, fails to properly account for the fact that the water right is not sufficient to accomplish the purpose of the geologic repository operations area.

#### **RESPONSE**

This contention proffers two distinct bases concerning DOE's efforts to obtain water rights to accomplish the purpose of the GROA. First, Nevada argues that DOE has failed to comply with 10 C.F.R. §§ 63.21(c)(24), 63.31(a)(3) and 63.121 because DOE did not obtain the necessary water rights upon application submittal. Petition at 1012–13. And, second, Nevada argues that SAR Section 5.8 “is materially incomplete because it fails to acknowledge that the water from well VH-1 cannot be used for the construction or operation of the Yucca Mountain repository.” *Id.* at 1014.

This contention is inadmissible for three reasons, as further explained below. First, this Licensing Board does not have the legal authority or jurisdiction to adjudicate DOE's efforts to obtain water rights. Second, even if the Board could consider this issue, this contention is inadmissible because the regulations that Nevada relies upon do not require that DOE obtain the necessary water rights at this point of the proceeding. And, third, this contention is inadmissible because the information that Nevada alleges is missing from the Application is, in fact, there.<sup>123</sup>

---

<sup>123</sup> It should be noted that Nevada contradicts itself with respect to its claim that the Application is incomplete. For example, on page 1013, Nevada states that “SAR Subsection 5.8.4 at 5.8-8 further states that well VH-1 only provides DOE with a permanent right to 2.3 acre-feet of water annually, and DOE admits that this supply will not provide for the projected water demands to construct and operate the Yucca Mountain repository.” Petition at 1013.

**a. Statement of Issue of Law or Fact to be Controverted**

As explained below, this contention fails to state a legitimate issue of law or fact to be controverted in this proceeding because it raises an issue that is not in the scope of the proceeding. Thus, the Board lacks jurisdiction over the issue raised in this contention.

**b. Brief Explanation of Basis**

As explained below, Nevada has failed to provide an adequate basis in law or fact to support admission of this contention because the issue raised is outside the scope of this proceeding, depriving it of legal foundation, and the Application contains the information Nevada claims is missing, similarly depriving it of an adequate factual basis.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is inadmissible because challenging DOE's efforts to obtain water rights for the GROA does not raise an issue within the scope of the proceeding.

In accordance with 10 C.F.R. § 63.31(a)(3)(ii), the NRC must determine whether the "site" complies with the requirements set forth in 10 C.F.R. Subpart E, specifically, as applicable here, 10 C.F.R. § 63.121. Section 63.121 requires that DOE obtain the water rights needed to accomplish the purpose of the GROA, and to include water rights in the additional controls that DOE must establish to prevent adverse human actions that could significantly reduce the GROA's ability to achieve isolation. 10 C.F.R. § 63.121(b), (d).

To meet these requirements, DOE has been pursuing water permit applications from the State of Nevada. SAR at 5.8-8. DOE filed water appropriation requests with the Office of Nevada State Engineer on July 22, 1997, for permanent rights to 430 acre-ft. of water annually. *Id.* The Nevada State Engineer denied the permit applications. *Id.* The United States has filed an action seeking declaratory and injunctive relief, and that litigation is currently pending before

the U.S. District Court for the District of Nevada. *Id.* (See *United States v. Nevada*, CV-S-00268-RHL-(LRL)).

The NRC's role here is to determine *whether* DOE has obtained sufficient water rights to accomplish the GROA's purpose. But the NRC does not have the authority or jurisdiction to determine *how* DOE obtains these water rights. Indeed, decisions about water rights will be made by a tribunal other than the NRC (that is, a federal district court based upon an appeal from the Nevada State Engineer). Therefore, this is not the proper forum to challenge DOE's efforts to obtain these rights.

The Commission previously acknowledged its lack of authority to address similar claims in the Statements of Consideration for Part 63:

**Comment**—Commenters were concerned about whether DOE must conform to State water law to obtain water rights (one commenter indicated DOE is required, under State water law, to show beneficial use in order to obtain water). A commenter viewed § 63.121 as giving DOE the right to take water rights in order to achieve waste isolation and stated that the rule must acknowledge the responsibilities of the Federal Government for compensation when initiating takings.

**Response**—Section 63.121(c)(1) requires DOE to obtain such water rights as may be needed to accomplish the purpose of the GROA. . . . *Whether DOE is subject to State law in obtaining any water rights that may be needed for this purpose is a matter to be determined by DOE and the State. The NRC does not have the authority to require that DOE conform to State law.*

Final Rule—Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, Nevada, 66 Fed. Reg. 55,732, 55,766 (Nov. 2, 2001) (emphasis added).

Accordingly, the NRC does not have the authority to address Nevada's claim.

Finally, as a matter of policy, Licensing Boards should reject contentions that attempt to litigate an issue that is “primarily the responsibility of other federal or state/local regulatory agencies.” *See PPL Susquehanna LLC* (Susquehanna Steam Electric Station, Units 1 and 2), LBP-07-10, 66 NRC 1, 27 (2007). Such contentions expand the scope of the proceeding and significantly divert limited NRC resources. As set forth above, the decision about DOE’s water permit requests will be determined by a federal court, based on an appeal from a state regulatory agency.

Accordingly, the Licensing Board should reject this contention as outside the scope of the proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, this section of the contention identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that “[t]his contention alleges non-compliance with these regulatory provisions and therefore raises a material issue within the scope of the licensing proceeding.” 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by Nevada that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding . . . ,” not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a “citation to a statute or regulation that, explicitly or implicitly, has not been satisfied” because specific citations are “preferable” to general citations (June 20, 2008 CMO, at 7), this direction cannot be

read to dispense with the well-recognized requirement that resolving the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on “format” and “procedural matters.” CMO at 3.

However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As mentioned at the outset, this contention relies upon two distinct bases. For the reasons discussed below, these bases fail to create a genuine dispute on a material issue of law or fact.

**(1) DOE Does Not Need to Obtain Water Rights at This Stage of the Proceeding**

Even if the Licensing Board had the legal authority to address Nevada’s water rights claim, this basis of the contention is inadmissible because DOE is not required to complete these activities at this early phase of the licensing process.

10 C.F.R. § 63.121 set forth certain requirements that DOE must establish with respect to land and water rights. The guidance set forth in the YMRP confirms that DOE may continue to pursue these activities while the NRC Staff reviews the Application:

Verify that steps within the U.S. Department of Energy purview to establish effective jurisdiction and control and legislative or other transfer activities will be completed before the completion of the U.S. Nuclear Regulatory Commission review and decision on the license application.

YMRP, *Controls to Restrict Access and Regulate Land Uses*, § 2.5.8 at 2.5 - 96. This guidance is set forth under Review Method 1, which addresses ownership of land on which the GROA will be located. It is only logical that this guidance also provides DOE with time to obtain control of water rights.

At this early stage of the proceeding, therefore, NRC regulations require only that the Application include a “description of the controls that DOE will apply to restrict access and to regulate land use at the Yucca Mountain site and adjacent areas. . . .” 10 C.F.R. § 63.21(c)(24). SAR § 5.8 provides a sufficient description of these issues, including a description of water rights at SAR Section 5.8.4.

In short, there is no dispute that DOE has not obtained the requisite water for the GROA. DOE has been pursuing water permit applications, and DOE will update its application after the water is obtained. The NRC does not require that DOE complete these activities until later stages of the licensing process. Accordingly, this basis of the contention fails to create a genuine dispute on a material issue of law or fact.

**(2) The Application Sufficiently Describes DOE’s Current Water Rights**

Nevada also incorrectly argues that the SAR is “materially incomplete because it fails to acknowledge that the water from well VH-1 cannot be used for the construction and operation of the Yucca Mountain repository.”<sup>124</sup> Nevada Petition at 1014. This allegation is mistaken because SAR Section 5.8.4 explicitly acknowledges the “missing” information. This section provides in relevant part:

---

<sup>124</sup> The contention incorrectly refers to SAR Subsection 5.8.1.1, which addresses current DOE land-use interests—not water rights. SAR Subsection 5.8.4 addresses water rights.

The DOE received water appropriation permits from the State of Nevada to support the repository site characterization phase. The permits were issued for wells J-12, J-13, VH-1, and the C-Wells complex. These permits, with the exception of VH-1, expired on April 9, 2002. The DOE has filed proof of beneficial use to establish a permanent right to 2.3 acre-ft of water annually from well VH-1. *This supply from VH-1 will not provide for the projected water demands to construct and operate the repository.*

SAR at 5.8-8 (emphasis added) (citations omitted).

Put simply, this basis of the contention fails to demonstrate a genuine dispute because the Application acknowledges that the supply from this well will not provide for the projected water demands for repository construction and operation. As such, the Licensing Board must dismiss this contention to the extent it argues that the Application's description is "materially incomplete."

For all the reasons discussed above, this contention must be dismissed in its entirety.

**195. NEV-SAFETY-195 - 9/11 Terrorist Attack**

DOE's security measures for physical protection of HLW, as described in section 3 of the General Information portion of the LA at 3-1 to 3-9, are inadequate to protect public health and safety because DOE fails to provide any evidence that there will be any protective or mitigation measures to respond adequately to a terrorist attack using aircraft, including an attack using large aircraft as occurred on 9-11.

**RESPONSE**

This contention raises an issue that is outside the scope of this proceeding because it requests a change to NRC's design basis threat (DBT) rule in 10 C.F.R. Part 73 to require DOE to protect against a terrorist attack using aircraft. Furthermore, it fails to satisfy the standards in Section 2.335 and should not, therefore, be granted a waiver or exception from Part 73.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

As explained below, the purported legal basis for this contention is fundamentally flawed because it seeks to challenge existing NRC regulations in 10 C.F.R. Part 73.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is outside the scope of this proceeding. The contention challenges NRC regulations, 10 C.F.R. §§ 73.1 and 73.51, by stating that DOE's application fails to provide a description of physical protective measures that are designed for a terrorist attack using an aircraft. This, Nevada cannot do. 10 C.F.R. § 2.335(a) and (b) ("no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding"). Nevada implies that the

Commission, in CLI-08-20, authorized Nevada to raise this issue without running afoul of Section 2.335(a). Petition at 1016. But the Commission’s ruling in CLI-08-20 did not speak to the admissibility of any of Nevada’s arguments in that petition. Rather, the Commission dismissed Nevada’s petition without prejudice to Nevada’s right to pursue its claims as “*proposed* adjudicatory ‘contentions,’ when and if the application is docketed and a Notice of Hearing issues.” *U.S. Dep’t of Energy* (High-Level Waste Repository: Pre-Application Matters), CLI-08-20, 67 NRC \_\_ (slip op. at 5) (August 22, 2008) (emphasis added). In other words, the Commission merely spoke to when, as a procedural matter, it was appropriate for Nevada to raise certain issues and did not rule on whether these issues fell within the scope of this proceeding. *See id.* at 4.

Nevada acknowledges that it is challenging NRC regulations and, in the alternative to having the contention admitted, requests that the Board certify this issue to the Commission for a waiver or exception to the DBT rule, pursuant to 10 C.F.R. § 2.335(d).<sup>125</sup> (Petition at 1017.) Specifically, Nevada seeks a waiver of or exception to the application of the Commission’s DBT rule, codified at 10 C.F.R. § 73.1, which does not include terrorist attacks using large aircraft. *See* Final Rule, Design Basis Threat, 72 Fed. Reg. 12,705, 12,710-11, 12,725 (March 19, 2007). Nevada does not cite 10 C.F.R. § 73.1, but it refers to the DBT which is located in that section.

Nevada’s request does not meet the requirements for waiver or exception under Section 2.335(b) and must be denied. Section 2.335(b) provides that the “sole ground for petition of waiver or exception is that special circumstances with respect to the subject matter of the particular proceeding are such that the application of the rule or regulation (or a provision of it) would not serve the purposes for which the rule or regulation was adopted.” The presiding

---

<sup>125</sup> Although Nevada cites to § 2.335(d) as a basis for its request for certification of the waiver issue, the standard for determining whether a *prima facie* showing has been made is in § 2.335(b). *See* 10 C.F.R. § 2.335(b).

officer's role is to determine whether the petitioner has made a *prima facie* showing that application of the rule would not serve the purposes underlying the rule. *See* 10 C.F.R. §§ 2.335(c) and (d). A petitioner seeking waiver or exception (1) must present special circumstances by pleading one or more facts, "not common to a large class of applicants or facilities, that were not considered either explicitly or by necessary implication in the rulemaking proceeding leading to the rule sought to be waived" and (2) must show those special circumstances undermine the purpose of the rule the petitioner seeks to have waived. *See Entergy Nuclear Operations, Inc.* (Indian Point Nuclear Generating Units 2 and 3), LBP-07-858, 67 NRC \_\_ (slip op. at 3) (July 31, 2008) (citing *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-88-10, 28 NRC 573, 597 (1988)).

Nevada does not present the required *prima facie* showing because application of the DBT rule in this proceeding will not undermine its purpose. Nevada takes out of context certain portions of the Commission's Statement of Considerations in the final DBT rule to conclude that the rule's purpose is to "recogniz[e] the limits of the private sector in protecting against terrorism." Petition at 1018. Nevada argues that this licensing action under Part 63 presents "special circumstances" because DOE is not a private entity and application of the DBT rule to this LA would undermine its purpose. *See id.*

Nevada's contorted reading of the SOCs for the DBT rule is incorrect. Although the Commission considered the "adversary characteristics which a private sector security force can reasonably be expected to defend" in determining the DBTs, 72 Fed. Reg. at 12,713, this is not the purpose of the DBT rule. The purpose of the DBT rule is to provide NRC licensees with a basis to form "site-specific defensive strategies implemented through physical security plans, safeguards contingency plans, and security personnel training and qualification plans," in order

to “ensure that the public health and safety and common defense and security are adequately protected.” 72 Fed. Reg. at 12,705; *see* 10 C.F.R. § 73.1(a). Applying the DBT rule in this proceeding will not undermine this purpose. In fact, not applying this rule will undermine its purpose by taking away a basis for forming physical security measures. Consequently, Nevada has not made the requisite *prima facie* showing and Nevada’s petition for waiver should be denied.

Perhaps most to the point, the Commission is in the process of changing its regulations with respect to security requirements for a GROA and has explicitly requested comments on whether a specific physical protection protocol for a GROA is needed or if the existing DBT should be applied. *See* Geologic Repository Operations Area Security and Material Control and Accounting Requirements, Proposed Rule, 72 Fed. Reg. 72,522, 72,526 (December 20, 2007). A longstanding agency policy states that “Licensing Boards ‘should not accept in individual license proceedings contentions which are (or are about to become) the subject of general rulemaking by the Commission.’” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 345 (citations omitted); *see Texas Util. Generating Co.* (Comanche Peak Steam Electric Station, Units 1 and 2), LBP-81-51, 14 NRC 896, 898 (1981). The more appropriate forum in which to raise the issue contained in this contention is the associated rulemaking proceeding. *See Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 345 (1999); *cf. Phila. Elec. Co.* (Peach Bottom Atomic Power Station, Units 2 and 3), ALAB-216, 8 AEC 13, 21 n.33 (1974) (a contention stating the petitioner’s views about what the regulatory policy should be indicates that the petitioner should choose a role other than a party to an adjudicatory proceeding). Therefore, this contention is not a litigable issue and is outside the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise a material issue, and must be dismissed. A petitioner must demonstrate that an issue it seeks to raise is material to the findings that the Commission must make in its review of DOE's LA. As discussed above, a challenge to NRC regulations on the DBT is not material to the findings the NRC must make with respect to *this proceeding*.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

To show that there is a genuine dispute with DOE on a material issue of law or fact, as required by 10 C.F.R. § 2.309(f)(1)(vi), Petitioner "must include references to specific portions of the application . . . that the petitioner disputes . . . or, if the petitioner believes that the application fails to contain information on a relevant matter as required by law, the identification of each failure . . ." As explained above, the issue that Petitioner disputes is whether currently established NRC regulations are adequate. There is no dispute that DOE's application meets the physical security regulations currently in force. Additionally, Nevada has failed to establish a *prima facie* showing warranting certification of its petition for waiver or exception to the Commission. Consequently, this contention does not give rise to a genuine dispute because it is an impermissible challenge to NRC regulations. Therefore, the contention must be dismissed in its entirety.

**196. NEV-SAFETY-196 - Description Of Security Measures**

The application does not describe the detailed security measures required for physical protection as required by the regulations.

**RESPONSE**

This contention argues, incorrectly, that the Application’s GI Section 3 fails to provide a “description of the detailed security measures for physical protection,” contrary to 10 C.F.R. § 63.21(b)(3). Petition at 1021. According to Nevada, the Application states only that DOE will submit a full Physical Protection Plan to the NRC after it grants construction authorization and that the Application merely “track[s] each acceptance criterion of NUREG-1804 § 1.3 and its Subparts, and announce[s] that these criteria will be met by whatever will be provided.” *Id.* Because Petitioner has mischaracterized both the governing regulatory requirements and the content of the Application, the purported bases for the contention are deficient and there is no genuine issue for the Licensing Board to resolve here.

**a. Statement of Issue of Law or Fact to be Controverted**

Contrary to the contention’s stated premise, the Application adequately *describes*, in sufficient detail, the security measures for physical protection of HLW, and does not simply pair a commitment with a cursory tracking of relevant acceptance criteria.

**b. Brief Explanation of Basis**

In its stated basis for the contention, Nevada claims that “[i]nstead of describing the detailed security measures, the application merely declares that there will be a physical protection plan” after the NRC issues a construction authorization. Petition at 1020. The contention then cites numerous subsections in GI Section 3. As discussed above, the cited bases for the contention are not adequate to support its admission, as the actual content meets the

requirements of 10 C.F.R. § 63.21(b)(3) that an applicant provide a “description” of its intended Physical Protection Plan.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because: (1) the contention does not reference any documents, other than the license application and YMRP; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. This approach falls short of the requirement to provide conclusions supported by reasoned bases or explanation.

For the reasons set forth in the following section, Nevada has not provided adequate support for its contention or erroneous interpretation of 10 C.F.R. § 63.21(b)(3). Accordingly, the Licensing Board must dismiss this contention.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

10 C.F.R. Part 63 requires only that DOE provide a “description” of the Physical Protection Plan with its initial Application. 10 C.F.R. § 63.21(b)(3). The regulation by no means requires that DOE include the actual plan in the Application.

A Physical Protection Plan need only be submitted after issuance of the Construction Authorization. *See, e.g.*, Final Report, Yucca Mountain Review Plan, NUREG-1804, Rev. 2, 68 Fed. Reg. 45,086, 45,090 (July 31, 2003) (YMRP) (“After the issuance of a construction authorization, the applicant [DOE] would submit a baseline physical protection plan for technical review to enable the NRC staff to determine whether the requirements of 10 C.F.R. § 73.51 are met.”) A Physical Protection Plan is needed to safeguard SNF and HLW, which DOE will not be authorized to receive until the NRC grants DOE a license to receive that radioactive material. That is why a “description” of the Plan is appropriate at this stage of the licensing proceeding. The NRC addressed this point in the Statements of Consideration for Part 63:

[P]art 63 provides for a multi-staged licensing process that affords the Commission the flexibility to make decisions in a logical time sequence that accounts for DOE collecting and analyzing additional information over the construction and operational phases of the repository. The multi-staged approach comprises four major decisions by the Commission: (1) Construction authorization; (2) license to receive and emplace waste; (3) license amendment for permanent closure; and (4) termination of license. The time required to complete the stages of this process . . . is extensive and will allow for generation of additional information. Clearly, the knowledge available at the time of construction authorization will be less than at the subsequent stages.

Disposal of High-Level Radioactive Wastes in a Proposed Geologic Repository at Yucca Mountain, Nevada, 66 Fed. Reg. 55,732, 55,738 (November 2, 2001). The NRC made a point directly applicable to this contention in the recent Statements of Consideration accompanying the

Commission’s proposed rule regarding GROA security. There, the Commission noted that DOE should submit its Physical Protection Plan after construction authorization so that it “can take advantage of any new technology and concepts that may not be available at the time the construction application is submitted.” Geologic Repository Operations Area Security and Material Control and Accounting Requirements, 72 Fed. Reg. 72,522, 72,524 (December 20, 2007).

Accordingly, the only issue for consideration in this proceeding is whether the Application’s “description” is reasonably sufficient—particularly in light of the fact that Section 63.21(a) expressly states that the Application “must be as complete as *possible in the light of the information that is reasonably available at the time of docketing.*” 10 C.F.R. § 63.21(a) (emphasis added).

The description of the Physical Protection Plan provided by DOE in the Application is reasonably sufficient. Nevada erroneously asserts that the Application merely tracks each acceptance criterion in Section 1.3 of the YMRP. While it is true that the Application appropriately addresses the relevant YMRP acceptance criteria and contains certain commitments consistent therewith, GI Section 3 goes beyond simply tracking the acceptance criteria’s language. For example:

- The Application includes a *description* of DOE’s general performance objectives and its protection goal to protect against a loss of control that could cause radiation exposures exceeding dose requirements. GI at 3-4.
- The Application includes a *description* of various aspects of the project’s security organization. The Application notes that the security force will be subject to a fitness-for-duty program and that the organization will be in place before receiving waste. The

security force will operate under DOE authority to carry firearms and make limited arrests consistent with the regulations set forth in 10 C.F.R. Parts 1046 and 1047.

Security force suitability and qualifications include physical suitability and requirements for education, reasoning skills, and knowledge of and ability to perform security-related tasks. The Application also discusses the training program for the security force; it will involve classroom and exercise modules, including firearm training and qualification.

Refresher training courses will be conducted annually. Training for those providing offsite assistance will be accomplished by preparing for and participating in coordinated exercises. GI at 3-4 to -5.

- The Application includes a *description* of the DOE's physical barrier and access control subsystems. The Application discusses that access to nuclear material will require passage through or penetration of two physical barriers, one barrier at the perimeter of the protected area and one barrier offering substantial penetration resistance consistent with 10 C.F.R. § 73.51. The Application states that records of access control will be retained for 3 years after the record is generated or until the NRC terminates the license. GI at 3-5 to -6.
- The Application includes a *description* of DOE's active intrusion detection system at the protected area perimeter. The isolation zone will be monitored to detect the presence of individuals or vehicles within the zone. The intrusion detectors and associated alarm systems will be installed to cover the entire perimeter of the protected area barrier. Sensors will be positioned to overlap so that there are no gaps in the coverage of the perimeter of the protected area. The protected area's perimeter will be under continuous surveillance by video systems or by members of the security force. The protected area

perimeter will be divided into multiple segments that are independently alarmed. The primary alarm station will have bullet-resisting walls, doors, ceilings, and floors and the interior will not be visible from outside the protected area. GI 3-6 to -7.

- The Application includes a *description* of the communication subsystem and equipment operability and compensatory measures. After installation, security equipment will be initially and periodically tested to demonstrate its ability to meet the manufacturer's operating specifications and the physical protection needs. Furthermore, to verify the integrity of physical barriers, the protected area, including movable openings such as gates, will be patrolled at random intervals by members of the security force. GI at 3-7 to -8.
- And the Application includes a *description* of what the Safeguards Contingency Plan will include and how DOE will report safeguards events to the NRC. GI at 3-8 to -9.

Based on these examples—and more importantly on the information in the Application—it is clear that Nevada has mischaracterized the content of the Application. It goes beyond merely restating the YMRP acceptance criteria as Nevada contends.

Finally, Nevada has failed to explain how purportedly “missing” information violates the regulations or precludes the NRC from making the requisite findings for granting construction authorization. As explained above, NRC regulations require only that the Application “be as complete as possible in light of information that is reasonably available at the time of docketing.” 10 C.F.R. § 63.21(a). Nevada asserts that some undefined security-related design information was reasonably available to DOE at the time it submitted the Application, Petition at 1023-4, yet nowhere provides a single example of such information. This lack of specificity runs afoul of

NRC pleading requirements, and further demonstrates that Nevada has failed to shoulder its burden as a petitioner.

Accordingly, this contention is inadmissible and must be dismissed.

**197. NEV-SAFETY-197 - Physical Protection Standard**

DOE purports to adopt security measures for physical protection in accordance with standards that date largely from 1998 but, because the Commission has recently determined that those standards are inadequate in light of the terrorist attacks of September 11, 2001, DOE's plans are not adequate to protect the public and safety or the common defense and security. This contention petitions for a rule challenge pursuant to 10 C.F.R. § 2.335.

**RESPONSE**

This contention asserts that the NRC regulations regarding physical security measures are inadequate to protect the public health and safety or common defense and security in light of the terrorist attacks of September 11, 2001. Based upon this assertion, Nevada concludes that the security measures described in DOE's application are inadequate because they comply with current NRC regulations, and if determined to be a challenge to the current regulations, "petitions for a rule challenge pursuant to 10 C.F.R. § 2.335." Petition at 1025. As explained below, the contention itself falls far afield of the scope of the proceeding as, on its face, it challenges an NRC rule. Moreover, Petitioner has failed to satisfy the standards governing regulatory waivers as set forth in Section 2.335. Therefore, the contention is inadmissible.

**a. Statement of Issue of Law or Fact to be Controverted**

As Nevada seeks to challenge an existing NRC regulation, it must seek a waiver pursuant to 10 C.F.R. § 2.335, as it has done. Because Petitioner has failed to meet the governing waiver standards, however, it has failed to state an issue of law within the jurisdiction of this Board. As a result, the Board cannot grant it the relief it seeks through this contention and it should be dismissed.

**b. Brief Explanation of Basis**

As explained below, the purported legal basis for this contention is fundamentally flawed because it seeks to challenge existing NRC regulations in 10 C.F.R. Part 73, by relying on the statements of considerations on the proposed rule for Geologic Repository Operations Area Security and Material Control and Accounting Requirements, at 72 Fed. Reg. 72,522 (December 20, 2007).<sup>126</sup> Moreover, Petitioner has failed to justify issuance of the requested waiver pursuant to Section 2.335, thereby depriving it of a legal basis upon which to proceed.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is outside the scope of this proceeding. Specifically, the contention improperly challenges NRC regulations, 10 C.F.R. §§ 73.2, 73.51, and 10 C.F.R. Part 73, Appendices B, C, and G, by stating that DOE's application fails to provide a description of physical security measures that are adequate in light of the terrorist attacks of September 11, 2001. 10 C.F.R. § 2.335(a) and (b) ("no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding").

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In apparent recognition of the fact that the contention is outside the scope of this proceeding, Nevada explicitly "petitions for a rule challenge pursuant to 10 C.F.R. § 2.335." *See* Petition at 1025. Nevada's purported justification, set forth in paragraph 4 of the contention and in paragraphs 5 through 7 of the Fitzpatrick Affidavit, however, fails to satisfy the requirements for issuance of a waiver or exception as explained below.<sup>127</sup>

---

<sup>126</sup> This proposed rule has not been finalized. DOE commented on the proposed rule.

<sup>127</sup> Nevada also vaguely refers to a "previously filed affidavit" to support its request for waiver. Petition at 1027. As discussed further below, Nevada does not specifically identify what affidavit it is referring to, nor has it met the stricter requirement of identifying specific portions of the affidavit it relies on. *See Pub. Serv. Co. of N.H.*

As a threshold matter, Section 2.335(b) provides that the “sole ground for petition of waiver or exception is that special circumstances with respect to the subject matter of the particular proceeding are such that the application of the rule or regulation (or a provision of it) would not serve the purposes for which the rule or regulation was adopted.” The presiding officer’s role is to determine whether the petitioner has made a *prima facie* showing that application of the rule would not serve the purposes underlying the rule. *See* 10 C.F.R. §§ 2.335(c) and (d). A petitioner seeking waiver or exception: (1) must present special circumstances by pleading one or more facts, “not common to a large class of applicants or facilities, that were not considered either explicitly or by necessary implication in the rulemaking proceeding leading to the rule sought to be waived;” and (2) must show those special circumstances undermine the purpose of the rule the petitioner seeks to have waived. *See Entergy Nuclear Operations, Inc.* (Indian Point Nuclear Generating Units 2 and 3), LBP 07 858, 68 NRC \_\_ (slip op. at 3) (July 31, 2008) (citing *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-88-10, 28 NRC 573, 597 (1988)).

Nevada cites to the affidavit of Charles J. Fitzpatrick, one of Nevada's attorneys, to identify the purported special circumstances that it asserts undermines the purpose of the physical protection rules. Petition at 1026. Specifically, Nevada relies on paragraphs 5 through 7 of the Fitzpatrick Affidavit. *Id.* Paragraph 5 of the affidavit merely lists the sections of the LA, in which DOE states its intention to conform to existing security regulations, and identifies 10 C.F.R. §§ 73.2, 73.51, and 10 C.F.R. Part 73, Appendices B, C, and G, as the relevant regulations. Fitzpatrick Affidavit at ¶ 5. Paragraph 6 relies on the proposed rule for Geologic Repository Operations Area Security and Material Control and Accounting Requirements for the

---

(Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). Consequently, this “previously filed affidavit” does not support the requirements for waiver or exception from the NRC rules.

position that the Commission has found the existing regulations inadequate. *Id.* at ¶ 6. In paragraph 7, Fitzpatrick then draws on these generic pieces of information to conclude that the Commission's statement that these regulations are inadequate constitutes a special circumstance that makes application of Sections 73.2, 73.51, and 10 C.F.R. Part 73, Appendices B, C, and G, undermine the purpose of these regulations. *See id.* at ¶ 7.

Standing alone, the Commission's statement that the current security requirements are not adequate in light of the post-September 11, 2001 threat environment does not constitute a special circumstance in and of itself. As acknowledged in the Fitzpatrick Affidavit, the Commission made this statement when explaining its reasons for revising regulations addressing security requirements for a GROA. *See* Geologic Repository Operations Area Security and Material Control and Accounting Requirements, Proposed Rule, 72 Fed. Reg. 72,522 (December 20, 2007). Rather than constituting special circumstances, the fact that there is an ongoing rulemaking proceeding demonstrates that this is an impermissible contention. It is longstanding agency policy that, "Licensing Boards 'should not accept in individual license proceedings contentions which are (or are about to become) the subject of general rulemaking by the Commission.'" *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 345 (1999) (citations omitted); *see Texas Util. Generating Co.* (Comanche Peak Steam Electric Station, Units 1 and 2), LBP-81-51, 14 NRC 896, 898 (1981). The more appropriate forum for Nevada's concerns about the Commission's physical security regulations is the ongoing rulemaking proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 345; *cf. Phila. Elec. Co.* (Peach Bottom Atomic Power Station, Units 2 and 3), ALAB-216, 8 AEC 13, 21 n.33 (1974) (a contention stating the petitioner's views about what the regulatory policy should be indicates that the petitioner should choose a role other than a party to an adjudicatory

proceeding). Consequently, this issue is not a litigable issue and is outside the scope of this proceeding.

Moreover, even if it could be said that the Commission's pending rulemaking proceeding constituted "special circumstances," Nevada has not shown that application of the current security requirements would undermine the purpose of the regulations. The purpose of 10 C.F.R. Part 73 is to "prescribe[] requirements for the establishment and maintenance of a physical protection system which will have capabilities for the protection of special nuclear material at fixed sites and in transit and of plants." 10 C.F.R. § 73.1(a). Notwithstanding the Commission's reason for revising the security regulations, application of the current security regulations will not undermine their purpose. In fact, the waiver or exception that Nevada seeks is not even specified. Nowhere does Nevada explain what requirements it believes should be put in place of the existing rules. Nevada's request, if granted, would leave no requirements for establishing and maintaining a physical protection system in place. Consequently, the grant of the requested exception, not the application of the regulations, would undermine the purpose of these requirements. Therefore, Nevada has failed to make the *prima facie* showing required and Nevada's petition for waiver or exception should be denied.

For all of these reasons, this contention fails to raise a material issue or justify issuance of a waiver, contrary to 10 C.F.R. §§ 2.309(f)(1)(iv) or 2.335, and therefore must be dismissed. A petitioner must demonstrate that an issue it seeks to raise is material to the findings that the Commission must make in its review of DOE's LA. As discussed above, a challenge to NRC regulations is not material to the findings the NRC must make with respect to *this proceeding*.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

As discussed above, the supporting Fitzpatrick Affidavit does not provide the requisite support for this contention, or issuance of the requested waiver under Section 2.335. Furthermore, the contention suggests that a “previously filed [] affidavit, pursuant to 10 C.F.R. § 2.335(b), [] identifies the specific aspects of the subject matter of the proceeding as to which the application of the rule or regulation (or provision of it) would not serve the purposes for which the rule or regulation was adopted,” but does not in any way elaborate on this alleged deficiency. Petition at 1027. Nevada is required to identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). This vague reference to a “previously filed affidavit” does not meet this requirement. Moreover, the Commission has previously cautioned against such generalized claims followed by citations of earlier briefs: “The Commission should not be expected to sift unaided through large swaths of earlier briefs . . . in order to piece together and discern the intervenors’ particular concerns or the grounds for their claims.” *Hydro Res., Inc.* (P.O. Box 15910 Rio Rancho, NM 87174), CLI-01-04, 53 NRC 31, 46 (2001). Therefore, Nevada has failed to provide the requisite support for this contention, or issuance of the requested waiver or exception under Section 2.335.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

To show that there is a genuine dispute with DOE on a material issue of law or fact, as required by 10 C.F.R. § 2.309(f)(1)(vi), Petitioner “must include references to specific portions of the application . . . that the petitioner disputes . . . or, if the petitioner believes that the application fails to contain information on a relevant matter as required by law, the identification

of each failure . . .” As explained above, the heart of the issue that Petitioner disputes does not reside in the application, but rather in NRC regulations—and it questions their adequacy. There is no dispute raised by this contention that questions how DOE’s application satisfies currently-effective NRC physical security regulations. In recognition of this deficiency, Nevada has requested a waiver under Section 2.335, but has failed to establish a *prima facie* showing warranting certification of its petition for waiver or exception to the Commission. Consequently, this contention does not give rise to a genuine dispute and must be dismissed in its entirety.

**198. NEV-SAFETY-198 - Material Control And Accounting Plan**

DOE purports to adopt a material control and accounting program in accordance with standards that date largely from 1998 but, because the Commission has recently determined that those standards are inadequate in light of the terrorist attacks of September 11, 2001, DOE's plans are not adequate to protect the public and safety or the common defense and security. This contention petitions for a rule challenge pursuant to 10 C.F.R. § 2.335.

**RESPONSE**

This contention asserts that the NRC regulations regarding material control and accounting measures are inadequate to protect the public health and safety or common defense and security in light of the terrorist attacks of September 11, 2001. Based upon this assertion, Nevada concludes that the material control and accounting measures described in DOE's application are inadequate because they comply with current NRC regulations, and if determined to be a challenge to the current regulations, "petitions for a rule challenge pursuant to 10 C.F.R. § 2.335." Petition at 1028. As explained below, the contention itself falls outside the scope of this proceeding as, on its face, it challenges an NRC rule. Moreover, Petitioner has failed to satisfy the standards governing regulatory waivers as set forth in Section 2.335. Therefore, this contention is inadmissible.

**a. Statement of Issue of Law or Fact to be Controverted**

As Nevada seeks to challenge an existing NRC regulation, it must seek a waiver pursuant to 10 C.F.R. § 2.335, as it has done. Because Petitioner has failed to meet the governing waiver standards, however, it has failed to state an issue of law within the jurisdiction of this Board. As a result, the Board cannot grant it the relief it seeks through this contention and it should be dismissed.

**b. Brief Explanation of Basis**

As explained below, the purported legal basis for this contention is fundamentally flawed because it seeks to challenge existing NRC regulations in 10 C.F.R. Parts 72 and 74 by relying on the statements of considerations on the proposed rule for Geologic Repository Operations Area Security and Material Control and Accounting Requirements, at 72 Fed. Reg. 72,522 (December 20, 2007).<sup>128</sup> Moreover, Petitioner has failed to justify issuance of the requested waiver pursuant to 10 C.F.R. § 2.335, thereby depriving it of a legal basis upon which to proceed.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is clearly outside the scope of the licensing action, contrary to 10 C.F.R. § 2.309(f)(1)(iii). Specifically, the contention improperly challenges NRC regulations, 10 C.F.R. §§ 72.72, 72.74, 72.76, 72.78, and 74.4, by stating that DOE's application fails to provide a material control and accounting program that is adequate in light of the terrorist attacks of September 11, 2001. 10 C.F.R. § 2.335(a) and (b) ("no rule or regulation of the Commission ... is subject to attack ... in any adjudicatory proceeding").

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In apparent recognition of the fact that the contention is outside the scope of this proceeding, Nevada explicitly "petitions for a rule challenge pursuant to 10 C.F.R. § 2.335." Petition at 1028. Nevada's purported justification, set forth in paragraphs 8 through 10 of the

---

<sup>128</sup> This proposed rule has not been finalized. DOE commented on the proposed rule.

Fitzpatrick Affidavit, however, fails to satisfy the requirements for issuance of a waiver or exception as explained below.<sup>129</sup>

As a threshold matter, 10 C.F.R. § 2.335(b) provides that the “sole ground for petition of waiver or exception is that special circumstances with respect to the subject matter of the particular proceeding are such that the application of the rule or regulation (or a provision of it) would not serve the purposes for which the rule or regulation was adopted.” The presiding officer’s role is to determine whether the petitioner has made a *prima facie* showing that application of the rule would not serve the purposes underlying the rule. *See* 10 C.F.R. §§ 2.335(c) and (d). A petitioner seeking waiver or exception (1) must present special circumstances by pleading one or more facts, “not common to a large class of applicants or facilities, that were not considered either explicitly or by necessary implication in the rulemaking proceeding leading to the rule sought to be waived;” and (2) must show those special circumstances undermine the purpose of the rule the petitioner seeks to have waived. *See Entergy Nuclear Operations, Inc.* (Indian Point Nuclear Generating Units 2 and 3), LBP 07-858, 68 NRC \_\_ (slip op. at 3) (July 31, 2008) (citing *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-88-10, 28 NRC 573, 597 (1988)).

Nevada cites to the affidavit of Charles J. Fitzpatrick, one of Nevada's attorneys, to identify the purported special circumstances that, it asserts, undermines the purpose of the material control and accounting rules. Petition at 1029. Specifically, Nevada relies on paragraphs 8 through 10 of the Fitzpatrick Affidavit. *Id.* Paragraph 8 of the affidavit merely

---

129 Nevada also vaguely refers to a “previously filed affidavit” to support its request for waiver. Petition at 1030. As discussed further below, Nevada does not specifically identify what affidavit it is referring to, nor has it met the stricter requirement of identifying specific portions of the affidavit it relies on. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). Consequently, this “previously filed affidavit” does not support the requirements for waiver or exception from the NRC rules.

lists the sections of the LA, in which DOE states its intention to conform to existing material control and accounting regulations, and identifies 10 C.F.R. §§ 72.72, 72.74, 72.76, 72.78, and 74.4, as the relevant regulations. Fitzpatrick Affidavit at ¶ 8. Paragraph 9 relies on the proposed rule for Geologic Repository Operations Area Security and Material Control and Accounting Requirements for the positions that the Commission has found the existing regulations inadequate. *id.* at ¶ 9. In paragraph 10, Fitzpatrick then draws on these generic pieces of information to conclude that the Commission's statement that these regulations are inadequate constitutes a special circumstance that makes application of Sections 72.72, 72.74, 72.76, 72.78, and 74.4, undermine the purpose of these regulations. *See id.* at ¶ 10.

Standing alone, the Commission's statement that the current material control and accounting requirements are not adequate in light of the post-September 11, 2001 threat environment does not constitute a special circumstance in and of itself. As acknowledged in the Fitzpatrick Affidavit, the Commission made this statement when explaining its reasons for revising regulations addressing material control and accounting requirements for a GROA. *See* Geologic Repository Operations Area Security and Material Control and Accounting Requirements, Proposed Rule, 72 Fed. Reg. 72,522 (December 20, 2007). Rather than constituting special circumstances, the fact that there is an on-going rulemaking proceeding demonstrates that this is an impermissible contention. It is longstanding agency policy that, "Licensing Boards 'should not accept in individual license proceedings contentions which are (or are about to become) the subject of general rulemaking by the Commission.'" *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2, and 3), CLI-99-11, 49 NRC 328, 345 (1999) (citations omitted); *see Texas Util. Generating Co.* (Comanche Peak Steam Electric Station, Units 1 and 2), LBP-81-51, 14 NRC 896, 898 (1981). Perhaps the more appropriate forum for

Nevada's concerns about the Commission's material control and accounting regulations is the on-going rulemaking proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 345; *cf. Phila. Elec. Co.* (Peach Bottom Atomic Power Station, Units 2 and 3), ALAB-216, 8 AEC 13, 21 n.33 (1974) (a contention stating the petitioner's views about what the regulatory policy should be indicates that the petitioner should choose a role other than a party to an adjudicatory proceeding). Consequently, this issue is not a litigable issue and is outside the scope of this proceeding.

Moreover, even if it could be said that the Commission's pending rulemaking proceeding constituted "special circumstances," Nevada has not shown that application of the current material control and accounting requirements would undermine the purpose of the regulations. The purpose of 10 C.F.R. Part 72, in part, is to "establish requirements, procedures, and criteria for the issuance of licenses to the Department of Energy (DOE) to receive, transfer, package, and possess power reactor spent fuel, high-level radioactive waste, power reactor-related GTCC waste, and other radioactive materials associated with the storage of these materials in a monitored retrievable storage installation (MRS)." 10 C.F.R. § 72.1. The purpose of 10 C.F.R. Part 74 is to "contain the requirements for the control and accounting of special nuclear material at fixed sites and for documenting the transfer of special nuclear material." 10 C.F.R. § 74.1(a). Notwithstanding the Commission's reason for revising these regulations, application of the current material control and accounting regulations will not undermine their purpose. In fact, the waiver or exception that Nevada seeks is not even specified. Nowhere does Nevada explain what requirements it believes should be put in place of the existing rules. Nevada's request, if granted, would leave no requirements for DOE's material control and accounting measures in place. Consequently, the grant of the requested exception, not the application of the regulations,

would undermine the purpose of these requirements. Therefore, Nevada has failed to make the *prima facie* showing required and Nevada's petition for waiver or exception should be denied.

For all of these reasons, this contention fails to raise a material issue or justify issuance of a waiver or exception, contrary to 10 C.F.R. §§ 2.309(f)(1)(iv) or 2.335, and therefore must be dismissed. A petitioner must demonstrate that an issue it seeks to raise is material to the findings that the Commission must make in its review of DOE's LA. As discussed above, a challenge to NRC regulations is not material to the findings the NRC must make with respect to *this proceeding*.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

As discussed above, the supporting Fitzpatrick Affidavit does not provide the requisite support for this contention, or issuance of the requested waiver or exception under Section 2.335. Furthermore, the contention suggests that a "previously filed [] affidavit, pursuant to 10 C.F.R. § 2.335(b), [] identifies the specific aspects of the subject matter of the proceeding as to which the application of the rule or regulation (or provision of it) would not serve the purposes for which the rule or regulation was adopted," but does not in any way elaborate on this alleged deficiency. Petition at 1030. Nevada is required to identify specific portions of the documents on which it relies. *See Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989). This vague reference to a "previously filed affidavit" does not meet this requirement. Moreover, the Commission has previously cautioned against such generalized claims followed by citations of earlier briefs: "The Commission should not be expected to sift unaided through large swaths of earlier briefs . . . in order to piece together and discern the intervenors' particular concerns or the grounds for their claims." *Hydro Res., Inc.* (P.O. Box 15910 Rio Rancho, NM 87174), CLI-01-04, 53 NRC 31, 46 (2001). Therefore, Nevada has

failed to provide the requisite support for this contention, or issuance of the requested waiver or exception under Section 2.335.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

To show that there is a genuine dispute with DOE on a material issue of law or fact, as required by 10 C.F.R. § 2.309(f)(1)(vi), Petitioner “must include references to specific portions of the application . . . that the petitioner disputes . . . or, if the petitioner believes that the application fails to contain information on a relevant matter as required by law, the identification of each failure . . .” As explained above, the heart of the issue that Petitioner disputes does not reside in the application, but rather in NRC regulations—and it questions their adequacy. There is no dispute raised by this contention that questions how DOE’s application satisfies currently-effective NRC material control and accounting regulations. In recognition of this deficiency, Nevada has requested a waiver under Section 2.335, but has failed to establish the *prima facie* showing necessary for the Board to certify its petition for waiver or exception to the Commission pursuant to Section 2.335(d). Consequently, this contention does not give rise to a genuine dispute and must be dismissed in its entirety.

**199. NEV-SAFETY-199 - Performance Confirmation And Available Technology**

SAR Chapter 4, which describes what purports to be DOE's Performance Confirmation Program, fails to provide sufficient description of key equipment and process activities critical to implementation of the Performance Confirmation Program as described, and some of the key activities needed for the Program, as described, rely impermissibly on technology development or integration that is not currently available.

**RESPONSE**

This contention asserts that DOE has failed "to provide sufficient description of key equipment and process activities critical to implementation of the Performance Confirmation Program as described, and some of the key activities needed for the Program, as described, rely impermissibly on technology development or integration that is not currently available." Petition at 1031.

**a. Statement of Issue of Law or Fact to be Controverted**

Nevada's assertion that DOE's Performance Confirmation Program relies impermissibly on future technology development or integration is based on a misapplication of 10 C.F.R. § 63.305(b), which states:

DOE should not project changes in society, ... human biology, or increases or decreases of human knowledge or technology. In all analyses done to demonstrate compliance with this part, DOE must assume that all of those factors remain constant as they are at the time of submission of the license application.

This regulation, which is entitled, "Required characteristics of the reference biosphere" and is not even applicable to the Performance Confirmation Program. 10 C.F.R. § 63.305(b), which is found in Subpart L-Postclosure *Public Health and Environmental Standards* (emphasis added), is applicable to 1) health and environmental standards; 2) analyses of the reference biosphere; and

3) human knowledge or technology during the postclosure period. In contrast, the Performance Confirmation Program focuses on collecting, evaluating, and reporting on data used to confirm the basis for estimates of repository performance (Performance Confirmation Plan, TDR-PCS-SE-000001 REV 05 AD 01 (Feb. 2008) LSN# DEN001590480 at xi); which is based on “parameters and natural processes pertaining to the geologic setting” (10 C.F.R. § 63.131(d)(2)), not health and environmental standards. Nowhere in 10 C.F.R. Subpart F, Performance Confirmation Program, does the word “analyses” even appear, much less any mention of the reference biosphere. Finally, 10 C.F.R. § 63.305(b) is applicable to technology development during the *postclosure* period, while the Performance Confirmation Program will be conducted during the *preclosure* period, so any technology development to be applied to the Performance Confirmation Program will necessarily occur well in advance of the postclosure period. For all of these reasons, Nevada’s asserted legal basis is wholly inapplicable to its contention, which is therefore inadmissible.

**b. Brief Explanation of Basis**

As explained in Section *a* above, Nevada misinterprets the regulatory requirements in Part 63. Therefore, it fails to provide "sufficient foundation" for its assertion that some of the key Performance Confirmation Program activities rely impermissibly on technology development or integration that is not currently available. *See Public Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-942, 32 NRC 395, 428 (1990). Accordingly, Nevada fails to provide a litigable basis for the contention, which must be dismissed.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." Petition at 1032. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7.), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete

assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in the contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

In addition, Nevada's misinterpretation of the regulatory requirements as described above in a cannot provide a basis for a finding that Nevada has raised a material issue.

Nevada asserts that a more detailed description of the Performance Confirmation Program is required in the License Application and that some of the key activities rely impermissibly on technology development or integration that is not currently available. Petition at 1031. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach two affidavits (Douglas F. Hambley and Steven A. Frishman), which purportedly provide expert opinions to support this contention. However, rather than providing information to support the assertions in this contention, the affidavits simply "adopt" Paragraph 5 of the otherwise unsupported assertions made in the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention fails to raise a genuine dispute on a material issue of law or fact. Nevada criticizes DOE for improperly

assuming the near-future availability of technology to meet the requirements for its performance confirmation program, without which the required performance confirmation would be ineffectual in meeting the requirements of 10 C.F.R. §§ 63.21(c)(17), 63.102(m), 63.131(c), 63.132(b), 63.134(a) and 63.305(b). DOE has provided no technical basis for its assumption, nor has it considered alternative methodologies in the event of not being able to provide required in situ monitoring and testing of some of the most important elements of repository performance.

Petition at 1034.

For the reasons discussed below, these arguments do not raise a genuine dispute of material fact or law and must be dismissed.

First, as discussed above in Section a, Nevada relies on an inapplicable regulation for its assertion that DOE cannot rely on near-future “technology to meet the requirements for its performance confirmation program.” Petition at 1034. Therefore, the contention does not establish a genuine issue of material fact.

Second, Nevada cites examples of seepage monitoring, drift inspection, thermally accelerated drift in-drift environment monitoring, thermally accelerated drift thermal-mechanical monitoring, and waste package monitoring as the elements of the program that require the need for remote monitoring under conditions of ambient high temperature and high radiation. It goes on to assert, without any support, “[i]f the technology existed to overcome and perform adequately under these challenging conditions, the SAR would have so stated and demonstrated, at least by reference, which it has not.” Petition at 1033. Nevada has not established, or even

asserted that DOE is required to include in the SAR details about the specific technology that will be used in performing the referenced monitoring activities. An allegation that some aspect of the LA is inadequate or deficient does not give rise to a genuine dispute, unless it is supported by facts and a reasoned statement of why the LA is unacceptable in some material respect. *See Fla. Power & Light Co.* LBP-90-16, 31 NRC 509, 521 n.12 (1990). Nevada has not met this burden.

Finally, Nevada asserts that DOE has not “considered alternative methodologies in the event of not being able to provide required in situ monitoring and testing of some of the most important elements of repository performance.” Petition at 1034. This statement cites to no requirement that DOE consider such alternative methodologies, nor does it provide any details about what types of alternative methodologies DOE should have considered. Furthermore, there is no mention whatsoever of alternative technologies in any of the Performance Confirmation Program regulations. *See* 10 C.F.R. § 63.2, 63.21(c)(17), 63.102(m) and Subpart F. Therefore, Nevada’s claim regarding DOE’s failure to consider alternative methodologies must necessarily fail, as it lacks both supporting facts and a reasoned statement of why the LA is unacceptable. *See Fla. Power & Light Co.*, LBP-90-16, 31 NRC at 521 n.12.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected.

**200. NEV-SAFETY-200 - Performance Confirmation Program Level Of Information**

SAR Chapter 4, which describes what purports to be DOE's Performance Confirmation Program, fails to provide an adequate description of such a program because DOE's efforts to develop its Program are so incomplete that meaningful and reviewable descriptions are impossible.

**RESPONSE**

This contention asserts that DOE has failed to provide an adequate description of a Performance Confirmation Program because "DOE's efforts to develop its Program are so incomplete that meaningful and reviewable descriptions are impossible." Petition at 1035.

**a. Statement of Issue of Law or Fact to be Controverted**

Nevada claims that, in connection with the Performance Confirmation Program, DOE has violated 10 C.F.R. § 63.305(b), which states:

DOE should not project changes in society, ... human biology, or increases or decreases of human knowledge or technology. In all analyses done to demonstrate compliance with this part, DOE must assume that all of those factors remain constant as they are at the time of submission of the license application.

This regulation, which is entitled, "Required characteristics of the reference biosphere," is not even applicable to the Performance Confirmation Program. 10 C.F.R. § 63.305(b), which is found in Subpart L-Postclosure *Public Health and Environmental Standards* (emphasis added), is applicable to 1) health and environmental standards; 2) analyses of the reference biosphere; and 3) human knowledge or technology during the postclosure period. In contrast, the Performance Confirmation Program focuses on collecting, evaluating, and reporting on data used to confirm

the basis for estimates of repository performance (Performance Confirmation Plan. TDR-PCS-SE-000001 REV 05 AD 01 (Feb. 1008), LSN# DEN001590480 at xi); which is based on “parameters and natural processes pertaining to the geologic setting” (10 C.F.R. § 63.131(d)(2)), not health and environmental standards. Nowhere in 10 C.F.R. Subpart F, Performance Confirmation Program, does the word “analyses” even appear, much less any mention of the reference biosphere. Finally, 10 C.F.R. § 63.305(b) is applicable to technology development during the *postclosure* period, while the Performance Confirmation Program will be conducted during the *preclosure* period, so any technology development to be applied to the Performance Confirmation Program will necessarily occur well in advance of the postclosure period. For all of these reasons, Nevada’s asserted legal basis is inapplicable to its contention, which is therefore inadmissible.

**b. Brief Explanation of Basis**

As explained in a above, Nevada misinterprets the regulatory requirements in Part 63. Therefore, it fails to provide a “sufficient foundation” for its assertion that some of the key Performance Confirmation Program activities rely impermissibly on technology development or integration that is not currently available. *See Public Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-942, 32 NRC 395, 428 (1990). Accordingly, Nevada fails to provide a litigable basis for the contention, which must be dismissed.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In its attempt to demonstrate that this contention is material to the findings that the NRC must make in this proceeding, Nevada identifies various regulations. Nevada concludes this general description of various sections of 10 C.F.R. Part 63 with the mere assertion that "this contention alleges noncompliance with these regulatory provisions and therefore raises a material issue." Petition at 1036. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that "the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ...," not merely a citation of the relevant regulations. In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

While the Advisory PAPO Board directed the potential parties to provide a "citation to a statute or regulation that, explicitly or implicitly, has not been satisfied" because specific citations are "preferable" to general citations (June 20, 2008 CMO, at 7.), this direction cannot be read to dispense with the well-recognized requirement that resolution of the contention would make a difference in the outcome of the proceeding, particularly since the CMO focused exclusively on "format" and "procedural matters." CMO at 3.

In particular, because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However, as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101 (a)(2), "because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system," DOE is *not* required to provide complete

assurance that each postclosure performance objective specified at § 63.113 will be met.

Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing the issue in the contention is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

As stated in Section V.A.3. above, Part 63 permits DOE to use probabilistic analyses to calculate potential postclosure radiation doses, 10 C.F.R. § 63.102(j), and to report those doses as mean doses. *See* 10 C.F.R. § 63.303. Therefore, contentions that either independently or cumulatively, fail to demonstrate an increase in the mean dose above regulatory limits are immaterial and inadmissible because they would not “make a difference in the outcome of the licensing proceeding.” *Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34. Also as stated in Section V.A.3, Nevada has the ability to undertake quantitative and qualitative analyses of how a contention will impact the postclosure model. Nevada has failed to provide even a qualitative analysis of the impacts of this contention on dose, much less identify a likelihood of a dose limit being exceeded. Therefore, Nevada has not demonstrated that its contention is material to this proceeding.

In addition, Nevada's misinterpretation of the regulatory requirements as described above in a cannot provide a basis for a finding that Nevada has raised a material issue.

Nevada asserts that that a more detailed description of the Performance Confirmation Program is required in the License Application. However, Nevada fails to demonstrate that this issue is material to any finding the NRC must make to authorize construction of the repository. Specifically, Nevada fails to demonstrate that resolution of the contention would make a difference in the proceeding.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Section V.A.3 above discusses the legal standards under 10 C.F.R. § 2.309(f)(1)(v) that require adequate factual support or expert opinion in order for a contention to be admitted. This contention fails to meet those standards because, in contrast to the requirements of 10 C.F.R. § 2.309(f)(1)(v), as discussed in Section V.A.3 above and the specific response below: (1) the contention does not reference any documents, other than the license application and DOE's supporting documents; (2) the contention contains only unsupported assertions of counsel; and (3) the contention does not reference any expert opinion. Nevada's Petition does attach one affidavit (Steven A. Frishman), which purportedly provides expert opinions to support this contention. However, rather than providing information to support the assertions in paragraph 5 of this contention, the affidavit simply "adopt[s]" the otherwise unsupported assertions made in paragraph 5 of the contention. That approach falls far short of the requirement to provide conclusions supported by reasoned bases or explanation.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention fails to raise a genuine dispute on a material issue of law or fact. Nevada challenges “SAR Chapter 4 compliance with the requirements of 10 C.F.R. §§ 63.21(c)(17) to provide a description of the performance confirmation program, as defined in 10 C.F.R. § 63.2, and failure to implement the concept of Performance Confirmation, as described in 10 C.F.R. §§ 63.102(m), 63.131(c), 63.132(b), 63.134(a) and 63.305(b).” Petition at 1038. For the reasons discussed below, these arguments do not raise a genuine dispute of material fact or law and must be dismissed.

First, Nevada claims that the plans and procedures for the Performance Confirmation Program “already should have been completed and described in the SAR.” Petition at 1038. However, it provides no basis for asserting the existence of a requirement for completed plans and procedures as of the time of filing the LA. Nevada has not cited to any regulatory requirement for the completion of program plans and procedures before LA filing. In fact, examination of the regulations applicable to the Performance Confirmation Program reveals that there is no mention of any such requirement. *See* 10 C.F.R. §§ 63.2, 63.102(m), and Part 63, Subpart F. Absent a requirement for completed plans and procedures, Nevada’s contention fails to establish the existence of a genuine dispute on a material issue of law or fact.

Second, Nevada’s criticisms of SAR Chapter 4 are factually incorrect and inconsistent with the SAR. Nevada states that “at least in respect to operational period activities, the Performance Confirmation Program is simply a plan for a plan for which there is *no committed substance*.” Petition at 1037 (emphasis added). To the contrary, the Performance Confirmation Plan, which is the primary reference for SAR Chapter 4, provides, for each of the 20 program activities, “a title, description, purpose, selection justification (both technical and regulatory), a

current understanding of each activity, and the anticipated methodology for the test.”

Performance Confirmation Plan. TDR-PCS-SE-000001 REV 05 AD 01, (Feb. 2008) LSN# DEN001590480 at 3-1. For each activity description, DOE has also identified candidate parameters for comparison of the monitoring and testing results with the model inputs and assumptions. *Id.* at Table 3-2. Nevada has apparently interpreted “committed substance” of the program to mean completed technical plans and procedures, a definitional exercise lacking any basis in the applicable regulations. Nevada cites as its only support for its narrow definition of “committed substance” a DOE statement that distinguishes between the Performance Confirmation Plan and the test plans and indicates that changes may need to be made to the Performance Confirmation Plan as detailed test plans are developed. *See* Petition at 1037, citing Performance Confirmation Plan. TDR-PCS-SE-000001 REV 05 AD 01, (Feb. 2008) LSN# DEN001590480 at 1[a]. However, the possibility of changes does not mean that there is no committed substance to the program, as changes are anticipated and controlled under the regulations. *See* 10 C.F.R. § 63.44. Therefore, Nevada’s criticisms of SAR Chapter 4 fail to raise a genuine dispute on a material issue of fact.

In summary, this contention does not establish a genuine issue of material fact. Therefore, the contention does not satisfy 10 C.F.R. § 2.309(f)(1)(vi) and should be rejected.

**201. NEV-SAFETY-201 - Reliance On Preliminary Or Conceptual Design Information**

Legal Issue: The LA cannot be granted because it relies on preliminary or conceptual design information for both preclosure and postclosure aspects.

**RESPONSE**

This contention is identical to NEV-SAFETY-146, and must be dismissed for the reasons given in the response to that contention.

## **202. NEV-MISC-01 - Erosion And Geologic Disposal**

Legal issue: The construction authorization cannot be granted because, as contention NEV-SAFETY-41 establishes, Yucca Mountain will erode to the level of the repository drifts beginning around 500,000 years after waste emplacement, thereby exposing the waste packages to the atmosphere, with the result that for the period after about 500,000 years and continuing throughout the period of geologic stability the facility will no longer constitute a "repository" but would, at best, constitute a retrievable storage facility, in violation of sections 2(18), 114(d), 141(g) and 302(d) of the NWPA, section 801(a) of the EnPA, and Public Law No. 107-200 (42 U.S.C. § 10135 note).

### **RESPONSE**

Nevada challenges DOE's characterization of Yucca Mountain and the jurisdiction of the NRC to grant a construction authorization for the repository because it claims that erosion will cause the emplaced waste packages to be exposed to the atmosphere 500,000 years after permanent closure. Nevada also asserts that when this occurs, the facility will cease to be a geological repository as defined by sections 2(18), 114(d), 141(g) and 302(d) of the NWPA, Section 801(a) of the EnPA, and Public Law No. 107-200 (42 U.S.C. § 10135 note), and in violation of Section 141(g) of the NWPA.

#### **a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Nevada must demonstrate that the issue raised in the contention is within the scope of the proceeding. Underlying the issues Nevada raises in the contention is its position that Yucca Mountain will cease to be a suitable location for a geologic repository 500,000 years after permanent closure. *See* Petition at 1144. This, however, is a direct challenge to DOE's site recommendation and, as a result, is outside the scope of this proceeding and must be dismissed under 10 C.F.R. § 2.309(f)(1)(iii).

In 2002, the Secretary of Energy officially recommended Yucca Mountain to the President as the site for a geological repository for spent nuclear fuel and HLW. The President thereafter recommended the site to Congress, and over Nevada's notice of disapproval, Congress passed a Joint Resolution, pursuant to NWPA § 115(c), designating Yucca Mountain as the site for the geological repository. *See* Pub. L. No. 107-2000. The NWPA also specifically restricts the quantity of waste that can be emplaced at Yucca Mountain to 70 metric tons (MTHM). NWPA § 114(d). By, in effect, asking this Board to reconsider the Secretary and President's site approval and the Joint Congressional Resolution affirming this recommendation based on allegations that Yucca Mountain is not a suitable location for a geologic repository, this contention seeks to reverse the decisions of the President and of Congress to construct the geologic repository at Yucca Mountain.

Furthermore, site selection has already been the subject of a judicial challenge, which was found to be without merit. In 2004, a group challenged the suitability of the Yucca

Mountain site, attacking, among other things, the Secretary of Energy's recommendation to the President and the President's subsequent recommendation to Congress. *Nuclear Energy Institute, Inc. v. EPA*, 373 F.3d 1251 (D.C. Cir. 2004). The D.C. Circuit, in holding that it had no authority to overturn the Joint Congressional Resolution, found that Congress had unequivocally intended to approve the Yucca Mountain site as suitable for a geological repository. *Id.* at 1309-11.

This licensing proceeding is an inappropriate forum for a petitioner to raise attacks on that decision. The NRC must base its decision to grant or deny DOE's license application on the criteria identified in 10 C.F.R. Part 63. It cannot consider Nevada's challenges to decisions made at the highest level by various government bodies in selecting the Yucca Mountain site, and in the courts in affirming those decisions. Thus, any attempt to litigate this issue is outside the scope of this proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention also fails to raise an issue that is material to the findings that the Commission must make in this proceeding, and must be dismissed. As noted above, the contention's challenge to the selection of the Yucca Mountain site is outside the scope of this proceeding and, therefore, the contention does not raise an issue material to the finding the Commission must make. The reasons set forth below provide additional bases demonstrating that Nevada's contention fails to raise a material issue.

Because the issue presented in this contention concerns postclosure performance, Nevada must demonstrate that the resolution of the issue would prevent the NRC from finding that there is a "reasonable expectation" that the radioactive materials can be disposed of without unreasonable risk to the health and safety of the public. *See* 10 C.F.R. § 63.31(a)(2). However,

as discussed in Section V.A.3 *supra*, and in 10 C.F.R. § 63.101(a)(2), “because of the uncertainties inherent in the understanding of the evolution of the geologic setting, biosphere, and engineered barrier system,” DOE is not required to provide complete assurance that each postclosure performance objective specified at § 63.113 will be met. Therefore, Nevada must demonstrate that there is no reasonable expectation that the overall objective could be met. This contention makes no such showing.

The method the DOE used in addressing erosion is consistent with what the NRC contemplates in 10 C.F.R. § 63.304, which recognizes that determining that there is a “reasonable expectation”: (1) requires less than absolute proof, (2) accounts for the inherently greater uncertainties in making long-term projections of disposal system performance, (3) does not exclude important parameters from assessments and analyses due to the difficulty in quantifying with a high degree of confidence, and (4) focuses on performance assessments and analyses on the full range of defensible and reasonable parameter distributions rather than only upon extreme physical situations and parameter values.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

This contention relies almost entirely upon another contention by Nevada, NEV-SAFETY-41. *See* Petition at 1145. For the reasons discussed in the response to NEV-SAFETY-41, Nevada does not sufficiently identify documents or expert opinion to support either contention. Therefore, this contention does not satisfy 10 C.F.R. § 2.309(f)(1)(v) and should be rejected.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention bootstraps Nevada's technical argument made in NEV-SAFETY-41 into an alleged statutory violation, and in doing so, fails to raise a genuine dispute. Admission of this contention depends upon admission of NEV-SAFETY-41, which, as DOE has shown in its response to that contention, falls short of the admissibility criteria at 10 C.F.R. § 2.309(f)(1)(iv)-(vi) and must be rejected.

Relying on the flawed technical argument presented at NEV-SAFETY-41, this contention embarks upon unreasonable speculation assuming all conservative parameters for erosion. *See* NEV-SAFETY-41 at 240-241 (citing LSN# NEV000005187, at 1 (predicting significant erosion within 500,000 to 5,000,000 years only with "conservative estimates for all involved parameters")). Nevada's assumptions are in conflict with the requirements of proposed 10 C.F.R. § 63.305(c), which states that DOE must vary factors related to geology based upon "cautious, but *reasonable* assumptions" that could affect Yucca Mountain during the period of geologic stability. 70 Fed. Reg. at 53,319 (emphasis added). Nevada's speculation thus fails to raise a genuine dispute of a material issue.

Nevada's speculative position regarding statutory violations that may result from the unrealistic erosion rates it predicts in NEV-SAFETY-41 is the only position that distinguishes this contention from that one. In presenting this position, Nevada attempts to fabricate a violation where there is none. Clearly, the entire design and analysis for the proposed facility at Yucca Mountain has been for a deep, geological repository. The facility, as designed, complies with all applicable statutes and regulations. Accordingly, Nevada fails to raise a genuine issue of material fact or law.

For the aforementioned reasons, the contention does not satisfy 10 C.F.R.  
§ 2.309(f)(1)(vi) and must be rejected.

**203. NEV-MISC-02 - Alternate Waste Storage Plans**

Legal issue: The LA cannot be granted because its discussion of alternate storage plans for spent fuel following retrieval violates the NWPA.

**RESPONSE**

In this contention, Nevada argues that DOE’s proposed alternate storage plans for SNF following retrieval violates Section 141(g) of the NWPA, which prohibits locating a monitored retrievable storage (MRS) facility in the State of Nevada. *See* 42 U.S.C. § 10142 (“No . . . [MRS] developed pursuant to this section may be constructed in any State in which there is located any site approved under Section 112 [of the NWPA].”). Nevada suggests, but does not explicitly state, that the alternate storage areas constitute a MRS because they are facilities “for indefinitely long-term storage of spent fuel in Nevada, unrelated to efficient disposal of spent fuel in a safe and viable repository.” Petition at 1147.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention should be dismissed because the issue that it raises is outside the scope of this proceeding. As discussed in section f. of this response, DOE’s current plans for alternate storage areas do not fit the definition of a MRS, nor do they violate the NWPA in any other way. Nevada’s claim to the contrary amounts to a challenge of Section 122 of the NWPA, which as

explained below, requires that DOE design and construct the proposed repository in a way that will permit the retrieval of SNF. The NRC's regulations implementing this provision clearly allow for and explicitly contemplate DOE's use of alternate storage areas as a part of the repository design so that DOE can meet its obligations under Section 122 of the NWPA. 10 C.F.R. § 63.21(c)(7).

Accordingly, in arguing against the use of alternate storage areas at the repository, Nevada is challenging Section 122 of the NWPA and the NRC's reasonable interpretation and implementation of that provision. It is well established that a petitioner may not challenge applicable statutes or regulations as part of an adjudicatory proceeding. *Carolina Power & Light* (Shearon Harris Nuclear Power Plant Unit 1), LBP-07-11, 65 NRC 41, 57-58 (2007)(citing *Phila. Elec. Co.* (Peach Bottom Atomic Power Station, Units 2 and 3), ALAB-216, 8 AEC 13, 20 (1974)) (stating that any contention that collaterally attacks applicable statutory requirements must be rejected by the Board as outside the scope of the proceeding); 10 C.F.R. § 2.335(a) (providing that "no rule or regulation of the Commission . . . is subject to attack . . . in any adjudicatory proceeding").

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The NWPA and associated NRC regulations demonstrate that the proposed geologic repository must allow for the retrieval of SNF and may include alternate storage areas at the surface of the GROA to facilitate retrieval activities. Section 122 of the NWPA provides that the repository “must be designed and constructed to permit the retrieval of any [SNF] . . . placed in . . . [the] repository,” 42 U.S.C. § 10142; and one of the NRC’s regulations implementing this requirement explains that “[t]o satisfy this objective, the [GROA] must be designed so that any or all of the emplaced waste could be retrieved on a reasonable schedule.” 10 C.F.R. § 63.111(e).

These provisions clearly contemplate the possibility that alternate storage areas may be located at the surface portion of the GROA for the purpose of facilitating retrieval, should a decision to retrieve SNF from the repository be made. Indeed, the NRC’s regulations governing the content of the Application require that DOE include “[a] description of plans for retrieval and alternate storage of the radioactive wastes, should retrieval be necessary.” 10 C.F.R. § 63.21. Although this provision does not expressly require that the alternate storage areas be located at the GROA, 10 C.F.R. Part 63 clearly contemplates that they could be included among the repository’s *surface* facilities for receiving, handling, packaging, and *storing* waste. 10 C.F.R. § 63.2.

In this contention, Nevada ignores all of these principles, including DOE’s obligation to demonstrate to the NRC that it will be able to execute retrieval operations, if necessary, within a reasonable schedule, as well as the NRC’s obvious recognition, as reflected in its regulations, that in order to meet DOE’s obligation, DOE can develop alternative storage areas, and that such areas could be located at the GROA. Nevada addresses none of these points in its contention. Instead, Nevada implicitly argues that the alternative storage areas violate Section 141(g) of the

NWPA, as a MRS facility because they are facilities “for indefinitely long-term storage of spent fuel in Nevada, unrelated to efficient disposal of spent fuel in a safe and viable repository.”

Petition at 1147.

Nevada misunderstands the concept of a MRS. Subtitle C of the NWPA authorized DOE to study the need for, site, construct and operate a MRS facility for SNF. 42 U.S.C. § 10161. According to the statute’s legislative history, the MRS, if approved by Congress, “would serve as a “*back-up*” to the repository program.” *Tennessee v. Herrington*, 806 F.2d 642, 644 (6th Cir. 1986) (discussing NWPA legislative history) (quoting H.R. Rep. No. 491, *reprinted in* 1982 U.S. Code Cong. & Ad. News at 3810). The NRC promulgated regulations in 10 CFR Part 72 that govern licensing a MRS. There, the NRC defines a MRS as a “complex . . . for the receipt, transfer, handling, packaging, possession, safeguarding, and storage . . . *pending shipment to a HLW repository . . .*” 10 C.F.R. § 72.3 (emphasis added).

In sum, the MRS was intended to support the repository program as a separate, *back-up* facility used to store SNF *before* sending it to a repository. In contrast, DOE’s current concept for alternate storage areas at the GROA treats these areas as *part of* the repository; and they are intended to store SNF *after* it has been sent to the repository. Obviously, the SNF to be retrieved and stored at the alternate storage areas will already be at the repository. In this regard, Nevada is correct in asserting that the alternate storage areas do not facilitate the “efficient disposal of [SNF].” Petition at 1147. That, however, only distinguishes an alternate storage area from a MRS facility.

Furthermore, rather than functioning as a separate “*back-up facility*,” alternate storage areas are intended to function as part of the facility. Thus, an alternate storage area and a MRS are very different. In light of this, the fact that the alternate storage areas may support the long-

term storage of SNF is a red-herring. What ultimately matters is the integrated function of the areas, not how long they will be used to store SNF. Here, unlike a MRS, DOE's proposed alternate storage areas are part of the proposed "repository" under the NWPA and 10 C.F.R. Part 63.

Accordingly, the Licensing Board must dismiss this contention because it does not establish a genuine dispute on a material issue of law or fact.

#### **204. NEV-MISC-03 - LA References**

Error of Omission: The LA SAR is insufficient on its face because it cannot be determined whether its safety conclusions are correct without also considering about 196 references listed therein, but as provided in LA General Information Subsection 1.4.1 at 1-21, DOE refuses to incorporate these references into the LA.

#### **RESPONSE**

This contention asserts that the LA SAR is insufficient “on its face” because it assertedly relies on 196 references that are not incorporated into the LA. Petition at 1149. Nevada contends that these references must be reviewed to determine the validity of the safety conclusions contained in the SAR and that because these references are not incorporated by reference, the LA is insufficient. *Id.* As explained below, this contention should be dismissed because it falls outside the scope of this proceeding, does not present an issue material to the findings that the NRC must make, is not supported by factual or expert opinion, and presents no genuine dispute on a material issue of law or fact.

##### **a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

##### **b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

##### **c. Whether the Issue is Within the Scope of the Proceeding**

Nevada asserts that the Application is insufficient because, although DOE submitted the 196 references to the NRC, DOE did not incorporate them by reference into the Application.

Petition at 1149. The reason for the alleged insufficiency is less clear. The actual tenor of Nevada's complaint might be that non-inclusion of these references fatally prejudices its ability to review the Application and prepare contentions; or that the Staff is legally precluded from availing itself of information in those references; or that DOE is legally estopped from relying on them in the presentation of its case. Whatever the intended focus, the contention seeks to raise issues that either do not pose a genuine dispute on a material issue of fact or law, as outlined further in section f. below, or challenge a decision that is committed to the discretion of the NRC Staff. In either case, they do not raise an issue within the scope of the proceeding.

This contention impermissibly challenges the Staff's underlying sufficiency determination that resulted in the docketing of the Application. And this is not the first time that Nevada has raised this issue. In response to an inquiry from Nevada's counsel, the NRC stated that DOE did *not* need to incorporate by reference these documents into the LA. *See* Letter from Lawrence E. Kokajko, Director, Division of High-Level Waste Repository Safety Office of Nuclear Material Safety and Safeguards, U.S. Nuclear Regulatory Comm'n to Martin G. Malsch, Esq., "Response to Egan, Fitzpatrick & Malsch, PLLC Letter of July 25, 2008 Concerning the Status of 196 Yucca Mountain Reference Documents," August 29, 2008, *available at* ADAMS Accession No. ML082420891 (Kokajko Letter); NRC Presentation at September 23, 2008 Public Outreach Meeting, *available at* ADAMS Accession No. ML083030512 (Public Outreach Meeting Presentation). Nevada cannot use this proceeding to litigate the Staff's docketing determination. That determination is solely within the discretion of the NRC Staff. Therefore, this contention is outside the scope of this proceeding.

Nevada also alleges that DOE "refuses" to incorporate by reference the 196 references in the LA. Petition at 1149. DOE does not "refuse" to incorporate these references into the LA;

rather the DOE is following the regulatory requirements for the contents of the Application as well as years of licensing precedent and numerous previously submitted safety analysis reports when it chooses to describe in the Application either directly, or in summary form, information from supporting documents. Such rhetoric does not raise an issue within the scope of the proceeding.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada characterizes this contention as presenting a material issue by stating that “[t]his contention raises the issue whether the safety findings required by 10 C.F.R. § 63.31(a) can be made on the basis of the information in the SAR itself and the closely related issue whether DOE has complied with 10 C.F.R. § 63.24.” Petition at 1149. 10 C.F.R. § 2.309(f)(1)(iv) requires a showing by a petitioner that “the issue raised in the contention is material to the findings the NRC must make to support the action that is involved in the proceeding ....” In this regard, a contention is material only if its resolution would make a difference in the outcome of the proceeding. *See Duke Energy Corp.*, CLI-99-11, 49 NRC at 333-34.

Whether the 196 references are incorporated by reference in the SAR is not material to a finding that the NRC must make because its resolution would not make a difference in the outcome of the proceeding. The NRC Staff can consider information regardless of whether that information is incorporated by reference in the Application. *See Kokajko Letter*; Public Outreach Meeting Presentation. And in proceedings before this Board, DOE (or Nevada or any other party) cannot be precluded from making use of the information in those references for whatever purpose it deems useful, as long as that information is properly qualified. And whether the record of this proceeding will sustain the necessary licensing findings is a matter for issue-

by-issue determination upon the complete record, not dependent on whether these references have been incorporated by reference into the Application.

Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and thus, must be dismissed.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Nevada points vaguely to its “contentions addressed to the SAR” and the expert opinions supporting those contentions to support its assertion that the SAR is insufficient without incorporation of referenced documents. Petition at 1150. Specifically, Nevada asserts that its experts “usually found it impossible to review the safety conclusions in the cited subsections of the SAR, especially those in Chapter 2, without considering scientific facts and analyses in the referenced documents, and sometimes also scientific facts and analyses in documents referenced in the references.” *Id.* But not one affidavit from a Nevada expert supports this statement. Thus, this contention contains hearsay, and unsupported assertions of counsel. This fails to meet the standards of 10 C.F.R. § 2.309(f)(1)(v).

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

This contention fails to present a genuine dispute on a material issue of law or fact because failure to incorporate by reference the 196 documents does not violate any statutory or regulatory provision. Nevada asserts that the SAR is insufficient because it does not incorporate by reference 196 general references discussed in the SAR. Petition at 1149, 1151. Nevada does not point to any authority requiring the incorporation of those references. *See id.* There is none; the only reference in 10 C.F.R. Part 63 to incorporation by reference is in § 63.23, entitled “Elimination of Repetition,” which provides broad authority to incorporate material by reference

but does not require doing so. Nor has research disclosed any case law supporting the proposition that information, to be available to support a decision, must be either in the application itself or formally incorporated into it by reference.

And there is clearly no regulatory requirement to submit every drawing, calculation, specification, report, analysis, plan, model, etc. as part of the license application, so there can be no genuine dispute to litigate in this proceeding. 10 C.F.R. § 63.21, “Content of Application,” uses words such as description, discussion, explanation, assessment, and evaluation. And the Yucca Mountain Review Plan (YMRP) acknowledges that there are materials relevant to the licensing process that may not be in the license application. YMRP, A1.1.1, Licensing Review Philosophy, at A-4 (NUREG-1804). It states that “[t]he U.S. Nuclear Regulatory Commission should evaluate whether a license application meets the applicable regulations based upon a review of what is in the application and *supporting* materials.” *Id.* (emphasis added). The inclusion of “supporting” materials is clear evidence that not all of the information for technical review of the license application must be contained within the application itself. Thus, whether particular documents must be incorporated by reference in the Application does not raise a genuine dispute on a material issue of law or fact.

Similarly, to the extent that the contention attempts to preclude the NRC Staff from making use of information in the unincorporated references in its completeness and subsequent substantive review of the License Application, it raises matters beyond the jurisdiction of this Board. To that effect, the NRC Staff informed Nevada’s counsel that it would not require the DOE to incorporate the 196 general references that DOE provided when it submitted the LA. *See Kokajko Letter*. Moreover, the documents referenced in the LA are available for public review as evidenced by the contention itself and the NRC Staff have stated it considers

supporting information regardless of whether these references are incorporated in the LA. *See* Public Outreach Meeting Presentation.

Finally, with respect to Petitioner's complaint, albeit unsubstantiated, about its alleged need to review all of the unincorporated references, that complaint, even if it were accurate, is beside the point.<sup>130</sup> If Nevada believes that the application is not properly supported without material in these references, Nevada should have demonstrated that fact on an issue-by-issue basis, rather than attempting to assert, categorically, that the application must be preemptively rejected because not all references listed in it have been formally incorporated into it.

Consequently, this contention presents no genuine dispute on a material issue of law or fact and must be dismissed.

---

<sup>130</sup> Petitioners complain about the amount of work entailed by review of all the unincorporated references but do not allege it as a legal defect in the application. The references, of course, have all been available to Petitioners for at least the better part of a year, and most for far longer, via the LSN. Thus the complaint has little but rhetorical value and will not be treated further here.

**205. NEV-MISC-04 - Aging Facility Role Under NWPA**

DOE's plan to have up to 21,000 metric tons of heavy metal sitting on "aging pads" for decades violates the Nuclear Waste Policy Act, as amended, by making Nevada the site of both a repository and a retrievable storage facility.

**RESPONSE**

This contention raises two purely legal issues. Nevada claims that DOE's proposed surface Aging Facility at Yucca Mountain constitutes either (1) a federal interim storage installation or (2) a monitored retrievable storage facility as defined under the NWPA and NRC regulations set forth in 10 C.F.R. Part 72. Petition at 1153. In Nevada's view, because the NWPA and NRC regulations prohibit co-locating these types of facilities and the proposed repository, DOE's Aging Facility "violates the law." *Id.* at 1154. This contention fails to establish that a genuine dispute exists with DOE on a material issue of law or fact. The Licensing Board must dismiss this contention, which isolates a limited aspect of the proposed Aging Facility's overall function; ignores other necessary and important functions to overall repository operation; and then offers a flawed argument alleging that the Aging Facility is something that it is not.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The NWPA and associated regulations contemplate that a proposed geologic repository design may include a surface aging facility. The NWPA defines the "repository" to include "both surface and subsurface areas at which [HLW and SNF] handling activities are conducted." 42 U.S.C. § 10101(18). Similarly, 10 C.F.R. Part 63, defines the GROA as a HLW facility that is part of a geologic repository, including both surface and subsurface facilities, where waste handling activities are conducted and contemplates that a proposed repository design may include *important to safety* structures, systems and components for receiving, handling, packaging, *storing*, emplacing and retrieving the SNF and HLW. 10 C.F.R. § 63.2.

Nevertheless, Nevada overlooks these principles and, instead, alleges that the Aging Facility "violates the law." This is not the first time this flawed analysis has surfaced. In 2004, during a public meeting between the NRC and DOE, Judy Treichel, Nevada Nuclear Waste Task Force, asked the NRC Staff whether it would review the proposed Aging Facility as part of the

application for a geologic repository at Yucca Mountain or, alternatively, as a waste storage facility licensed under 10 C.F.R. Part 72. Additionally, it was requested that the NRC Staff provide its criteria for making that decision.

In a letter dated April 19, 2004, the NRC Staff responded, setting forth its approach to addressing this issue. The NRC Staff first recognized that DOE's geologic design may include surface facilities for receiving, handling, packaging and storing waste:

It is our understanding that DOE intends to seek construction authorization and a license to receive and possess source, special nuclear, or byproduct material at a proposed geologic repository at Yucca Mountain, in accordance with NRC's regulations in 10 CFR Part 63. Part 63 contemplates that a proposed repository design may include surface facilities for the receipt, handling, packaging, and storage of waste. NRC would evaluate a surface aging facility incident to waste handling activities, if included in the proposed repository design.

Letter from C. William Reamer, Director, Division of High-Level Waste Repository Safety, to Judy Treichel, "Subject: Review of Yucca Mountain Geologic Repository Operations Area Facilities," Apr. 19, 2004, *available at* ADAMS Accession # ML041070038 at 1.

The NRC Staff then made a point directly applicable to and supportive of rejecting this contention; it acknowledged that the planned Aging Facility is incidental to repository operations and will serve important functions *other* than waste storage:

A surface aging facility, incident to waste handling activities is different than a facility licensed and regulated under Part 72. Interim storage facilities, licensed under Part 72, provide safe, temporary storage of waste. A surface aging facility will likely not be designed merely for temporary storage, but will serve other functions, which are integral to the logistics of waste handling for the purposes of permanent storage in the repository. The NRC will review the proposed [Application], in its entirety, in accordance with the requirements of 10 C.F.R. Part 63.

*Id.* at 2.

The NRC Staff's understanding of the several necessary functions of the Aging Facility to overall repository operation is precisely what is set forth in DOE's Application. As demonstrated in the Application, DOE's proposed Aging Facility is not intended merely for storing waste; it is necessary for, and designed to serve, other critical functions that are integral to the logistics of waste handling for the purposes of permanent storage in the repository. SAR § 1.2.7. At its core, the Aging Facility is designed to be a buffer facility, to "uncouple waste receipts from waste emplacement operations to accommodate repository temperature and thermal limits, operations workflow (differences in acceptance and emplacement rates), and maintenance outages." *Id.* at 1.2.7-1. This and its other specific functions outlined in the Application include:

- Providing up to 21,000 MTHM of aging capability for the Repository in 2,500 aging spaces;
- Protecting TADs and Dual Purpose Canisters from external hazards;
- Providing the capability to place commercial spent fuel in a location where it can be aged to appropriate thermal power levels and providing passive heat removal to preclude exceeding waste form temperature limits;
- Providing the capability to uncouple receipt of commercial spent fuel from emplacement of commercial spent fuel by creating a location to temporarily place commercial spent fuel until the waste emplacement process can accommodate it;
- Providing the capability to move commercial spent fuel between the Aging Facility and the handling facilities; and
- Protecting the workers and the public from radiation.

*Id.* at 1.2.7-3 to -4. Unquestionably, the Aging Facility is intended to serve important functions—beyond temporary waste storage—that are essential to the concept of surface waste handling operations for the repository. Nevada's interpretation would require that the GROA's surface facility be designed so that the incoming waste is immediately placed underground when it arrives on-site. This is clearly not a practical interpretation, and it is inconsistent with the regulatory structure of these types of facilities.

Furthermore, it is beyond dispute that the Aging Facility does not constitute either (1) a federal interim storage installation or (2) a monitored retrievable storage facility, as defined in the NWPA and NRC regulations.

With respect to interim storage, the NWPA sought to help nuclear power reactor owners and operators manage spent fuel while waiting for its permanent disposal. In Subtitle B, the NWPA specified that for the period from 1983 to 1990, DOE had the authority to provide for the interim *storage* of up to 1900 tons of private spent fuel not otherwise accounted for, and for which storage was necessary to ensure a reactor's continued operations. *See* 42 U.S.C. §§ 10155–10157 (setting forth requirements for federal interim storage). No reactor owners or operators ever made use of the federal interim storage program before it expired in 1990, nor has the NRC ever determined that a reactor was in danger of having to shut down for lack of storage capacity. *Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), CLI-02-29, 56 NRC 390, 395 (2002).<sup>131</sup>

Put simply, the Aging Facility does not meet any of the characteristics of the NWPA's federal interim storage program. As noted above, no reactor owner or operator ever took

---

<sup>131</sup> Department of Energy Final Interpretation of Nuclear Waste Acceptance Issues, Nuclear Waste Acceptance Issues, 60 Fed. Reg. 21,793, 21,797 (May 3, 1995) (“Under the Act [NWPA], DOE had authority to offer a limited interim storage option. However, that authority has, by its express terms, expired.”) (citation omitted).

advantage of this program before it expired in 1990. And, most importantly, the proposed Aging Facility is not intended merely for storing waste; it is necessary for, and designed to serve, other functions that are integral to the logistics of waste handling for the purposes of permanent storage in the repository. As such, the Licensing Board must dismiss this contention to the extent it argues that the Aging Facility represents a federal interim storage facility.

Likewise, the Licensing Board must dismiss this contention to the extent it argues that DOE's proposed Aging Facility represents a monitored retrievable storage facility. Subtitle C of the NWSA authorized DOE to study the need for, site, construct and operate a monitored retrievable storage facility for spent fuel. 42 U.S.C. § 10161. In two separate places, the NWSA specifies that monitored retrievable storage should provide for the *long-term* storage of spent fuel. 42 U.S.C. § 10161(a)(1)–(2). According to the statute's legislative history, the monitored retrievable storage system, if approved by Congress, "would serve as a 'back-up' to the repository program." *Tennessee v. Herrington*, 806 F.2d 642, 644 (6th Cir. 1986) (discussing NWSA legislative history) (quoting H.R. Rep. No. 491, *reprinted in* 1982 U.S. Code Cong. & Ad. News at 3810). The NRC promulgated regulations in 10 C.F.R. Part 72 that govern licensing a monitored retrievable storage facility. There, the NRC defines a monitored retrievable storage facility as a "complex . . . for the receipt, transfer, handling, packaging, possession, safeguarding, and storage . . . *pending shipment to a HLW repository. . . .*" 10 C.F.R. § 72.3 (emphasis added).

For two reasons, the Aging Facility does not meet the definition of a monitored retrievable storage facility (a complex for storing waste *pending shipment to a geologic repository*). First, the Aging Facility is located *inside* the GROA. *See* SAR at 1.2.7-3 *citing* SAR at 1.2.1-33 (Figure 1.2.1-1 (GROA site plan)). Thus, the spent fuel that the Aging Facility

will receive will already have been shipped to the repository (in other words, the waste is not pending shipment to the repository). And second, as discussed above in detail, the Aging Facility is not intended merely for storing waste and, in any event, is not intended to be used for long-term storage. Rather than constituting a monitored retrievable storage complex, DOE's proposed Aging Facility clearly falls within the definition of "repository" under the NWPA and 10 C.F.R. Part 63.

Accordingly, the proposed Aging Facility is not a federal interim storage facility *or* a monitored retrievable storage facility as defined by the NWPA and 10 C.F.R. Part 72. As such, the Licensing Board must dismiss this contention because it does not establish a genuine dispute on a material issue of law or fact.

## 206. NEV-MISC-05 - Role Of Aging Facility

SAR Subsections 1.1.2.1 and 1.2.7, and various similar and related subsections, which describe DOE's plan to construct and operate an Aging Facility at the GROA is neither necessary for nor integral to the safe operation of the repository, and cannot be justified under the NWPA.

### RESPONSE

This contention challenges DOE's proposed surface Aging Facility at Yucca Mountain. To support this contention, Nevada raises two principal bases. The first basis—recycled from a previous contention as discussed below—states that the Aging Facility constitutes either a monitored retrievable storage (MRS) facility or federal independent spent fuel storage installation (ISFSI) as defined under the NWPA and NRC regulations set forth in 10 C.F.R. Part 72. Petition at 1157. In Nevada's view, because the NWPA and NRC regulations prohibit co-locating these types of facilities and the proposed repository, DOE's Aging Facility violates the law. *Id.* at 1155–57, 1159. The second basis states that, even if the NWPA and NRC regulations permit the construction of a surface aging facility, “DOE's explanation for *this* aging pad is pretextual.” *Id.* at 1157 (emphasis added). According to Nevada, “[t]he real reason for having an aging pad . . . is . . . to *provide a means of providing what the law prohibits*: interim storage away from the generation sites.” *Id.* at 1158 (emphasis added).

For the reasons explained below, this contention is inadmissible. The Licensing Board must dismiss the first basis of the contention because it isolates a limited aspect of the proposed Aging Facility's overall purpose; ignores other necessary and important functions to overall repository operation; and then offers a flawed argument alleging that the Aging Facility is something that it is not. As a result, this first basis lacks adequate support and fails to raise a

material issue. Similarly, the Licensing Board must dismiss the second basis because Nevada's speculation about the Aging Facility does not raise a material issue or create a genuine dispute on a material issue of law or fact.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

For the reasons discussed below, Nevada has not proffered any credible factual basis for its assertions that the Application's descriptions are "pretextual."

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

As mentioned at the outset, this contention relies upon two distinct bases. For the reasons discussed below, these bases fail to raise a material issue relative to this proceeding.

Nevada first raises the legal argument that the proposed Aging Facility "is both a monitored retrievable storage installation and an independent spent fuel storage installation" as defined under the NWPA and 10 C.F.R. Part 72. *Id.* at 1159. Nevada raises precisely the same issues in a different contention—NEV-MISC-04. DOE's response to NEV-MISC-04 fully addresses why the Aging Facility is neither a MRS installation nor an ISFSI. Because the Board that will review that contention is likely to be the Board that reviews this one, DOE incorporates by reference its response to NEV-MISC-04 into this response.

The second basis for the contention states that “[e]ven if the NWSA and Commission’s regulations . . . permitted the construction of an on-site aging facility . . . , DOE’s explanation for this aging pad is pretextual.” Petition at 1157. Nevada proffers three factual averments—which are fully addressed in section f. below—to support its claim that DOE’s explanation is pretextual. Specifically, Nevada claims that:

- DOE “does not actually need the cooling it claims to require[;]”
- “[E]ven if cooling were required, there is no reason, nor apparent explanation in the license application, for why cooling must take place at the repository instead of the generation sites as Congress contemplated[;]” and
- The “capacity of the aging pad vastly exceeds any that could be necessary for cooling, in any event.”

Petition at 1157–58.

These factual allegations ignore the fact that the Aging Facility represents an integral component of the proposed geologic repository, and has independent utility in the efficient conduct of the GROA’s surface operations, as described in SAR § 1.2.7 (Aging Facility). None of the three factual arguments set forth in this contention establish that the Aging Facility is either a MRS facility or federal ISFSI. Nor do the factual averments allege a proposition—even if sustained—that would demonstrate a violation of the NRC’s requirements.

With respect to the need of the Aging Facility for thermal management, DOE has set forth its rationale at length in an analysis in SAR §§ 1.2 and 1.3, none of which is controverted by Nevada. Even if the Nuclear Waste Technical Review Board were to believe that the Aging Facility is not essential for a particular function, that fact alone does not strip the Aging Facility of its independent utility, nor does it convert the facility into an MRS or ISFSI, or establish any other violation of statute or NRC requirements. And Nevada does not directly argue that it does.

The same is true of a design determination to provide the capability of cooling fuel at the repository rather than solely at reactor sites, and of the selection of any particular cooling capacity.

In short, the only legal requirement that Nevada alleges is violated by the Aging Facility is the proscription against an MRS or an ISFSI; but Nevada does not allege *any* discernible link between *any* of these three factual averments to *any* specific provision of the NWPA or NRC regulations, which would tend to establish that the Aging Facility is either an MRS or an ISFSI. In short, even conceding all of Nevada's arguments, which DOE does not do, they do not allege a violation of law or regulatory requirement.

Contentions alleging an error or omission in an application must establish some significant link between the claimed deficiency and protection of the health and safety of the public or environment, or some other violation of legal requirements. *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), LBP-04-15, 60 NRC 81, 89 (2004), *aff'd*, CLI-04-6, 60 NRC 631 (2004). This contention does not do so. Accordingly, this contention fails to raise an issue that is material to the findings that the NRC must make in this proceeding, and, thus, the Licensing Board must dismiss it.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

The Licensing Board must also reject this contention because it fails to create a genuine dispute on a material issue of law or fact. As discussed above, Nevada first claims that the

Aging Facility “is both a monitored retrievable storage installation and an independent spent fuel storage installation” as defined under the NWPA and 10 C.F.R. Part 72. *Id.* at 1159. For the same reasons that this argument fails to raise an issue material to the findings the NRC must make in this proceeding, discussed in section d. above, it also fails to raise a genuine dispute on a material issue of law or fact and must be dismissed.

As the second basis, Nevada states that DOE’s explanation for the Aging Facility is “pretextual[.]” presumably for a desire to build a forbidden MRS or ISFSI. *Id.* at 1157. The contention then advances the three factual assertions outlined above, apparently in support of this argument. For the same reasons that these three arguments fail to raise issues material to the findings the NRC must make in this proceeding, discussed in section d. above, they also fail to raise a genuine dispute on a material issue of law or fact and must be dismissed. In this regard, DOE has good-faith, valid technical bases on each of the factual “pretext” issues raised by this contention.

With respect to Nevada’s first “pretext” claim—DOE “does not actually need the cooling it claims to require”—Nevada cites an NWTRB evaluation opining that “[s]urface aging of the hotter Commercial Spent Nuclear Fuel (CSNF), as opposed to subsurface aging, has limited benefit on the postclosure thermal response. DOE should reevaluate the need to surface-age the CSNF at the repository.” *Id.* (quoting “Thermal-Response Evaluation of Yucca Mountain During the Preclosure and Postclosure Phases,” NWTRB (July 2008) (LSN# NEV000005151)).

Contrary to Nevada’s assertion, the Aging Facility’s cooling capability is integral to repository operations. The Aging Facility is designed “to accommodate repository temperature and thermal limits[.]” SAR at 1.2.7-1. SAR Section 1.3.1 describes these temperature and thermal limits. Some of the waste canisters that arrive at Yucca Mountain will require cooling

(aging) before being emplaced in the repository to ensure that emplacement heat loads are not exceeded. The Application's thermal analyses were performed under certain parameters, including:

- TAD canisters can be shipped to the GROA with a thermal output as high as 22.0 kW, which corresponds to the current limit on licensed transportation casks of similar capacity;
- No waste package emplaced in the repository could exceed a thermal output of 18.0 kW;
- A maximum linear heat load at emplacement, over the length of a seven-waste-package segment of 2.0 kW/m; and
- Calculated thermal energy density of any seven adjacent as-emplaced waste packages “not to result in exceeding a thermal-energy-density index (temperature) of 96°C at the midpillar (between adjacent emplacement drifts), adjusted to account for host-rock thermal conductivity and hydrologic conditions in the host rock[.]”

*Id.* at 1.3.1-16, -20, and -47. Therefore, to ensure that the repository does not exceed temperature and thermal limits, at a minimum, waste packages received at the GROA with a thermal output greater than 18.0 kW must be cooled before being emplaced into the repository. Accordingly, the repository requires the capability to cool waste canisters above-ground before emplacement.

With respect to Nevada's second “pretext” claim—“even if cooling were required, there is no reason, nor apparent explanation in the license application, for why cooling must take place at the repository instead of the generation sites as Congress contemplated”—there is also no genuine dispute. Petition at 1158.

As a threshold matter, Nevada does not actually discuss any authorities suggesting that Congress contemplated all cooling would take place at generation sites, nor does it provide any

citation to these authorities. The Licensing Board should not make assumptions of fact that favor the petitioner or supply information that is lacking. *See Ariz. Pub. Serv. Co.* (Palo Verde Nuclear Generating Station, Unit Nos. 1, 2 and 3), CLI-91-12, 34 NRC 149, 155 (1991). Again, such generalities, unsupported by fact, do not suffice for purposes of admissibility in this proceeding.

Moreover, contrary to this allegation, the Application explains why the capability to cool SNF must be built into the repository. The Application describes a representative waste stream, which demonstrates the flexibility of the repository to receive and emplace waste. SAR at 1.3.1-17. The Application further identifies that there is a wide variability in the waste stream. *Id.* at 1.3.1-18. This variability is based upon several factors, including the availability of waste at the generator site, availability of waste that conforms to the acceptance criteria, availability of the allocated quantity of waste from each site, and the availability of the transportation cask fleet to transport the waste. *Id.* The estimated limiting waste stream also utilizes waste deliveries in conformance with the commercial utility contracts. 10 C.F.R. Part 961—Standard Contract for Disposal of Spent Nuclear Fuel and/or High-Level Radioactive Waste—does not specify a maximum thermal limit on the waste to be received from the utilities, other than SNF having been out of the reactor for at least 5 years. Thus, the estimated limiting waste stream developed in the Application is a representative case since the actual waste receipt is yet to be determined. *Id.* at 1.3.1-20. Accordingly, this contention is incorrect when it states that there is no reason nor apparent explanation in the Application for why cooling should take place at the repository.

With respect to Nevada's third "pretext" argument—the "capacity of the aging pad vastly exceeds any that could be necessary for cooling"—Nevada ignores the actual explanation set forth in the Application and supporting references. Petition at 1158.

The proposed Aging Facility provides up to 21,000 MTHM of aging capability for the repository in 2,500 aging spaces. SAR at 1.2.7-3. DOE analyzed a range of possible thermal loadings in the Engineering Study, Total System Model Analysis for Repository Postclosure Thermal Envelope Study, Phase 2 (000-00R-G000-01000-000-000, LSN# : DN2002501778). This study concluded (on pages 29–30) that the required aging pad capacity varied, depending on preclosure and postclosure thermal requirements, and thermal content of the waste stream. In addition, on page 26, the study concluded that aging capacity was needed for thermal blending even at the least restrictive preclosure and postclosure thermal limits examined (96° C midpillar temperature limit, 30 kW waste package limit, and 2.2 kW/m line load). The postclosure thermal study was a demonstration of the approach to thermal management, not the actual implementation proposed for repository operations. The actual implementation will occur on a drift-by-drift basis when a specific waste stream and resulting waste packages can be identified and each emplacement drift analyzed for loading. SAR at 1.3.1-20. Therefore, above-ground cooling at the repository of 21,000 MTHM does not, contrary to Nevada’s allegation, “vastly exceed . . . what is necessary for cooling[.]” Petition at 1158. Rather, the current Aging Facility capacity (21,000 MTHM of commercial SNF) was chosen to suggest a reasonable range of possible requirements.

In short, the Licensing Board must reject this basis of the contention. The Application sufficiently describes the Aging Facility, including its functions, operational processes, design bases and criteria, and design methodologies. The Application and its supporting references also explicitly address each of Nevada’s pretextual criticisms—why the repository requires the above-ground capability to cool; why cooling cannot take place entirely at the individual utility sites; and why the total capacity of the planned Aging Facility is for 2,500 aging spaces.

Nevada’s allegations do not allege a specific authority, much less establish any violation of the NWPA or 10 C.F.R. Part 63, from any or all of these assertions.

Finally, to the extent that Nevada’s allegation of “pretext” adds a further dimension to this contention—implicitly, an allegation that DOE has not acted in good faith in describing the purposes and functions of the proposed Aging Facility, or that DOE has covertly tried to characterize an MRS or ISFSI in other terms—Nevada is again in error. Nevada’s Petition provides in relevant part:

The real reason for having an aging pad, is instead, *to provide a means of providing what the law prohibits*: interim storage away from the generation sites, for which there is no statutory or regulatory authorization.

Petition at 1158 (emphasis added).

The three factual assertions raised in this contention do not establish that the Aging Facility is an MRS or ISFSI, much less that DOE “pretextually” characterized the Aging Facility in other, regulatory acceptable terms. There is no evidence for this accusation, and the contention fails to allege any.

It is well settled that government officials are presumed to act conscientiously and in good faith in the discharge of their duties. *See, e.g., Libertatia Assocs., Inc. v. United States*, 46 Fed. Cl. 702, 706 (2000). To overcome this presumption, a party must allege *and prove*, by clear and strong evidence, specific acts of bad faith on the part of the government. *Id.* The level of proof to overcome this presumption is high. *Id.* The Commission recognized these well-settled principles in a related proceeding earlier this year:

A presumption of regularity attaches to the actions of Government agencies. Absent clear evidence to the contrary, we presume that public officers will properly discharge their official duties.

*U.S. Dep't of Energy* (High Level Waste Repository: Pre-Application Matters), CLI-08-11, slip op. at 7–8 (June 5, 2008) (brackets and internal citations omitted) (quoting *U.S. Postal Serv. v. Gregory*, 534 U.S. 1, 10 (2001); *Pub. Serv. Co. of N.H.*, LBP-89-04, 29 NRC 62, 73 (1989)).

DOE has not, in any manner, engaged in bad faith with respect to the proposed Aging Facility. As demonstrated above, Nevada has not suggested any credible factual basis for its assertions that the Application's description is "pretextual." Nor does Nevada's contention provide any showing of actual or likely bad faith by DOE, or any concrete basis for the Licensing Board to assume that DOE would take actions in violation of law. Accordingly, this basis of the contention does not create a genuine dispute on a material issue of law or fact.

For all these reasons, the Licensing Board must dismiss this contention in its entirety.

## **207. NEV-NEPA-01 - Transportation Sabotage Scenarios**

Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) (“FSEIS”) Subsection 6.3.4.2 and Appendix G.8, regarding transportation sabotage events, fail to evaluate reasonably foreseeable attack scenarios that could result in significantly greater consequences than the scenarios considered by DOE. This deficiency is significant because, without considering reasonably foreseeable attack scenarios, there is no adequate disclosure of environmental impacts under NEPA. If reasonably foreseeable attack scenarios were added, the disclosure of radiological impacts could be materially different, thus the FEIS and FSEIS cannot be adopted by the NRC.

### **RESPONSE**

In this contention, the State of Nevada asserts that DOE’s analysis of potential sabotage events is inadequate because DOE allegedly failed to evaluate reasonable attack scenarios that could result in significantly greater consequences than the scenarios considered by DOE.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R.

§ 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavits. First, Nevada does not, in its experts’ affidavits or anywhere in its Petition, separately address the criteria for §§ 51.109 and 2.326(a) or demonstrate that the contention raises a significant environmental issue or that the contention, if proven, would or would likely result in a materially different outcome in the proceeding. Nevada’s two experts’ affidavits simply adopt paragraphs in the Petition. Thorne Affidavit at 1; Halstead Affidavit at 1. Neither of Nevada’s two experts make any representation that they have conducted any study or investigation regarding the matters discussed in the adopted paragraphs. With regard to the most difficult showing – a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true – Nevada’s two experts, Mr. Thorne and Mr. Halstead, simply point to reports prepared by others, such as the RWMA report, Petition at 1046, and note that these reports suggest additional sabotage scenarios that were not considered in the discussion of the environmental impacts due to transportation. Neither Mr. Thorne nor Mr. Halstead claims that he has assured himself through independent study and analysis that the reports to which he refers (principally the RWMA report) have any scientific validity. Instead, the experts simply report what the reports say – a practice that has been held to be inappropriate in the federal courts unless the person who actually prepared the report is available to testify, *Weaver v. Phoenix Home Life Ins. Co.*, 990 F.2d 154, 159 (4th Cir. 1993) – and make the conclusory statement that “[i]f reasonably foreseeable attack scenarios

were added, the disclosure of radiological impacts *could* be materially different, thus the FEIS and Repository SEIS cannot be adopted by the NRC.” Petition at 1046 (emphasis added). This is nothing more than a statement that something might be possible. The standard that must be met is not what “could be materially different,” but what would be or would likely be materially different. As to that standard, the affidavits of Mr. Thorne and Mr. Halstead are silent.

Neither of Nevada’s two experts is an expert on sabotage events. Mr. Thorne’s training and experience is in the area of health physics, and there is nothing in his background which would qualify him to provide expert testimony on possible sabotage events involving two weapons (of a type never explained by either Mr. Halstead). *See* Thorne Affidavit, Attach. A. Similarly, Mr. Halstead has nothing in his training or experience that would qualify him to offer expert opinions on a sabotage event involving two weapons. *See* Halstead Affidavit, Attach. A. By education, Mr. Halstead is an historian with a Masters degree in American History. He has worked on transportation issues involving spent nuclear fuel, but he has no discernable background in weapons, ballistics, or sabotage events. Given the lack of qualifications of its two experts to provide expert opinions on sabotage events, the affidavits of Nevada’s two experts fail to meet the NRC’s admissibility standards and this contention should be rejected. *See Private Fuel Storage, L.L.C. (Independent Spent Fuel Storage Installation)*, LBP-98-13, 47 NRC 360, 367-68 (1998).

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions challenging DOE's transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of this proceeding and may also be barred under res judicata or finality principles. Nevada's contention regarding DOE's analysis of potential sabotage events is objectionable on all three grounds.

First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have regulatory authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. In particular, challenges to the April 2004 ROD and the transportation-related portions of the 2002 FEIS on which it was based, are no longer subject to review in any forum, as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA. Any

challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

Nevada has failed to identify any issue relating to transportation sabotage for which the approach specified in Section 119 was or is not available.

In summary, challenges to the April 2004 ROD, and the transportation-related portions of the 2002 FEIS on which it was based, including DOE's analysis of potential sabotage events, are no longer subject to review in any forum, both as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA and as a result of the D.C. Circuit's 2006 decision in *Nevada v. Department of Energy*, 457 F.3d 78 (D.C.Cir. 2006). Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD also are not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In addition to being outside the scope of this proceeding and instead within the exclusive jurisdiction of the court of appeals, as well as being barred under res judicata and finality principles, the contention does not present an issue material to the findings the NRC must make. Nevada's contention fails as a matter of law to raise a litigable issue under NEPA, and thus does not present an issue material to the findings the NRC must make. Even if the Board were to conclude that this contention involved disputed expert opinions, it is well-settled law that a petitioner does not raise a material issue under NEPA simply by presenting a battle of experts. In *Price Road Neighborhood Ass'n, Inc. v. Dep't of Transportation*, 113 F.3d 1505 (9th Cir.

1997), the Court of Appeals affirmed a district court's grant of summary judgment to the agency.

The Ninth Circuit stated that the appellant had:

sought to engage in a battle of the experts with regard to several impacts, including air quality and noise, offering their own studies to contradict those of the agencies. We have consistently rejected such attempts, noting that "when specialists express conflicting views, an agency must have discretion to rely on the reasonable opinions of its own qualified experts...."

*Id.* at 1511, citing *Greenpeace Action v. Franklin*, 14 F.3d 1324, 1332 (9th Cir. 1992) (quoting *Marsh v. Or. Natural Res. Council*, 490 U.S. 360, 378 (1989)) accord *Havasupai Tribe v. Robertson*, 943 F.2d 32, 34 (9th Cir. 1991) (affirming district court decision based on the administrative record that no supplementation of an EIS was required because "disagreement among experts does not invalidate an EIS" (citation omitted)).

As the Supreme Court stated in *Marsh*, an agency must have the discretion to rely on the reasonable opinions of its own experts "even if, as an original matter, a court might find contrary views more persuasive." *Marsh*, 490 U.S. at 378. This is because, as the Supreme Court explained in *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976), "[n]either the statute nor its legislative history contemplates that a court should substitute its judgment for that of the agency as to the environmental consequences of its actions." The NRC has indicated that it would adhere to this same tenet in deciding whether to adopt DOE's EISs. Specifically, in promulgating 10 C.F.R. § 51.109, the NRC stated that "[t]he adoption of the [DOE] statement does not necessarily mean that NRC would independently have arrived at the same conclusions on matters of fact or policy." NEPA Review Procedures for Geologic Repositories for High-Level Waste, 53 Fed. Reg. 16,131, 16,142 (May 5, 1988). Accordingly, a NEPA contention that is premised on a disagreement between a potential intervenor's expert and DOE's expert analysis in an EIS does not create a litigable issue and should not be admitted.

Similarly, an agency is entitled to rely on reasonable assumptions in its environmental analyses. *Inland Empire Pub. Lands Council v. U.S. Forest Serv.*, 88 F.3d 754, 761 (9th Cir. 1996), citing *Sierra Club v. Marita*, 845 F. Supp. 1317, 1331 (E.D. Wis. 1994), *aff'd*, 46 F.3d 606 (7th Cir. 1995); *Greenpeace Action v. Franklin*, 14 F.3d 1324, 1335-36 (9th Cir. 1992). As in the case of a reviewing court, it is not the role of the NRC “to decide what assumptions ... we would make were we in the Secretary’s position, but rather to scrutinize the record to ensure that the Secretary has provided a reasoned explanation for his policy assumptions ....” *Wyo. Lodging and Rest. Ass’n v. Dep’t of the Interior*, 398 F. Supp. 2d 1197, 1214 (D. Wyo. 2005), citing *Am. Iron & Steel Inst. v. OSHA*, 939 F.2d 975, 982 (D.C. Cir. 1991); *S.F. Baykeeper v. U.S. Army Corps of Eng’rs*, 219 F. Supp. 2d 1001, 1015 (N.D. Cal. 2002) (holding that an agency’s reasonable assumptions were entitled to deference). DOE has provided reasonable explanations for the assumptions it has made in its NEPA analyses regarding potential sabotage events, Repository SEIS, Vol. I at 6-24 to -31, and it is not the Commission’s duty to “second guess” those assumptions. *Wyo. Lodging and Rest. Ass’n*, 398 F. Supp. 2d at 1214.

Nevada contends that DOE’s NEPA analysis of potential sabotage events does not sufficiently consider the possible ways in which a terrorist attack could be mounted against a train or truck carrying SNF or HLW. However, DOE evaluated events in which a military jet or commercial airliner would crash into a cask or a modern weapon would penetrate a cask, and recognized the uncertainty inherent in the analysis of potential sabotage events, noting that the possibilities are infinite. *See, e.g.*, Repository SEIS, Vol. I at 6-24 to 6-31. Recognizing these same difficulties, in *Pacific Gas & Electric Co.*, the Commission recently rejected as inadmissible a contention that the NRC Staff’s environmental assessment had failed to consider alternate threat scenarios. The Commission held that “[a]djudicating alternate terrorist scenarios

is impracticable. The range of conceivable (albeit highly unlikely) terrorist scenarios is essentially limitless, confined only by the limits of human ingenuity.” *Pac. Gas & Elec. Co.* (Diablo Canyon Power Plant Independent Spent Fuel Storage Installation), CLI-08-01, 67 NRC \_\_\_ (slip op. at 24) (Jan. 15, 2008). Moreover, DOE’s analysis fully meets the requirements that an agency take a “hard look” at environmental consequences. *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n. 21 (1976).

As DOE recognized in the Repository SEIS, it is always possible to postulate scenarios that could produce higher consequences than previous estimates. Repository SEIS, Vol. I at 6-24 to -31. However, NEPA does not require DOE to conduct a “worst-case” analysis. In eliminating the requirement to conduct such an analysis from its regulations in 1985, the Council on Environmental Quality noted that “one can always conjure up a worse ‘worst case’” by adding more variables to a hypothetical event, National Environmental Policy Act Regulations, 50 Fed. Reg. 32,234, 32,236 (Aug. 9, 1985), and that “‘worst case analysis’ is an unproductive and ineffective method . . . one which can breed endless hypothesis and speculation.” 51 Fed. Reg. at 15,624-5 (Apr. 25, 1986). In *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 356 (1989), the Supreme Court held that the CEQ acted reasonably in eliminating the requirement that an agency conduct a worst-case analysis. The Court noted that CEQ regulations are “entitled to substantial deference,” and that the “worst case analysis” requirement had been abandoned for the well-considered reason that it had “distort[ed] the decisionmaking process by overemphasizing highly speculative harms.” *Id.*; *Edwardsen v. U.S. Dep’t of Interior*, 268 F.3d 781, 785 (9th Cir. 2001) (“an EIS need not include a worst case scenario”). Accordingly, an EIS “need not discuss in detail every possible negative effect” of an action in order for an agency to

fulfill its NEPA obligations. *County of San Diego v. Babbitt*, 847 F.Supp. 768, 775 (S.D. Cal. 1994).

Nevada's alternate threat scenario involving two warheads, in which the second is somehow placed precisely in the entry hole of the first thereby resulting in an exit hole on the opposite side of the cask, *see* Petition at 1044-45, is exactly the kind of highly speculative, worst-case terrorist scenario that both the Commission and the courts have held agencies need not consider in an EIS.

Contrary to the State's assertion that DOE failed to evaluate reasonably foreseeable attack scenarios, to ensure that it took a 'hard look,' DOE considered the scenarios postulated by the State and presented them in the Repository SEIS, together with DOE's own evaluation. *See* Repository SEIS, at S-23 to -24, and Vol. I at 6-28 to 31.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding, because Nevada's claim is barred by res judicata and finality, and because the contention is of a type that courts and the Commission have rejected as impermissible under NEPA.

## **208. NEV-NEPA-02 - Transportation Sabotage Cleanup Costs**

Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) (“FSEIS”) Subsection 6.3.4.2 and Appendix G.8 regarding transportation sabotage events, and FSEIS Appendix G.9.7 regarding cost of cleanup after accidents, fail to provide an estimate of the cost of cleanup and other economic impacts following a sabotage event that resulted in release of radioactive materials, even though DOE assumes that cleanup would occur. This deficiency is significant because, without considering the cleanup costs of reasonably foreseeable attack scenarios, there is no adequate disclosure of environmental impacts under NEPA. If the cleanup costs of reasonably foreseeable attack scenarios were added, the disclosure of radiological impacts could be materially different, thus the FEIS and FSEIS cannot be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada asserts that DOE failed to provide an estimate of the cost of cleanup and other economic impacts following a transportation sabotage event, and that if cleanup costs were added, “the disclosure of radiological impacts could be materially different.” Nevada asserts that for these reasons, the 2002 FEIS and Repository SEIS cannot be adopted by the NRC.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4 Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if

proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavits. First, Nevada does not, in its experts’ affidavits or anywhere in its Petition, separately address the criteria for §§ 51.109 and 2.326(a) or demonstrate that the contention raises a significant environmental issue or that the contention, if proven, would or would likely result in a materially different outcome in the proceeding. Nevada’s two experts’ affidavits simply adopt paragraphs in the Petition. Halstead Affidavit at 1; Frishman Affidavit at 1. Neither of Nevada’s experts make any representation that they have conducted any study or investigation regarding the matters discussed in the adopted paragraphs. With regard to the most difficult showing – a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true – Nevada’s two experts, Mr. Halstead and Mr. Frishman, simply point to reports prepared by others, such as the RWMA report, *see* Petition at 1050, and note that these reports discuss a range of cleanup costs following sabotage events. Neither Mr. Halstead nor Mr. Frishman claims that they have assured themselves through independent study and analysis that the reports to which they refer (principally the RWMA report) have any scientific validity. Instead the experts simply report

what the reports say – a practice that has been held to be inappropriate by the federal courts unless the person who actually prepared the report is available to testify. *Weaver v. Phoenix Home Life Mut. Ins. Co.*, 990 F.2d 154, 159 (4th Cir. 1993). Nevada’s experts then make the conclusory statement that “[i]f the cleanup costs of reasonably foreseeable attack scenarios were added, the disclosure of radiological impacts *could* be materially different, thus the FEIS and FSEIS cannot be adopted by the NRC.” Petition at 1048 (emphasis added). This conclusion is nothing more than a statement that something might be possible. The standard that must be met is not what “could be materially different,” but what would be or would likely be materially different. As to that standard, the affidavits of Mr. Halstead and Mr. Frishman are silent.

Neither of Nevada’s two experts is an expert on sabotage events. Mr. Frishman is a geologist, and there is nothing identified in his background which would qualify him to provide expert testimony on possible sabotage events involving two weapons (of a type never explained by either Mr. Frishman or Mr. Halstead) or the cleanup costs following such events. Frishman Affidavit, Attach. A. Similarly, Mr. Halstead has nothing in his training or experience that would qualify him to offer expert opinions on a sabotage event involving two weapons or cleanup costs. Halstead Affidavit, Attach. A. By education, Mr. Halstead is an historian with a Masters degree in American History. He has worked on transportation issues involving spent nuclear fuel, but he has no discernable background in weapons, ballistics, or sabotage events. Given the lack of qualifications to provide expert opinions on sabotage events, the affidavits of Nevada’s two experts fail to meet NRC admissibility standards and this contention should be rejected. *See Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), LBP-98-13, 47 NRC 360, 367-68 (1998).

There are a number of additional flaws in the contention and Nevada's experts' affidavits. Paragraph 5 references, without any detailed factual or technical discussion, computer software which DOE allegedly could have used to calculate costs.<sup>132</sup> Even if the software did include the ability to address cleanup costs, its application for the hypothetical accident and sabotage scenarios evaluated in the Repository SEIS would be inappropriate. For example, the Department of Homeland Security has stated that "cleanup criteria should be derived through a site-specific optimization process" and lists a large number of such site-specific factors. Notice of Final Guidance: Planning Guidance for Protection and Recovery Following Radiological Disposal Device (RDD) and Improvised Nuclear Device (IND) Incidents, 73 Fed. Reg. 45,029, 45,036 (Aug. 1, 2008). DOE reasonably concluded in the 2002 FEIS that "[t]he restoration that would be necessary following an accident cannot be predicted. It would depend on the environmental factors involved – 1) the levels of contamination from the accident, 2) cleanup levels and decontamination methods used, and 3) location and ecology of the affected land areas – and the restoration goal that was used." *See* 2002 FEIS, Vol. II, App. J at J-73. Nowhere in the discussion in Paragraph 5 do Nevada's experts explain why the studies and estimates of cleanup costs in the event of an accidental release of radioactive material that DOE did present in the 2002 FEIS and Repository SEIS are inaccurate and do not reasonably reflect the possible cleanup costs. *See* 2002 FEIS, Vol. II., App. J at J-72 to -74; Repository SEIS, Vol. II, App. G at G-55 to -57. Under such circumstances, Nevada's experts do not demonstrate that DOE's

---

<sup>132</sup> In fact, the reference upon which Nevada's experts rely is to a superseded version of RADTRAN. Petition at 1050. DOE used RADTRAN 5.5, not RADTRAN 5 as Section 5 states. *See* "Calculation Package for the Transportation Impacts for the [Repository SEIS]," Attachment 07B (June 5, 2008) Special Instruction Sheet for Calculation Package For the Transportation Impacts for the Final SEIS (LSN DEN001598031). This version of RADTRAN 5 does not contain an economic model.

approach was unreasonable or that any different approach would lead or would be likely to lead to a different result.

DOE also explained in detail in the Repository SEIS why Nevada's assertion of higher consequences is unrealistic. Repository SEIS, Vol. I at 6-28 to -31; Vol. II, App. G at G-55 to -57. Nevada's experts do not address the Repository SEIS's response to Nevada's assertions regarding cleanup costs, much less demonstrate that DOE was erroneous. Ultimately, all that Nevada's experts have done in their affidavits is show that the RWMA estimates of costs are different from those DOE discusses in the 2002 FEIS and Repository SEIS. Thus, the affidavits do not meet the standards of 10 C.F.R. §§ 51.109 and 2.326 and do not provide any support for admissibility of the contention. Absent adequate affidavits, 10 C.F.R. §§ 51.109 and 2.326 require that the contention be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions challenging DOE's transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of this proceeding and may also be barred under res judicata or finality principles. Nevada's contention regarding DOE's analysis of cleanup costs from a potential sabotage event is objectionable on all three grounds.

First, as addressed in Section V.A.5(a)(1) above, under the AEA and the ERA, the NRC does not have regulatory authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. In particular, challenges to the April 2004 ROD and the transportation-related portions of the 2002 FEIS on which it was based, are no longer subject to review in any forum, as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals. Nevada has failed to identify any issue relating to transportation sabotage for which the approach specified in Section 119 was or is not available.

In summary, challenges to the April 2004 ROD, and the transportation-related portions of the 2002 FEIS on which it was based, including DOE's analysis of potential sabotage events, are no longer subject to review in any forum, both as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA and as a result of the D.C. Circuit's

2006 decision in *Nevada v. Department of Energy*, 457 F.3d 78 (D.C.Cir. 2006). Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD also are not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In addition to being outside the scope of this proceeding and instead within the exclusive jurisdiction of a federal court of appeals, as well as being barred under res judicata and finality principles, the contention does not present an issue material to the findings that the NRC must make. As a threshold matter, as demonstrated above, Nevada's allegation that radiological impacts "*could* be materially different," if cleanup costs were added, Petition at 1048, 1051, does not allege a material issue. Moreover, Nevada cites no authority for the proposition that inclusion of financial costs of cleanup following a sabotage event was necessary for a proper "disclosure of radiological impacts." *Id.* at 1048. The accepted methodology to quantify the radiological impacts of a transportation accident or sabotage event involving the release of radioactivity is by estimating the number of latent cancer fatalities that could result if the accident occurred. ("Recommendations for Analyzing Accidents Under the National Environmental Policy Act," (July 2002) (LSN#DN2001714520, Section 4.1 at 10)). In the Repository SEIS, estimates of latent cancer fatalities that could result from the maximum reasonably foreseeable transportation accident and transportation sabotage events are presented in Table 6-7 at 6-24 and Table 6-8 at 6-27. The costs of cleanup have no effect on the number of latent cancer fatalities (*i.e.*, the radiological impacts) and consequently, the radiological impacts would not be materially different irrespective of the costs of cleanup.

In any event, DOE did examine cleanup costs resulting from an accident or sabotage event during the transport of SNF and HLW to the repository. *See* Repository SEIS, App. G at G-55. DOE provided estimates of the costs of cleanup of the release of radioactive materials resulting from accidents during transport of SNF and HLW. DOE considered a wide range of potential cleanup costs that it could expect for severe accidents during the transport of SNF to the Yucca Mountain repository in the unlikely event such an event were to occur. *See* 2002 FEIS, Vol. II, App. J at J-72 to -73; *see also* Repository SEIS, Vol. II at G-55 to -57. In the 2002 FEIS, DOE estimated such costs could range from \$200,000 to \$10 billion. DOE also expressly considered estimates prepared by the State of Nevada. Repository SEIS, Vol. II at G-57. DOE discussed the methodology for Nevada's estimates and expressly explained why those estimates yield unrealistically high results. *See id.* DOE's analysis fully meets the requirement that an agency take a "hard look" at environmental consequences. *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976).

It is settled law under NEPA that an agency is entitled to deference in determining which methodologies to use in making decisions. *See, e.g., Wyo. Lodging & Rest. Ass'n v. U.S. Dep't of Interior*, 398 F. Supp. 2d 1197, 1213 (D. Wyo. 2005) (citing cases). NEPA does not require that an EIS be "based on the best scientific methodology available," *Lands Council v. McNair*, 537 F.3d 981, 1003 (9th Cir. 2008); (quoting *Friends of Endangered Species, Inc. v. Jantzen*, 760 F.2d 976, 986 (9th Cir. 1985)), as long as the agency acted reasonably, as DOE did here. Given DOE's acknowledgement that costs could be as high as \$10 billion (albeit under very unlikely circumstances), it cannot be said that DOE has failed to consider the costs of a transportation accident. The NRC is not required "to resolve disagreements among various scientists as to methodology," *see Friends of Endangered Species, Inc.*, 760 F.2d at 986, let alone a

disagreement about the speculative economic effects of environmental cleanup alleged by a non-economist “expert.” Accordingly, Nevada’s experts’ preference that a different methodology for estimating accident costs be used, involving a superseded version of a computer program, does not raise a material issue.

Similarly, although Mr. Frishman and Mr. Halstead are not qualified experts, and even if the Board were to conclude that this contention involved disputed expert opinions, it is well-settled law that a petitioner does not raise a material issue under NEPA simply by presenting a battle of experts. In *Price Road Neighborhood Ass’n, Inc. v. Department of Transportation*, 113 F. 3d 1505 (9th Cir. 1997), the Court of Appeals affirmed a district court’s grant of summary judgment to the agency. The Ninth Circuit stated that the appellant had:

sought to engage in a battle of the experts with regard to several impacts, including air quality and noise, offering their own studies to contradict those of the agencies. We have consistently rejected such attempts, noting that “when specialists express conflicting views, an agency must have discretion to rely on the reasonable opinions of its own qualified experts....”

*Id.* at 1511, citing *Greenpeace Action v. Franklin*, 14 F.3d 1324, 1332 (quoting *Marsh v. Or. Natural Res. Council*, 490 U.S. 360, 378 (1989)) accord *Havasupai Tribe v. Robertson*, 943 F.2d 32, 34 (9th Cir. 1991) (affirming district court decision based on the administrative record that no supplementation of an EIS was required because “disagreement among experts does not invalidate an EIS” (citation omitted)).

As the Supreme Court stated in *Marsh*, an agency must have the discretion to rely on the reasonable opinions of its own experts “even if, as an original matter, a court might find contrary views more persuasive.” *Marsh*, 490 U.S. at 378. This is because, as the Supreme Court explained in *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976), “[n]either the statute nor its legislative history contemplates that a court should substitute its judgment for that of the agency

as to the environmental consequences of its actions.” The NRC has indicated that it would adhere to this same tenet in deciding whether to adopt DOE’s EIS. Accordingly, this contention, which is premised on a disagreement between an intervenor’s expert and DOE’s expert analysis in an EIS does not create a litigable issue and therefore should not be admitted.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R. § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE’s transportation decisions and supporting NEPA analysis are outside the scope of this proceeding, because the contention is barred by res judicata and by Nevada’s failure to raise its claim within 180 days of issuance of the April 2004 ROD, and because the contention does not raise a claim under NEPA.

### **209. NEV-NEPA-03 - Transportation Accident Cleanup Costs**

Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") Appendix G.9.7, regarding the cost of cleanup from transportation accidents, fails to provide verifiable estimates of the costs of cleanup following severe transportation accidents that resulted in release of radioactive materials. This deficiency is significant because, without considering reasonably foreseeable transportation accidents and their effects including cleanup costs, there is no adequate disclosure of environmental impacts under NEPA. If reasonably foreseeable transportation accidents and their effects including cleanup costs were properly considered, the disclosure of radiological impacts could be materially different, thus the FEIS and FSEIS cannot be adopted by the NRC.

#### **RESPONSE**

In this contention, the State of Nevada asserts that DOE failed to provide an estimate of the cost of cleanup following a transportation accident and that if cleanup costs were considered, "the disclosure of radiological impacts could be materially different." Nevada asserts that for these reasons, the 2002 FEIS and Repository SEIS cannot be adopted by the NRC.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4 Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a

qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavits. First, Nevada does not in its experts’ affidavits or anywhere in its Petition separately address the criteria for §§ 51.109 and 2.326(a) or demonstrate that the contention raises a significant environmental issue or that the contention, if proven, would or would likely result in a materially different outcome in the proceeding. Nevada’s two experts’ affidavits simply adopt paragraphs in the Petition. Halstead Affidavit at 1; Frishman Affidavit at 1. Neither of Nevada’s experts make any representation that they have conducted any study or investigation regarding the matters discussed in the adopted paragraphs. With regard to the most difficult showing – a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true – Nevada’s two experts, Mr. Halstead and Mr. Frishman, simply point to reports prepared by others, such as the RWMA reports, Petition at 1055, and note that these reports discuss a range of cleanup costs following accidents. Neither Mr. Halstead nor Mr. Frishman claim that they have assured themselves through independent study and analysis that the documents to which they refer (principally the RWMA reports) have any scientific validity. Instead, the experts simply report what the reports say – a practice that has been held to be inappropriate in the federal courts unless the person who actually prepared the report is available to testify. *Weaver v. Phoenix Home Life Mut. Ins. Co.*,

990 F.2d 154, 159 (4th Cir. 1993). Nevada's experts then make the conclusory statement that "[i]f reasonably foreseeable transportation accidents and their effects including cleanup costs were properly considered, the disclosure of radiological impacts *could* be materially different, thus the FEIS and FSEIS cannot be adopted by the NRC." Petition at 1055 (emphasis added). This conclusion is nothing more than a statement that something might be possible. The standard that must be met is not what "could be materially different," but what would be or would likely be materially different. As to that standard, the affidavits of Mr. Halstead and Mr. Frishman are silent.

Neither of Nevada's two experts is an expert on transportation accidents involving SNF or HLW. Mr. Frishman is a geologist, and there is nothing identified in his background which would qualify him to provide expert testimony on the risk of transportation accidents, the radiological impacts thereof, or the cleanup costs following such events. Frishman Affidavit, Attach. A. Similarly, Mr. Halstead has nothing in his training or experience that would qualify him to offer such expert opinions. Halstead Affidavit, Attach. A. By education, Mr. Halstead is an historian with a Masters degree in American History. He has worked on transportation issues involving spent nuclear fuel, but he has no discernable background which would enable him to address the accuracy and adequacy of DOE's analysis of the impacts of transportation accidents. Given the lack of qualifications to provide expert opinions on transportation accidents and impacts thereof, the affidavits of Nevada's two experts fail to meet the NRC's admissibility standards and this contention should be rejected. *See Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), LBP-98-13, 47 NRC 360, 367-68 (1998).

There are a number of additional flaws in the contention and Nevada's experts' affidavits, including their discussion of computer software which DOE allegedly could have used to

calculate costs.<sup>133</sup> Even if the software did include the ability to address cleanup costs, its application for the hypothetical accident scenarios evaluated in the Repository SEIS would be inappropriate. For example, the Department of Homeland Security has stated that “cleanup criteria should be derived through a site-specific optimization process” and lists a large number of such site-specific factors. Notice of Final Guidance: Planning Guidance for Protection and Recovery Following Radiological Disposal Device (RDD) and Improvised Nuclear Device (IND) Incidents, 73 Fed. Reg. 45,029, 45,036 (Aug. 1, 2008). DOE reasonably concluded in the 2002 FEIS that “[t]he restoration that would be necessary following an accident cannot be predicted. It would depend on the environmental factors involved – 1) the levels of contamination from the accident, 2) cleanup levels and decontamination methods used, and 3) location and ecology of the affected land areas – and the restoration goal that was used.” *See* 2002 FEIS, Vol. II, App. J at J-73. Nowhere in the discussion in Paragraph 5 do Nevada’s experts explain why the estimates of cleanup costs in the event of an accidental release of radioactive material that DOE did present in the 2002 FEIS and Repository SEIS are inaccurate and do not reasonably reflect the possible cleanup costs. *See* 2002 FEIS, Vol. II, App. J at J-72 to -74; Repository SEIS, Vol. II, App. G at G-55 to -57. Under such circumstances, Nevada’s experts do not demonstrate that DOE’s approach was unreasonable or that any different approach would lead or would be likely to lead to a different result.

DOE also explained in the Repository SEIS why Nevada’s assertion of higher consequences is unrealistic:

---

<sup>133</sup> In fact, the reference upon which Nevada’s experts rely is to a superseded version of RADTRAN. Petition at 1054-55. DOE used RADTRAN 5.5, not RADTRAN 5 as Section 5 states. *See* Special Instruction Sheet For Calculation Package For The Transportation Impacts For The Final SEIS (LSN# DEN00159031). This version of RADTRAN 5 does not contain an economic model.

[T]he State's analysis used values for parameters that would be at or near their maximum values. DOE guidance for the evaluation of accidents in environmental impact statements [LSN# DN2001714520] specifically cautions against the evaluation of scenarios for which conservative (or bounding) values are selected for multiple parameters because the approach yields unrealistically high results.

Repository SEIS, Vol. I at 6-23. Nevada's experts do not address the Repository SEIS's analysis of Nevada's assertions regarding consequences, much less demonstrate that DOE was erroneous. Ultimately, all that Nevada's experts have done in their affidavits is show that the RWMA estimates of costs are different from those DOE discussed in the 2002 FEIS and Repository SEIS. Thus, the affidavits do not meet the standards of 10 C.F.R. §§ 51.109 and 2.326 and do not provide any support for admissibility of the contention. Absent adequate affidavits, 10 C.F.R. §§ 51.109 and 2.326 require that this contention be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions challenging DOE's transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of this proceeding and may also be barred under res judicata or finality principles. Nevada's contention regarding DOE's analysis of transportation accidents is objectionable on all three grounds.

First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have regulatory authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. In particular, challenges to the April 2004 ROD and the transportation-related portions of the 2002 FEIS on which it was based are no longer subject to review in any forum, as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals. Nevada has failed to identify any issue relating to transportation accidents for which the approach specified in Section 119 was or is not available.

In summary, challenges to the April 2004 ROD, and the transportation-related portions of the 2002 FEIS on which it was based, including DOE's analysis of potential transportation accidents, are no longer subject to review in any forum, both as a result of the expiration of the

180 day period to challenge that ROD set forth in Section 119 of the NWPAA and as a result of the D.C. Circuit's 2006 decision in *Nevada v. Department of Energy*, 457 F.3d 78 (D.C. Cir. 2006). Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD also are not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In addition to being outside the scope of this proceeding and instead within the exclusive jurisdiction of the court of appeals, as well as being barred under res judicata and finality principles, the contention does not present an issue material to a finding the NRC must make. As a threshold matter, as demonstrated above, Nevada's allegation that "radiological impacts *could* be materially different," if cleanup costs were considered, Petition at 1052, 1055, does not allege a material issue. Moreover, Nevada cites no authority for the proposition that inclusion of financial costs of cleanup following an accident was necessary for a proper "disclosure of radiological impacts." Petition at 1052. The accepted methodology to quantify the radiological impacts of a transportation accident event involving the release of radioactivity is by estimating the number of latent cancer fatalities that could result if the accident occurred. ("Recommendations for Analyzing Accidents Under the National Environmental Policy Act," (July 2002) (LSN#DN2001714520, Section 4.1, at 10)). In the Repository SEIS, estimates of latent cancer fatalities that could result from the maximum reasonably foreseeable transportation accident and transportation sabotage events are presented in Table 6-7, at 6-24, and Table 6-8 at 6-27. The costs of cleanup have no effect on the number of latent cancer fatalities (*i.e.*, the radiological impacts) and consequently, the radiological impacts would not be materially different irrespective of the costs of cleanup.

In any event, DOE did examine cleanup costs resulting from an accident during the transport of SNF and HLW to the repository. *See* Repository SEIS, Vol. II, App. G at G-55. DOE provided estimates of the costs of cleanup of the release of radioactive materials resulting from the maximum reasonably foreseeable accident during transport of SNF and HLW. DOE considered a wide range of potential cleanup costs that it could expect for severe accidents during the transport of SNF to the Yucca Mountain repository in the unlikely event such an event were to occur. *See* 2002 FEIS, Vol. II, App. J at J-72 to -73; *see also* Repository SEIS Vol. II, App. G at G-55 to -57. In the 2002 FEIS, DOE estimated such costs could range from \$200,000 to \$10 billion. DOE also expressly considered estimates prepared by the State of Nevada. *See id.* DOE discussed the methodology for Nevada's estimates and expressly explained why those estimates yield unrealistically high results. *See* Repository SEIS, Vol. II, App. G at G-57.

It is settled law under NEPA that an agency is entitled to deference in determining which methodologies to use in making decisions. *See, e.g., Wyo. Lodging & Rest. Ass'n v. U.S. Dep't of Interior*, 398 F. Supp. 2d 1197, 1213 (D. Wyo. 2005) (citing cases). NEPA does not require that an EIS be "based on the best scientific methodology available," *Lands Council v. McNair*, 537 F.3d 981, 1003 (9th Cir. 2008) (quoting *Friends of Endangered Species, Inc. v. Jantzen*, 760 F.2d 976, 986 (9th Cir. 1985)), as long as the agency acted reasonably, as DOE did here. Given DOE's acknowledgement that costs could be as high as \$10 billion (albeit under very unlikely circumstances), it cannot be said that DOE has failed to consider the costs of a transportation accident. The NRC is not required "to resolve disagreements among various scientists as to methodology," *see Friends of Endangered Species, Inc.*, 760 F.2d at 986. Accordingly, Nevada's experts' preference that a different methodology for estimating accident costs be used, involving a superseded version of a computer program, does not raise a material issue.

Similarly, although Mr. Frishman and Mr. Halstead are not qualified experts, and even if the Board were to conclude that this contention involved disputed expert opinions, the well-settled law that a petitioner does not raise a material issue under NEPA simply by presenting a battle of experts, still applies. In *Price Road Neighborhood Ass'n, Inc. v. Department of Transportation*, 113 F. 3d 1505 (9th Cir. 1997), the Court of Appeals affirmed a district court's grant of summary judgment to the agency. The Ninth Circuit stated that the appellant had:

sought to engage in a battle of the experts with regard to several impacts, including air quality and noise, offering their own studies to contradict those of the agencies. We have consistently rejected such attempts, noting that "when specialists express conflicting views, an agency must have discretion to rely on the reasonable opinions of its own qualified experts...."

*Id* at 1511, citing *Greenpeace Action v. Franklin*, 14 F.3d 1324, 1332 (quoting *Marsh v. Or. Natural Res. Council*, 490 U.S. 360, 378 (1989)); accord *Havasupai Tribe v. Robertson*, 943 F.2d 32, 34 (9th Cir. 1991) (affirming district court decision based on the administrative record that no supplementation of an EIS was required because "disagreement among experts does not invalidate an EIS" (citation omitted)).

As the Supreme Court stated in *Marsh*, an agency must have the discretion to rely on the reasonable opinions of its own experts "even if, as an original matter, a court might find contrary views more persuasive." *Marsh*, 490 U.S. at 378. This is because, as the Supreme Court explained in *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976), "[n]either the statute nor its legislative history contemplates that a court should substitute its judgment for that of the agency as to the environmental consequences of its actions." The NRC has indicated that it would adhere to this same tenet in deciding whether to adopt DOE's EIS. Accordingly, this contention, which is premised on a disagreement between an intervenor's expert and DOE's expert analysis in an EIS does not create a litigable issue and therefore should not be admitted.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R. § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analysis are outside the scope of this proceeding, because the contention is barred by res judicata and by Nevada's failure to raise its claim within 180 days of issuance of the April 2004 ROD, and because the contention does not raise a claim under NEPA.

## **210. NEV-NEPA-04 - Shared Use Option**

Final Environmental Impact Statement for a Rail Alignment, DOE/EIS 0369 (06/2008) ("Rail Alignment FEIS" or "RA FEIS") Subsections 4.2.1 and 4.2.10, incorporated by reference in Section 6.4 of the Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") (*see* FSEIS at 6-1), fail to adequately evaluate operational impacts of the shared use option generally, and specifically fail to evaluate the potential operational impacts of induced traffic growth. This deficiency is significant because, without fully considering the operational impacts of shared use under common carrier obligations, there is no adequate disclosure under NEPA. If a reasonable discussion of the operational impacts of the shared use option was included, the disclosure of shared use operational impacts could be materially different. Therefore, the FEIS and FSEIS cannot be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada asserts that DOE's Rail Alignment EIS and the Repository SEIS are inadequate because they "fail to adequately evaluate operational impacts of the shared use option generally, and specifically fail to evaluate the potential operational impacts of induced traffic growth." Petition at 1057.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if

proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.* to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to meet any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavits. With regard to the most difficult and important showing – a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true – Nevada’s petition and the affidavit of its expert, Mr. Robert Halstead, are silent. Halstead Affidavit at 1. Equally important, Nevada’s expert never provides the analysis that is explicitly called for by the terms of §§ 51.109 and 2.326. In his affidavit, Mr. Halstead does not set forth factual and/or technical bases in support of the contention, nor does he provide a specific explanation of why the requirements of § 2.326 have been met. Nevada has ignored the requirements of §§ 51.109 and 2.236 and its contention should, therefore, be rejected.

Mr. Halstead’s affidavit is flawed in several other respects. Mr. Halstead adopts Paragraph 5 of the contention as the substance of his affidavit. Paragraph 5 misstates the analysis conducted by DOE in the Rail Alignment EIS, stating that the DOE’s analysis of “shared use” was limited to “interviews with existing businesses.” Petition at 1059. Paragraph 5 then quotes from Nevada’s comments on the Rail Alignment EIS and speculates that operation of

the Caliente line “could result in large-scale rail shipments to coal-fired power plants, bio-fuels or other energy production facilities, and/or solid waste recycling and disposal facilities.” *Id.* In support of that assertion, Mr. Halstead offers no evidence other than a 2005 slide presentation by a railroad executive promoting the use of coal. The presentation does not provide any basis for the contention’s speculative assumption that the Caliente line as a common carriage rail line would result in large-scale rail shipments to coal fired power plants, bio-fuels or other energy production facilities and/or solid waste recycling and disposal facilities. Mr. Halstead offers no evidence or fact of any kind to support his speculation that the Caliente line could be used to transport 2 million tons of coal to an unplanned power plant which could possibly be located somewhere along the Caliente line. Mr. Halstead also claims that DOE’s consideration of “induced traffic growth” was inadequate but provides no evidence of any such growth or its magnitude. Mr. Halstead’s affidavit thus lacks a factual basis and therefore has no evidentiary value and cannot be the basis for the admission of this contention. The contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention, which challenges DOE’s transportation decisions and the environmental impact statements upon which those decisions are based, is beyond the scope of this proceeding.

First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have authority over DOE's transportation facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention does not present an issue material to the findings that the NRC must make because challenges to DOE's transportation decisions are outside the scope of this proceeding. In addition, this contention does not present a material issue because DOE adequately addressed "shared use" in the Rail Alignment EIS.

As required by NEPA, DOE took a "hard look" at environmental impacts of the proposed Nevada rail line, including those from shared use of the Caliente line. *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976). In response to Nevada's comment quoted in its contention, Petition at 1059, DOE explained that its analysis of shared-use was a conservative estimate of the

types of commodities and potential shipments that could operate along the proposed rail line. Rail Alignment EIS, Vol. VI at CRD 3-57. As explained in the Rail Alignment EIS, DOE used a study conducted by Nye County, and also conducted its own analysis, to project commercial freight demand along the Caliente route. Rail Alignment EIS, Vol. I at 2-111 to -113. Nye County developed low-to-high range estimates of commercial freight shipments by interviewing “stakeholders throughout the three counties traversed by the Caliente Corridor, including elected officials, agency employees, representatives of corridor businesses, and consultants and academics who have performed related studies.” (DIRS 185244-Wilbur Smith Associates 2007 at 7). LSN# DN2002213277 That study also considered potential new markets and opportunities for economic development that could result from operation of the railroad. *Id.* at 16). DOE also interviewed potential shippers along the route. Rail Alignment EIS, Vol. I at 2-112. The persons interviewed in these studies were located primarily in areas along the route where industry and infrastructure exist (*e.g.*, existing mining districts and population centers) and were therefore the most likely individuals to identify potential growth in the region that would be induced by construction of the railroad. The remainder of the route crosses rural, remote areas of Nevada with little or no infrastructure.

Based on these interviews and as described in § 2.2.6.1 at 2-112 of the Rail Alignment EIS, DOE developed reasonable projections of commercial freight demand that could occur along the Caliente rail alignment for purposes of analysis under NEPA. DOE estimated there could be about 223 carloads per week, which is similar to the mid-range demand scenario in the Nye County study, and about twice the low-range estimate in the Nye County study. DOE did not include in its projection shipments from additional, unplanned facilities or industries, such as a coal-fired power plant suggested by Nevada, because there were no indications that other

industries would be planning such facilities. For this reason, DOE determined that to assume unplanned facilities or industries would be speculative and unreasonable.

Nevada provides no evidence or alternative analytical method to support its contention that induced growth would be greater than that analyzed in the shared-used alternative of the Rail Alignment EIS, and offers only speculation that facilities such as a coal-fired power plant or other industry could be induced by the rail line. As reflected in the very decisions Nevada cites in support of its contention, environmental impact statements need not discuss matters which are “only remote and speculative possibilities.” *Fla. Power & Light Co.* (Turkey Point Nuclear Generating Station, Units 3 and 4), LBP-81-14, 13 NRC 677, 688 (1981); *Pub. Ser. Elec. & Gas Co.* (Hope Creek Generating Station, Units 1 and 2), ALAB-518, 9 NRC 14, 17 (1979), citing *Vt. Yankee Nuclear Power Corp. v. Natural Res. Def. Council*, 435 U.S. 519, 551 (1978) and *Natural Res. Def. Council v. Morton*, 458 F.2d 827, 837-38 (D.C. Cir. 1972). “A reasonably thorough discussion of the significant aspects of the probable environmental consequences is all that is required by an EIS.” *Pub. Ser. Elec. & Gas Co.*, ALAB-518, 9 NRC at 17, quoting *Trout Unlimited v. Morton*, 509 F.2d 1276, 1283 (9th Cir. 1974). DOE fully complied with this obligation in its discussion of possible shared use of the railroad.

For example, the analysis of shared-use impacts in § 4.2.1 considered the potential environmental consequences on the physical setting of the construction of additional railroad facilities (*e.g.*, sidings) required to support commercial shipments. DOE concluded that implementation of the shared-use option as analyzed would increase the area of surface disturbance required to construct the railroad by less than 0.1%. *See* Rail Alignment EIS, Vol. III at 4-32. Even doubling the number of additional railroad facilities needed to support additional commercial enterprises not considered by DOE would result in an increase of less than

0.2% in the amount of land disturbed, which is by no means a materially different result from that considered in the Rail Alignment EIS. Additional analyses of new railroad spurs, branch lines, or other facilities to support the types of unplanned projects suggested by Nevada would require speculation.

Similarly, to analyze the environmental consequences of the shared-use alternative on human health and safety, DOE evaluated the potential impacts of eight commercial trains per week, in addition to the 17 trains per week associated with operation of the repository and railroad. *See* Rail Alignment EIS, Vol. III at 4-356 to -358. DOE concluded that the eight additional commercial trains per week would have a small impact on the potential for an accident involving a cask car, that the overall density of trains on the rail line would still be considered low, and that a total of about three additional fatalities and 13 additional accidents would be expected to occur for the entire set of estimated railcar movements associated with commercial shipments. *Id.*

In sum, DOE has provided a “reasonably complete” analysis of possible environmental impacts from shared use of the Caliente line in the Rail Alignment EIS sufficient to satisfy NEPA’s requirement that an agency take a “hard look” at potential environmental effects. *Kleppe*, 427 U.S. at 410 n.21. Nevada’s assertion that DOE failed to meet NEPA’s requirements to evaluate shared-use impacts is entirely unsupported by the facts and relevant caselaw. The contention should, therefore, be rejected.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R.

§ 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact,  
With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention therefore should be rejected.

## **211. NEV-NEPA-05 - Radiological Regions Of Influence For Transportation**

Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") Subsections 3.2.2 and 6.4.1, and Final Environmental Impact Statement for a Rail Alignment, DOE/EIS 0369 (06/2008) ("Rail Alignment FEIS" or "RA FEIS") (incorporated by reference in the FSEIS at 6-1) Subsection 3.2.10, which address the radiological regions of influence for transportation, fail to apply the preferred method of analysis consistently for transportation impacts in Nevada and nationally. This failure is significant because without consistently evaluating the radiological regions of influence for transportation DOE has failed to adequately assess their environmental impacts, and because those environmental impacts could be materially different from that presented in the FSEIS and the RA FEIS, neither document can be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada argues that DOE failed to consistently apply the preferred method of analysis in evaluating the radiological regions of influence to assess transportation impacts within the Caliente and Mina rail corridors in relation to transportation impacts in other parts of Nevada and in relation to transportation impacts nationally.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R §§ 51.109 and 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its

environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners....” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address the mandatory requirements of §§ 51.109 and 2.326. With regard to the most important and difficult showing, a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true, Nevada’s Petition and the affidavit of its expert, Mr. Robert Halstead, are silent. Halstead Affidavit at 1. Equally important, Nevada’s expert never provides the analysis that is explicitly called for by the terms of § 2.326(b). This regulation requires Nevada’s expert to “set forth the factual and/or technical bases for the movant’s claim that the criteria of paragraph (a) of this section have been satisfied.” Section 2.326(b) goes on to state that “[e]ach of the criteria must be separately addressed, with a specific explanation of why it has been met.” Mr. Halstead’s affidavit says nothing about any of these criteria and merely adopts the words of Paragraph 5 of the Petition. Paragraph 5, in turn, provides none of the analyses or explanations required by the Commission’s regulations. Petition at 1063. The affidavit and this contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions challenging DOE's transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of this proceeding and may also be barred under res judicata or finality principles. Nevada's contention regarding DOE's analysis of transportation routes is objectionable for all three reasons. First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), NRC does not have authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. In particular, challenges to the April 2004 ROD and the transportation-related portions of the 2002 FEIS on which it was based, are no longer subject to review in any forum, as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail

Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

Nevada has failed to identify any issue relating to this contention for which the approach specified in Section 119 was or is not available.

In summary, challenges to the April 2004 ROD, and the transportation-related portions of the 2002 FEIS on which it was based, including DOE's analysis of radiological regions of influence, are no longer subject to review in any forum, both as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPAA and as a result of the D.C. Circuit's 2006 decision in *Nevada v. Dep't of Energy*, 457 F.3d 78 (D.C. Cir. 2006). Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD also are not appropriately a part of this proceeding, and may only be challenged through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For the reasons discussed in Section c. above, this issue is not material to the findings the NRC must make because Nevada's challenges to DOE's transportation decisions are outside the scope of this proceeding and because the contention is barred under res judicata and finality principles. Additionally, this issue is not material because Nevada has not established any inadequacy under NEPA. As required by NEPA, a potential intervenor must demonstrate that DOE has failed to take a "hard look" at environmental consequences. *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976). An EIS is adequate under this standard if it "contains a reasonably thorough discussion of the significant aspects of the probable environmental consequences." *Churchill County v. Norton*, 276 F.3d 1060, 1071 (9th Cir. 2001) (citation omitted); *Idaho*

*Conservation League v. Mumma*, 956 F.2d 1508, 1519 (9th Cir. 1992). DOE's analysis fully meets the requirement that an agency take a "hard look" at environmental consequences.

Contrary to Nevada's assertion, DOE has analyzed radiological regions of influence along routes other than the Caliente and Mina rail alignments, including in the Las Vegas metropolitan area. DOE selected representative routes in its NEPA documents to analyze the potential impacts of transportation of SNF and HLW to Yucca Mountain. 2002 FEIS, Vol. I at 2-43, 2-45, 3-120. These representative routes included potential routes through the Las Vegas region. *Id.* at 2-49. For all of its representative transportation routes, DOE evaluated radiation doses using *the same* region of influence that Nevada is seeking – 0.5 miles for incident-free radiation doses and 50 miles for transportation accidents. Repository SEIS, Vol. I at 3-95, 6-16. DOE also specifically analyzed impacts to the Las Vegas area, even evaluating scenarios unique to Las Vegas based on potential distances to rail lines and population densities. *Id.*, Vol. II. App. G at G-39, G-44. Accordingly, DOE did provide "population and dose information," contrary to Nevada's claim, Petition at 1063, for the routes it analyzed. *Id.* at G-5 to -50 and Attach. 03A, 03B "Special Instruction Sheet for Calculation Package for the Transportation Impacts for the Final SEIS," (June 5, 2008) (LSN#DEN001598031). Thus, Nevada is simply incorrect that DOE does not apply consistent radiological region of influence analysis in other parts of Nevada or for transportation impacts nationally, and it has failed to show that DOE has not taken a "hard look" at the radiological consequences of transportation to Yucca Mountain.

Further, to the extent Nevada is arguing that radiological regions of influence need to be analyzed for the actual routes DOE will use for transportation of SNF and HLW to Yucca Mountain, DOE has no obligation to identify its actual routes at this point in the process. As stated in the Repository SEIS, "[a]t this time, many years before shipments could begin, it is

premature to predict the highway routes or rail lines DOE might use.” Repository SEIS, Vol. III at CR-185.

The policies and procedures of DOE and the CEQ that implement the requirements of NEPA call for agencies to “integrate the NEPA process with other planning at the earliest possible time” in the development of a proposed federal project. 40 C.F.R. § 1501.2. In particular, CEQ regulations 40 C.F.R. §§ 1500.5, 1501.2, 1502.5 and 1508.23 all stress the need to prepare an EIS early in the process. NEPA analysis of environmental consequences must be made “as soon as it can reasonably be done.” *Kern v. U.S. Bur. of Land Mgmt.*, 284 F.3d 1062, 1072 (9th Cir. 2002) (citing *Save Our Ecosystems v. Clark*, 747 F.2d 1240, 1246 n.9 (9th Cir. 1984)). Nevada does not cite a single case in which an environmental impact statement was found invalid because it was prepared too early in the process. It is simply too soon to require DOE to identify the specific routes it will use, including radiological regions of influence along those routes, many years before a possible first shipment.

In addition, there are processes for determining if there is a need for further NEPA analyses after an EIS is finalized if an agency proposes substantial changes to a proposed action that are relevant to environmental concerns, or if there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts. 40 C.F.R. § 1502.9(c); 10 C.F.R. § 1021.314(a). DOE would conduct supplemental NEPA review if DOE makes substantial changes in the proposed action relevant to environmental concerns or there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R. § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding, because the contention is barred by res judicata, because Nevada failed to raise its claim within 180 days of the issuance of the 2004 ROD, and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention therefore should be rejected.

## **212. NEV-NEPA-06 - Caliente Rail Alignment Plan And Profile Information**

The Final Environmental Impact Statement for a Rail Alignment, DOE/EIS 0369 (06/2008) ("Rail Alignment FEIS" or "RA FEIS") Subsection 2.2.1, and the supporting references therein, fail to provide sufficiently detailed plan and profile information about the proposed Caliente rail alignment to support the impact findings reported in RA FEIS Chapter 4 and incorporated by reference in the Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") at FSEIS at 6-1 and 6-32. This deficiency is significant because, without sufficiently detailed rail alignment plan and profile information, the impact findings reported in RA FEIS Chapter 4, incorporated by reference in FSEIS Chapter 6, cannot be verified, and thus the FEIS and FSEIS cannot be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada argues that DOE provided insufficiently detailed plan and profile information about the proposed Caliente rail alignment.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these

two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address the mandatory requirements of §§ 51.109 and 2.326. With regard to the most important and difficult showing, a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true, Nevada’s Petition and the affidavit of its expert, Mr. Robert Halstead, are silent. Halstead Affidavit at 1. Equally important, Nevada’s expert does not provide the analysis that is explicitly called for by the terms of § 2.326(b). This regulation requires Nevada’s expert to “set forth the factual and/or technical bases for the movant’s claim that the criteria of paragraph (a) of this section have been satisfied.” Section 2.326(b) goes on to state that “[e]ach of the criteria must be separately addressed, with a specific explanation of why it has been met.” Mr. Halstead’s affidavit says nothing about any of these criteria and merely adopts the words of Paragraph 5 of the Petition. Paragraph 5, in turn, provides none of the analyses or explanations required by the Commission’s regulations. Petition at 1067-69. The affidavit and this contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions challenging DOE's transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of this proceeding and may also be barred under res judicata or finality principles. Nevada's contention regarding DOE's inclusion of rail alignment design maps and plan views is objectionable on jurisdictional and finality grounds. First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have regulatory authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals. Nevada has failed to identify any issue relating to this contention for which the approach specified in Section 119 was or is not available.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For the reasons discussed in Section c. above, this issue is not material to the findings the NRC must make because Nevada's challenges to DOE's transportation decisions are outside the scope of this proceeding and are instead within the exclusive jurisdiction of the courts of appeals. Additionally, this issue is not material because Nevada has not established any inadequacy under NEPA. A potential intervenor must demonstrate that DOE has failed to take a "hard look" at potential environmental consequences. *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976). An EIS is adequate under this standard if it "contains a reasonably thorough discussion of the significant aspects of the probable environmental consequences." *Churchill County v. Norton*, 276 F.3d 1060, 1071 (9th Cir. 2001) (citation omitted); *Idaho Conservation League v. Mumma*, 956 F.2d 1508, 1519 (9th Cir. 1992). DOE's analysis fully meets the requirement that an agency take a "hard look" at environmental consequences.

Contrary to Nevada's assertions, DOE has provided sufficient information to demonstrate that it has performed an adequate and meaningful evaluation of the Caliente rail alignment. DOE made clear the information on which it relied in response to Nevada's earlier comment: "Detailed vertical profile drawings are provided in the Plan and Profile Drawings (DIRS 182674-Nevada Rail Partners 2007, all; DIRS 180871-Nevada Rail Partners 2007, all). Detailed map view drawings of the entire rail alignments are provided in the Caliente Map Atlas (DIRS 185492-DOE 2008, all). . . ." Rail Alignment EIS, Vol. VI at CRD 3-12. The descriptions of impact evaluation methods in the Rail Alignment EIS specifically cited detailed alignment parameters, such as proposed structures and road crossings, and engineering parameters, such as total rise and fall and total earthworks. *Id.*, Vol. III at 4-7 to -13. DOE's plan and profile drawings and map views provided detailed information to assess the impacts of the Caliente rail

alignment, and Nevada has failed to demonstrate that they do not represent a “hard look” at these impacts.

To present an admissible contention, a petitioner cannot simply repeat the comment it made to DOE on the draft, but must demonstrate, through affidavits that comply with the requirements of 10 C.F.R. §§ 51.109 and 2.326, why the NEPA documents, including DOE’s response to the comment, fail to comply with NEPA. *City of Los Angeles v. Nat’l Highway Traffic Safety Admin.*, 912 F.2d 478, 488 (D.C. Cir. 1990) (finding that simple disagreement with an agency’s findings or its methods is not sufficient to render an EA or EIS inadequate under NEPA). The contention does not show why DOE’s response to its comments is incorrect. Nevada’s contention consists simply of unsupported assertions that DOE’s plan and profile documentation, including drawings, are not “sufficiently” detailed or are inaccurate. Moreover, Nevada did not attach any of the documentatation, contrary to the direction of the Advisory PAPO Board in its Case Management Order. The volume of the material in question, consisting of many gigabytes of electronic data, disproves Nevada’s contention that DOE’s analysis lacked adequate detail. It was incumbent on Nevada to demonstrate that, despite this large volume of material regarding the alignment of the Nevada railroad, DOE’s analysis of the rail alignment was insufficiently detailed. Nevada did not do so, and this fact alone requires that Nevada’s contention be rejected. *See U.S. Dep’t of Energy*, (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board), LBP-08-10, 67 NRC \_\_\_\_ (June 20, 2008) (Case Management Order).

Nevada argues that DOE failed to post the Plan and Profile Document on the Draft Rail Alignment EIS reference website, or to provide it to Nevada and other stakeholders in time for review of the Draft Rail Alignment EIS, and did not post the document on its website until June

2008. Petition at 1067. However, detailed map view drawings of the entire rail alignments were provided in the Caliente Map Atlas (DIRS 182843-DOE 2007, all) for the Draft Rail Alignment EIS, which was made available in DOE Reading Rooms during the Draft Review period. Also provided was the alignment summary document, with detailed alignment parameters. Rail Alignment EIS, Attach. E. Moreover, Nevada has failed to show that the absence of the Plan and Profile Document left it unable to make known its environmental concerns about the Caliente rail alignment. And even if Nevada could make such a showing – which is highly doubtful – courts have found that a Draft EIS satisfies the regulatory requirements “even if the public was unable to analyze each aspect of the project.” *Nat’l Comm. for the New River, Inc. v. F.E.R.C.*, 373 F.3d 1323, 1329 (D.C. Cir. 2004) (upholding Draft EIS where applicant had not filed a site-specific crossing plan of a waterway for a natural gas pipeline extension).<sup>134</sup>

As to Nevada’s critique that certain documentation is marked “conceptual,” this is irrelevant, as is Nevada’s argument that “[n]umerous design issues remain unresolved. Petition at 1068-69. The policies and procedures of DOE and the CEQ that implement the requirements of NEPA call for agencies to “integrate NEPA process with other planning at the earliest possible time” in the development of a proposed federal project. 40 C.F.R. § 1501.2. In particular, CEQ regulations 40 C.F.R. §§ 1500.5, 1501.2, 1502.5 and 1508.23 all stress the need to prepare an EIS early in the process. NEPA analysis of environmental consequences must be made “as soon as it can reasonably be done.” *Kern v. U.S. Bureau of Land Mgmt.*, 284 F.3d

---

<sup>134</sup> Nevada argues that the Plan and Profile Document’s technical acceptance date of May 15, 2007 raises concerns about whether it was used for the Draft Rail Alignment EIS. Petition at 1067. Nowhere does Nevada explain why this would be relevant, even if true. Regardless, this report and the corresponding profile data were originally prepared in 2005 for use in the Rail Alignment EIS impact analyses and were used to assess the potential environmental impacts presented in Chapter 4 of the Draft Rail Alignment EIS. The report was then revised in 2007 to remove “Privileged” markings that were included on the documents during the agency’s deliberative process, without changing the technical content therein, leading to the 2007 acceptance date. This is therefore a non-issue.

1062, 1072 (9th Cir. 2002) (citing *Save Our Ecosystems v. Clark*, 747 F.2d 1240, 1246 n.9 (9th Cir. 1984)). Nevada does not cite a single case in which an environmental impact statement was found invalid because it was prepared too early in the process. DOE has provided detailed plan and profile information for the Caliente rail alignment appropriate for this point in the process. In addition, there are processes for determining if there is a need for further NEPA analyses after an EIS is finalized if an agency proposes substantial changes to a proposed action, or if there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts. 40 C.F.R. § 1502.9(c); 10 C.F.R. § 1021.314(a).

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R. § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding, the contention is barred by res judicate on finality or inappropriate jurisdiction and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention therefore should be rejected.

### **213. NEV-NEPA-07 - Overweight Trucks**

Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") Subsection 6.1.6, regarding use of overweight trucks for shipment of legal-weight truck casks, fails to systematically assess the impacts of using overweight trucks for spent fuel shipments to Yucca Mountain, nationally and in Nevada. This failure is significant because without assessing the impacts of using overweight trucks for spent fuel shipments DOE has failed to adequately assess their environmental impacts, and because those environmental impacts could be materially different from that presented in the FSEIS and the "Final Environmental Impact Statement for a Rail Alignment," DOE/EIS 0369 (06/2008), LSN# DEN001593557 ("FEIS"), neither document can be adopted by the NRC.

#### **RESPONSE**

In this contention, Nevada alleges that DOE's NEPA documents are inadequate because they fail "to systematically assess the impacts of using overweight trucks for spent fuel shipments to Yucca Mountain, nationally and in Nevada." Petition at 1070.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R. §§ 51.109 and 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Nevada's environmental contention must also be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these

two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to meet any of the mandatory requirements of §§ 51.109 and 2.326. With regard to the most difficult and important showing – a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true – the Petition and the affidavit of its expert are silent. Equally important, Nevada’s expert does not provide the analysis that is explicitly called for by the terms of §§ 51.109 and 2.326. Nevada’s witness, Mr. Robert Halstead, does not set forth the factual and/or technical bases in support of the contention, nor does he provide a specific explanation of why the requirements of § 2.326 have been met. Halstead Affidavit at 1. Nevada has ignored the requirements of §§ 51.109 and 2.326 and its contention should therefore be rejected.

There are a number of additional flaws in Mr. Halstead’s affidavit. Mr. Halstead simply adopts the two paragraphs of Paragraph 5 of the contention as the substance of his affidavit. The first part of Paragraph 5 merely lists earlier documents in which it is alleged that it was assumed that only “legal weight trucks” would be used to transport SNF. Petition at 1072. The first part of Paragraph 5 provides no support for this contention and is largely irrelevant. The second part of Paragraph 5 merely lists alleged omissions in the discussion of overweight trucks in the Repository SEIS, Petition at 1072-73, but fails to provide any analysis of the significance of any of these alleged omissions or why any of them would have a material impact on the outcome of

this proceeding – the very burden Nevada must meet before this contention can be admitted. This contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to the other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to the other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions challenging DOE’s transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of this proceeding. Nevada’s challenge to the use of overweight trucks to transport SNF is objectionable on jurisdiction grounds for the following reasons.

First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have regulatory authority over DOE’s transportation facilities and activities, and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE’s decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep’t of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC’s lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of

environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For the reasons discussed in section c. above, this issue is not material to the findings the NRC must make because challenges to DOE's transportation decisions are outside the scope of this proceeding. In addition, it does not present a material issue because DOE did not impermissibly fail to evaluate adequately the environmental impacts relating to the use of overweight trucks. In fact, DOE has already prepared two detailed EISs providing extensive analysis of the project, including transportation involving overweight trucks, according to NEPA's requirements. The EISs examine the project as a whole, including detailed discussion of transportation alternatives in the vicinity of the repository as well as broader analysis of regional and national transportation options and their potential environmental effects. *See, e.g.*, 2002 FEIS, Vol. I, at 6-10 to -232; Repository SEIS, Vol. I at 6-2 to -10, 6-15 to -60. The transportation analysis was an exacting one in which representative routes nationwide were thoroughly examined for environmental impacts.

In the Repository SEIS, the analysis of overweight trucks acknowledged that DOE had decided after the initial FEIS had been issued that trucks used to transport SNF in truck casks would likely be somewhat heavier than "legal-weight" trucks and that the overweight trucks would be subject to permitting requirements in the states through which they traveled. Repository SEIS, Vol. I at 6-5. The Repository SEIS also noted that permit requirements in each

state typically “address such matters as the time of day when overweight trucks can travel and whether they can travel on holidays and weekends.” *Id.* Moreover, DOE relied on two studies which considered worker radiation exposure. *Id.* at 6-5 to -8. The first found that there would be a 13% decrease in dose using overweight trucks, but did not consider the impact of increased restrictions on travel that slightly increased travel times and dose. *Id.* at 6-8. A second study found that with increased travel times due to permit restrictions, there would be a 12% increase in dose. *Id.* From this DOE concluded that “radiation doses from overweight truck shipments would be similar to the radiation doses for legal-weight trucks.” *Id.* Finally, the Repository SEIS addressed accidents using overweight trucks and concluded that because overweight trucks carried the same casks as legal-weight trucks, there would be no impact on the consequences of an accident. *Id.* at 6-8. At this early stage of the development of a transportation plan that will not be in place for many years, DOE’s evaluation meets its obligation to take a “hard look” at the impact of overweight trucks. *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976). An EIS is adequate under this standard if it “contains a reasonably thorough discussion of the significant aspects of the probable environmental consequences.” *Churchill County v. Norton*, 276 F.3d 1060, 1071 (9th Cir. 2001) (citation omitted); *Idaho Conservation League v. Mumma*, 956 F.2d 1508, 1519 (9th Cir. 1992).

Nevada complains that the analysis of overweight trucks did not take into account estimated stop time and shipment times likely to result from state permit requirements and did not address doses to state safety inspectors or the general public. In fact, as described above, DOE did take into account state permit requirements generally. The premise of Nevada’s claim is that DOE did not specifically look at each of the states through which SNF might be transported, the length of the transport, and the permit requirements applicable in each state that

would deal with issues such as safety inspections, or stop and start times. That is, Nevada's complaint is that DOE should have analyzed specific routes (necessary to determine the affected states) and modes of transportation rather than representative transportation routes.

It was entirely reasonable for DOE to use representative routes at this stage in the process. As stated in the Repository SEIS, "[A]t this time, many years before shipments could begin, it is premature to predict the highway routes or rail lines DOE might use." Repository SEIS, Vol. III at CR-185. DOE appropriately decided to use representative routes that reflect typical industry practices. Repository SEIS, Vol. II, App. G, at G-5; App. A, at A-5 to -8. To identify these representative routes, DOE used the TRAGIS computer model, which is a regularly updated information system containing thousands of miles of rail lines and highways and allowing users to calculate routes by simulating historical rail and freight routing practices. *Id.*, Vol. II, App. G at G-5 to -13. The highway routes were selected in accordance with Department of Transportation highway routing regulations (49 C.F.R. § 397.101). *Id.*, Vol. II, App. G at G-13. This methodology is entirely reasonable at this stage of the process and identifies routes that could be used in the shipment of SNF and HLW to Yucca Mountain. "[F]ederal agencies are assigned the primary task of defining the scope of NEPA review and their determination is given considerable discretion . . . ." *Wetlands Action Network v. U.S. Army Corps of Eng'rs*, 222 F.3d 1105, 1118 (9th Cir. 2000) (citation omitted); *see also Benton County v. Dep't of Energy*, 256 F. Supp. 2d 1195, 1200 (E.D. Wa. 2003) ("DOE's determination of the appropriate scope of the environmental process . . . is entitled to deference, unless it is arbitrary and capricious."). The record demonstrates that DOE's decision to use representative routes to analyze environmental impacts, including the impact of overweight trucks, was appropriate.

In addition, DOE's use of representative routes in evaluating impacts due to transportation is entirely consistent with CEQ regulations and NEPA caselaw and thus does not raise a material issue. The policies and procedures of DOE and the CEQ that implement the requirements of NEPA call for agencies to "integrate the NEPA process with other planning at the earliest possible time" in the development of a proposed federal project. 40 C.F.R. § 1501.2. In particular, CEQ regulations 40 C.F.R. §§ 1500.5, 1501.2, 1502.5 and 1508.23 all stress the need to prepare an EIS early in the process. Moreover, with respect to situations in which only preliminary design plans had been prepared, courts have held that "the lack of final design plans does not excuse an agency from conducting the most thorough analysis possible of a proposed action." *Crouse Corp. v. ICC*, 781 F.2d 1176, 1194 (6th Cir. 1986). Nevada has not cited a single case in which an environmental impact statement was found invalid because it was prepared too early in the process. Therefore, the fact that DOE provided "the most thorough analysis possible" of transportation issues associated with the project as a whole, including discussion of representative national, regional, and local transportation routes is sufficient to satisfy NEPA's requirements.

It is settled law under NEPA that an agency is entitled to deference in determining which methodologies to use in making decisions. *See, e.g., Wyo. Lodging & Rest. Ass'n v. U.S. Dep't of Interior*, 398 F. Supp. 2d 1197, 1213 (D. Wyo. 2005) (citing cases). NEPA does not require that an EIS be "based on the best scientific methodology available," *Lands Council v. McNair*, 537 F.3d 981, 1003 (9th Cir. 2008) (quoting *Friends of Endangered Species, Inc. v. Jantzen*, 760 F.2d 976, 986, (9th Cir. 1985)) as long as the agency acted reasonably, as DOE did here.

Accordingly, this contention does not present a material issue because DOE was not required to evaluate environmental impacts of the use of overweight trucks using specifically

identified routes. Rather, DOE's analysis of such impacts using representative routes met its obligations under NEPA and the CEQ regulations.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3, regarding the legal standards under 10 C.F.R. § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding, and the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention therefore should be rejected.

#### **214. NEV-NEPA-08 - Impacts On Aesthetic Resources**

Final Environmental Impact Statement for a Rail Alignment, DOE/EIS 0369 (06/2008) ("Rail Alignment FEIS" or "RA FEIS") Subsections 4.2.3, C.4.1.3, and D.1, regarding Caliente rail alignment aesthetic resources, fail to acknowledge unacceptable adverse impacts on a cultural resource of national and international significance, and fail to apply avoidance as the appropriate method of eliminating an unacceptable adverse impact that cannot be mitigated. The impact findings reported in Rail Alignment FEIS, Chapter 4, are incorporated by reference in Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") Chapter 6. This deficiency is significant because without appropriately considering rail alignment impacts on aesthetic resources DOE has failed to adequately assess their environmental impacts, and because those environmental impacts could be materially different from that presented in the FSEIS and the RA FEIS, neither document can be adopted by the NRC.

#### **RESPONSE**

In this contention, Nevada alleges that DOE inadequately analyzed and failed to mitigate the impact of DOE's choice of the Caliente rail alignment on the "City" landscape sculpture.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R §§ 51.109 and 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its

environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavits. Its supporting affidavit is submitted by a witness without any qualifications to render expert opinions on aesthetic resources. Mr. Robert J. Halstead submits an affidavit on the cultural significance of a land sculpture located in Garden Valley. Halstead Affidavit at 1. Mr. Halstead by academic training is an historian with a Master’s degree in American History. By experience, he has worked on transportation issues for several states. Nothing in his background, however, qualifies him to provide opinions about the aesthetic resources in Nevada, the United States, or anywhere else. His affidavit is no more valid or reliable than the rejected testimony of a mathematician who tried to provide expert opinions on engineering matters, *Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-86-23, 24 NRC 108 (1986), or the environmental health expert who tried to provide expert evidence on physical security matters. *Private Fuel Storage, LLC* (Independent Spent Fuel Storage Installation), LBP-98-13, 47 NRC 360 (1998).

This contention is not supported by a credible qualified expert and ignores all of the requirements and criteria of 10 C.F.R. §§ 2.326 and 51.109. It should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is directed at the location of the Nevada railroad and therefore challenges DOE's transportation decisions and the environmental impact statements upon which those decisions are based. For the reasons which follow, it is beyond the scope of this proceeding and barred under res judicata and finality principles.

First, as addressed in Section V.A.5(a)(1) above, under the AEA and the ERA, the NRC does not have regulatory authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. In particular, challenges to the April 2004 ROD and the transportation-related portions of the 2002 FEIS on

which it was based, are no longer subject to review in any forum, as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, also are not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals. Nevada has failed to identify any issue relating to aesthetic resources for which the approach specified in Section 119 was or is not available.

In summary, challenges to the April 2004 ROD, and the transportation-related portions of the 2002 FEIS on which it was based, including DOE's analysis of the effect of the Caliente rail alignment on the "City" sculpture, are no longer subject to review in any forum, both as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA and as a result of the D.C. Circuit's 2006 decision in *Nevada v. Dep't of Energy*, 457 F.3d 78 (D.C. Cir. 2006). Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD also are not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For the reasons discussed in section c. above, this issue is not material to the findings the NRC must make because Nevada's challenges to DOE's transportation decisions are outside the scope of this proceeding and because the contention is barred under res judicata and finality principles. This contention also is not material because it fails to demonstrate any inadequacy under NEPA. It is a well-settled principle of administrative law that review of agency action is to be based on the administrative record made before the agency. *Fla. Power & Light Co. v. Lorion*, 470 U.S. 729, 743-44 (1985). This standard is applicable to review of agency action

under NEPA. *Animal Def. Council v. Hodel*, 840 F.2d 1432, 1436 (9th Cir. 1988). Thus, except under exceptional circumstances not present here, the adequacy of an EIS must be determined based on the administrative record made before DOE, not a new record made in this proceeding. *See, e.g., Friends of the Earth v. Hintz*, 800 F.2d 822, 828-29 (9th Cir. 1986). The administrative record here includes, among other documents, the draft and final 2002 FEIS and Repository SEIS, the comments, and the responses to comments.

To present an admissible contention, a petitioner cannot simply repeat the comment it made to DOE on the draft, but must demonstrate, through affidavits that comply with the requirements of 10 C.F.R. §§ 51.109 and 2.326, why the NEPA documents, including DOE's response to the comment, fail to comply with NEPA. *City of Los Angeles v. Nat'l Highway Traffic Safety Admin.*, 912 F.2d 478, 488 (D.C. Cir. 1990) (stating that simple disagreement with an agency's findings or its methods is not sufficient to render a NEPA document inadequate under NEPA). Accordingly, a potential intervenor must demonstrate that DOE has failed to take a "hard look" at environmental consequences. *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976). An EIS is adequate under this standard if it "contains a reasonably thorough discussion of the significant aspects of the probable environmental consequences." *Churchill County v. Norton*, 276 F.3d 1060, 1071 (9th Cir. 2001) (citation omitted); *Idaho Conservation League v. Mumma*, 956 F.2d 1508, 1519 (9th Cir. 1992).

The thorough discussion of the "City" sculpture in DOE's Rail Alignment EIS meets NEPA requirements. Although Nevada contends that DOE "fail[s] to acknowledge" the "existence" of the "City" land sculpture, Petition at 1074, this is plainly false. DOE explicitly discusses the "City" sculpture and engages in a careful study of the potential aesthetic and noise impacts of the Caliente Rail Corridor on the sculpture. *See Rail Alignment EIS, Vol. III at 4-87*

to -88, 4-95 to -97, Vol. V , App. D. at Figures D-29 to -50 at D-17 to -27. DOE used standard accepted methods developed by the Bureau of Land Management (BLM) to evaluate impacts to aesthetics and viewsheds. *See id.*, Vol. III at 3-106 to -107. Nevada provides no basis for its argument that the visual or noise impact analyses were inadequate, except that DOE’s conclusions conflicted with “comments to the contrary.” Petition at 1077.<sup>135</sup> A simple disagreement with the agency’s findings is insufficient. *See City of Los Angeles*, 912 F.2d at 488. It is also not material that DOE does not identify the “City” sculpture as a cultural resource, given that it undertook a detailed analysis of the impacts of the Caliente Corridor on the “City.”

Nevada is also incorrect in its position that NEPA requires DOE to adopt alternative segments to avoid alleged impacts to the “City” sculpture. Petition at 1074-75. NEPA “does not impose any substantive requirements on federal agencies – it exists to ensure a process.” *Lands Council v. McNair*, 537 F.3d 981, 1000 (9th Cir. 2008) (internal citations and quotations omitted). Thus, simply finding that a project will have an impact does not require DOE to select Nevada’s preferred rail route. DOE evaluated the technical feasibility of route segments that would avoid Garden Valley, proposed by Nevada and others as alternatives, and determined that those alternatives would not be feasible because of engineering and design constraints. *See Rail Alignment EIS*, Vol. V at Table C-5 at C-21. On this basis, DOE concluded these alternative alignments were not reasonable.

NEPA likewise does not require DOE to implement specific mitigation measures. The Supreme Court has rejected the notion that NEPA contains a “substantive requirement” that “action be taken to mitigate the adverse effects of major federal actions” or “that a complete

---

<sup>135</sup> Nor is it relevant that DOE did not measure noise at potential viewing platforms from “City.” DOE reasonably decided to measure noise levels by following relevant noise measurement guidelines. *Rail Alignment EIS*, Vol. VI, at CRD3-222. Further, changing the location of the analysis would not have affected the conclusions of the noise studies. *See id.*, Vol. III at 4-267 to -286; Figures 4-15 at 4-274, 4-19 at 4-280, and 4-20 at 4-281.

mitigation plan be actually formulated and adopted.” *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 352-3 (1989). DOE has more than satisfied its NEPA burden to provide “a reasonably complete discussion of possible mitigation measures.” *Id.* at 333. It has identified measures to mitigate the noise and aesthetic impacts on the “City” sculpture, selecting a route that would have the least impact of the alternative segments analyzed in detail in the Rail Alignment EIS. Record of Decision and Floodplain Statement of Findings-Nevada Rail Alignment for the Disposal of [SNF] and [HLW] at Yucca Mountain, Nye County, Nevada, 73 Fed. Reg. 60,247, 60,256 (Oct. 10, 2008). DOE has also proposed mitigating the visual impact of the rail line by constructing “low, rolling earthwork berms with soils and vegetation that match the surroundings.” Rail Alignment EIS, Vol III at 4-95.

Accordingly, this contention does not present a material issue and should therefore be rejected.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R. § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE’s transportation decisions and supporting NEPA analyses are outside the scope of this proceeding, because the contention is

barred on res judicata and finality grounds, and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention should therefore be rejected.

**215. NEV-NEPA-09 - Transportation Sabotage Risk Vs. At-Reactor Storage**

Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") Subsection 6.3.4 and Appendix G.8, regarding transportation sabotage events, describe what DOE considers to be reasonably foreseeable sabotage events involving repository shipments in urban areas that could result in radiological consequences. FSEIS Subsection 2.2, the No-Action Alternative, fails to consider reasonably foreseeable sabotage events at one or more of the 76 identified commercial reactor or DOE storage sites. This deficiency is significant because, without equally considering reasonably foreseeable sabotage events under both the Proposed Action and the No-Action Alternative, DOE has failed to adequately assess their environmental impacts, and because those environmental impacts could be materially different from that presented in the FSEIS the document cannot be adopted by the NRC.

**RESPONSE**

In this contention, the State of Nevada contends that the Repository SEIS cannot be adopted by the NRC because the No-Action Alternative fails to consider foreseeable sabotage events at one or more of the 76 identified commercial reactor or DOE storage sites. Petition at 1079.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R §§ 51.109 and 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true,

would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavit. First, Nevada does not in its expert’s affidavit or anywhere in its Petition separately address the criteria for §§ 51.109 and 2.326(a) or demonstrate that the contention raises a significant environmental issue or that the contention, if proven, would or would likely result in a materially different outcome in the proceeding. Indeed, Nevada merely asserts that because environmental impacts of sabotage at reactor sites “*could* be materially different from that presented in the FSEIS the document cannot be adopted.” Petition at 1079 (emphasis added). This conclusion is nothing more than a statement that something might be possible. The standard that must be met is not what “could be materially different,” but what would be or would likely be materially different.

Nevada’s expert’s affidavit simply adopts Paragraph 5 in the Petition. In fact, Nevada’s expert, Robert J. Halstead, does not make any representation that he has conducted any study or investigation regarding the matters discussed in the adopted paragraph. Halstead Affidavit at 1. Mr. Halstead and Paragraph 5 of the contention refer to just two documents. The first is characterized as “a detailed estimate of the radiological consequences of a successful sabotage

event at a commercial reactor storage site.” Petition at 1081. In fact, this “detailed estimate” is a two-and-one-half page memorandum from Marvin Resnikoff of RWMA to Mr. Halstead. (“Diablo Canyon Environmental Assessment Supplement” (June 27, 2007) (LSN# NEV000005457)). As to the validity of its conclusions, the memorandum itself makes clear their hypothetical and contingent nature. For example, the memorandum states that “[w]ithout knowing what design basis threats (DBT) for which PG&E must plan, we cannot know whether a hypothesized sabotage scenario would be successful.” *Id.* at 1.

The other document is a report Mr. Halstead and three other individuals prepared for the State of Nevada. Nowhere in his affidavit does Mr. Halstead indicate that he contributed the statements from the report that are paraphrased in Paragraph 5. Statements relating to matters such as what SNF is thermally hotter and more radioactive and the amount of a surface dose that is capable of producing an unshielded lethal exposure do not appear to fall within the expertise of Mr. Halstead. By education, Mr. Halstead is an historian with a Masters degree in American History. Halstead Affidavit, Attach. A. He has worked on transportation issues involving spent nuclear fuel, but he has no discernable background that would enable him to address the dose rates, nuclear fuel cooling rates or the radiological consequences of sabotage events. Given the lack of qualifications to provide expert opinions on transportation accidents and impacts thereof, Mr. Halstead’s affidavit fails to meet NRC admissibility standards and this contention should be rejected. *See Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), LBP-98-13, 47 NRC 360, 367-68 (1998).

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Although the 2002 FEIS and the Repository SEIS do discuss a No-Action Alternative, no challenge to the adequacy of DOE's discussion of such alternative is within the scope of this proceeding because the Nuclear Waste Policy Act of 1982, as amended, 42 U.S.C. § 10101 *et seq.*, expressly provides that an environmental impact statement prepared for the Yucca Mountain Site need not "consider the need for a repository, the alternatives to geological disposal, or alternative sites to the Yucca Mountain Site." 42 U.S.C. § 10134(a)(1)(D).

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For the reasons stated in section c. above, there is no issue material to the findings that the NRC must make regarding this contention because the NWPA expressly forecloses the need to consider alternatives to the Yucca Mountain Site, which includes "No-Action Alternatives." 42 U.S.C. § 10134(a)(1)(D). Second, the contention also does not present a material issue because, as demonstrated above, Nevada's allegation that impacts "*could* be materially different from that presented" in the Repository SEIS, Petition at 1079 (emphasis added), does not even allege a material issue. Third, the contention does not raise a material issue because, even if DOE had to consider alternatives to the Yucca Mountain site, DOE's analysis of alternatives was reasonable.

DOE selected two No-Action Alternatives: Scenario 1, where long-term storage of SNF and HLW would occur at the current storage sites with effective institutional control for at least 10,000 years; and Scenario 2, where storage would occur at the current sites with no effective

institutional control after about 100 years. Repository SEIS, Vol. I at 2-56, 4-77. DOE selected these two Scenarios to illustrate the range of potential environmental impacts that would be possible if the Yucca Mountain repository is not completed. *Id.* As DOE explained, it recognizes that “the future course Congress, DOE, and the commercial utilities would take, if Yucca Mountain was not approved, is uncertain.” *Id.* Faced with this uncertainty, DOE selected bounding scenarios.

Nevada has not shown that DOE’s selection of No-Action Alternative scenarios was unreasonable. As DOE stressed, the No-Action scenario in this case is by no means clear. There are a number of plausible outcomes, including “the continued storage of spent nuclear fuel and high-level radioactive waste at each generator site in expanded onsite storage facilities, storage of these materials at one or more centralized locations, study and selection of another location for a deep geologic repository . . . , development of new technologies, or reconsideration of alternatives to geologic disposal.” Repository SEIS, Vol. I at 7-2.

The courts have held that the rule of reason applicable to preparation of an EIS also “govern both *which* alternatives the agency must discuss, and the *extent* to which it must discuss them.” *Citizens Against Burlington, Inc. v. Busey*, 938 F.2d 190, 195 (D.C. Cir. 1991) (internal quotations omitted), quoting *Alaska v. Andrus*, 580 F.2d 465, 475 (D.C. Cir. 1978), *vacated in part as moot sub. nom W. Oil & Gas Ass’n v. Alaska*, 439 U.S. 922 (1978). An agency “need not examine an infinite number of alternatives in infinite detail.” *Allison v. Dep’t of Transp.*, 908 F.2d 1024, 1031 (D.C. Cir. 1990). Consideration of alternatives must be “bounded by some notion of feasibility.” *Id.* at 1031.

Nevada’s argument that DOE was required as part of its analysis of a No-Action Alternative to conduct an analysis of “reasonably foreseeable sabotage events at one or more of

the 76 identified commercial reactor or DOE storage sites,” Petition at 1079, would significantly expand the extent of DOE’s discussion of the No-Action Alternative, and Nevada does not demonstrate its feasibility. As DOE recognized in the Repository SEIS, there is no “reasonably foreseeable sabotage event.” Repository SEIS, Vol. I at 6-26 (“the exact nature and location of the events or the magnitude of the consequences of such acts if they were to occur, is inherently uncertain - the possibilities are infinite”). Recognizing these same difficulties regarding analysis of sabotage events, in *Pacific Gas & Electric Co.*, the Commission recently rejected as inadmissible a contention that the NRC Staff’s environmental assessment had failed to consider alternate threat scenarios. The Commission held that “[a]djudicating alternate terrorist scenarios is impracticable. The range of conceivable (albeit highly unlikely) terrorist scenarios is essentially limitless, confined only by the limits of human ingenuity.” *Pac. Gas. & Elec. Co.*, (Diablo Canyon Power Plant Independent Spent Fuel Storage Installation), CLI-08-01, 67 NRC \_\_\_\_, (slip op. at 24) (Jan. 15, 2008). DOE nonetheless took a “hard look” at the issue of sabotage. DOE evaluated events in which a military jet or commercial airliner would crash into a cask or a modern weapon would penetrate a cask, as discussed in detail in its environmental analyses. *See, e.g.*, Repository SEIS, Vol. I at 6-24 to -31. There is no NEPA requirement that DOE must expand that effort to an unspecified number of reactor sites in order to adequately analyze a no-action alternative.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact,  
With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because the contention raises an issue that is outside the scope of the proceedings and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention therefore should be rejected.

## **216. NEV-NEPA-10 - Long-Term Radiation Exposure Following Sabotage**

Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") Subsection 6.3.4.2 and Appendix G.8 regarding transportation sabotage events, and Appendix G.9.7 regarding cost of cleanup after accidents, fail to provide a realistic estimate of population radiation doses and the cost of cleanup following a sabotage event. Since insurance coverage available under the Price-Anderson Act (Section 170 of the Atomic Energy Act of 1954, as amended) would be inadequate, Congress would have to supplement the cleanup costs. Also, the period of cleanup could be greater than one year, implying an increase in radiation exposure over that assessed by DOE. This deficiency is significant because, without considering a reasonable cost of cleanup following a sabotage event, DOE has failed to adequately assess its environmental impact, and because that environmental impact could be materially different from that presented in the FSEIS, the document cannot be adopted by the NRC.

### **RESPONSE**

In this contention, the State of Nevada asserts that DOE failed to provide a realistic estimate of population radiation doses and the cost of cleanup following a transportation sabotage event. In addition, Nevada states that the period of cleanup could be greater than one year and that without considering a reasonable cost of cleanup the "environmental impact could be materially different." Petition at 1083. Nevada asserts that for these reasons, DOE's NEPA documents cannot be adopted by the NRC.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R §§ 51.109 and 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to

meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.* to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavit. Nevada does not in its expert’s affidavit or anywhere in its Petition separately address the criteria for §§ 51.109 and 2.326(a) and to demonstrate that the contention raises a significant environmental issue or that the contention, if proven, would or would likely result in a materially different outcome in the proceeding. Nevada’s expert affidavit simply adopts Paragraph 5 in the Petition. In fact, Nevada’s expert makes no representation that he has conducted any study or investigation regarding the matters discussed in the adopted paragraph. Halstead Affidavit at 1. With regard to the most difficult showing – a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true – Nevada’s expert, Robert J. Halstead, simply points to reports prepared by others, such as the RWMA report, Petition at 1085, and notes that these reports discuss a range of cleanup costs following sabotage events. Mr. Halstead never claims that he

has assured himself through independent study and analysis that the reports to which he refers (principally the RWMA report) have any scientific validity. Instead, he simply reports what the reports say – a practice that has been held to be inappropriate in the federal courts unless the person who actually prepared the report is available to testify. *Weaver v. Phoenix Home Life Mut. Ins. Co.*, 990 F.2d 154, 159 (4th Cir. 1993). Mr. Halstead asserts that DOE “acknowledges the vulnerability of truck and rail shipping casks to various sabotage event scenarios.” Petition at 1085. To the contrary, DOE stated that “[f]or the reasons stated above, DOE believes that under general credible threat conditions, the probability of a sabotage event that would result in a major radiological release would be low.” Respository SEIS, Vol. I at 6-50.

The contention makes the conclusory statement that “without considering a reasonable cost of cleanup following a sabotage event, DOE has failed to adequately assess its environmental impact, and because that environmental impact *could* be materially different from that presented in the FSEIS, the document cannot be adopted by the NRC.” Petition at 1083 (emphasis added). This conclusion is nothing more than a statement that something might be possible. The standard that must be met is not what “could be materially different,” but what would be or would likely be materially different. As to that standard, the affidavit of Mr. Halstead is silent.

Nevada’s expert is not an expert in sabotage events or the costs of cleanup. By education, Mr. Halstead is an historian with a Masters degree in American History. Halstead Affidavit, Attach. A. He has worked on transportation issues involving spent nuclear fuel, but he has no discernable background in weapons, ballistics, sabotage events, or the cleanup costs following such events. Given the lack of qualifications to provide expert opinions on sabotage events, his affidavit fails to meet the NRC’s admissibility standards and this contention should be

rejected. *See Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), LBP-98-13, 47 NRC 360, 367-68 (1998).

There are a number of additional flaws in the contention. Paragraph 2 of the contention references, without any detailed factual or technical discussion, computer software which DOE allegedly could have used to calculate costs.<sup>136</sup> Even if the software did include the ability to address cleanup costs, its application for the hypothetical accident and sabotage scenarios evaluated in the Repository SEIS would be inappropriate. For example, the Department of Homeland Security has stated that “cleanup criteria should be derived through a site-specific optimization process” and lists a large number of such site-specific factors. Notice of Final Guidance: Planning Guidance for Protection and Recovery Following Radiological Disposal Device (RDD) and Improvised Nuclear Device (IND) Incidents, 73 Fed. Reg. 45,029, 45,036 (Aug. 1, 2008). DOE reasonably concluded in the 2002 FEIS that “the restoration that would be necessary following an accident cannot be predicted. It would depend on the environmental factors involved – 1) the levels of contamination from the accident, 2) cleanup levels and decontamination methods used, and 3) location and ecology of the affected land areas – and the restoration goal that was used.” *See* 2002 FEIS, Vol. II, App. J at J-73. Nowhere in the discussion in Paragraph 5, Petition at 1085-86, does Nevada’s expert explain why the studies and estimates of cleanup costs in the event of an accidental release of radioactive material that DOE did present in the 2002 FEIS and Repository SEIS are inaccurate and do not reasonably reflect the possible cleanup costs. *See* 2002 FEIS, Vol. II, App. J at J-72 to -74; Repository SEIS, Vol. II, App. G at G-55 to -57. Under such circumstances, Nevada’s expert does not demonstrate that

---

<sup>136</sup> In fact, the reference upon which Nevada’s experts rely is to a superseded version of RADTRAN. DOE used RADTRAN 5.5, not RADTRAN 5 as Paragraph 5 states. *See* Calculation Package for Transportation Impacts, Attachment 07B (LSN#DEN001600380). This version of RADTRAN 5 does not contain an economic model.

DOE's approach was unreasonable or that any different approach would lead or would be likely to lead to a different result.

DOE also explained in detail in the Repository SEIS why Nevada's assertion of higher consequences is unrealistic. Repository SEIS, Vol. I at 6-28 to -31. Nevada's expert does not address the Repository SEIS's analysis of Nevada's assertions regarding consequences, much less demonstrate that DOE was erroneous. Ultimately, all that Nevada's expert has done in his affidavit is show that the RWMA estimates of costs are different from those DOE discusses in the 2002 FEIS and Repository SEIS. Thus, his affidavit does not meet the standards of 10 C.F.R. §§ 51.109 and 2.326 and does not provide any support for admissibility of the contention. Absent an adequate affidavit, 10 C.F.R. §§ 51.109 and 2.326 require that a contention be rejected.

Finally, in the first sentence of the contention Nevada states that DOE failed to provide a "realistic estimate of population radiation doses." Petition at 1083. This assertion, however, is never revisited in either the contention or Mr. Halstead's affidavit, and therefore is totally lacking in evidentiary support and does not meet the requirements of 10 C.F.R. §§ 51.109 and 2.326.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions challenging DOE's transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of this proceeding and may also be barred under res judicata or finality principles. Nevada's contention regarding DOE's analysis of a potential sabotage event is objectionable on all three grounds.

First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have regulatory authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, NRC must take DOE's decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

In addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. In particular, challenges to the April 2004 ROD and the transportation-related portions of the 2002 FEIS on which it was based, are no longer subject to review in any forum, as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

Nevada has failed to identify any issue relating to transportation sabotage for which the approach specified in Section 119 was or is not available.

In summary, challenges to the April 2004 ROD, and the transportation-related portions of the 2002 FEIS on which it was based, are no longer subject to review in any forum, both as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA and as a result of the D.C. Circuit's 2006 decision in *Nevada v. Dep't of Energy*, 457 F.3d 78 (D.C. Cir. 2006). Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD also are not appropriately a part of this proceeding, and may only be challenged through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In addition to being outside the scope of this proceeding and instead within the exclusive jurisdiction of the court of appeals, as well as being barred under *res judicata* and finality principles, the contention does not present an issue material to a finding the NRC must make. As a threshold matter, as demonstrated above, Nevada's allegation that "radiological impacts *could* be materially different" if cleanup costs were added, Petition at 1083, does not allege a material issue.

In any event, DOE did examine cleanup costs resulting from an accident during the transport of SNF and HLW to the repository. *See* Repository SEIS, Vol. II, App. G at G-55. DOE provided estimates of the costs of cleanup of the release of radioactive materials resulting from accidents during transport of SNF and HLW. DOE considered a wide range of potential cleanup costs that it could expect for severe accidents during the transport of SNF to the Yucca Mountain repository in the unlikely event such an event were to occur. *See* 2002 FEIS, Vol. II, App. J at J-72 to -73; *see also* Repository SEIS, Vol. II, App. G at G-55 to -57. In the 2002

FEIS, DOE estimated such costs could range from \$200,000 to \$10 billion. DOE also expressly considered estimates prepared by the State of Nevada. *See* Repository SEIS, Vol. II, App. G at G-57. DOE discussed the methodology for Nevada's estimates and expressly explained why those estimates yield unrealistically high results. *See id.*

It is settled law under NEPA that an agency is entitled to deference in determining which methodologies to use in making decisions. *See, e.g., Wyo. Lodging & Rest. Ass'n v. U.S. Dep't of Interior*, 398 F. Supp. 2d 1197, 1213 (D. Wyo. 2005) (citing cases). NEPA does not require that an EIS be "based on the best scientific methodology available," *Lands Council v. McNair*, 537 F.3d 981, 1003 (9th Cir. 2008) (quoting *Friends of Endangered Species, Inc. v. Jantzen*, 760 F.2d 97, 986 (9th Cir. 1985)), as long as the agency acted reasonably, as DOE did here. Given DOE's acknowledgement that costs could be as high as \$10 billion (albeit under very unlikely circumstances), it cannot be said that DOE has failed to consider the costs of a transportation accident. The NRC is not required "to resolve disagreements among various scientists as to methodology," *see Friends of Endangered Species, Inc.*, 760 F.2d at 986. Accordingly, Nevada's expert's preference that a different methodology for estimating accident costs be used does not raise a material issue.

Similarly, although Mr. Halstead is not a qualified expert, even if the Board were to conclude that this contention involved disputed expert opinions, the well-settled law that a petitioner does not raise a material issue under NEPA simply by presenting a battle of experts, still applies. In *Price Road Neighborhood Ass'n, Inc. v. Dep't of Transp.*, 113 F. 3d 1505 (9th Cir. 1997), the Court of Appeals affirmed a district court's grant of summary judgment to the agency. The Ninth Circuit stated that the appellant had:

sought to engage in a battle of the experts with regard to several impacts, including air quality and noise, offering their own studies

to contradict those of the agencies. We have consistently rejected such attempts, noting that “when specialists express conflicting views, an agency must have discretion to rely on the reasonable opinions of its own qualified experts”....

*Id.* at 1511 (citing *Greenpeace Action v. Franklin*, 14 F.3d 1324, 1332 (quoting *Marsh v. Or. Natural Res. Council*, 490 U.S. 360, 378 (1989)); accord, *Havasupai Tribe v. Robertson*, 943 F.2d 32, 34 (9th Cir. 1991) (affirming district court decision based on the administrative record that no supplementation of an EIS was required because “disagreement among experts does not invalidate an EIS” (citation omitted)).

As the Supreme Court stated in *Marsh*, an agency must have the discretion to rely on the reasonable opinions of its own experts “even if, as an original matter, a court might find contrary views more persuasive.” *Marsh*, 490 U.S. at 378. This is because, as the Supreme Court explained in *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976), “[n]either the statute nor its legislative history contemplates that a court should substitute its judgment for that of the agency as to the environmental consequences of its actions.” The NRC has indicated that it would adhere to this same tenet in deciding whether to adopt DOE’s EIS. Accordingly, this contention, which is premised on a disagreement between an intervenor’s expert and DOE’s expert analysis in an EIS does not create a litigable issue and therefore should not be admitted.

Finally, Nevada alleges that if the costs of cleanup exceed the insurance limits covered under the Price-Anderson Act, a possible delay in congressional action to cover the remaining costs would extend the cleanup time and, conceivably, increase long-term radiation doses beyond DOE’s one-year exposure period. Petition at 1085-86. As reflected in the very decisions Nevada cites in support of its contention, environmental impact statements need not discuss matters which are “only remote and speculative possibilities.” *Fla. Power & Light Co.*, (Turkey Point Nuclear Generating Station, Units 3 and 4), LBP-81-14, 13 NRC 677, 688 (1981); *Pub.*

*Serv. Elec. & Gas Co.*, (Hope Creek Generating Station, Units 1 and 2), ALAB-518, 9 NRC 14, 17 (1979), citing *Vt. Yankee Nuclear Power Corp. v. Natural Res. Def. Council*, 435 U.S. 519, 551 (1978) and *Natural Res. Def. Council v. Morton*, 458 F.2d 827, 837-38 (D.C. Cir. 1972). “A reasonably thorough discussion of the significant aspects of the probable environmental consequences is all that is required by an EIS.” *Pub. Serv. Elec. & Gas Co.*, ALAB-518, 9 NRC at 17, quoting *Trout Unlimited v. Morton*, 509 F.2d 1276, 1283 (9th Cir. 1974). Here, Nevada provides no analysis or underlying basis as to *why* there would be such a delay in congressional action. Without any facts, expert opinion, or references to support this assertion it amounts to nothing more than pure speculation.

Moreover, Nevada’s speculation regarding a delay in cleanup is predicated on incorrect facts. In order to assess potential radiological consequences, the Repository SEIS *assumes* there would be no cleanup for one year after an accident or sabotage event. Repository SEIS at 6-24. The Repository SEIS also states, however, that “DOE anticipates that for any significant release emergency response, interdiction, and cleanup actions would be initiated. Therefore, the assumption that no interdiction or cleanup would take place for 1 year after a severe accident or sabotage event would tend to result in overestimation of the impacts of severe accidents and sabotage events.” *Id.* Thus, there is no factual basis for Nevada’s assertion that “the period of cleanup could be greater than one year,” Petition at 1083, 1086, and the contention should also be rejected on this ground.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R. §

2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons set forth in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding, because Nevada's claim is barred by res judicata, because Nevada failed to raise its claim within 180 days of the issuance of the 2004 ROD, and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention therefore should be rejected.

**217. NEV-NEPA-11 - Sabotage Risk, Pressurized Cask**

Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 250S-F1 (07/2008) ("FSEIS"), Subsections 2.1 and 2.2 compare the preferred alternative of disposing spent nuclear fuel at the proposed Yucca Mountain repository to the no-action alternative of storing spent nuclear fuel at commercial reactor sites, however, FSEIS Subsections 6.1.11 and 6.3.4.2 fail to properly account for cask pressurization in a sabotage event during transportation. The cost/benefit ratio is therefore biased towards the preferred alternative. This deficiency is significant because without appropriately considering a sabotage event during transportation, DOE has failed to adequately assess its environmental impacts, and because those environmental impacts could be materially different from that presented in the FSEIS, the document cannot be adopted by the NRC.

**RESPONSE**

In this contention, the State of Nevada asserts that DOE allegedly failed to properly account for cask pressurization in a transportation sabotage event and as a result the environmental impacts could be materially different from that presented in the Repository SEIS.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R §§ 51.109 and 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4 Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth

the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavits. First, Nevada makes the conclusory statement that the “FSEIS [Repository SEIS] Subsections 6.1.11 and 6.3.4.2 fail to properly account for cask pressurization in a sabotage event during transportation” and therefore the “environmental impacts *could* be materially different from that presented in the FSEIS....” Petition at 1087 (emphasis added). This conclusion is nothing more than a statement that something might be possible. The standard that must be met is not what “could be materially different,” but what would be or would likely be materially different. As to that standard, the affidavits of Dr. Thorne and Mr. Halstead are silent. Thorne Affidavit at 1; Halstead Affidavit at 1.

Nevada does not in its experts’ affidavits or anywhere in its Petition separately address the criteria for §§ 51.109 and 2.326(a) or demonstrate that the contention raises a significant environmental issue or that the contention, if proven, would or would likely result in a materially different outcome in the proceeding. Nevada’s two experts’ affidavits simply adopt paragraphs in the Petition. Neither of Nevada’s experts makes any representation that they have conducted any study or investigation regarding the matters discussed in the adopted paragraphs. With regard to the most difficult showing – a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true – Nevada’s two experts,

Dr. Thorne and Mr. Halstead, simply point to reports prepared by others. Neither Dr. Thorne nor Mr. Halstead claims that he has assured himself through independent study and analysis that the reports to which he refers have any scientific validity. Instead the experts simply report what the reports say.

Dr. Thorne and Mr. Halstead refer to a one-page excerpt of a report of Holtec International to the effect that storage casks in use at reactor sites are pressurized with helium. Petition at 1089. Nevada's experts then argue in Paragraph 5, without citing to any supporting references that "[w]hen punctured by an explosion, the blowdown effect would be far greater with a pressurized cask." *Id.*

Dr. Thorne also adopts paragraph 6 of the contention, Thorne Affidavit, Attach. C., and relies on a RWMA report for the proposition that "in a potential sabotage event, the consequences would be greater for a pressurized cask." Petition at 1090. However, that report expressly states that it "has not carried out the calculations" to support such a conclusion, but states only that pressurization to 100 psig "impl[ies] the blowdown effect would be much greater." "Potential Consequences of a Successful Sabotage Attack on a Spent Fuel Shipping Container: Updated Analysis Revised Final Version," RWMA (Nov. 1, 2008) (LSN# NEV000005444). Neither Dr. Thorne nor Mr. Halstead has the necessary expertise to offer an expert opinion to this effect. Dr. Thorne's training and experience is in the area of health physics and there is nothing in his background which would qualify him to provide expert testimony on possible sabotage events or SNF release fractions from a pressurized or un-pressurized cask. *See* Thorne Affidavit, Attach. A. Similarly, Mr. Halstead has nothing in his training or experience that would permit him to offer expert opinions on these subjects. *See* Halstead Affidavit, Attach. A. By education, Mr. Halstead is an historian with a Masters degree in American History. He

has worked on transportation issues involving spent nuclear fuel, but he has no discernable background in weapons, ballistics, or sabotage events. Given the lack of any qualifications to provide expert opinions, the affidavits of Nevada's two experts fail to meet the NRC's admissibility standards and contention should be rejected. *See Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), LBP-98-13, 47 NRC 360, 367-68 (1998).

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions challenging DOE's transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of this proceeding and may also be barred under res judicata or finality principles. Nevada's contention regarding DOE's analysis of a potential sabotage event and the consequences associated with a punctured pressurized cask is objectionable on all three grounds. First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have regulatory authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's decisions concerning transportation facilities

and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE's transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. In particular, challenges to the April 2004 ROD and the transportation-related portions of the 2002 FEIS on which it was based, are no longer subject to review in any forum, as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, also are not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals. Nevada has failed to identify any issue relating to transportation sabotage for which the approach specified in Section 119 was or is not available.

In summary, challenges to the April 2004 ROD, and the transportation-related portions of the 2002 FEIS on which it was based, including DOE's analysis of potential sabotage events, are no longer subject to review in any forum, both as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA and as a result of the D.C. Circuit's 2006 decision in *Nevada v. Dep't of Energy*, 457 F.3d 78 (D.C. Cir. 2006). Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD also are not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In addition to being outside the scope of this proceeding and instead within the exclusive jurisdiction of the court of appeals, as well as being barred under res judicata and finality principles, the contention does not present an issue material to a finding the NRC must make. As a threshold matter, as demonstrated above, Nevada's allegation that "environmental impacts *could* be materially different," if cask pressurization were considered, Petition at 1087 (emphasis added), does not allege a material issue. In any event, DOE did evaluate events in which a military jet or commercial airliner would crash into a cask or a modern weapon would penetrate a cask, and recognized the uncertainty inherent in the analysis of potential sabotage events, noting that the possibilities are infinite. *See, e.g.*, Repository SEIS, Vol. I at 6-24 to -31. Recognizing these same difficulties, in *Pacific Gas & Electric Co.*, the Commission recently rejected as inadmissible a contention that the NRC Staff's environmental assessment had failed to consider alternate threat scenarios. The Commission held that "[a]djudicating alternate terrorist scenarios is impracticable. The range of conceivable (albeit highly unlikely) terrorist scenarios is essentially limitless, confined only by the limits of human ingenuity." *Pac. Gas & Elec. Co.* (Diablo Canyon Power Plant Independent Spent Fuel Storage Installation), CLI-08-01, 67 NRC \_\_\_ (slip op. at 24) (Jan. 15, 2008). Nevada has not demonstrated that adding cask pressurization to the analysis would or would be likely to materially change the result.

Even if the Board were to conclude that this contention involved disputed expert opinions, it is well-settled law that a petitioner does not raise a material issue under NEPA simply by presenting a battle of experts. In *Price Road Neighborhood Ass'n, Inc. v. Dep't of Transp.*, 113 F. 3d 1505 (9th Cir. 1997), the Court of Appeals affirmed a district court's grant of summary judgment to the agency. The Ninth Circuit stated that the appellant had:

sought to engage in a battle of the experts with regard to several impacts, including air quality and noise, offering their own studies to contradict those of the agencies. We have consistently rejected such attempts, noting that “when specialists express conflicting views, an agency must have discretion to rely on the reasonable opinions of its own qualified experts....”

*Id.* at 1511, citing *Greenpeace Action v. Franklin*, 14 F.3d 1324, 1332 (9th Cir. 1992) (quoting *Marsh v. Or. Natural Res. Council*, 490 U.S. 360, 378 (1989); accord *Havasupai Tribe v. Robertson*, 943 F.2d 32, 34 (9th Cir. 1991) (affirming district court decision based on the administrative record that no supplementation of an EIS was required because “disagreement among experts does not invalidate an EIS”) (citation omitted).

As the Supreme Court stated in *Marsh*, an agency must have the discretion to rely on the reasonable opinions of its own experts “even if, as an original matter, a court might find contrary views more persuasive.” *Marsh*, 490 U.S. at 378. This is because, as the Supreme Court explained in *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976), “[n]either the statute nor its legislative history contemplates that a court should substitute its judgment for that of the agency as to the environmental consequences of its actions.” The NRC has indicated that it would adhere to this same tenet in deciding whether to adopt DOE’s EIS. Specifically, in promulgating 10 C.F.R. § 51.109, the NRC stated that “the adoption of the [DOE] statement does not necessarily mean that NRC would independently have arrived at the same conclusions on matters of fact or policy.” NEPA Review Procedures for Geologic Repositories for High-Level Waste, 53 Fed. Reg. 16,131, 16,142 (May 5, 1988). Accordingly, a NEPA contention that is premised on a disagreement between an intervenor’s expert and DOE’s expert analysis in an EIS does not create a litigable issue and should not be admitted.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in section c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding, because Nevada's claim is barred by res judicata, because Nevada failed to raise its claim within 180 days of the issuance of the 2004 ROD, and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention therefore should be rejected.

## **218. NEV-NEPA-12 - Transportation Risk Assumptions**

Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") Subsection 6.3 regarding national transportation events, and Appendices G.6 through G.8, specifically regarding transportation event assumptions, fail to use the consistent application of weather and release fraction assumptions to all reasonably foreseeable accident and sabotage scenarios. This deficiency is significant because, without the consistent application of weather and release fraction assumptions to transportation accident or sabotage events, DOE has failed to adequately assess their environmental impacts, and because those environmental impacts could be materially different from that presented in the FSEIS and the "Final Environmental Impact Statement for a Rail Alignment," DOE/EIS 0369 (06/2008), LSN# DEN001593557 ("Rail Alignment FEIS" or "RA FEIS"), neither document can be adopted by the NRC.

### **RESPONSE**

In this contention, the State of Nevada asserts that DOE failed to consistently apply the same weather and release fraction assumptions to all reasonably foreseeable transportation accident and sabotage scenarios, thus the environmental impacts could be materially different from that presented in the Repository SEIS and Rail Alignment FEIS.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if

proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavits. Nevada does not in its experts’ affidavits or anywhere in its Petition separately address the criteria for §§ 51.109 and 2.326(a) or demonstrate that the contention raises a significant environmental issue or that the contention, if proven, would or would likely result in a materially different outcome in the proceeding. Nevada’s two experts’ affidavits simply adopt paragraphs in the Petition. Neither of Nevada’s experts, Mr. Halstead and Mr. Frishman, makes any representation that he has conducted any study or investigation regarding the matters discussed in the adopted paragraphs. Nevada simply makes the conclusory statement that “without the consistent application of weather and release fraction assumptions to transportation accident or sabotage events, DOE has failed to adequately assess their environmental impacts, and because those environmental impacts *could* be materially different from ... [the Repository SEIS and Rail Alignment EIS], neither document can be adopted by the NRC.” Petition at 1091 (emphasis added). This conclusion is nothing more than a statement that something might be possible. The standard that must be met is not what “*could* be materially

different,” but what would be or would likely be materially different. As to that standard, the affidavits of Mr. Halstead and Mr. Frishman are silent.

Neither of Nevada’s two experts is an expert on weather and release fraction assumptions for potential transportation accident and sabotage scenarios. Mr. Frishman is a geologist and there is nothing identified in his background to suggest that he is qualified to provide expertise on these matters. Frishment Affidavit, Attach. A. Similarly, Mr. Halstead has nothing in his training or experience that qualifies him to offer expert opinions on these topics. Halstead Affidavit, Attach. A. By education, Mr. Halstead is an historian with a Masters degree in American History. He has worked on transportation issues involving spent nuclear fuel, but he has no discernable background in atmospheric, more specifically, dispersion of contaminants, or the calculation of release fraction assumptions that might be incurred in the event of an accidental release of radiation during transportation of SNF. Given the lack of qualifications to provide expert opinions on weather and release fractions, the affidavits of Nevada’s two experts fail to meet the NRC’s admissibility standards and this contention should be rejected. *See Private Fuel Storage, L.L.C. (Independent Spent Fuel Storage Installation)*, LBP-98-13, 47 NRC 360, 367-68 (1998).

Nevada’s two experts rely solely on a report prepared by someone else (the RWMA Report, LSN# NEV000005444), and a spreadsheet submitted by Nevada to the LSN. Petition at 1094. The spreadsheet, which provides two tables of Pasquill Stability Categories, provides no analysis, references, or the underlying assumptions used to support the various Pasquill Category F and D values. *See* “Halstead Spreadsheet Calculating Population Exposures When Meteorology is Changed from Pasquill Category D to Pasquill Category F,” (Nov. 21, 2008) (LSN# NEV000005464). Although entitled “Halstead Spreadsheet,” Mr. Halstead does not state

in his affidavit that he prepared this spreadsheet or that it was prepared under his direction. Halstead Affidavit at 1. Indeed, the subject matter of the spreadsheet regarding calculation of radiation dose and the expected number of cancer fatalities and non-cancer fatalities would appear to be beyond his area of expertise. *Id.* at Attach. A.

Furthermore, neither Mr. Frishman nor Mr. Halstead claims that he has assured himself through independent study and analysis that the reports to which he refers have at least some scientific validity. Instead, the experts simply adopt what the reports say and make the conclusory statement that DOE's "use of different weather and release fractions between these evaluations [DOE's Pasquill Stability classes] is an inconsistent application of assumptions," and that therefore DOE did not consider the maximum reasonably foreseeable transportation accident scenario. Petition at 1093. Even if there is an inconsistency in an assumption, that does not establish that DOE did not consider the maximum reasonably foreseeable transportation accident scenario.

Finally, Nevada's experts contend that "DOE did not consider the maximum reasonably foreseeable sabotage scenario in the [Repository SEIS]." Petition 1094. However, as DOE explained in the Repository SEIS, "[w]hether acts of sabotage or terrorism would occur, and the exact nature and location of the events or the magnitude of the consequences of such acts if they were to occur, is inherently uncertain – the possibilities are infinite." Repository SEIS, Vol. I at 6-26. Nevada's experts do not even address DOE's conclusion, much less demonstrate that it is incorrect.

In sum, this contention is not supported by evidence or analysis provided by a credible qualified expert witness and ignores all of the requirements and criteria of 10 C.F.R. §§ 2.326 and 51.109. This contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions challenging DOE's transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of this proceeding and may also be barred under res judicata or finality principles. Nevada's contention regarding DOE's analysis of potential transportation accident or sabotage events is objectionable on all three grounds.

First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have regulatory authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are

within the original and exclusive jurisdiction of the federal courts of appeals. In particular, challenges to the April 2004 ROD and the transportation-related portions of the 2002 FEIS on which it was based, are no longer subject to review in any forum, as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals. Nevada has failed to identify any issue relating to transportation sabotage for which the approach specified in Section 119 was or is not available.

In summary, challenges to the April 2004 ROD, and the transportation-related portions of the 2002 FEIS on which it was based, including DOE's analysis of potential sabotage events, are no longer subject to review in any forum, both as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA and as a result of the D.C. Circuit's 2006 decision in *Nevada v. Dep't of Energy*, 457 F.3d 78 (D.C. Cir. 2006). Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD also are not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

In addition to being outside the scope of this proceeding and instead within the exclusive jurisdiction of the court of appeals, as well as being barred under *res judicata* and finality principles, the contention does not present an issue material to a finding the NRC must make. As a threshold matter, as demonstrated above, Nevada's allegation that environmental impacts "could" be materially different does not allege a material issue. Indeed, neither Nevada nor its

experts explain how DOE's application of Pasquill Stability Class F for a transportation accident versus Class D for a sabotage event has any bearing on the overall environmental impacts.

Petition at 1093-94. Nevada merely asserts that DOE's use of Class F (assuming "stable conditions") for the reasonably foreseeable transportation accident is somehow inconsistent with the use of Class D (assuming "neutral conditions") for a sabotage event. *Id.*

With respect to the reasonably foreseeable transportation accident, in the FEIS, DOE reported the results using a Pasquill Class F status. (2002 FEIS, Vol. II, App. J. at Table J-22 at J-61; Table J-23 at J-62. While Stability Class D consequences were analyzed, the 2002 FEIS stated that "because the consequences are smaller than those of class F stability conditions, they are not presented." 2002 FEIS, Vol. II, App. J at J-61. In an effort to compare the results with the 2002 FEIS, in the Repository SEIS, the consequences of the maximum reasonably foreseeable transportation accident were again estimated using Class F stability and a wind speed of 0.89 m/s. Repository SEIS, Vol. II, App. G at, G-47. If the Repository SEIS had presented the consequences based on Class D stability, the consequences would again be less than those already included in the Repository SEIS. With respect to sabotage events, as DOE explained in the Repository SEIS, "because it is not possible to forecast the environmental conditions that might exist during an act of sabotage, DOE used neutral atmospheric conditions (Class D stability) which represent plume concentrations that would not be exceeded 50 percent of the time." Repository SEIS, Vol. I at 6-30. Nevada fails to demonstrate why these were not reasonable assumptions.

Nevada also complains about the use of 21 fuel assemblies per cask in DOE's maximum reasonably foreseeable accident analysis versus 26 fuel assemblies in its sabotage analysis. In the accident analysis, DOE used 21 assemblies because this is the number that would be

contained in a TAD which did not become a part of the project until after completion of the 2002 FEIS. Repository SEIS at S-8. However, DOE used 26 fuel assemblies for transportation sabotage events because the original release fractions were based on a cask containing 26 fuel assemblies. *Id.*, Vol. II, App. G at G-49. DOE chose to estimate the consequences of a rail sabotage event based on the radionuclide inventory in 26 spent fuel assemblies – recognizing that this would overestimate consequences by approximately 24 percent – rather than re-estimate the release fractions for a 21 spent nuclear fuel assembly cask. Nevada similarly fails to demonstrate that this approach was unreasonable.

An agency is entitled to rely on reasonable assumptions in its environmental analyses. *Inland Empire Pub. Lands Council v. U.S. Forest Serv.*, 88 F.3d 754, 761 (9th Cir. 1996), citing *Sierra Club v. Marita*, 845 F. Supp. 1317, 1331 (E.D. Wis. 1994) *aff'd*, 46 F.3d 606 (7th Cir. 1995); *Greenpeace Action v. Franklin*, 14 F.3d 1324, 1335-36 (9th Cir. 1992). As in the case of a reviewing court, it is not the role of the NRC “to decide what assumptions ... we would make were we in the Secretary’s position, but rather to scrutinize the record to ensure that the Secretary has provided a reasoned explanation for his policy assumptions ....” *Wyo. Lodging and Rest. Ass’n v. Dept. of Interior*, 398 F. Supp. 2d 1197, 1214 (D. Wyo. 2005), citing *Am. Iron & Steel Inst. v. OSHA.*, 939 F.2d 975, 982 (D.C. Cir. 1991)); *S.F. Baykeeper v. U.S. Army Corps of Eng’rs*, 219 F. Supp. 2d 1001, 1015 (N.D. Cal. 2002) (agency’s reasonable assumptions entitled to deference).

The NRC has already made clear that the decision to adopt DOE’s environmental analyses “does not necessarily mean that NRC would independently have arrived at the same conclusions on matters of fact or policy.” NEPA Review Procedures for Geologic Repositories for High-Level Waste, 53 Fed Reg. 16,131, 16,142 (May 5, 1988). DOE has provided

reasonable explanations for the assumptions it has made in its NEPA analyses and it is not the Commission's duty to "second guess" assumptions such as the use of Class D weather conditions for a sabotage event. *Wyo. Lodging and Rest. Ass'n*, 398 F. Supp. 2d at 1214.

Nevada alleges in Paragraph 5 that "DOE did not consider the maximum reasonably foreseeable sabotage scenario in the FSEIS and does not comply with NEPA requirements." Petition at 1094. However, as described above, there is no "maximum reasonably foreseeable sabotage scenario," given the infinite number of possibilities. Recognizing these same difficulties regarding analysis of sabotage events, in *Pacific Gas & Electric Co.*, the Commission recently rejected as inadmissible a contention that the NRC Staff's environmental assessment had failed to consider alternate threat scenarios. The Commission held that "[a]djudicating alternate terrorist scenarios is impracticable. The range of conceivable (albeit highly unlikely) terrorist scenarios is essentially limitless, confined only by the limits of human ingenuity." *Pacific Gas & Electric Co. (Diablo Canyon Power Plant Independent Spent Fuel Storage Installation)*, CLI-08-01, 67 NRC \_\_\_, (slip op. at 24 (Jan. 15, 2008)). DOE nonetheless took a "hard look" at the issue of sabotage. DOE evaluated events in which a military jet or commercial airliner would crash into a cask or a modern weapon would penetrate a cask as discussed in detail in its environmental analyses. *See, e.g.*, Repository SEIS, Vol. I at 6-24 to -31.

NEPA does not require DOE to conduct a "worst-case" analysis. In eliminating the requirement to conduct such an analysis from its regulations in 1985, the Council on Environmental Quality (CEQ) pointed out that "one can always conjure up a worse 'worst case'" by adding more variables to a hypothetical event (quoting 50 Fed. Reg. 32,234, 32,236 (Aug. 8, 1985)), and that "'worst case analysis' is an unproductive and ineffective method . . . one which can breed endless hypothesis and speculation" (quoting 51 Fed. Reg. 15,620, 15,624-5 (Apr. 25,

1986)). In *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 356 (1989), the Supreme Court held that the CEQ acted reasonably in eliminating the requirement that an agency conduct a worst-case analysis. The Court noted that CEQ regulations are “entitled to substantial deference,” and that the “worst case analysis” requirement had been abandoned for the well-considered reason that it had “distort[ed] the decision-making process by overemphasizing highly speculative harms.” *Id*; *Edwardsen v. U.S. Dep’t of Interior*, 268 F.3d 781, 785 (9th Cir. 2001) (“an EIS need not include a worst case scenario”). Accordingly, EISs “need not discuss in detail every possible negative effect” of an action in order for an agency to fulfill its NEPA obligations. *County of San Diego v. Babbitt*, 847 F. Supp. 768, 775 (S.D. Cal. 1994).

DOE – as acknowledged by Nevada in this contention (Petition at 1091, 1093-94) – and as discussed above, did examine weather and release fraction assumptions and took a hard look at the issue of sabotage. *See* Petition at 1091, 1093-94. It is settled law under NEPA that an agency is entitled to deference in determining which methodologies to use in making decisions. *See, e.g., Wyo. Lodging & Rest. Ass’n*, 398 F. Supp. 2d at 1213 (citing cases). NEPA does not require that an EIS be “based on the best scientific methodology available,” *Lands Council v. McNair*, 537 F.3d 981, 1003 (9th Cir. 2008) (quoting *Friends of Endangered Species, Inc. v. Jantzen*, 760 F.2d at 986), as long as the agency acted reasonably, as DOE did here. The NRC is not required “to resolve disagreements among various scientists as to methodology.” *Friends of Endangered Species, Inc.*, 760 F.2d at 976, 986 (9th Cir. 1985). Accordingly, Nevada’s experts’ preference that a different methodology for estimating weather and release fraction assumptions be utilized does not raise a material issue.

Finally, although Mr. Frishman and Mr. Halstead are not qualified experts, and even if the Board were to conclude that this contention involved disputed expert opinions, the well-

settled law that a petitioner does not raise a material issue under NEPA simply by presenting a battle of experts still applies. In *Price Road Neighborhood Ass'n Inc. v. Dep't of Transp.*, 113 F.3d 1505 (9th Cir. 1997), the Court of Appeals affirmed a district court's grant of summary judgment to the agency. The Ninth Circuit stated that the appellant had:

sought to engage in a battle of the experts with regard to several impacts, including air quality and noise, offering their own studies to contradict those of the agencies. We have consistently rejected such attempts, noting that "when specialists express conflicting views, an agency must have discretion to rely on the reasonable opinions of its own qualified experts"....

*Id.* at 1511 citing *Greenpeace Action v. Franklin*, 14 F.3d 1324, 1332 (9th Cir. 1992) (quoting *Marsh v. Or. Natural Res. Council*, 490 U.S. 360, 378 (1989); accord, *Havasupai Tribe v. Robertson*, 943 F.2d 32, 34 (9th Cir. 1991) (affirming district court decision based on the administrative record that no supplementation of an EIS was required because "disagreement among experts does not invalidate an EIS") (citation omitted).

As the Supreme Court stated in *Marsh*, an agency must have the discretion to rely on the reasonable opinions of its own experts "even if, as an original matter, a court might find contrary views more persuasive." *Marsh*, 490 U.S. at 378. This is because, as the Supreme Court explained in *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976), "[n]either the statute nor its legislative history contemplates that a court should substitute its judgment for that of the agency as to the environmental consequences of its actions." The NRC has indicated that it would adhere to this same tenet in deciding whether to adopt DOE's EIS. Accordingly, this contention, which is premised on a disagreement between an intervenor's expert and DOE's expert analysis in an EIS, does not create a litigable issue and therefore should not be admitted.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons set forth in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding, because Nevada's claim is barred by res judicata, because Nevada failed to raise its claim within 180 days of the issuance of the 2004 ROD, and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention should therefore be rejected.

## **219. NEV-NEPA-13 - Grazing Impacts**

Final Environmental Impact Statement for a Rail Alignment, DOE/EIS 0369 (06/2008) ("Rail Alignment FEIS" or "RA FEIS") Subsections 4.2.2.2.3.2 and 4.3.2.2.3.2, incorporated by reference in Section 6.4 of the Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") (*see* FSEIS at 6-1), acknowledge that DOE failed to apply the appropriate methodology in assessing the impacts of railroad construction on up to 32 active Bureau of Land Management (BLM) grazing allotments. This deficiency is significant because, without accurately assessing impacts of railroad construction on grazing allotments, there is no adequate disclosure of alternatives under NEPA. If reasonable alternative corridors, alignments, and segments were assessed, the disclosure of impacts on grazing allotments could be materially different, thus the FEIS and FSEIS cannot be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada alleges that DOE has failed to adequately address the impacts of railroad construction on grazing allotments.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Nevada's environmental contention must also be supported by the affidavit of a

qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met 10 C.F.R. § 2.326(b).” As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting affidavits. Its supporting affidavits are submitted by witnesses without any qualifications to render expert opinions on grazing impacts. Mr. Robert J. Halstead submits an affidavit on grazing impacts. Halstead Affidavit at 1, Attach. B. Mr. Halstead by academic training is an historian with a Master’s degree in American History. *Id.*, Attach. A. By experience, he has worked on transportation issues for several states. Nothing in his background, however, qualifies him to provide opinions about grazing in Nevada, the United States or anywhere else. His affidavit is no more valid or reliable than the rejected testimony of a mathematician who tried to provide expert opinions on engineering matters, *Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-86-23, 24 N.R.C. 108 (1986), or the environmental health expert who tried to provide expert evidence on physical security matters. *Private Fuel Storage, L.L.C.*, (Independent Spent Fuel Storage Installation), LBP 98-13, 47 NRC 360 (1998). The background of Mr. Steven A. Frishman is also insufficient to qualify him to provide expert opinions about issues of grazing in Nevada. Frishman Affidavit at 1, Attach. B. Mr. Frishman’s education and professional experience is in the area of geology, particularly oceanography and coastal resource management in Texas. *See* Frishman Affidavit,

Attach. A. Nothing in Mr. Frishman's background suggests that he is qualified to provide expertise on issues of grazing.

Apart from the failure to provide an affidavit from a qualified expert, the affidavits provided in support of this contention largely ignore the criteria of 10 C.F.R. §§ 2.326 and 51.109. The affidavits do not separately address each of the criteria of § 2.326 nor do they provide a "specific explanation" of why each requirement has been met. Mr. Halstead and Mr. Frishman merely adopt the allegations set forth in Paragraph 5 of this contention. Neither Mr. Halstead nor Mr. Frishman provides any evidence, explanation, or analysis to support the allegations set forth by this contention.

Paragraph 5, in turn, simply quotes a series of unsupported statements previously submitted as comments to DOE on behalf of Nevada by "Richard Moore, P.E." Petition at 1097-98. Mr. Halstead and Mr. Frishman do not even claim to have reviewed or analyzed the work of Mr. Moore beyond the quote set forth in Paragraph 5. Paragraph 5 is repeating, out of context, what another has reported – a practice that has been found to be inappropriate in the federal courts unless the person who actually prepared the report is available to testify. *Weaver v. Phoenix Home Life Mut. Ins. Co.*, 990 F.2d 154, 159 (4th Cir. 1993). In addition, to present an admissible contention, a petitioner cannot simply repeat the comment it made to DOE on the draft, but must demonstrate, through affidavits that comply with the requirements of 10 C.F.R. §§ 51.109 and 2.326, why the NEPA documents, including DOE's response to the comment, fails to comply with NEPA. *City of Los Angeles v. Nat'l Highway Traffic Safety Admin.*, 912 F.2d 478, 488 (D.C. Cir. 1990) (simple disagreement with an agency's findings or its methods is not, however, sufficient to render an EA or EIS inadequate under NEPA).

With regard to the most important requirement of § 2.326 – whether a materially different result would be likely – Paragraph 5 of the contention and the affidavits of Mr. Halstead and Mr. Frishman are silent. This contention is not supported by a credible qualified expert and ignores all of the requirements and criteria of 10 C.F.R. §§ 2.326 and 51.109. This contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to the other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to the other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions challenging DOE’s transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of this proceeding and may also be barred under res judicata or finality principles. Nevada’s contention regarding the impacts on grazing of railway construction is objectionable on jurisdictional grounds.

First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have regulatory authority over DOE’s transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE’s decisions concerning transportation facilities and activities as a given in considering

the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For the reasons discussed in section c. above, this issue is not material to the findings the NRC must make because challenges to DOE's transportation decisions are outside the scope of this proceeding. In addition, this contention does not present a material issue because DOE's NEPA documents adequately analyze potential impacts on grazing allotments.

Nevada alleges that DOE failed to satisfy NEPA's requirements because DOE did not "accurately assess[ ] impacts of railroad construction on grazing allotments." Petition at 1095. Under NEPA, DOE is required to take a "hard look" at potential environmental consequences. *See Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976). In its NEPA documents, DOE analyzed the environmental and economic impacts of the proposed railway on grazing, including the potential impacts of construction as well as operation of the railway. *See, e.g., Rail Alignment EIS*, Vol. III at 4-46, 4-62, 4-65 to -70, 4-296 to -298; *id.*, Vol. V at 5-24 to -27, 5-29 to -31, 7-42 to -44. In particular, DOE analyzed the estimated potential loss of animal unit months for grazing allotments that would fall within the rail line construction right-of-way and

support facilities, *id.* at Vol. III at 4-46, the potential effects of railroad operations, *id.*, Vol. III at 4-62 to -65, and possible mitigation measures “to reduce impacts to both grazing operations and existing range improvements,” *id.*, Vol. III at 4-47.

The methods used in the Rail Alignment EIS to evaluate loss of animal unit months were developed in conjunction with the U.S. Bureau of Land Management (BLM), a cooperating agency on the Rail Alignment EIS and the federal agency responsible for managing grazing on public lands crossed by the rail line. *See* Rail Alignment EIS, Vol. I at 1-10 to -11. Using these methods, DOE estimated the potential loss of animal unit months with respect to “the proportion of land within each grazing allotment that would fall within the footprints of the rail line construction right-of-way and support facilities.” *Id.*, Vol. III at 4-62 to -65. For this analysis, DOE assumed “that the entire land area within the rail line construction right-of-way would be unavailable for forage and would no longer support grazing.” *Id.*, Vol. III at 4-46. DOE’s use of the 1,000-foot-wide construction right-of-way as the basis for its analysis provided a conservative estimate of the amount of land that would be disturbed because long-term impacts to grazing would more closely relate to the significantly narrower (“nominally [200 feet] on either side of the centerline of the rail line”) operations right-of-way.<sup>137</sup> *Id.*, Vol. III at 4-7, 4-32. In addition, “[t]he construction phase encompasses the most intensive land use in terms of noise, human activity, and disruptions to land access.” *Id.*, Vol. II at 3-36. DOE concluded that no more than 6.6 percent of animal unit months would be lost for any allotment, and less than two

---

<sup>137</sup> DOE noted that “[l]ands formerly inside the construction right-of-way but not included in the operations right-of-way would be reclaimed (restored to natural conditions), as appropriate.” Rail Alignment EIS, Vol. I at 2-5. Nowhere in its NEPA documents does DOE assume, however, that forage lost during construction would be reclaimed and available by the operations phase or that “reclamation will occur quickly,” as alleged by Nevada. Petition at 1098. Instead, DOE described its intent to conduct reclamation activities in accordance with the Best Management Practices set forth in Chapter 7 of the Rail Alignment EIS. *See* Rail Alignment EIS, Vol. III at Table 7-1 at 7-24 to -25.

percent would be lost for most allotments crossed by the rail line construction right-of-way. *Id.*, Vol. III at Tables 4-15 to -22 at 4-49 to -54.

DOE acknowledged the inherent uncertainties in this analysis and noted that the estimation of potential animal unit month losses would not be used to determine actual mitigation or compensation amounts. *See id.*, Vol. III at 4-46 to -47. DOE explained that because the estimation of potential animal unit month losses did not include “allotment-specific characteristics, such as topography and the quality and quantity of grass cover,” the “animal unit month loss estimates would not be appropriate for determining [actual] levels of mitigation or compensation.” *Id.*, Vol. VI at CRD3-96. Nowhere does DOE state, however, that the methods used to estimate grazing impacts were in any way “inappropriate, for the purpose of analyzing potential impacts in accordance with NEPA, as alleged by Nevada. The DOE’s conservative estimate of the amount of affected land would likely account for any site-specific impacts, such as potential impacts on high-quality forage and/or drainage patterns. *See id.*, Vol. III at 4-46. The fact that DOE provided a conservative and reasonably thorough analysis of potential impacts on grazing allotments is sufficient to satisfy NEPA’s requirements.

DOE’s NEPA documents also analyzed possible mitigation measures that could be developed and implemented in conjunction with the BLM “to minimize or compensate for the loss of animal unit months,” as necessary, in accordance with the Best Management Practices set forth in Chapter 7 of the Rail Alignment EIS. Rail Alignment EIS, Vol. III at 4-47; *see also id.*, Vol. IV at 7-24 to -25, 7-42 to -44, 7-46.

Possible mitigation measures analyzed by DOE include: “[r]elocating existing infrastructure and water resources,” “[p]roviding temporary feed, water, and assistance in cattle movement during rail line construction,” and “construction of culverts, bridges, and cattle guards

to facilitate or prevent the movement of livestock” where necessary. *Id.*, Vol. III at 4-47. Once implemented, these measures would address specific effects as determined through coordination with the BLM, Surface Transportation Board, and affected permittees. *Id.* At this early stage, many years before shipments begin, it would be premature to attempt to predict the exact effects to be mitigated or attempt to provide site-specific mitigation plans. *See Duke Energy Corp.* (McGuire Nuclear Station, Units 1 and 2; Catawba Nuclear Station, Units 1 and 2), CLI-03-17, 58 NRC 419, 431 (2003) (finding that NEPA does not demand a “detailed explanation of specific measures which *will* be employed to mitigate adverse environmental effects” (emphasis added)); *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 353 (1989) (holding that NEPA does not require “a fully developed plan that will mitigate environmental harm before an agency can act”).

Nevada’s allegation that DOE’s NEPA documents are inadequate because DOE’s NEPA documents do not address potential effects on a site-specific basis is inconsistent with CEQ regulations and NEPA caselaw and thus does not raise a material issue. *See* Petition at 1098-99. The policies and procedures of DOE and the CEQ that implement the requirements of NEPA call for agencies to “integrate the NEPA process with other planning at the earliest possible time” in the development of a proposed federal project. 40 C.F.R. § 1501.2. In particular, CEQ regulations 40 C.F.R. §§ 1500.5, 1501.2, 1502.5 and 1508.23 all stress the need to prepare an EIS early in the process. NEPA analysis of environmental consequences must be made “as soon as it can reasonably be done.” *Kern v. U.S. Bureau of Land Mgmt.*, 284 F.3d 1062, 1072 (9th Cir. 2002) (citing *Save Our Ecosystems v. Clark*, 747 F.2d 1240, 1246 n.9 (9th Cir. 1984) (“Reasonable forecasting and speculation is . . . implicit in NEPA.”) (internal citation omitted)). Nevada has not cited a single case in which an environmental impact statement was found

invalid because it was prepared too early in the process. Therefore, the fact that DOE provided a reasonably thorough analysis of transportation issues associated with the project, including a discussion of potential impacts of rail construction and operations on grazing allotments, is sufficient to satisfy NEPA's procedural requirements.

Accordingly, this contention does not present a material issue and should therefore be rejected.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R. § 2.309(f)(1)(v), Nevada has failed to provide the required supporting facts, expert opinions, and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention should therefore be rejected.

**220. NEV-NEPA-14 - Deferred Assessment Of Railroad Construction Impacts On Grazing**

“Final Environmental Impact Statement for a Rail Alignment,” DOE/EIS 0369 (06/2008), LSN# DEN001593557 (“Rail Alignment FEIS” or “RA FEIS”) Subsections 4.2.2.2.3.2 and 4.3.2.2.3.2, incorporated by reference in Section 6.4 of the Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) (“FSEIS”) (*see* FSEIS at 6-1) illegally defer assessment of impacts of railroad construction on individual BLM grazing allotments to a future action by the Bureau of Land Management (BLM). DOE has no authority to transfer its NEPA responsibilities to BLM, and DOE has no authority to assign to BLM the responsibility for mitigation of impacts resulting from DOE’s proposed action. If the appropriate assessment and disclosure of railroad construction impacts on individual grazing allotments is deferred, the FEIS and FSEIS cannot be adopted by the NRC.

**RESPONSE**

In this contention, Nevada alleges that DOE improperly deferred the “assessment, selection of a preferred alternative, and mitigation of impacts” related to grazing. Petition at 1102.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Nevada’s environmental contention must also be supported by the affidavit of a

qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting affidavits. Its supporting affidavits are submitted by witnesses without any qualifications to render expert opinions on grazing impacts. Mr. Robert J. Halstead submits an affidavit on grazing impacts. Halstead Affidavit at 1, Attach. B. Mr. Halstead by academic training is an historian with a Master’s degree in American History. *Id.*, Attach. A. By experience, he has worked on transportation issues for several states. Nothing in his background, however, qualifies him to provide opinions about grazing in Nevada, the United States or anywhere else. His affidavit is no more valid or reliable than the rejected testimony of a mathematician who tried to provide expert opinions on engineering matters, *Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-86-23, 24 NRC 108 (1986), or the environmental health expert who tried to provide expert evidence on physical security matters. *Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), LBP-98-13, 47 NRC 360 (1998).

The background of Mr. Steven A. Frishman is also insufficient to qualify him to provide expert opinions about issues of grazing in Nevada. Mr. Frishman’s education and professional experience is in the area of geology, particularly oceanography and coastal resource management

in Texas. *See* Frishman Affidavit, Attach. A. Nothing in Mr. Frishman’s background suggests that he is qualified to provide expertise on issues of grazing.

Apart from the failure to provide an affidavit from a qualified expert, the affidavits provided in support of this contention largely ignore the criteria of 10 C.F.R. §§ 2.326 and 51.109. The affidavits do not separately address each of the criteria of § 2.326 nor do they provide a “specific explanation” of why each criteria has been met. Mr. Halstead and Mr. Frishman merely adopt the allegations set forth in Paragraph 5 of this contention. Neither Mr. Halstead nor Mr. Frishman provides any evidence, explanation or analysis to support the allegations set forth by this contention. With regard to the most important criteria of § 2.326 – whether a materially different result would be likely – the contention and affidavits of Mr. Halstead and Mr. Frishman are silent.

This contention is not supported by a credible qualified expert and ignores all of the requirements and criteria of 10 C.F.R. §§ 2.326 and 51.109. This contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to the other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to the other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention, challenging DOE’s transportation decisions, and the environmental impact statements upon which those decisions is based, are beyond the scope of this proceeding.

First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have regulatory authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For the reasons discussed in section c. above, this issue is not material to the findings the NRC must make because challenges to DOE's transportation decisions are outside the scope of this proceeding. In addition, this contention does not present a material issue because DOE's NEPA documents do not impermissibly defer or delegate DOE's NEPA responsibilities to BLM and adequately address potential impacts on grazing.

Nevada alleges that DOE "illegally defer[red] assessment of impacts of railroad construction on individual BLM grazing allotments to a future action by [BLM]." Petition at

1100. This allegation relies on DOE's statements in the Rail Alignment EIS that "[t]he BLM would work with affected permittees to develop Interim Grazing Management[ ] Plans and revise their allotment management plans to address impacts of the rail alignment," and "[t]he BLM would determine actual loss of animal unit months for each affected allotment . . . in association with the issuance of a right-of-way grant." Rail Alignment EIS, Vol. III at 4-46 to -47.

Nevada's allegation misinterprets DOE's statements, which were simply referring to possible BLM actions in accordance with the Taylor Grazing Act of 1934, 43 U.S.C. § 315, *et seq.*, and the Federal Land Policy and Management Act, 43 U.S.C. § 1701, *et seq.*, and BLM regulations relating to the issuance and modification of grazing permits. *See* Rail Alignment EIS, Vol. I at 1-10 to -11; *id.*, Vol. II at 3-60. DOE's consideration in its NEPA documents of the possible regulatory actions of a cooperating agency does not amount to a deferral or delegation of DOE's NEPA analysis.<sup>138</sup>

In addition, Nevada alleges that DOE failed to satisfy NEPA by relying on BLM for "proper impact assessment and mitigation." Petition at 1103. Under NEPA, DOE is required to take a "hard look" at potential environmental consequences. *See Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976). In its NEPA documents, DOE analyzed the environmental and economic impacts of the proposed railway on grazing, including the potential impacts of construction as well as operation of the railway. *See, e.g.*, Rail Alignment EIS, Vol. III at 4-46, 4-62, 4-65 to -70, 4-296 to -298; Vol. V at 5-24 to -27, 5-29 to -31, 7-42 to -44. In particular, DOE analyzed "the proportion of land within each grazing allotment that would fall within the footprints of the rail

---

<sup>138</sup> Nevada's allegation that BLM's regulatory assessment amounts to "potentially impermissible segmentation" is also unavailing. Segmentation occurs when an agency "avoid[s] the NEPA requirement that an EIS be prepared for all major federal actions with significant environmental impacts by segmenting an overall plan into smaller parts involving action with less significant environmental effects." *West Chicago v. NRC*, 701 F.2d 632, 650 (7th Cir. 1983). That did not occur here. DOE has not sought to avoid NEPA's requirements by segmenting portions of the project to minimize the environmental effects, nor has it sought to divide the project to avoid preparation of an EIS.

line construction right-of-way and support facilities,” *id.*, Vol. III at 4-46, the potential effects of railroad operations, *id.* at 4-62 to -65, and possible mitigation measures “to reduce impacts to both grazing operations and existing range improvements,” *id.*, Vol. III at 4-47. Although DOE recognized that “additional land and possibly water features” may be affected, nowhere does DOE state that its analysis of potential grazing impacts was “deficient,” as alleged by Nevada, nor does DOE’s analysis of possible uncertainties amount to such an admission. *See* Petition at 1102. The fact that DOE provided a reasonably thorough analysis of potential impacts on grazing, including analysis of any possible uncertainties, is sufficient to satisfy NEPA’s requirements. *See Save Our Ecosystems v. Clark*, 747 F.2d 1240, 1246 n.9 (9th Cir. 1984) (“Reasonable forecasting and speculation is . . . implicit in NEPA.”) (internal citation omitted)).

Nevada also alleges that DOE failed to adequately address its role in implementing possible mitigation measures and failed to “estimate the costs of providing mitigation.” Petition at 1103. Nevada alleges that “DOE has no authority to ensure that BLM actually implements the mitigation measures described in Chapter 7” of the Rail Alignment EIS. *Id.* In fact, the mitigation measures that DOE analyzed in its NEPA documents are measures that DOE could develop and implement *in conjunction with* BLM. *See, e.g.*, Rail Alignment EIS, Vol. III at 4-47; *id.*, Vol. IV at 7-24 to -25, 7-42 to -44, 7-46. Because BLM has primary responsibility for grazing administration, *see, e.g.*, 43 C.F.R. § 4100, *et seq.*, DOE must work in conjunction with BLM as a cooperating agency to implement mitigation plans, *see, e.g.* Rail Alignment EIS, Vol. I at 1-9 to -11. In its NEPA documents, DOE adequately analyzed possible mitigation measures that would be within the responsibility of DOE, including: “[r]elocating existing infrastructure and water resources,” “[p]roviding temporary feed, water, and assistance in cattle movement during rail line construction,” and “construction of culverts, bridges, and cattle guards to

facilitate or prevent the movement of livestock” where necessary. *Id.*, Vol. III at 4-47; *see also id.* at Vol. IV at 7-24 to -25, 7-42 to -44, 7-46. Once implemented, these measures would address specific effects as determined through coordination with BLM, the Surface Transportation Board, and affected permittees. *Id.* At this early stage, many years before shipments begin, it would be premature to attempt to predict the exact effects to be mitigated, cost of mitigation measures, or site-specific mitigation plans. *See Duke Energy Corp.* (McGuire Nuclear Station, Units 1 and 2; Catawba Nuclear Station, Units 1 and 2), CLI-03-17, 58 NRC 419, 431 (2003) (finding that NEPA does not demand a “detailed explanation of specific measures which *will* be employed to mitigate adverse environmental effects”) (emphasis added); *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 353 (1989) (holding that NEPA does not require “a fully developed plan that will mitigate environmental harm before an agency can act”).

Nevada’s allegation that DOE’s NEPA documents are inadequate because site-specific effects have not yet been addressed is inconsistent with CEQ regulations and NEPA caselaw and thus does not raise a material issue. *See* Petition at 1103-04. The policies and procedures of DOE and the CEQ that implement the requirements of NEPA call for agencies to “integrate the NEPA process with other planning at the earliest possible time” in the development of a proposed federal project. 40 C.F.R. § 1501.2. In particular, CEQ regulations 40 C.F.R. §§ 1500.5, 1501.2, 1502.5 and 1508.23 all stress the need to prepare an EIS early in the process. NEPA analysis of environmental consequences must be made “as soon as it can reasonably be done.” *Kern v. U.S. Bureau of Land Mgmt.*, 284 F.3d 1062, 1072 (9th Cir. 2002) (citing *Save Our Ecosystems v. Clark*, 747 F.2d 1240, 1246 n.9 (9th Cir. 1984) (“Reasonable forecasting and speculation is . . . implicit in NEPA.”) (internal citation omitted)). Nevada has not cited a single

case in which an environmental impact statement was found invalid because it was prepared too early in the process. Therefore, the fact that DOE provided a reasonably thorough analysis of transportation issues associated with the project, including analysis of potential impacts of rail construction and operations on grazing, is sufficient to satisfy NEPA's procedural requirements.

Accordingly, this contention does not present a material issue and should therefore be rejected.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R. § 2.309(f)(1)(v), Nevada has failed to provide the required supporting facts, expert opinions, and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention should therefore be rejected.

## **221. NEV-NEPA-15 - TAD Shipment Estimates**

Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") Subsection 6.1.7 and Appendix G.3, regarding shipment estimates that assume the use of transportation, aging and disposal ("TAD") canisters at commercial reactor sites, fail to consider reasonable shipment estimates based on the existing standard contracts and current modal capabilities of the shipping sites. Thus, the FSEIS fails to provide a sufficient basis for the transportation impacts estimated in Sections 6.3 and 6.4. In addition, the FSEIS fails to provide a basis for determining if DOE can comply with SAR Subsection 1.5.1.1, which presumes 90 percent of commercial spent nuclear fuel will be shipped in TAD canisters. Because DOE failed to consider reasonable shipment estimates, particularly regarding the modal mix between rail and truck, DOE has failed to adequately assess their environmental impacts, and because those environmental impacts could be materially different from that presented in the FSEIS and the "Final Environmental Impact Statement for a Rail Alignment," DOE/EIS 0369 (06/2008), LSN# DEN001593557 ("Rail Alignment FEIS" or "RA FEIS"), neither document can be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada alleges that DOE failed to adequately consider potential transportation impacts under NEPA because DOE allegedly failed “to provide a basis for determining if [it] can comply with SAR Subsection 1.5.1.1, which presumes 90 percent of commercial spent nuclear fuel will be shipped in TAD [Transportation, Aging and Disposal] canisters,” and “to consider reasonable shipment estimates based on the existing standard contracts and current modal capabilities of the shipping sites.” Petition at 1105.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Nevada's environmental contention must also be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a "specific explanation of why it has been met." 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, "the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners." *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavit. The affidavit submitted by Nevada's witness, Mr. Halstead, in support of this contention never provides the analysis that is explicitly called for by the terms of § 2.326(b). Mr. Halstead's affidavit does not separately address each of the criteria of § 2.326 nor does it provide a "specific explanation" of why each criteria has been met. Mr. Halstead merely adopts the allegations set forth in Paragraph 5 of this contention. Halstead Affidavit at 1. Mr. Halstead does not provide any evidence or analysis to support the allegations set forth by this contention. With regard to the most important criteria of § 2.326 – whether a materially different result would be likely if the contention were proven true – the contention and affidavit of Mr. Halstead are silent.

This contention does not satisfy the requirements and criteria of 10 C.F.R. §§ 2.326 and 51.109. This contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to the other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**b. Brief Explanation of Basis**

Without prejudice to the other positions taken by DOE, DOE expresses no legal objection based on this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions relating to the proposal by DOE to accept up to 90% of commercial SNF in TADs is not within the scope of this proceeding. As discussed in section V.A.5(b) above, contentions relating to DOE's proposal to accept a substantial amount of commercial SNF for transportation and disposal in TADs are outside the scope of this proceeding. NRC has no statutory or regulatory authority over how DOE will accept commercial SNF pursuant to the contract between DOE and the generator of the SNF. While NRC can consider the effects of using TADs to accept commercial SNF, it cannot go behind those decisions and, in effect, dictate how much commercial SNF DOE can accept in TADs. Thus, any contention premised on such action is beyond the scope of this proceeding. Put simply, NRC must take DOE's proposal to accept up to as much as 90% of commercial SNF in TADs as a given in deciding whether to issue construction authorization for the repository.

Moreover, contentions challenging DOE's transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of

this proceeding. To the extent that Nevada's contention challenges DOE's transportation analysis, it is barred on this jurisdictional ground as well.

First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have regulatory authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals. Nevada has failed to identify any issue relating to DOE's transportation analysis based on the use of TADs for which the approach specified in Section 119 of the NWPA is not available.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For the reasons discussed in section c. above, because this issue is beyond the scope of this proceeding, it is not material to the findings the NRC must make. The contention also does

not raise a material issue because it does not demonstrate any inadequacy in DOE's environmental analyses.

Nevada alleges that DOE failed to adequately address potential impacts under NEPA because DOE allegedly failed "to provide a basis for determining if [it] can comply with SAR Subsection 1.5.1.1, which presumes 90 percent of commercial spent nuclear fuel will be shipped in TAD canisters," and "to consider reasonable shipment estimates based on the existing standard contracts and current modal capabilities of the shipping sites." Petition at 1105. Under NEPA, DOE is required to take a "hard look" at potential environmental consequences. *See Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976). In its NEPA documents, DOE analyzed the environmental impacts that would result from DOE's receipt of up to 90% of spent nuclear fuel in TADs at the repository, *see, e.g.*, Repository SEIS, Vol. I at 2-5 to -7, 4-64 to -66, 4-71, 4-73 to -75, 4-90, 4-97, 4-100, and during transportation, *see, e.g., id.*, at 6-8, 6-10 to -14, 6-59. In addition, DOE analyzed a scenario in which less than 90% of spent nuclear fuel would be shipped in TADs due to existing utilities contracts and/or modal capabilities at the generator sites. *See, e.g., id.*, Vol. I at 1-15 to -16, 2-5 to -7; Vol. II, App. A at A-2 to -5.

DOE's analysis of impacts under both packaging scenarios incorporated the potential impacts of shipping a certain amount of non-TAD canisters to be placed into TADs once they reach the repository site. *See id.* In addition to its analysis of a scenario in which 90% of commercial spent nuclear fuel would be transported to the repository in TADs, DOE performed a sensitivity analysis, examining the potential impacts of a situation in which utilities shipped only 75% of spent nuclear fuel in TADs. *See id.*, Vol. II, App. A at A-2 to -5. In the sensitivity analysis, DOE analyzed the impacts of placing the remainder of the shipments into TADs once they reach the repository site and determined that "a deviation in the percentage of

implementation of TAD canisters at the reactor site would not measurably affect the transportation impacts.” *Id.*, Vol. II at A-3. The Repository SEIS concluded that, “[i]n summary, the analysis illustrated that the deviations in the percentage implementation of TAD canisters would have little effect on transportation or repository-related estimated impacts.” *Id.* at A-5. Accordingly, Nevada cannot demonstrate that DOE has failed to adequately analyze potential environmental impacts based on shipments of less than 90% of spent nuclear fuel in TADs. *See* Petition at 1105.

DOE’s assumption that 90% of the SNF would be shipped in TADs while also considering the possibility of a smaller amount shipped in TADs was clearly a reasonable one and should not be second-guessed or challenged by potential intervenors. *Inland Empire Pub. Lands Council v. U.S. Forest Serv.*, 88 F.3d 754, 761 (9th Cir. 1996) (citing *Sierra Club v. Marita*, 845 F. Supp. 1317, 1331 (E.D.Wis. 1994) *aff’d*, 46 F.3d 606 (7th Cir. 1995)); *Greenpeace Action v. Franklin*, 14 F.3d 1324, 1335-36 (9th Cir. 1992). As in the case of a reviewing court, it is not the role of the NRC “to decide what assumptions . . . we would make were we in the Secretary’s position, but rather to scrutinize the record to ensure that the Secretary has provided a reasoned explanation for his policy assumptions.” *Wy. Lodging & Rest. Ass’n v. Dep’t. of Interior*, 398 F. Supp. 2d 1197, 1214 (D. Wyo. 2005) (citing *Am. Iron & Steel Inst. v. OSHA*, 939 F.2d 975, 982 (D.C. Cir. 1991)); *S.F. Baykeeper v. U.S. Army Corps of Eng’rs*, 219 F. Supp. 2d 1001, 1015 (N.D.Cal. 2002) (agency’s reasonable assumptions entitled to deference).

The NRC has already made clear that the decision to adopt DOE’s environmental analyses “does not necessarily mean that NRC would independently have arrived at the same conclusions on matters of fact or policy.” NEPA Review Procedures for Geologic Repositories

for High-Level Waste, 53 Fed. Reg. 16,131, 16,142 (May 5, 1988). DOE has provided reasonable explanations for the assumptions it has made in its NEPA analyses and it is not the Commission's duty to "second guess" those assumptions. *Wy. Lodging & Rest. Ass'n.*, 398 F. Supp. 2d at 1214.

Accordingly, this contention does not present a material issue and should therefore be rejected.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326, Nevada has failed to provide the required supporting facts, expert opinions, and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's decision to accept spent nuclear fuel in TADs and DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding, and because the contention fails to demonstrate inadequacy in DOE's NEPA analyses. The contention should therefore be rejected.

## **222. NEV-NEPA-16 - Representative Routes**

Final Supplemental Environmental Impact Statement for Yucca Mountain, DOE/EIS 0250S-F1 (07/2008) ("FSEIS") Subsection 6.3 and Appendices A.3 and G.2, regarding "representative routes" that DOE could use for shipments of spent nuclear fuel and high-level radioactive waste, fail to identify the affected environment for repository transportation impacts nationally and in Nevada. FSEIS Appendix A3 states that DOE used historic rail industry practices to estimate the representative rail routes that would be used under the Proposed Action. However, DOE's representative rail routes incorporate rail industry practices in only a generic way, and ignore information provided to DOE by potential rail carriers and by affected states about other potential rail routes, different from those identified by DOE, that could be used for repository shipments. This deficiency is significant because without appropriately considering specific impacts from specific rail routes, DOE has failed to adequately assess environmental impacts, and because those environmental impacts could be materially different from that presented in the FSEIS the document cannot be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada asserts that DOE improperly used representative routes in its NEPA analysis, and "ignore[d] information provided to DOE by potential rail carriers and by affected states about other potential rail routes . . . that could be used for repository shipments." Petition at 1110.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its

contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.*, (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavits. It does not show that its contention raises a significant environmental issue. With regard to the most difficult and important showing – a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true, Nevada’s petition and the affidavit of its expert are silent. Equally important, Nevada’s expert, Robert J. Halstead, never provides the analysis that is explicitly called for by the terms of § 2.326. This regulation requires Nevada’s expert, Mr. Halstead, to “set forth the factual and/or technical bases for the movant’s claim that the criteria of paragraph (a) of this section have been satisfied.” Section 2.326(b) goes on to state that “[e]ach of the criteria must be separately addressed, with a specific explanation of why it has been met.” Here, Nevada has failed to meet these requirements and its contention should be rejected.

Apart from its failure to comply with the requirements of §§ 2.326 and 51.109, Nevada has also failed to submit an affidavit that provides a reasoned explanation of the basis for its expert's opinions and more importantly why the issue raised by the contention is of any significance. Nevada's expert, Mr. Halstead, merely adopts Paragraph 5 of this contention as the entire substance of his testimony. Halstead Affidavit at 1. Mr. Halstead contends that DOE's analysis of rail shipments should have used the actual routes proposed by a railroad and Midwestern States, rather than a model which looks at representative routes.

Mr. Halstead fails to explain why this contention raises a significant concern. Mr. Halstead states, for example, that Union Pacific provided DOE with its preferred routes for shipping SNF in 2005 and these routes should have been used in the analysis. In 2005, at a presentation made by Union Pacific in Pueblo Colorado to the Transportation External Coordination Working Group (TEC), slide 26 of 28 contained a map of the United States roughly showing rail routes to Yucca Mountain.<sup>139</sup> See "Union Pacific Rail Transportation," Rodger Dolson (Sept. 2005) (LSN# NEV000005499). According to the notes for this meeting, Mr. Dolson made two recommendations for routing: that DOE 1) avoid a high volume route across Nebraska; and 2) avoid the Moffat Tunnel in Colorado. DOE, Transp. External Coordination Working Group (TEC) Meeting, Meeting Notes, 19 (Sep. 20-21, 2005) (Attachment NEV-NEPA-16-1). In fact, DOE developed representative routes incorporating both of these recommendations. Repository SEIS, Vol. II, App. A at A-5. Therefore, it is clear that the DOE did not ignore routes suggested by railroads and in fact incorporated the railroad's suggestions into the analyses presented in the Repository SEIS. Mr. Halstead's allegation that DOE purportedly failed to consider the Union Pacific's rail proposals is incorrect.

---

<sup>139</sup> Portions of the routes are obscured by arrows and other markings. It is inconceivable that any railroad would propose nationwide routing of hazardous material based on such a map.

In further support of his opinion, Mr. Halstead points to a report by the Council of State Governments' Midwestern Radioactive Materials Transportation Committee. *See* Petition at 1112. Mr. Halstead claims that this report contains one of several "requests for early action on route selection and identification." *Id.* at 1113. In fact, the report does no such thing. Rather, the report specifically states that it was *not* requesting DOE to adopt its routes nor does it ask for DOE to take "early action" on route selection. *See* "The Council of State Governments' Midwestern Radioactive Transportation Committee, Route Identification Project: Final Report to the U.S. Department of Energy's Office of Civilian Radioactive Waste Management," (December 7, 2005) (LSN# NEV000005459 at 3). According to the report, "[a]bove all, the work group members asked the states to emphasize that the region would not recommend that DOE use the proposed routes through the Midwest. Instead, the recommendation would be that DOE use the proposed route maps as a starting point for discussions at the national level." *Id.* at 3.<sup>140</sup>

Mr. Halstead also points to the report of the National Academy of Science (NAS), which according to Mr. Halstead "urged DOE to precisely define the routes used to ship High-Level Radioactive Waste." Petition at 1112-13. Contrary to Mr. Halstead's assertion, the NAS report was not criticizing the 2002 FEIS but only recommending that DOE begin working with the States and Tribes on emergency planning issues as soon as practicable. National Research Council, *Going the Distance?: The Safe Transport of Spent Nuclear Fuel and High-Level*

---

<sup>140</sup> Mr. Halstead also cites to Nevada's comments on the Draft Repository SEIS as evidence of another "request[] for early action on route selection and identification." Petition at 1113. Nevada cannot simply repeat the comment it made to DOE on the Draft Repository SEIS, but must demonstrate, through affidavits that comply with the requirements of 10 C.F.R. §§ 51.109 and 2.326, why DOE's response to the comment fails to comply with NEPA. *See City of Los Angeles v. Nat'l Highway Traffic Safety Admin.*, 912 F.2d 478, 488 (D.C. Cir. 1990) (finding that simple disagreement with an agency's findings or its methods is not sufficient to render an EA or EIS inadequate under NEPA). As discussed, Mr. Halstead's affidavit does not meet the requirements of §§ 51.109 and 2.326, much less address any deficiency in DOE's response to this comment.

*Radioactive Waste in the United States* at 228 (The National Academies Press 2006). This course of action is already contained in the Repository SEIS. *See* Repository SEIS, Vol. II, App. H at H-29 to -30, H-31 to -32. NAS never suggested that the 2002 FEIS was inadequate in its treatment of transportation. In fact, much of the report is complimentary of DOE's efforts. *See, e.g., id.* at 210 (finding that "[t]he Department of Energy's procedures for selecting routes within the United States for shipments of foreign research reactor spent fuel appear on the whole to be adequate and reasonable"). For example, the report recommends that DOE follow its foreign research reactor spent fuel transport program of involving states and Tribes in these route selections. *Id.* at 228. The report also endorsed DOE's choice of the "mostly rail" option. *Id.* at 217.

As demonstrated above, none of the documents referenced by Nevada call for the early selection of routes for the evaluation of transportation environmental impacts and none of these reports provides any support for the admission of this contention. Additionally, Mr. Halstead does not explain why the existing transportation analysis using representative routes and analyzing possible risks is not appropriate at this stage of transportation planning. Nor is there any discussion about whether any of these issues is significant or would have any material impact on the outcome. Consequently, Mr. Halstead's affidavit provides no support for this contention and this contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Contentions challenging DOE's transportation decisions, and the environmental impact statements upon which those decisions are based, are beyond the scope of this proceeding and may also be barred under res judicata or finality principles. Nevada's contention regarding DOE's decision to use representative routes is objectionable on all three grounds.

First, as addressed in Section V.A.5(a)(1) above, under the Atomic Energy Act (AEA) and the Energy Reorganization Act (ERA), the NRC does not have regulatory authority over DOE's transportation facilities and activities and thus has no direct NEPA responsibilities with respect to those facilities and activities. To the extent such facilities and activities may contribute to the cumulative impacts of the proposed Yucca Mountain repository, the NRC must take DOE's decisions concerning transportation facilities and activities as a given in considering the cumulative impacts of the proposed repository. *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752 (2004).

Second, in addition to the NRC's lack of regulatory authority over transportation of SNF and HLW, as addressed in Section V.A.5(a)(2) above, any challenges to the analysis of environmental impacts arising from DOE transportation decisions, to the extent reviewable, are within the original and exclusive jurisdiction of the federal courts of appeals. In particular, challenges to the April 2004 ROD and the transportation-related portions of the 2002 FEIS on which it was based, are no longer subject to review in any forum, as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA. Any

challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD and the Rail Alignment EIS on which it was based, are also not appropriately a part of this proceeding; such challenges may be pursued only through a petition for review to a federal court of appeals.

Nevada has failed to identify any issue relating to DOE's use of representative routes for which the approach specified in Section 119 was or is not available.

In summary, challenges to the April 2004 ROD, and the transportation-related portions of the 2002 FEIS on which it was based, including DOE's use of representative routes, are no longer subject to review in any forum, both as a result of the expiration of the 180-day period to challenge that ROD set forth in Section 119 of the NWPA and as a result of the D.C. Circuit's 2006 decision in *Nevada v. Dep't of Energy*, 457 F.3d 78 (D.C. Cir. 2006). Any challenges to DOE's transportation decisions set forth in the October 10, 2008 ROD also are not appropriately a part of this proceeding, and may only be challenged through a petition for review to a federal court of appeals.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For the reasons discussed in section c. above, this issue is not material to the findings the NRC must make because challenges to DOE's transportation decisions are outside the scope of this proceeding and the contention is barred on res judicata and finality grounds. In addition, it was reasonable for DOE to use representative routes at this stage in the process. As stated in the Repository SEIS, "[a]t this time, many years before shipments could begin, it is premature to predict the highway routes or rail lines DOE might use." Repository SEIS, Vol. III at CR-185. DOE appropriately decided to use representative routes that reflect typical industry practices. *Id.*, Vol. II, App. G at G-5; App. A at A-5 to -8. To identify these representative routes, DOE used the TRAGIS computer model, which is a regularly updated information system containing

thousands of miles of rail lines and highways and allowing users to calculate routes by simulating historical rail and freight routing practices. *Id.*, Vol. II, App. G at G-5 to -13. DOE assumed routes for rail shipments that would provide expeditious travel, use of high quality track, and the minimum number of interchanges between railroads. *Id.*, Vol. II, App. G at G-5 to -6; 2002 FEIS, Vol. I at 3-120. The highway routes were selected in accordance with Department of Transportation highway routing regulations (49 C.F.R. § 397.101). Repository SEIS, Vol. II, App. G at G-13. This methodology is entirely reasonable at this stage of the process and identifies routes that could be used in the shipment of SNF and HLW to Yucca Mountain.

The policies and procedures of DOE and the CEQ that implement the requirements of NEPA call for agencies to “integrate the NEPA process with other planning at the earliest possible time” in the development of a proposed federal project. 40 C.F.R. § 1501.2. In particular, CEQ regulations 40 C.F.R. §§ 1500.5, 1501.2, 1502.5 and 1508.23 all stress the need to prepare an EIS early in the process. NEPA analysis of environmental consequences must be made “as soon as it can reasonably be done.” *Kern v. U.S. Bureau of Land Mgmt.*, 284 F.3d 1062, 1072 (9th Cir. 2002) (citing *Save Our Ecosystems v. Clark*, 747 F.2d 1240, 1246 n. 9 (9th Cir. 1984) (“Reasonable forecasting and speculation is . . . implicit in NEPA.”) (internal citation omitted)). Nevada has not cited a single case in which an environmental impact statement was found invalid because it was prepared too early in the process.

In addition, there are processes for determining if there is a need for further NEPA analyses after an EIS is finalized if an agency proposes substantial changes to a proposed action, or if there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action relevant to environmental concerns or its impacts. 40 C.F.R.

§ 1502.9(c); 10 C.F.R. § 1021.314(a). DOE would conduct supplemental NEPA review if DOE makes substantial changes in the proposed action that are relevant to environmental concerns, or there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts.

Nevada argues that DOE should have used the Union Pacific Railroad's preferred routes as the basis for conducting its environmental analysis. As discussed above, the railroads have not indicated to DOE which routes they are likely to choose. To the extent that input has been provided from the railroads, it has been factored into the representative routes analyzed. Further, as described in Appendix H to the Repository SEIS, railroads are privately owned and operated, and shippers and rail carriers determine routes based on a variety of factors. Thus, actual route selection for shipments to Yucca Mountain will involve discussions between DOE and the chosen rail carriers, with consideration of input from other stakeholders. Repository SEIS, Vol. II, App. H at H-4. Federal rules do not prescribe specific routes for SNF and HLW shipments by rail, although certain factors, as described below, must be considered in route selection.

DOT's Pipeline and Hazardous Materials Safety Administration, in coordination with the Federal Railroad Administration and the Transportation Security Administration, has issued a Final Rule revising requirements in the Hazardous Materials Regulations applicable to the safe and secure transportation of certain hazardous materials transported in commerce by rail. *See* Final Rule, Hazardous Materials: Enhancing Rail Transportation Safety and Security for Hazardous Materials Shipments, 73 Fed. Reg. 72,182 (Nov. 26, 2008). The Final Rule requires rail carriers to compile annual data on these shipments, use the data to analyze safety and security risks along rail routes where those materials are transported, assess alternative routing options, and make routing decisions based on those assessments to select the safest and most

secure practicable route. Many factors are to be considered in the safety and security risk analysis of routes, including rail traffic density, time and distance in transit, track class and conditions, environmentally-sensitive or significant areas, population density, emergency response capability, past incidents, availability of practicable alternatives, and other factors. Repository SEIS, Vol. II, App. H at H-4.

Finally, it is settled law under NEPA that an agency is entitled to deference in determining which methodologies to use in making decisions. *See, e.g., Wyo. Lodging & Rest. Ass'n v. U.S. Dep't of Interior*, 398 F. Supp. 2d 1197, 1213 (D. Wyo. 2005) (citing cases). NEPA does not require that an EIS be “based on the best scientific methodology available,” *Lands Council v. McNair*, 537 F.3d 981, 1003 (9th Cir. 2008) (quoting *Friends of Endangered Species, Inc. v. Jantzen*, 760 F.2d 976, 986 (9th Cir. 1985)), as long as the agency acted reasonably, as DOE did here. Nevada argues that DOE should have used the rail routes suggested by railroads and affected states as the basis for conducting its environmental analysis, rather than representative routes. Petition at 1112-13. But the NRC is not required to resolve disagreements regarding methodology, *see Friends of Endangered Species, Inc.*, 760 F.2d at 986, and Nevada’s preference that a different methodology for selecting routes be used accordingly does not raise a material issue.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R. § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact,  
With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because challenges to DOE's transportation decisions and supporting NEPA analyses are outside the scope of this proceeding, because the contention is barred by res judicata, because Nevada failed to raise its claim within 180 days of the issuance of the 2004 ROD, and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention therefore should be rejected.

### **223. NEV-NEPA-17 - NRC Staff's NEPA Review**

NRC Staff's adoption determination violates NEPA, and therefore cannot support NRC's proposed action, because NRC Staff stated explicitly that it would not necessarily have arrived at the same NEPA conclusions on matters of fact or policy. This deficiency is significant, and if it were to be addressed in a satisfactory manner, the adoption decision could be materially different. As a result, the FEIS and FSEIS cannot be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada raises the purely legal issue of whether the Staff's conclusion that the DOE's NEPA documents can be adopted with supplementation is deficient because the NRC Staff also stated that "NRC Staff determination of adoption of these EISs does not necessarily mean that NRC independently would have arrived at the same conclusions as DOE on matters of fact or policy." *See* Petition at 1117 (quoting U.S. Nuclear Regulatory Commission Staff's Adoption Determination Report for the U.S. Department of Energy's Environmental Impact Statements for the Proposed Geologic Repository at Yucca Mountain, (Sept. 5, 2008) (LSN# NRC000029699)).

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a

qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including “a specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 claiming that because this contention raises a purely legal issue, it need not make the showings required by §§ 51.109 and 2.326. Nothing in §§ 51.109 or 2.326 exempts Nevada from demonstrating through an appropriate affidavit that this issue is significant and that if true would or would likely result in a materially different outcome. In its Petition, Nevada states without any explanation or analysis that “[t]he deficiency is clearly significant from a legal perspective, and if it were to be addressed in a satisfactory manner by a more complete NRC Staff review, the adoption decision could be materially different.” Petition at 1117.

In imposing the requirements of 10 C.F.R. §§ 2.326 and 51.109 on all NEPA contentions, the NRC has demanded that intervenors meet a very high threshold burden of showing that the proffered contention presents a “seriously different picture of the environmental landscape,” such that it would “be likely to change the outcome of the proceeding or affect the licensing decision in a material way.” *Private Fuel Storage, LLC* (Independent Spent Fuel Storage Installation), CLI-06-03, 63 NRC 19, 23 (2006) (internal quotation and citation omitted). That showing cannot be made with the kind of vague and conclusory statements in Nevada’s Petition and the absence of an expert affidavit.

Further, there is nothing at all significant about the NRC Staff's statement that it might have reached different conclusions than DOE. The NRC Staff's statement simply echoes the statements of the Commission when it promulgated 10 C.F.R. § 51.109. In commenting on adoption, the Commission stated: "the adoption of the [DOE] statement does not necessarily mean that NRC would independently have arrived at the same conclusions on matters of fact or policy." NEPA Review Procedures for Geologic Repositories for High-Level Waste, 53 Fed. Reg. 16,131, 16,142 (May 5,1988). Decisions of the U.S. Supreme Court are to the same effect. *See Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976).

Nevada's statement that the "adoption decision could be materially different," Petition at 1117, is meaningless. It says nothing more than that there is a possibility that the Staff might have reached different conclusions than DOE. Yet, the standard under § 2.326 requires a demonstration that there would or would likely be a materially different outcome. Nevada's conclusory speculation cannot support the admission of this contention under the rigorous standards of §§ 51.109 and 2.326.

**a. Statement of Issue of Law or Fact to be Controverted**

The statement of the contention mischaracterizes the Staff's role. The NRC Staff's role as set forth in 10 C.F.R. § 51.109(a)(1) is only to "present its position on whether it is practicable to adopt, without further supplementation, the environmental impact statement (including any supplement thereto) prepared by the Secretary of Energy." The actual adoption determination is made by the presiding officer in the licensing proceeding. 10 C.F.R. § 51.109(c).

**b. Brief Explanation of Basis**

The statement of the basis mischaracterizes the law. Nevada's statement of the basis incorrectly states that the NWPA, 10 C.F.R § 63.31(c), CEQ regulations, and caselaw under

NEPA taken together do “not allow NRC to adopt DOE’s EISs, and therefore use them to satisfy its own NEPA duties, without stating whether it fully agrees with them.” Petition at 1116. In fact, as noted above, the law is directly to the contrary as acknowledged by the Commission itself.

**c. Whether the Issue is Within the Scope of the Proceeding**

The issue raised in this contention is not within the scope of this proceeding and, in effect, is a challenge to 10 C.F.R § 51.109 as interpreted by the Commission at the time it promulgated this regulation.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

The issue raised by this contention is not material to the findings the NRC must make. 10 C.F.R. § 63.31(c) requires the NRC to make environmental findings based on the actions of the presiding officer in adopting the DOE EIS in accordance with 10 C.F.R. § 51.109(c) or the alternative provisions of §§ 51.109(e) and (f) if adoption is not possible.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R § 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

As described above, there is no genuine dispute on a material issue of law or fact. Nevada has mischaracterized the NRC Staff’s role and is wrong as a matter of law in arguing that the NRC Staff may not adopt the DOE EIS unless it independently would have arrived at the

same conclusions as DOE on matters of fact or policy. Nevada's argument is contrary to § 51.109 as interpreted by the Commission.

#### **224. NEV-NEPA-18 - Overlap Between NEPA and AEA**

Certain of Nevada's safety contentions challenging aspects of DOE's TSPA-LA are applicable to DOE's 2008 FSEIS and to NRC Staff's September 5, 2008 adoption decision (U.S. Nuclear Regulatory Commission Staff's Adoption Determination Report for the U.S. Department of Energy's Environmental Impact Statements for the Proposed Geologic Repository at Yucca Mountain (09/05/2008), LSN# NRC000029699). *See* Attachment 3, Affidavit of Michael C. Thorne, Attachment C. These contentions are significant, individually but especially cumulatively, and if they were to be addressed in a satisfactory manner, the disclosure of overall radiological impacts would be materially different. As a result, the FEIS and FSEIS cannot be adopted by the NRC.

#### **RESPONSE**

In this contention, Nevada asserts that if 101 of their safety contentions were addressed cumulatively "the disclosure of overall radiological impacts would be materially different... [and] the FEIS and SEIS [could] not be adopted." Petition at 1118, 1119.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these

two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously –*i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada does not, in its experts’ affidavits or anywhere in its Petition, separately address §§ 51.109 and 2.326 (a) criteria. With regard to the most difficult showing – a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true — one of Nevada’s experts, Dr. Thorne, refers to *101 safety-related* contentions.<sup>141</sup> In each of these contentions, he merely adopts the countless number of reports and innumerable documentary materials cited therein. Dr. Thorne, now, in an entirely separate environmental contention and without *any* explanation of its connection to the safety contentions (or this contention), makes the bare assertion that if these 101 contentions were addressed cumulatively the “radiological impacts would be materially different” and, as a result, “the FEIS and FSEIS cannot be adopted by the NRC.” Petition at 1119, Petition, Attachment 3 (Thorne Affidavit at 1, Attach. B).

A petitioner “*may not simply incorporate massive documents by reference as the basis for or a statement of his contention[.]*” *See Dominion Nuclear Conn., Inc.* (Millstone Nuclear Power Station, Units 2 and 3), LBP-04-15, 60 NRC 81, 89 (2004) (quoting *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), CLI-89-03, 29 NRC 234, 240-41 (1989)), *aff’d*, CLI-04-6, 60 NRC 631 (2004) (emphasis added). Petitioners are expected “to clearly identify the matters on which they intend to rely with reference to a specific point.” *Id.* Similarly, Dr. Thorne has

---

<sup>141</sup> Furthermore, each of these contentions is inadmissible for the reasons set forth in DOE’s individual responses.

attempted to incorporate a large number of documents and contentions, without any meaningful support or underlying basis. Nevertheless, Dr. Thorne's empty affidavit in which he adopts the entirety of statements and arguments contained in Paragraph 5 of 101 contentions does not somehow save this contention from being rejected for failure to provide any factual or technical basis. Accordingly, the contention should be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

The Licensing Board must dismiss this contention because it fails to present an issue of law or fact to be controverted. Neither Nevada nor its expert alleges a specific regulatory requirement that DOE failed to satisfy, but instead vaguely implies that if the 101 safety contentions were considered cumulatively, then a materially different radiological impact would result. Petition at 1118, 1119. Because Nevada has failed to controvert a position taken by the applicant in the Application or Repository SEIS, the contention must be dismissed. *See Tenn. Valley Auth.* (Bellefonte Nuclear Power Plant Units 3 and 4), LBP08-16, 68 NRC \_\_ (slip op. at 18, 29, 39-40, 42) (Sept. 12, 2008); *Tex. Utils. Elec. Co.* (Comanche Peak Steam Electric Station, Unit 2), LBP-92-37, 36 NRC 370, 384 (1992).

The contention also runs afoul of the Case Management Order governing this proceeding, which requires that petitioners raise a "narrow, single-issue [contention]." *See U.S. Dep't of Energy*, (High-Level Waste Repository: Pre-Application Matters, Advisory PAPO Board), LBP-08-10, 67 NRC \_\_ (slip op. at 6) (June 20, 2008) (Case Management Order). In issuing the Case Management Order, the Advisory PAPO Board stated that "contentions should be sufficiently specific as to define the relevant issues for eventual rulings on the merits, and not require the parties or licensing boards to devote substantial resources to narrow or to clarify them." *Id.*

The Commission has explained that a contention must be “reasonably specific.” *Duke Energy Corp.* (Oconee Nuclear Station, Units 1, 2 and 3), CLI-99-11, 49 NRC 328, 335 (1999). In *Duke Energy*, a Licensing Board rejected a contention alleging that the application was incomplete, based on the NRC Staff having issued a large number of requests for additional information. In affirming, the Commission stated that, “[p]etitioners seeking to litigate contentions must do more than attach a list of RAIs and declare an application ‘incomplete.’ It is their job to review the application and to identify **what** deficiencies exist and to explain **why** the deficiencies raise material safety concerns.” *Id.* at 337; *see also Entergy Nuclear Operations, Inc.* (Indian Point Nuclear Power Station, Units 2 and 3), LBP-08-13, 68 NRC \_\_ (slip op. at 183-84) (July 30, 2008) (denying contention, which challenged Staff’s docketing decision, “as too broad and that [Petitioner] must deal with each ‘deficiency’ in the [Application] in a separate, specific, and well-supported contention”). Similarly, this contention, by indiscriminately referring to 101 safety-related contentions, constitutes a vague and generalized claim, which Nevada has made no effort to narrow. In addition, Nevada fails to identify the existence of *any* deficiency that raises a material concern.

Furthermore, as clearly stated in 10 C.F.R. § 2.309, Nevada has the burden to set forth adequately supported and well-pled contentions. To adjudicate this contention, however, DOE and the Licensing Board would need to parse through all 101 safety contentions along with their supporting documentation, at which point the same analytical gaps in Nevada’s contention would remain. This contention is merely an attempt to impermissibly shift Nevada’s well-established pleading requirement to the applicant. Such a process undermines the plain language of Section 2.309 and the Case Management Order.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

Nevada asserts that if the 101 safety contentions “were to be addressed” the radiological impacts “would be materially different.” Petition at 1118, 1119. However, both Nevada and Dr. Thorne fail to demonstrate that this position is material to any finding the NRC must make to authorize construction of the repository.

It is Nevada's burden to analyze the impacts of each of the 101 contentions and explain those impacts, and it has not done so. In its responses to Nevada’s safety contentions, DOE has demonstrated that Nevada has failed to offer even a qualitative argument as how its contentions individually or in combination might result in a significant increase in the anticipated dose – much less an increase above the regulatory limit.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner’s Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, Nevada has failed to provide the requisite supporting facts, expert opinions and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact,  
With Supporting References to the License Application**

For the reasons set forth in section a. and d. above, there is no genuine dispute on any material issue of law or fact because a conclusory challenge that attempts to adjudicate countless issues is the type of contention that courts and the Commission have rejected as impermissible and inadmissible.

## **225. NEV-NEPA-19 - Peak Dose Identification**

DOE's 2008 FSEIS and 2002 FEIS are inadequate because neither calculates or discloses the reasonably foreseeable post-closure impacts to human health from releases of radioactive materials after one million years. This deficiency is significant, and if it were to be addressed in a satisfactory manner, the disclosure of overall radiological impacts would be materially different. As a result, the FEIS and FSEIS cannot be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada alleges that DOE inappropriately failed to analyze impacts from releases of radioactive materials occurring more than one million years after closure.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4 Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a "specific explanation of why it has been met." 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, "the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners." *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavits. Instead, it submitted an affidavit prepared by Dr. Thorne that says nothing about any of these criteria and merely adopts the words of Paragraph 5 of Nevada's Petition, which contains three brief parts and provides none of the analysis and explanations required by the Commission's regulations. Rather, these short parts simply make conclusory remarks without any meaningful discussion or analysis. Paragraph 5 states, for example, that DOE's decision not to measure doses after one million years is a "significant" deficiency "and if it were to be addressed in a satisfactory manner, the disclosure of overall radiological impacts would be materially different." Petition at 1122. In the face of that kind of unequivocal assertion, one would expect a thorough, scientifically valid analysis showing that there would be a material difference and also addressing the issue of why it is reasonable and necessary to consider environmental impacts beyond one million years. As to those crucial issues and others, the Petition and Dr. Thorne's affidavit are silent.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

The issue raised by this contention is not material to findings the NRC must make because DOE's analysis of peak dose was reasonable. A potential intervenor must demonstrate that DOE has failed to take a "hard look" at environmental consequences. *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n 21 (1976). An EIS is adequate under this standard if it "contains a reasonably thorough discussion of the significant aspects of the probable environmental consequences." *Churchill County v. Norton*, 276 F.3d 1060, 1071 (9th Cir. 2001) (citation omitted); *Idaho Conservation League v. Mumma*, 956 F.2d 1508, 1519 (9th Cir. 1992). DOE's analysis fully meets the requirement that an agency take a "hard look" at environmental consequences.

DOE's analysis of peak radiation dose during the period from 10,000 to 1 million years after repository closure was reasonable. DOE thoroughly evaluated environmental impacts to the RMEI up to 1 million years postclosure. Repository SEIS, Vol. I at 5-2; 2002 FEIS, Vol. I at 5-23 to -31. NEPA does not envision analysis of every potential environmental impact on an unlimited time horizon. It requires only a "reasonably thorough" evaluation of consequences. Projecting consequences out 1 million years is "reasonably thorough" for NEPA's purposes.

Further, an agency is entitled to rely on reasonable assumptions in its environmental analyses. *Inland Empire Pub. Lands Council v. U.S. Forest Serv.*, 88 F.3d 754, 761 (9th Cir. 1996), citing *Sierra Club v. Marita*, 845 F. Supp. 1317, 1331 (E.D. Wis. 1994), *aff'd*, 46 F.3d 606 (7th Cir. 1995); *Greenpeace Action v. Franklin*, 14 F.3d 1324, 1335-36 (9th Cir. 1992). As in the case of a reviewing court, it is not the role of the NRC "to decide what assumptions . . . we would make were we in the Secretary's position, but rather to scrutinize the record to ensure that the Secretary has provided a reasoned explanation for his policy assumptions." *Wyo. Lodging*

*and Rest. Ass'n v. Dep't of the Interior*, 398 F. Supp. 2d 1197, 1214 (D. Wyo. 2005), citing *Am. Iron & Steel Inst. v. OSHA.*, 939 F.2d 975, 982 (D.C. Cir. 1991); *S.F. Baykeeper v. U.S. Army Corps of Eng'rs*, 219 F. Supp. 2d 1001, 1015 (N.D. Cal. 2002) (agency's reasonable assumptions entitled to deference). The NRC has already made clear that the decision to adopt DOE's environmental analyses "does not necessarily mean that NRC would independently have arrived at the same conclusions on matters of fact or policy." NEPA Review Procedures for Geologic Repositories for High-Level Waste, 53 Fed Reg. 16,131, 16,142 (May 5, 1988).

DOE has reasonably explained its assumption it made in deciding to analyze peak dose through 1 million years postclosure. DOE explained that it used 1 million years because:

[T]he U.S. Environmental Protection Agency and the U.S. Nuclear Regulatory Commission have proposed dose limits for a maximum annual individual dose [for the 10,000 year and 1 million year time periods]. DOE has compared the results of the postclosure performance assessments with the proposed limits to provide a context in which to consider the potential environmental impacts of the Proposed Action.

Repository SEIS, Vol. I at 5-2. This is a reasonable basis for deciding on a 1 million year time frame for peak dose analysis. Beyond such time, DOE would not have a maximum annual dose limit with which to compare its estimates. Despite Nevada's complaint that "this truncation is arbitrarily based on EPA standards," Petition at 1122, the decision to make a comparison where there is an adequate point of reference for maximum dose is not arbitrary. Also, there is nothing unreasonable about DOE's use of EPA standards to reasonably limit the scope of what could otherwise be a never-ending analysis.<sup>142</sup>

---

<sup>142</sup> Nevada also argues, pointing to Figure 2.4-10 of the SAR, that the expected doses are still increasing at one million years. Petition at 1122. DOE has the discretion under NEPA to set a reasonable end point for its analysis, and it has done so. Moreover, the dose level at 1 million years is projected to be only 2 mrem, Repository SEIS, Vol. I at 5-27, well below the individual protection standard of 100 mrem, Public Health and Environmental Radiation Protection Standards for Yucca Mountain, NV, 66 Fed. Reg. 32,074, 32,088 (Jun. 13, 2001).

The National Academy of Sciences provides additional support for the reasonableness of DOE's use of the 1 million year time horizon. According to the Academy, "compliance assessment is feasible for most physical and geologic aspects of repository performance on the time scale of the long-term stability of the fundamental geologic regime – a time scale that is on the order of  $10^6$  [one million] years at Yucca Mountain." *See Nuclear Energy Inst., Inc. v. EPA*, 373 F.3d 1251, 1267 (D.C. Cir. 2004) (citing Comm'n on Technical Bases for Yucca Mountain Standards, Nat'l Research Council, Technical Bases for Yucca Mountain Standards (1995)). If geologic stability ceases around 1 million years, this is a reasonable basis for limiting analysis of human health impacts to this timeframe. *See also* EPA, Final Rule, Public Health and Environmental Radiation Protection Standards for Yucca Mountain, NV, 73 Fed. Reg. 61255, 61275-78 (Oct. 15, 2008) (explaining why a 1 million year geologic stability period is appropriate).

It is not the Commission's duty to "second guess" DOE's reasonable assumptions, *Wyo. Lodging and Rest. Ass'n*, 398 F. Supp. 2d at 1214, and Nevada has provided no reason for the Commission to do so. An infinite timeframe is not reasonable under NEPA, and DOE has provided a reasoned explanation for its assumption in selecting a 1 million year timeframe. Therefore, this contention is not material to the findings that the NRC must make.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, Nevada has failed to provide the requisite supporting facts, expert opinions and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact,  
With Supporting References to the License Application**

For the reasons discussed in section d. above, there is no genuine dispute on any material issue of law or fact because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention therefore should be rejected.

## **226. NEV-NEPA-20 - Radionuclide Contamination of Aquifer**

The incomplete and inadequate 2002 FEIS and 2008 FSEIS analyses of cumulative impacts on groundwater quality due to contamination by radionuclides and other repository derived contaminants released to the volcanic/alluvial aquifer are significant deficiencies, and were they to be remedied, the disclosure of these impacts would be materially different, thus the FEIS and FSEIS cannot be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada alleges that DOE failed to adequately analyze the cumulative impacts on groundwater quality due to contamination by radionuclides and other contaminants released to the volcanic/alluvial aquifer. This raises essentially the same issue that the NRC Staff raised in its report on the adoption of the DOE NEPA documents, except that the contention proposes that DOE agree at the outset to use specific analytical methods.

Although DOE has agreed to perform an analysis of the cumulative impacts on groundwater quality due to contamination by radionuclides and other contaminants released to the volcanic/alluvial aquifer and supplement its NEPA documents at the request of the NRC Staff, DOE's agreement does not make this an admissible contention unless Nevada makes the threshold showings required by 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326. All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true,

would or would likely result in a materially different outcome in this proceeding. Nevada's environmental contention must also be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a "specific explanation of why it has been met." 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, "the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners." *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting affidavits. Neither of the witnesses who submitted affidavits in support of this contention, Mr. Frishman and Dr. Thorne, is qualified to provide expert opinions about issues of groundwater in Nevada. Mr. Frishman's educational background is in the general area of geology, but much of his professional experience has been in the area of oceanography and coastal resource management in Texas. Frishman Affidavit, Attach. A. Although he has also worked in nuclear waste management, there is nothing in Mr. Frishman's background to suggest that he is qualified to provide expertise on issues of groundwater. Similarly, while Dr. Thorne has a lengthy resume in the areas of climate research, radiological modeling for plants and animals, and soil analysis, he has essentially no experience in the area of hydrology. Thorne Affidavit, Attach. A. Nothing in his background qualifies him to provide expert opinions about groundwater in Nevada. The affidavits submitted by Mr. Frishman and Dr. Thorne are therefore no more valid or reliable than the rejected testimony of a mathematician who tried to provide expert opinions on engineering matters, *Fla. Power & Light Co.* (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-86-23, 24 NRC 108 (1986), or the environmental health

expert who tried to provide expert evidence on physical security matters. *Private Fuel Storage*, (Independent Spent Fuel Storage Installation), *LLC*, LBP 98-13, 47 NRC 360 (1998).

Apart from the failure to provide an affidavit from a qualified expert, both affidavits provided in support of this contention largely ignore the criteria of 10 C.F.R. §§ 2.326 and 51.109. The affidavits do not separately address each of the criteria of § 2.326 nor do they provide a “specific explanation” of why each criteria has been met. Dr. Thorne and Mr. Frishman merely adopt the allegations set forth in Paragraph 5 of this contention. *See* Thorne Affidavit at 1, Attach. B; Frishman Affidavit at 1, Attach. B. Neither Dr. Thorne nor Mr. Frishman provides any evidence, explanation or analysis to support the allegations set forth by this contention. Paragraph 5 of this contention simply repeats the comments provided by the NRC Staff and does not refer to either of Nevada’s affiants. With regard to the most important criteria of § 2.326 – whether a materially different result would be likely – the contention and affidavits of Dr. Thorne and Mr. Frishman are silent.

This contention is not supported by evidence or analysis provided by a credible qualified expert witness and ignores all of the requirements and criteria of 10 C.F.R. §§ 2.326 and 51.109. This contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

The issue presented by this contention is the subject of a supplement being prepared by DOE. In its evaluation undertaken at the request of the NRC Staff, DOE intends to rely on: (1) radiological and non-radiological contaminant concentrations predicted for groundwater at the RMEI location, and (2) groundwater pathways beyond the RMEI location as simulated by the Death Valley Regional Ground-Water Flow System model (developed by the United States Geological Survey) for current conditions. Groundwater impacts for a future wetter climate will

be based on a scaling factor from the TSPA-LA. The use of the scaling factor is appropriate because the regional modeling shows that the predominant flowpaths continue in the same volcanic-alluvial aquifer and the aquifer beyond the RMEI location is subject to similar changes in hydrologic conditions under the future wetter climate.

In addition, Nevada asserts that DOE's analysis should include descriptions of:

- the extent of the aquifer subject to contamination;
- an analysis of heterogeneities in the alluvial aquifer flow system that could affect radionuclide transport and concentration;
- an analysis of the potential for build-up of radionuclides in the aquifer due to retardation processes;
- an accounting of mass, concentration, and residence time of radionuclides in the affected aquifer throughout the regulatory period; and
- an assessment of potential long-term changes in the alluvial aquifer flow and transport system (including discharge) due to climate variation.

Petition at 1126. In the supplement being prepared by DOE at the request of NRC Staff, DOE intends to utilize radiological contaminant considerations predicted by the TSPA-LA model for groundwater at the RMEI location and groundwater pathways beyond the RMEI location as simulated by the regional model. The volcanic and alluvial aquifers in the Yucca Mountain region have been studied extensively and, as practicable, that information or abstractions of that information have been incorporated into the TSPA-LA and regional flow models. These models were developed using information from extensive field work, and they include heterogeneities appropriate for the scale of the model, and no additional analysis of aquifer heterogeneity is necessary to be included as part of the supplement. A simplified transport model, consistent with the expectations of the NRC Staff, will be implemented to estimate contaminant concentrations

over time along the regional flowpaths. Aquifer characteristics incorporated in the existing models represent the state of existing information. The use of relatively simplified models, based on existing information, will result in a conservative estimate of contaminant flow and transport in the groundwater system.

If the Board finds that the requirements of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326 have been met by Nevada, consideration of this contention should be deferred until DOE issues its supplement. If Nevada disagrees with the resolution of this issue in the supplement, this issue can be raised at that time.

**b. Brief Explanation of Basis**

See section a. above.

**c. Whether the Issue is Within the Scope of the Proceeding**

See section a. above.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

See section a. above.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

See discussion of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326 above.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

See section a. above.

## **227. NEV-NEPA-21 - Contaminated Aquifer Discharges**

The incomplete and inadequate 2002 FEIS and 2008 FSEIS analyses of the cumulative impacts of land surface discharge of groundwater contaminated with radionuclides and other repository derived contaminants are significant deficiencies, and were they to be remedied, the disclosure of these impacts would be materially different, thus the FEIS and FSEIS cannot be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada alleges that DOE failed to adequately analyze the cumulative impacts of the surface discharge of potentially contaminated groundwater. This raises essentially the same issue that the NRC Staff raised in its report on the adoption of the DOE NEPA documents, except that it proposes that DOE agree at the outset to evaluate specific surface discharge locations and use specific analytical methods.

Although DOE has agreed to perform an analysis of the cumulative impacts from the discharge of potentially contaminated groundwater and supplement its NEPA documents at the request of the NRC Staff, DOE's agreement does not make this an admissible contention unless Nevada makes the threshold showings required by 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326. All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Nevada's

environmental contention must also be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting affidavits. Neither of the witnesses who submitted affidavits in support of this contention, Mr. Frishman and Dr. Thorne, is qualified to provide expert opinions about issues of groundwater in Nevada. Mr. Frishman’s educational background is in the general area of geology, but much of his professional experience has been in the area of oceanography and coastal resource management in Texas. Frishman Affidavit, Attach. A. Although he has also worked in nuclear waste management, there is nothing in Mr. Frishman’s background to suggest that he is qualified to provide expertise on issues of groundwater. Similarly, while Dr. Thorne has a lengthy resume in the areas of climate research, radiological modeling for plants and animals, and soil analysis, he has essentially no experience in the area of hydrology. Thorne Affidavit, at Attach. A. Nothing in his background qualifies him to provide expert opinions about groundwater in Nevada. The affidavits submitted by Mr. Frishman and Dr. Thorne are therefore no more valid or reliable than the rejected testimony of a mathematician who tried to provide expert opinions on engineering matters, *Fla. Power & Light Co.*, (Turkey Point Nuclear Generating Plant, Units 3 and 4), LBP-86-23, 24 NRC 108 (1986), or the environmental health

expert who tried to provide expert evidence on physical security matters. *Private Fuel Storage, LLC*, (Independent Spent Fuel Storage Installation), LBP 98-13, 47 NRC 360 (1998).

Both affidavits provided in support of this contention largely ignore the criteria of 10 C.F.R. § 2.326 and 51.109. The affidavits do not separately address each of the criteria of § 2.326 nor do they provide a “specific explanation” of why each criteria has been met. Dr. Thorne and Mr. Frishman merely adopt the allegations set forth in Paragraph 5 of this contention. *See* Thorne Affidavit at 1, Attach. B; Frishman Affidavit at 1, Attach. B. Neither Dr. Thorne nor Mr. Frishman provides any evidence, explanation or analysis to support the allegations set forth by this contention. Paragraph 5 of this contention simply repeats the comments provided by the NRC Staff, and does not refer to either of Nevada’s witnesses. With regard to the most important criteria of § 2.326 – whether a materially different result would be likely—the contention and affidavits of Dr. Thorne and Dr. Frishman are silent.

This contention is not supported by evidence or analysis provided by a credible qualified expert witness and ignores all of the requirements and criteria of 10 C.F.R. §§ 2.326 and 51.109. This contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

The issue presented by this contention is the subject of a supplement being prepared by DOE. In its evaluation undertaken at the request of the NRC Staff, DOE intends to rely on: (1) radiological and non-radiological contaminant concentrations predicted for groundwater at the RMEI location, and (2) groundwater pathways beyond the RMEI location as simulated by the Death Valley Regional Ground-Water Flow System model (developed by the United States Geological Survey) for current conditions. The evaluation of potential discharge locations will depend on the output of the model. Potential discharge locations that coincide with the flow

pathways will be evaluated in the supplement. DOE will not, however, presuppose at the outset that any specific locations will be affected. Impacts for a future wetter climate will be evaluated based on a scaling factor for the groundwater specific discharge from the TSPA-LA. The use of the scaling factor is appropriate because the regional modeling shows that the predominant flowpaths continue in the same volcanic-alluvial aquifer and the aquifer beyond the RMEI location is subject to similar changes in hydrologic conditions under the future wetter climate.

In addition, Nevada asserts that DOE's analysis should include descriptions of:

- the extent of the aquifer subject to contamination;
- an analysis of heterogeneities in the alluvial aquifer flow system that could affect radionuclide transport and concentration;
- an analysis of the potential for build-up of radionuclides in the aquifer due to retardation processes;
- an accounting of mass, concentration, and residence time of radionuclides in the affected aquifer throughout the regulatory period; and
- an assessment of potential long-term changes in the alluvial aquifer flow and transport system (including discharge) due to climate variation.

Petition at 1131. In the supplement being prepared by DOE at the request of NRC Staff, DOE intends to utilize radiological contaminant concentrations predicted by the TSPA-LA model for groundwater at the RMEI location and groundwater pathways beyond the RMEI location as simulated by the regional model. The volcanic and alluvial aquifers in the Yucca Mountain region have been studied extensively and, as practicable, that information or abstractions of that information have been incorporated into the TSPA-LA and regional flow models. These models were developed using information from extensive field work and they include heterogeneities appropriate for the scale of the model, and no additional analysis of aquifer heterogeneity is

necessary to be included as part of the supplement. A simplified transport model, consistent with the expectations of the NRC Staff, will be implemented to estimate contaminant concentrations over time along the regional flowpaths. Aquifer characteristics incorporated in the existing models represent the state of existing information. The use of relatively simplified models, based on existing information, will result in a conservative estimate of contaminant flow and transport in the groundwater system.

If the Board finds that the requirements of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326 have been met by Nevada, consideration of this contention should be deferred until DOE issues its supplement. If Nevada disagrees with the resolution of this issue in the supplement, this issue can be raised at that time.

**b. Brief Explanation of Basis**

See section a. above.

**c. Whether the Issue is Within the Scope of the Proceeding**

See section a. above.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

See section a. above.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

See discussion of 10 C.F.R. § 51.109 and 10 C.F.R. § 2.326 above.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

See section a. above.

## **228. NEV-NEPA-22 - No-Action Alternative**

The 2002 FEIS's No-Action Alternative is neither an available, appropriate, nor reasonable alternative for analysis and decision making in that neither of the two No-Action Alternative scenarios likely ever would be determined acceptable for implementation; however, the current practice of at-reactor (or off-site ISFSI), NRC licensed spent nuclear fuel storage can be extrapolated, for EIS comparative impact analysis purposes, for a reasonable and feasible period of time in the future. This deficiency is significant, and if it were to be addressed in a satisfactory manner, the disclosure of overall environmental impacts would be materially different. As a result, the FEIS cannot be adopted by the NRC.

### **RESPONSE**

In this contention, Nevada alleges that DOE inappropriately selected No-Action Alternative scenarios that would not likely be determined acceptable for implementation.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R. § 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to

enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners....” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavits. It submitted affidavits prepared by Steven A. Frishman and Robert J. Halstead that say nothing about any of these criteria and merely adopt the words of Paragraph 5 of Nevada’s Petition, a paragraph that provides none of the analysis and explanations required by the Commission’s regulations. Frishman Affidavit at 1, Attach. B; Halstead Affidavit at 1, Attach. B. Neither expert provides the analysis that is explicitly called for by the terms of § 2.326(b). This regulation requires Nevada’s experts to “set forth the factual and/or technical bases for the movant’s claim that the criteria of paragraph (a) of this section have been satisfied.” Section 2.326(b) goes on to state that “[e]ach of the criteria must be separately addressed, with a specific explanation of why it has been met.”

Additionally, Paragraph 5 simply makes conclusory remarks without any meaningful discussion or analysis, and without an explanation of why the issue raised by the contention is of any significance. Paragraph 5 states, for example, that DOE’s choice of No-Action Alternative scenarios was a “significant” deficiency “and if it were to be addressed in a satisfactory manner, the disclosure of overall environmental impacts would be materially different.” Petition at 1134. In the face of that kind of unequivocal assertion, one would expect a meaningful, scientifically valid analysis showing that there would be a material difference in disclosure of environmental impacts if different No-Action Alternative scenarios were utilized. Instead, Paragraph 5 simply proposes a substitute No-Action Alternative scenario without any analysis whatsoever on this critical question. In fact, no such material difference would exist as DOE’s Scenario 1 included

the analysis Nevada proposes, reviewing the estimated radiological impacts from the operation of storage facilities at 77 locations around the U.S. over the time period during which the repository would be operated and monitored, but simply extended the analysis to incorporate the postclosure timeframe. Repository SEIS, Vol. I at 7-5 to -6. The affidavits and this contention should therefore be rejected.

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**c. Whether the Issue is Within the Scope of the Proceeding**

This contention is inadmissible because it is outside the scope of the proceeding under 10 C.F.R. § 2.309(f)(1)(iii). Although the 2002 FEIS and the Repository SEIS do discuss a No-Action Alternative, no challenge to the adequacy of DOE's discussion of such alternative may be entertained because the Nuclear Waste Policy Act of 1982, as amended, 42 U.S.C. § 10101 *et seq.*, (NWPA), expressly provides that an environmental impact statement prepared for the Yucca Mountain Site need not "consider the need for a repository, the alternatives to geological disposal, or alternative sites to the Yucca Mountain Site." 42 U.S.C. § 10134(a)(1)(D).

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

For the reasons stated in section c., there is no issue material to the findings that the NRC must make regarding this contention because the NWPA expressly forecloses the need to

consider alternatives to the Yucca Mountain Site, which includes “No-Action Alternatives.” 42 U.S.C. § 10134(a)(1)(D).

Further, there is no issue material to the findings that the NRC must make because, even if required, DOE’s consideration of No-Action Alternatives was reasonable. First, Nevada’s proposed “alternative” – that DOE analyze the “impacts of storing the waste, in equivalent amounts, at on-site or off-site facilities, for an equivalent period of time,” Petition at 1135 – has already been addressed. In Scenario 1, DOE reviewed the estimated radiological impacts from the operation of storage facilities at 77 locations around the U.S. over the time period during which the repository would be operated and monitored, and simply extended the analysis to incorporate the postclosure timeframe. Repository SEIS, Vol. I at 7-5 to -6. Nevada’s assertion that DOE did not analyze such storage impacts, but rather “generically determined [them] to be not significant,” Petition at 1135, is incorrect.

Second, a court will uphold an agency’s discussion of alternatives so long as “the alternatives are reasonable and the agency discusses them in reasonable detail.” *Citizens Against Burlington, Inc. v. Busey*, 938 F.2d 190, 196 (D.C. Cir. 1991). “An agency is required to examine only those alternatives necessary to permit a reasoned choice.” *Ass’n. of Pub. Agency Customers, Inc. v. Bonneville Power Admin.*, 126 F.3d 1158, 1185 (9th Cir. 1997).

DOE selected two No-Action Alternatives: Scenario 1, where long-term storage of SNF and HLW would occur at the current storage sites with effective institutional control for at least 10,000 years; and Scenario 2, where storage would occur at the current sites with no effective institutional control after about 100 years. Repository SEIS, Vol. I at 2-56. DOE selected these two Scenarios to illustrate the range of potential environmental impacts that would be possible if the Yucca Mountain repository is not completed. *Id.* As DOE explained, it recognizes that “the

future course Congress, DOE, and the commercial utilities would take, if Yucca Mountain was not approved, is uncertain.” *Id.* Faced with this uncertainty, DOE selected bounding scenarios.

Nevada has not shown that DOE’s selection of No-Action Alternatives was unreasonable. As DOE stressed, the No-Action scenario in this case is by no means clear. There are a number of plausible outcomes, including “the continued storage of spent nuclear fuel and high-level radioactive waste at each generator site in expanded onsite storage facilities, storage of these materials at one or more centralized locations, study and selection of another location for a deep geologic repository . . . , development of new technologies, or reconsideration of alternatives to geologic disposal.” Repository SEIS, Vol. I at 7-2. But DOE “need not examine an infinite number of alternatives in infinite detail.” *Allison v. Dep’t of Transp.*, 908 F.2d 1024, 1031 (D.C. Cir. 1990). It can use reasonable criteria to narrow the range of its alternative scenarios.

An agency has the discretion to estimate the reasonably foreseeable upper bound of an action’s impacts, and in doing so, fully comports with NEPA’s requirements. *See Natural Res. Def. Council, Inc. v. U.S. Nuclear Regulatory Comm’n*, 685 F.2d 459, 486 (D.C. Cir. 1982) (noting that “[i]f, after considering [the upper bound] of environmental damage, the decisionmakers conclude that the proposed action is worth its societal costs, full account will have been taken of the action’s environmental impact”), *rev’d on other grounds, Baltimore Gas and Elec. Co. v. Natural Res. Def. Council, Inc.*, 462 U.S. 87 (1983). As a result, courts have upheld NEPA analysis methodologies that result in a conservative estimate of environmental effects. *See Mid States Coalition for Progress v. Surface Transp. Bd.*, 345 F.3d 520, 539 (8th Cir. 2003) (finding that using a conservative estimate “did not undermine the purposes of NEPA”). It was therefore not unreasonable for DOE to use bounding scenarios for its No-Action Alternatives.

Nevada's arguments for why it was unreasonable to select these No-Action Alternatives are also unconvincing and inconsistent. It argues that it is "inconceivable" in Scenario 2 that society would permit no institutional controls after 100 years. Petition at 1134. Yet although Nevada argues that society would be unwilling to "accept the willful decision to cease maintenance," apparently this logic does not hold true in the context of Scenario 1, where Nevada contends that a long-term commitment to institutional controls "exceeds credibility." *Id.* DOE agrees that these scenarios are unlikely, 2002 FEIS, Vol. I at 2-65, but they were selected not for their likelihood but to demonstrate the impacts of bounding scenarios for the purpose of comparison. An agency must "set forth only those alternatives necessary to permit a reasoned choice." *Nw. Env'tl. Def. Ctr. v. Bonneville Power Admin.*, 117 F.3d 1520, 1538 (9th Cir. 1997) (internal quotation and citation omitted). This contention should therefore be rejected.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, Nevada has failed to provide the requisite supporting facts, expert opinions and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact, With Supporting References to the License Application**

For the reasons discussed in sections c. and d. above, there is no genuine dispute on any material issue of law or fact because it is outside the scope of the proceedings and because the contention fails to demonstrate any inadequacy in DOE's NEPA analyses. The contention therefore should be rejected.

**229. NEV-NEPA-23 - Aircraft Crash Scenarios – Aging Facility**

SEIS Appendix E, Section E.7, which states that DOE did not consider the Aging Facility to be vulnerable to a hypothetical sabotage scenario involving a large commercial jet aircraft crash due to the spacing and protective nature of the concrete overpacks, fails to accurately identify the number of overpacks damaged, fails to accurately assess the severity of the damage from such a crash, and fails to accurately analyze the amount of radioactive material that would be released from such a crash. These deficiencies are significant, and if they were to be addressed in a satisfactory manner, the disclosure of overall radiological impacts would be materially different, and thus the FEIS and SEIS cannot be adopted by the NRC.

**RESPONSE**

In this contention, the State of Nevada asserts that DOE did not consider the Aging Facility to be vulnerable to a hypothetical sabotage scenario involving a large commercial jet aircraft crash and thus fails to accurately identify the consequences of such a sabotage event.

All NEPA contentions must demonstrate that they meet the criteria of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326, as well as the standards for contentions of 10 C.F.R. § 2.309. Nevada fails to meet the express requirements of 10 C.F.R. §§ 2.326 and 51.109 in requesting that its contention be admitted in this proceeding. Specifically, as set forth in Section V.A.4, Nevada must (1) raise a significant environmental issue; and (2) demonstrate that its contention, if proven to be true, would or would likely result in a materially different outcome in this proceeding. Moreover, its environmental contention must be supported by the affidavit of a qualified witness that sets forth the factual and/or technical basis supporting the claim that these two criteria have been met, including a “specific explanation of why it has been met.” 10 C.F.R.

§ 2.326(b). As noted in Section V.A.4 above, “the Commission expects its adjudicatory boards to enforce the [Section 2.326] requirements rigorously – *i.e.*, to reject out-of-hand reopening motions that do not meet those requirements within their four corners.” *Pub. Serv. Co. of N.H.* (Seabrook Station, Units 1 and 2), ALAB-915, 29 NRC 427, 432 (1989).

Nevada fails to address any of the mandatory requirements of §§ 51.109 and 2.326 in its contention or supporting expert affidavit of Mr. Hugh Horstman. First, Nevada does not in its expert’s affidavit or anywhere in its Petition separately address the criteria for §§ 51.109 and 2.326(a) and demonstrate that the contention raises a significant environmental issue or that the contention, if proven, would or would likely result in a materially different outcome in the proceeding. Nevada’s expert’s affidavit simply adopts Paragraph 5 in the Petition. Horstman Affidavit at 1, Attach. B. With regard to the most difficult showing – a demonstration that a “materially different result would be or would have been likely” if the contention were proven to be true – Nevada’s expert, Mr. Horstman, simply points to the 2002 FEIS and Repository SEIS and documents referenced in those Statements, posits a new hypothetical sabotage event, and then criticizes DOE for not addressing it. The concluding sentence of Paragraph 5 then states, without elaboration, that if Mr. Horstman’s new sabotage event had been included in the Repository SEIS, “the disclosure of overall radiological impacts would have been different.” Petition at 1141. In adopting this statement, Mr. Horstman does not claim, much less demonstrate, that the consequences of this aircraft sabotage event are more severe or more likely than those already addressed in the 2002 FEIS and Repository SEIS.<sup>143</sup>

Mr. Horstman is not an expert on sabotage events. Horstman Affidavit, Attach. A. Mr. Horstman is currently a pilot with Southwest Airlines and formerly served as an Air Force

---

<sup>143</sup> Paragraph 5 and Mr. Horstman’s affidavit demonstrate the Nevada was well aware of the requirements of 10 C.F.R § 51.109 and 10 C.F.R. § 2.326 but largely chose to ignore them.

fighter pilot and instructor. He has degrees in Business Administration. He also has worked for the State of Utah as an aviation safety consultant. There is nothing, however, identified in his background which would qualify him to provide expert testimony on possible sabotage events and the radiological consequences of those events. He has adopted Paragraph 5 of the contention, including the statement that if the aircraft sabotage events occurred as he has suggested, “the disclosure of overall radiological impacts would be materially different.” That he is not an expert on sabotage events, and that his testimony is based on extraordinarily remote and speculative possibilities, is demonstrated by his statement in Paragraph 5 that the consequences of the sabotage event would be even worse if a B-52 bomber were used by the saboteurs because the B-52 bomber “would be carrying 4 to 8 times as many engines as assumed for the other aircraft.” Petition at 1140. How a saboteur would obtain and fly a B-52 bomber into the repository is never explained. Given the lack of qualifications to provide expert opinions on sabotage events or the radiological consequences of such events, the affidavit of Nevada’s expert fails to meet the NRC’s admissibility standards and this contention should be rejected. *See Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), LBP-98-13, 47 NRC 360, 367-68 (1998).

**a. Statement of Issue of Law or Fact to be Controverted**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**b. Brief Explanation of Basis**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement

**c. Whether the Issue is Within the Scope of the Proceeding**

Without prejudice to other positions taken by DOE, DOE expresses no legal objection based upon this requirement.

**d. Whether the Issue is Material to the Findings that the NRC Must Make**

This contention does not allege a material issue because DOE's analysis of sabotage events was reasonable and fully met the requirements of NEPA. In the Repository SEIS, DOE recognized that "[w]hether acts of sabotage or terrorism would occur, and the exact nature and location of the events, or the magnitude of the consequences of such acts if they were to occur is inherently uncertain—the possibilities are infinite." Repository SEIS, Vol. II, App. E at E-32. Nonetheless, in the Repository SEIS, DOE hypothesized a scenario in which a large commercial jet aircraft would crash into and penetrate the repository facility "with the largest inventory of radioactive material vulnerable to damage from such an event." *Id.* DOE also discussed whether it should consider such a crash into the Aging Facility but chose not to do so for several reasons:

(1) the aging overpacks on the Aging Facility pads, would be 5.5 meters (18 feet) apart (DIRS 184100-BSC 2007, all), such that an aircraft crash into the pad could not damage more than a few of the overpacks, and (2) the storage canisters would be enclosed in thick concrete overpacks that would provide protection from penetration by aircraft parts (DIRS 155970-DOE 2002, Appendix H, p. H-37 and Chapter 7, p. 7-30). Further, as noted in Section e.2.1.2.1, DOE would design the TAD aging overpacks to withstand an impact from a jet fighter aircraft crash.

*Id.*<sup>144</sup> Mr. Horstman does not suggest any errors in the aircraft sabotage analysis in the Repository SEIS but instead asserts that there should have been an additional analysis undertaken involving the Aging Facility. After describing the speed and size of a Boeing 757

---

<sup>144</sup> In its accident analysis, DOE considered the possible accidental crash of a fighter plane, "the most likely aircraft impact." Repository SEIS, Vol. II, App. E at E-11.

and a B-52 and the physical characteristics of the Aging Facility, Mr. Horstman contends that in addition to evaluating a large commercial plane crashing into the Repository, DOE should also have considered a saboteur crashing a large commercial aircraft or a B-52 somewhere in the facility, the aircraft then skidding perhaps as much as 1,400 feet including on the aging pad and damaging hundreds of overpacks. Petition at 1140. Mr. Horstman does not explain the extent of the damage to the overpacks or whether there would be any radiological releases. Nor does he assert that this new sabotage event would result in worse consequences than the event analyzed in the Repository SEIS.

As DOE recognized in the Repository SEIS, the analysis of sabotage events is highly uncertain and the possibilities are infinite. Recognizing these same difficulties, in *Pacific Gas and Electric Co.*, the Commission recently rejected as inadmissible a contention that the NRC Staff's environmental assessment had failed to consider alternate threat scenarios. The Commission held that "[a]djudicating alternate terrorist scenarios is impracticable. The range of conceivable (albeit highly unlikely) terrorist scenarios is essentially limitless, confined only by the limits of human ingenuity." *Pac. Gas & Elec. Co.* (Diablo Canyon Power Plant Independent Spent Fuel Storage Installation), CLI-08-01, 67 NRC \_\_ (slip op. at 24) (Jan. 15, 2008). DOE is not required under NEPA to address the kind of highly speculative event Mr. Hortsman proposes. *Fla. Power & Light Co.* (Turkey Point Nuclear Generating Station, Units 3 and 4), LBP-81-14, 13 NRC 677, 688 (1981).

Similarly, although Mr. Horstman is not a qualified expert, and even if the Board were to conclude that this contention involved disputed expert opinions, the well-settled law that a petitioner does not raise a material issue under NEPA simply by presenting a battle of experts, still applies. In *Price Road Neighborhood Ass'n, Inc. v. Department of Transportation.*, 113 F.

3d 1505 (9th Cir. 1997), the Court of Appeals affirmed a district court's grant of summary judgment to the agency. The Ninth Circuit stated that the appellant had:

sought to engage in a battle of the experts with regard to several impacts, including air quality and noise, offering their own studies to contradict those of the agencies. We have consistently rejected such attempts, noting that “when specialists express conflicting views, an agency must have discretion to rely on the reasonable opinions of its own qualified experts...”

*Id.* at 1511, citing *Greenpeace Action v. Franklin*, 14 F.3d 1324, 1332 (quoting *Marsh v. Or. Natural Res. Council*, 490 U.S. 360, 378 (1989)); accord *Havasupai Tribe v. Robertson*, 943 F.2d 32, 34 (9th Cir. 1991) (affirming district court decision based on the administrative record that no supplementation of an EIS was required because “disagreement among experts does not invalidate an EIS”) (citation omitted).

As the Supreme Court stated in *Marsh*, an agency must have the discretion to rely on the reasonable opinions of its own experts “even if, as an original matter, a court might find contrary views more persuasive.” *Marsh*, 490 U.S. at 378. This is because, as the Supreme Court explained in *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976), “[n]either the statute nor its legislative history contemplates that a court should substitute its judgment for that of the agency as to the environmental consequences of its actions.” The NRC has indicated that it would adhere to this same tenet in deciding whether to adopt DOE's EIS. Accordingly, this contention, which is premised on a disagreement between an intervenor's expert and DOE's expert analysis in an EIS does not create a litigable issue and therefore should not be admitted.

**e. Statement of Alleged Facts or Expert Opinion Supporting Petitioner's Position and Supporting References**

For the reasons discussed above with respect to the requirements of 10 C.F.R. §§ 51.109 and 2.326, and as addressed in Section V.A.3 regarding the legal standards under 10 C.F.R.

§ 2.309(f)(1)(v), Nevada has failed to provide the requisite supporting facts, expert opinion and references.

**f. Existence of a Genuine Dispute on a Material Issue of Law or Fact,  
With Supporting References to the License Application**

For the reasons discussed above with respect to the requirements of 10 C.F.R §§51.109 and 2.326 in d. above, there is no genuine dispute on any material issue of law or fact.

## VI. CONCLUSION

Nevada has failed to demonstrate that it is in substantial and timely compliance with its LSN obligations. While it has legal standing as the host state for the repository, it has failed to proffer any admissible contentions. Accordingly, its Petition should be denied.

Respectfully submitted,

# THE SAFETY OF A REPOSITORY AT YUCCA MOUNTAIN

## 1. INTRODUCTION

The U.S. Department of Energy (DOE) has now submitted a license application to the U.S. Nuclear Regulatory Commission (NRC) to construct a geologic repository at Yucca Mountain, Nevada, for the disposal of spent nuclear fuel (SNF) and high-level radioactive waste (HLW). The submittal of the license application is a major milestone in the history of site investigations, scientific analysis, and repository facilities design and is a major step toward safe, permanent disposal of nuclear waste.

This work was begun more than 25 years ago, when Congress adopted the Nuclear Waste Policy Act (NWPA), consistent with the overwhelming consensus in the international scientific community that the best option for a disposal facility for nuclear waste is a deep underground repository. More than 20 years ago, Congress directed the Secretary of Energy to investigate and recommend to the President whether such a repository could be located safely at Yucca Mountain. Following tens of millions of hours of research to answer this question, the Secretary recommended to the President that Yucca Mountain be developed as the site for an underground repository for spent fuel and other radioactive wastes. The Secretary also concluded that there are compelling national interests in favor of proceeding with the project. These national interests included national security, nonproliferation objectives, energy security, homeland security, and efforts to protect the environment. The President approved the recommendation, and in July 2002 the President signed the joint Congressional resolution known as the Yucca Mountain Development Act, designating the Yucca Mountain site for development as a repository for the disposal of SNF and HLW. This action authorized the DOE to proceed in the development of a license application and to seek approval from the NRC to construct a repository. At a later date, a separate licensing decision by the NRC will be required before the repository can commence operations.

The Yucca Mountain repository Construction Authorization license application, which the DOE submitted to the NRC in June of 2008, describes the results of scientific and engineering studies of the Yucca Mountain site, the waste forms to be disposed, the repository and waste package designs, the results of safety assessments of the operations to be carried out at the repository, and evaluations of the long-term performance of the repository, along with general and administrative information. The license application provides the information specified by the NRC in its regulations and other guidance documents. The license application contains results of long-term safety evaluations based on studies of the geologic, hydrologic, and geochemical environment and evaluations of how conditions might evolve over time. These evaluations consider a range of processes that could affect the repository. Because projections of performance for 10,000 years and longer are inherently uncertain, the uncertainties associated with analyses and models of long-term performance are also described in the license application.

This document presents a summary of why the DOE has concluded that it can safely construct and operate a repository for SNF and HLW at Yucca Mountain in Nye County, Nevada and demonstrates that the repository system will safely limit releases well into the future. The conclusion that the repository will be safe if constructed and operated as described in the license application is based on DOE assessments of the ability of the repository to meet EPA standards and NRC regulations governing a repository at Yucca Mountain. This document presents an overview of the evidence, analyses, and conclusions that quantify and substantiate the DOE position that the repository will be safe during operations and after closure, beyond the time when active control of the facility is

needed or can be relied on, and it presents a summary of the safety findings. The document discusses the safety of the repository in two time frames: (1) during the operation of the repository, while wastes are shipped to Yucca Mountain, packaged and placed underground, and monitored; and (2) after the repository is permanently closed. Each of these sections is organized to describe the safety principles governing the design and safety assessments, to present a description of the features or components of the repository that are important to demonstrating safety, and to present a summary of pertinent results accompanied by a discussion of why the DOE has confidence in the results.

**mrem.** The millirem, or mrem, is a measure of the amount of radiation a person receives and how it affects the body. One mrem is less than 0.5% of the amount of radiation received annually from naturally occurring radiation. 1,000 mrem is equal to 1 rem.

The DOE has addressed the potential risks associated with the handling and disposal of radioactive wastes in preparing the license application and its environmental impact statements. The handling and disposal of radioactive wastes are governed by standards and regulations issued and administered by the EPA and the NRC, respectively. These

standards and regulations specify maximum permissible levels of radiation doses, measured in millirem or rem, to workers and the public. The DOE must comply with these regulations and, in order to do so, must examine how the repository is expected to perform under expected or normal conditions as well as in response to the impact of potential hazards and very low probability events that could disrupt the repository system.

The detailed assessments establishing the safety of the repository are presented in the license application. As shown in the application and summarized in this document, the potential doses to workers and the public from the operation of the repository are below the limits imposed by the regulations. The same is true for protection of the public after the repository is permanently closed. In fact, the estimated doses to the public in the distant future are a small fraction of the limits imposed by the proposed regulations. The doses are calculated for a hypothetical individual designed by regulation to be situated in a manner to maximize the calculated dose. The expected doses to real people, especially those with an urban lifestyle, would be smaller. These projected estimates represent a very small fraction of the background radiation that all Americans receive just from living in the United States.

## 2. CONTRIBUTIONS TO SAFETY BY THE SITE, THE MATERIALS TO BE DISPOSED, AND THE REPOSITORY DESIGN

### 2.1 SITE DESCRIPTION AND SELECTION

Internationally, there is a consensus that geologic disposal is the best means for final disposal of SNF and HLW, that geologic disposal can be safe, and that the regulations and analytical approaches used to demonstrate such safety are reasonable. The science supporting the understanding of Yucca Mountain has been developed over more than 30 years by world-recognized experts and has been internationally reviewed. Scientists from the country's National Laboratories, including Sandia, Los Alamos, Lawrence Livermore, Lawrence Berkeley, and Argonne, have been involved since the program's beginning. Internationally recognized experts from the U.S. Geological Survey were responsible for the suggestion to look to the unsaturated zone (see below) for repository development to take advantage of the conditions of limited water. The engineering designs were developed to complement the site's unsaturated characteristics and, especially for the operational period, to build upon decades of precedent experience in the safe handling of SNF and other radioactive materials.

Yucca Mountain was one of nine sites initially studied for the first repository under the NWP. Its identification as a potential site followed early work by the U.S. Geological Survey showing that disposal in the unsaturated zone would offer advantages in deep geologic disposal of SNF and HLW. The conclusion was based on the premise that, because water was the medium that would eventually transport radionuclides away from the repository, a repository site in an environment with limited water would be a benefit to repository performance that was provided by the natural system.

The Yucca Mountain site, shown in Figure 1, is located on federal land adjacent to the Nevada Test Site in Nye County, Nevada, about 90 miles northwest of Las Vegas. The mountain consists of a series of ridges extending 25 miles from Timber Mountain in the north to the Amargosa Desert in the south. The water table at Yucca Mountain is approximately 1,600 to 2,600 ft below the surface of the mountain at the repository

**unsaturated zone.** The unsaturated zone is the zone between the land surface and the regional water table. The rocks in this zone are not completely dry, but the pore spaces are only partially filled with water. The water is held in the pores, which prevents it from moving freely, giving the unsaturated zone its unique character.

location. The underground facility will be located in the unsaturated zone, about 660 to 1,600 ft below the surface and, on average, about 1,000 ft above the water table. The deep water table and thick unsaturated zone at Yucca Mountain are the result of the low infiltration rate of surface water due to low annual rainfall and high rates of evaporation and transpiration (the process by which water passes from soil into plants and then into the air).

The repository will be located in volcanic rock called tuff that was deposited by a series of eruptions between approximately 11 and 14 million years ago. The characteristics of the volcanic rock have been studied in underground excavations and boreholes and by extensive geologic mapping of the surface. Mapping and other studies show that faults are present in the vicinity of Yucca Mountain. The location, timing, and amount of movement on these faults have been characterized as part of the DOE seismic hazard analysis. The location of the underground facility was identified using several factors, including the thickness of overlying rock and soil, the characteristics of the rock that would host the repository, the location of faults, and the depth to groundwater. The facility will be sited

Figure 1. Photograph of the Yucca Mountain Site

deep enough underground to prevent waste from being exposed to the environment and to prevent accidental human intrusion. The host rock for a geologic repository must be stable enough to sustain excavated openings during repository operations. The rock must also be able to absorb heat generated by the SNF and HLW. The Topopah Spring Tuff rock unit in which the underground facility will be constructed exhibits these characteristics.

The combination of the desert environment and the deep water table with the thick unsaturated zone between the surface and the water table define the hydrologic nature of the repository system at Yucca Mountain. The desert environment with its low rainfall and limited infiltration of water into the subsurface is a favorable long-term characteristic of the Yucca Mountain setting. Far in the future, the return of glacial climate conditions to North America would still leave Yucca Mountain in a desert environment. The location of the site significantly contributes to the inherent safety of repository operations. The site boundary is approximately 5 miles away from the waste handling facilities, and there are no permanent residents within approximately 14 miles of the repository. This remote location reduces the effects of potential radioactive releases from normal operations and the abnormal, highly unlikely events considered in the safety analysis. There are design features of the repository and waste handling operations facilities that prevent unlikely events or reduce their potential impact. These safety-enhancing design features are comparable to proven features currently required of nuclear power plants.

Following the process required by the NWPA, Yucca Mountain was one of the five sites originally nominated by the Secretary as suitable for site characterization for selection of the first repository site. Yucca Mountain was one of the three sites recommended by the Secretary to the President as candidate sites for site characterization. Those recommendations were approved by the President. DOE documents that compared the sites at that time showed Yucca Mountain to be one of the best performing sites for long-term safety out of the nine sites initially considered. As noted, the site recommendation and subsequent 2002 decision by Congress to designate Yucca Mountain as the site for development of the repository allowed the DOE to prepare the license application. A license application is the formal document an applicant submits to the NRC to describe proposed activities and document the safety analyses for those activities. The NRC evaluates an applicant's proposed activities and safety analyses through an extensive review of the license application. The NRC must approve the license application before construction of the repository is allowed to take place.

## 2.2 THE NATURE OF THE MATERIALS TO BE DISPOSED AND THE WASTE PACKAGES TO BE USED

The numerous locations where SNF and HLW is currently stored across the United States are shown in Figure 2. The waste forms transported to and received at Yucca Mountain will be solid and robust materials. No liquid waste forms will be accepted for disposal.

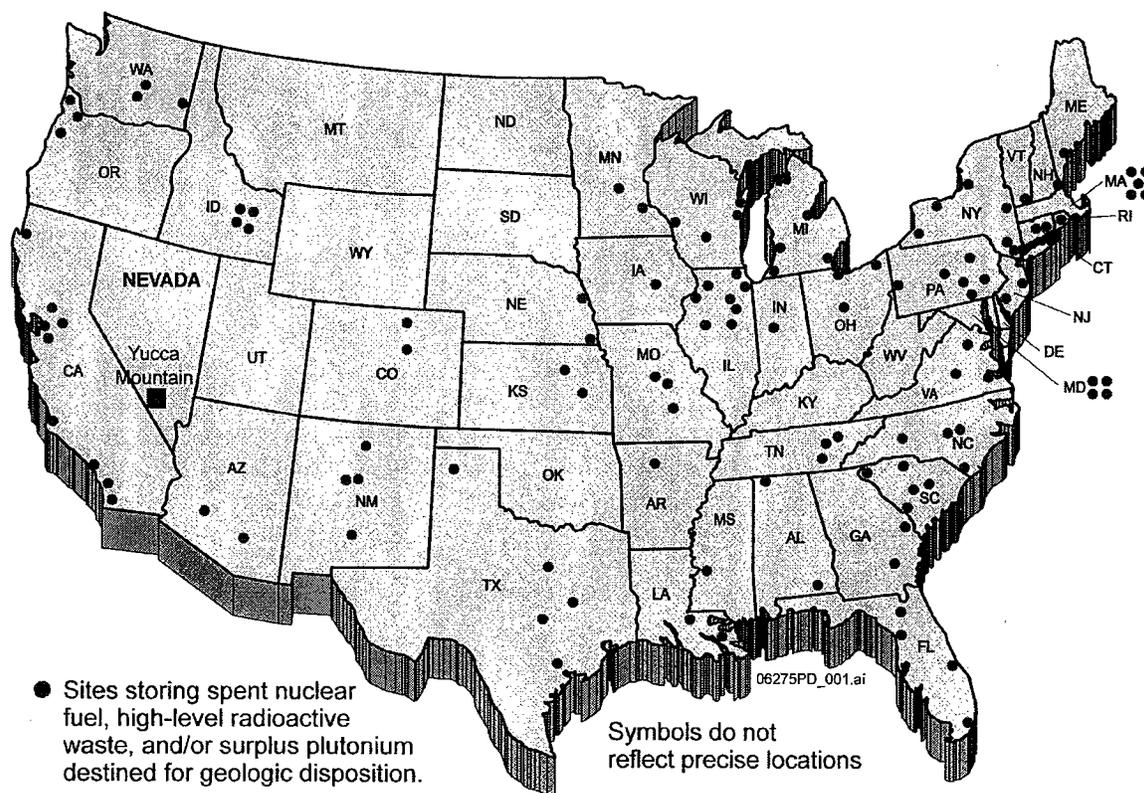

Figure 2. Current Locations of Nuclear Waste Storage Across the United States

Figure 3 shows the types of waste that will be emplaced at the repository. By statute, the DOE is responsible for the safe, permanent disposal of SNF from commercial nuclear power plants. The SNF consists of bundles of rods containing a ceramic uranium oxide fuel and is currently stored by each utility. This ceramic is very resistant to being dissolved. The DOE will also dispose of DOE-owned HLW from the past production of nuclear weapons and smaller quantities of SNF from weapons production reactors, research reactors, and naval reactors. The majority of the DOE SNF is currently stored at DOE sites in Idaho, South Carolina, and Washington state. In addition, the liquid waste from past nuclear weapons production programs is stored in underground tanks at the same DOE sites. Before disposal at Yucca Mountain, this liquid waste will be mixed with silica sand and other constituents, melted together to form a glass, and poured into stainless steel canisters. Once the glass solidifies (vitrifies), the canister will be sealed. When the repository is ready to receive the canisters, they will be loaded into transportation casks and shipped to the repository. Vitrified waste does not dissolve easily and will stay intact for many thousands of years. There is also a small amount of vitrified HLW from a past commercial SNF reprocessing activity that the DOE will receive and dispose of at the repository.

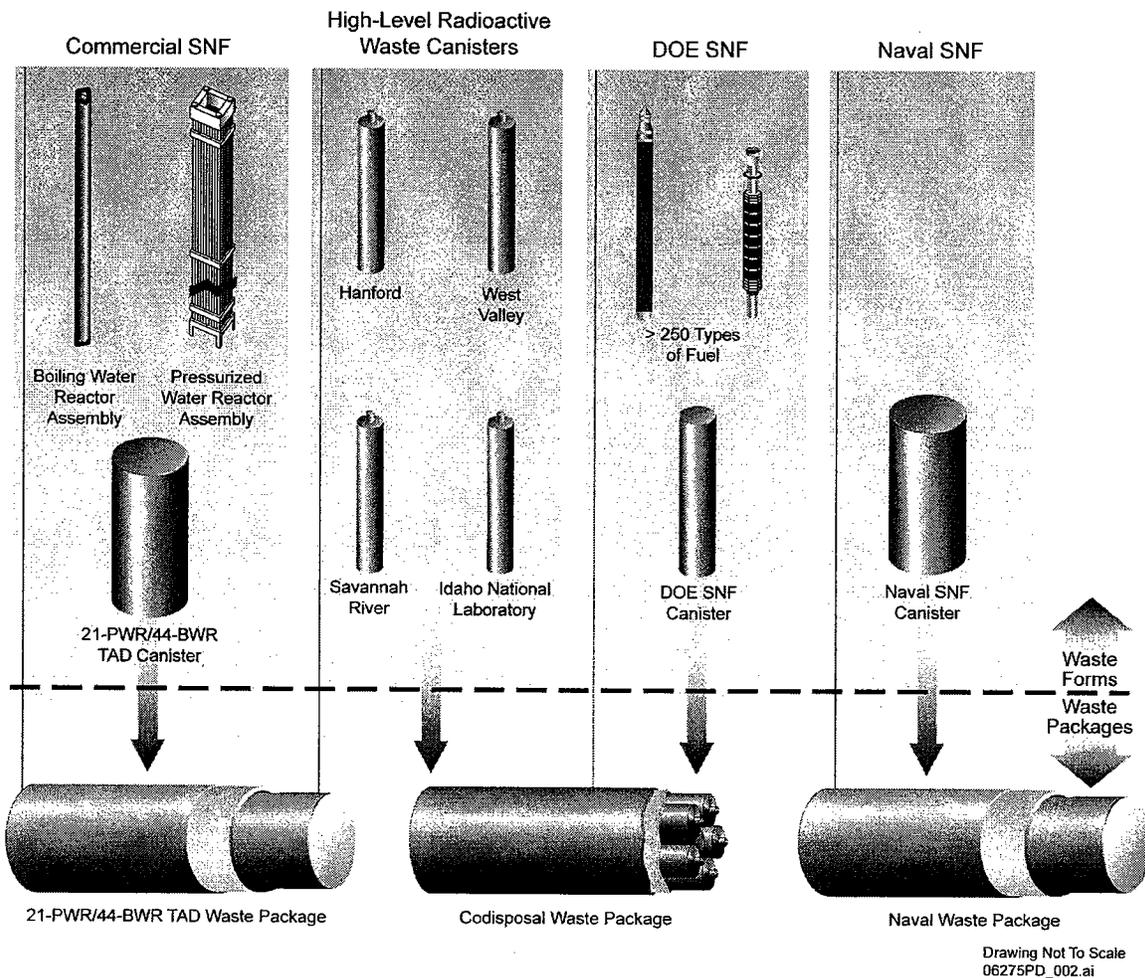

Figure 3. Types of Waste to be Emplaced at the Yucca Mountain Repository and the Waste Packages They Will Be Disposed In

Some of the material that will be disposed in the repository will come from surplus plutonium resulting from the decommissioning of nuclear weapons. Current plans call for the surplus plutonium to be combined with uranium to form fuel that will be used in commercial reactors. The resulting spent fuel will be disposed as commercial SNF. It is likely that more than the Yucca Mountain repository's regulated capacity of 70,000 metric tons of heavy metal (metric tons of heavy metal is the measure for expressing the quantity of SNF specified by Congress in the NWPA) of SNF and HLW will exist in various storage facilities by 2010 (Figure 2).

The waste packages into which the SNF and HLW will be placed are also robust and extremely resistant to corrosion. The waste packages are made of two concentric cylinders. The outermost cylinder of the waste package will be made of a highly corrosion-resistant nickel-based alloy called Alloy 22, which is known for its great resistance to corrosion. The inner cylinder is made of stainless steel and is also very corrosion resistant. Analyses presented in the license application show that, absent unexpected seismic or igneous events, these robust waste packages will last for hundreds of thousands of years.

Most of the SNF will arrive at the repository in a standardized canister known as the transportation, aging, and disposal (TAD) canister. This canister is also made of stainless steel and will be placed inside the other two cylinders, as shown in Figure 4.

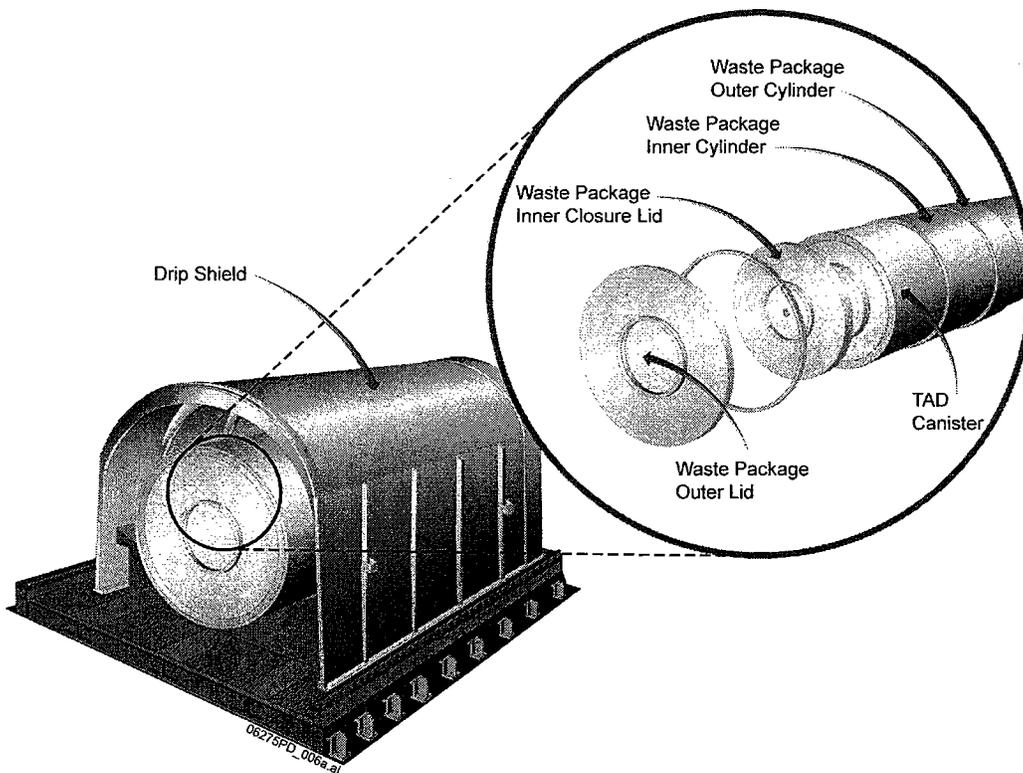

Figure 4. Schematic of TAD Canister Shown Placed inside Waste Package

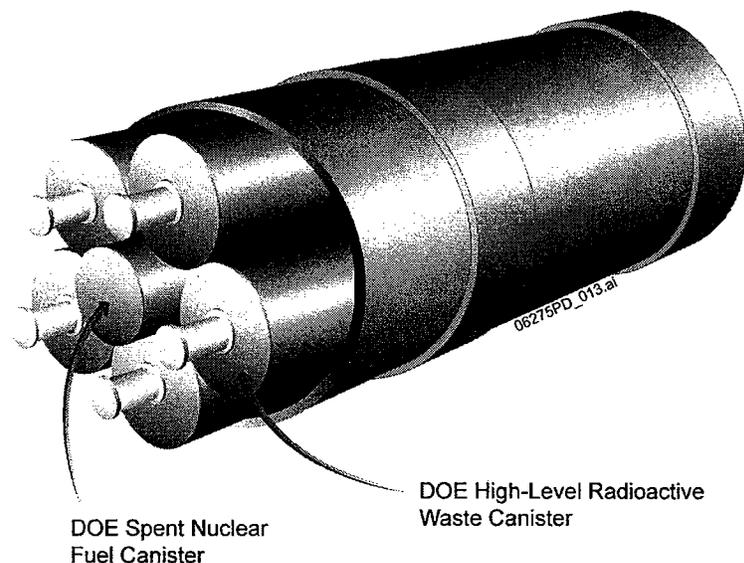

Figure 5. Schematic of DOE HLW Canister and DOE SNF Canister Placed in Waste Package

SNF that does not arrive in TAD canisters will be placed in a TAD canister at the repository. Naval SNF will arrive in a canister that will be placed in the waste package. The stainless steel canisters of vitrified HLW will also be placed inside the two cylinders of the waste package as shown in Figure 5. The figure also illustrates a center canister that will contain DOE SNF to be placed in the canister before shipment to Yucca Mountain.

Before closure of the repository, another metal layer will be placed over the waste packages to provide additional protection against the possibility of water contacting the wastes. The drip shield, shown in Figure 4, will be made of titanium, another

extremely corrosion-resistant metal. All together, there will be four separate layers of highly corrosion-resistant metal protecting the wastes, which are mostly ceramic with a metal cladding and glass, both of which are themselves highly resistant to dissolution.

### 2.3 REPOSITORY DESIGN

The repository design consists of surface and subsurface facilities that perform the functions necessary to receive and handle SNF and HLW, to place these materials into waste packages, to place these packages underground, and to monitor them until closure. Several of these functions are illustrated in Figure 6.

**Surface Facilities**—The principal surface buildings of the repository are the facilities that receive, stage, age, package, and support emplacement of waste (Figure 7). Wastes will be prepared for disposal in one of three types of facilities: the Initial Handling Facility, the Canister Receipt and Closure Facility (three of which will be constructed), or the Wet Handling Facility. The repository surface facilities are based on the concept of handling mostly (about 90%) canistered commercial SNF, with a small amount (about 10%) of the expected commercial SNF arriving either uncanistered in transportation casks or in dual-purpose containers that will need to be reopened and the wastes placed in TAD canisters. The vast majority of waste will arrive in a TAD canister loaded at the electric power company sites prior to shipment to Yucca Mountain. This will minimize the amount of handling needed for uncanistered commercial SNF at the repository. The Initial Handling Facility is capable of handling and transferring canistered waste to waste packages, including HLW and naval SNF. There are three Canister Receipt and Closure Facilities planned for the repository. These facilities are capable of receiving and handling commercial SNF in TAD canisters, placing them into waste packages, and closing the waste packages. The Canister Receipt and Closure Facilities also can handle HLW canisters and DOE SNF canisters.

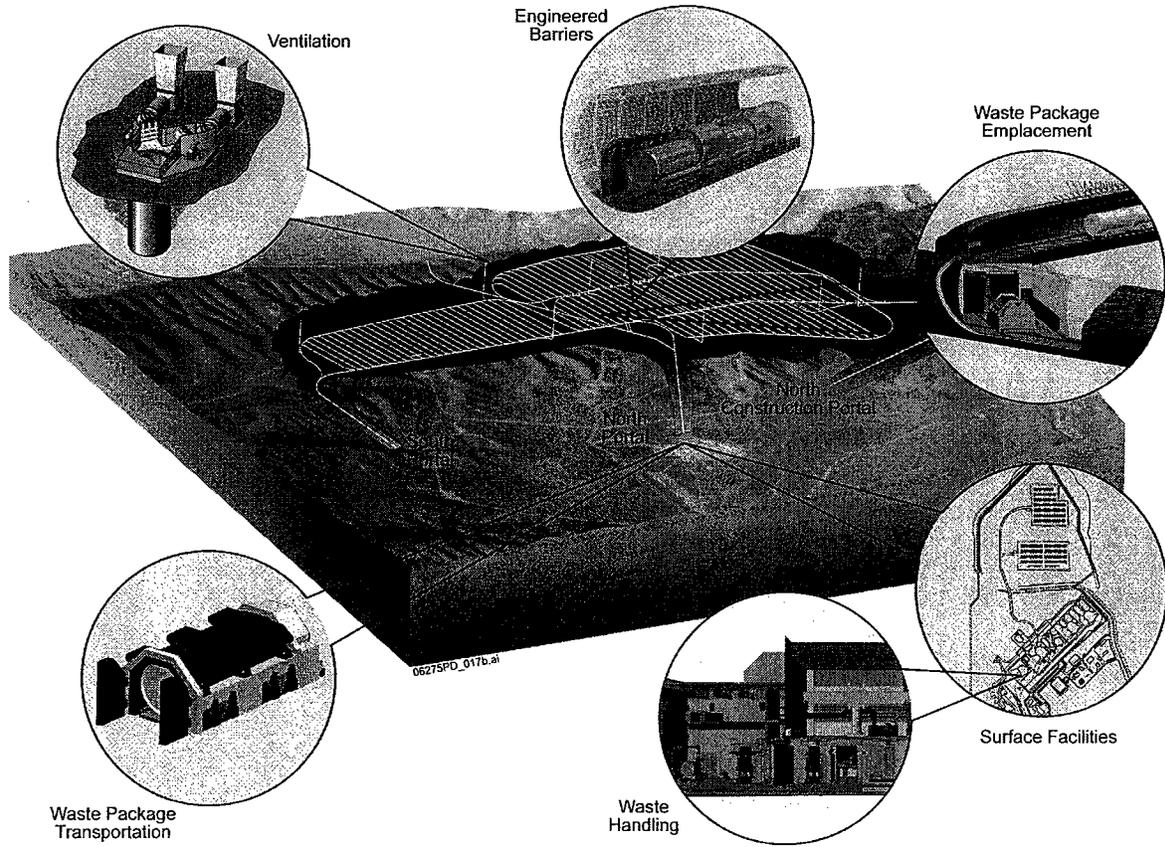

Figure 6. Repository Design Components and Functions

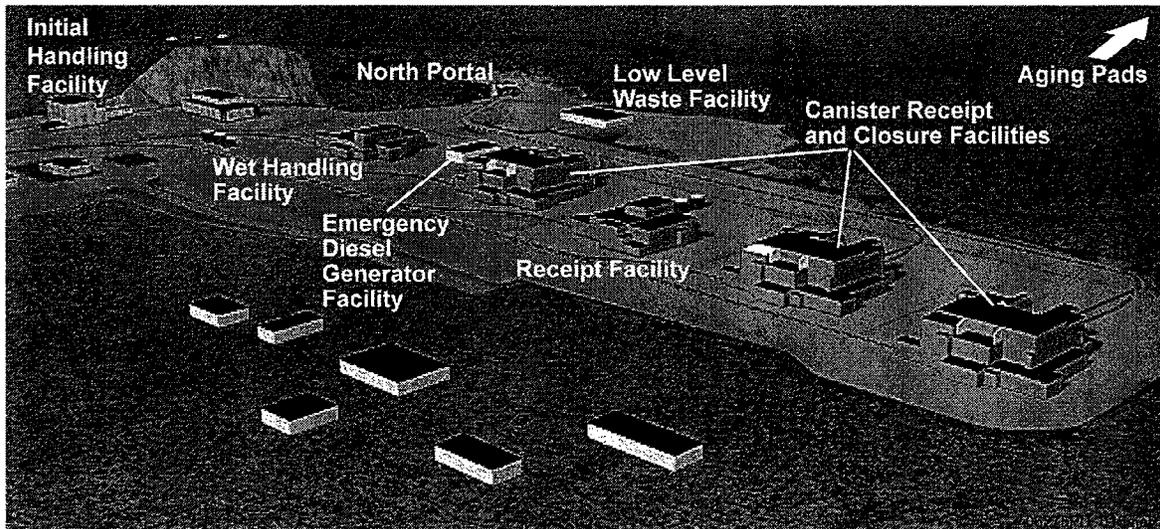

Figure 7. Representation of Principal Surface Buildings of the Repository

The Wet Handling Facility is designed to receive uncanistered commercial SNF. Commercial SNF is transferred under water in a pool into TAD canisters. The Wet Handling Facility includes provisions for handling SNF assemblies in a pool to provide shielding for workers to reduce the normal operating dose associated with handling uncanistered fuel assemblies. Commercial reactor sites already have such facilities; therefore, the repository is using well-developed and well-understood technology that has a record of safe operation.

The Aging Facility consist of the aging pads that provide safe cooling of commercial SNF until the thermal heat load of the SNF has decayed to a level low enough to be safely placed in a waste package. The design of the aging pads, aging overpacks, and TAD canisters is similar to existing dry cask storage systems used at nuclear utilities.

**Subsurface Facilities**—Waste packages will be placed underground in emplacement drifts, supported on emplacement pallets, and aligned end-to-end on the engineered drift invert. The emplacement drifts will be excavated by a tunnel boring machine that makes a circular opening. The invert is what is placed on the bottom of the drift to provide a flat surface. The packages will be spaced about 4 in. apart. The design includes area for up to 108 horizontal emplacement drifts excavated to a nominal 18-ft diameter at a center-to-center drift spacing of about 265 ft. The total subsurface area required to accommodate 70,000 metric tons of heavy metal is about 1,250 acres. The underground facility will be constructed over a period of about 30 years.

Waste packages will be moved, one at a time, from the surface to the emplacement drifts by way of a connecting rail system. The loaded transport and emplacement vehicle will move down the North Ramp and through the repository's main access drift to an emplacement drift and the designated position inside the drift (Figure 8). Before the repository is permanently closed, overlapping and interlocking drip shields will be placed over the waste packages to divert any water that might drip from the top of the emplacement drifts.

Emplacement operations will take place in finished emplacement drifts at the same time as future emplacement drifts are being constructed. During construction, separate ventilation systems operating on the development side and the waste emplacement side will allow separate control of airflow to accommodate different needs and to protect workers. During emplacement, and for the entire time before permanent closure, ventilation will maintain temperatures within the ranges selected for operation and preclosure monitoring. As part of a program to evaluate the repository performance, there will be instrumentation to allow monitoring of emplacement drift interactions with the emplaced wastes. The entire system will be monitored until permanent closure.

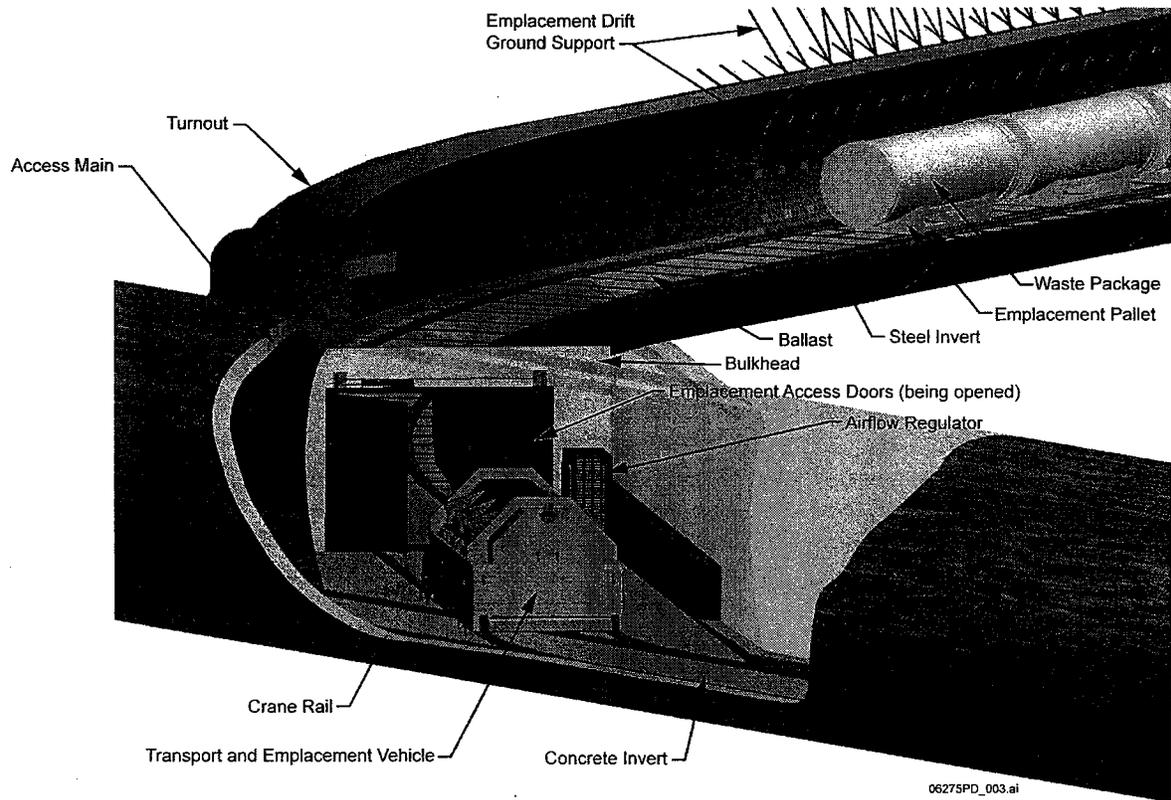

Figure 8. Depiction of the Transportation and Emplacement Vehicle Moving into to an Emplacement Drift to Emplace a Waste Package

### 3. SAFETY DURING THE OPERATIONS PERIOD

The safety principles implemented in the design of the surface facilities are to prevent events that can be foreseen and to make responses to any events that occur as automatic as possible.

Accordingly, the surface facilities are designed (1) to give priority to preventing events (i.e., reducing the likelihood of occurrence) rather than mitigating consequences (i.e., reducing the impact if they should occur); (2) where it is appropriate, to use engineering features in preference to administrative controls to prevent events; (3) to rely on passive features rather than active features or controls; and (4) to allow the automatic startup of safety equipment rather than requiring human intervention to start the equipment. A design that employs this safety philosophy results in a facility with less overall risk. Operational complexity is also reduced because safety features are simple and robust, automatically initiating if there is a need.

**Features of the Repository Facilities that are Important to Safe Operations**—The repository facilities are designed to protect workers and the public. Safety analyses are used to develop a design that prevents, to the extent practical, event sequences that could lead to the release of radioactive material or result in radiological exposure of workers or the public. This strategy requires using prevention features in the repository design wherever reasonable. Information is developed to identify (1) the essential safety functions needed to ensure worker and public safety, (2) the components relied on to ensure these essential safety functions are performed with a high degree of reliability and with margin, and (3) the administrative and procedural safety controls that, in conjunction with the repository design, ensure operations are conducted safely.

The design incorporates the means to limit concentration of radioactive material in air. Design features are incorporated to minimize and control the flow of airborne contaminants. Areas of potential contamination are identified and evaluated. Heating, ventilation, and air conditioning systems capable of limiting the spread of airborne radioactive contamination are provided in the surface handling facilities. These systems control the flow of air from areas with a low potential for contamination to areas with a higher potential for contamination. These systems ensure that radiological material released due to a potential breach of a waste container will pass through high-efficiency particulate air (HEPA) filters prior to exhaust to the atmosphere, thereby mitigating the consequences of this event sequence and protecting workers and the public from releases of radioactive material. The sampled air is continuously monitored for radioactivity by monitors located in potential release points in the surface facilities.

The heating, ventilation, and air conditioning systems are designed to minimize the spread of radioactive contamination by filtration zones and to ensure air flows from areas of low potential contamination toward areas of higher potential contamination. For example, the subsurface ventilation system is designed to have two separate systems for the ventilation of the emplacement drifts and the development area. The air flow and pressure differential between the construction side and emplacement side of the subsurface repository is maintained to ensure that airflow leakage travels from the construction side (supply positive pressure system) to the emplacement side (exhausting negative pressure system) of the subsurface repository. Thus, any leakage that could occur in the emplacement portion of the subsurface would not leak to the construction side.

The design protects workers from exposure to radiation by limiting the time required to perform work in the vicinity of radioactive materials. Design features and controls are implemented to reduce the time required to work in radiological areas during normal operations, consistent with design principles that ensure radiation dose levels are as low as reasonably achievable. Access to high radiation areas or airborne radioactivity areas is controlled, which limits the potential for

workers to be exposed to radiation. This includes access control to and within restricted areas. Controlling personnel access to normally unoccupied high radiation areas, very high radiation areas, or airborne radioactivity areas is part of normal operations. Suitable shielding is provided to protect workers from exposure. Shielding materials absorb radiation and protect workers in the areas where wastes are handled and in transportation underground. The pool of the Wet Handling Facility provides shielding, as do thick concrete walls and appropriate liner material.

A radiation alarm system to warn of significant increases in radiation levels, concentrations of radioactive material in air, and increased radioactivity in effluents will be used. Alarm annunciation will occur if a threshold radiation level has been reached, allowing workers to take appropriate action to protect themselves. Radiation detectors are interlocked with shield doors to ensure that the shield doors are not inadvertently opened if high radiation conditions are present. The facilities incorporate appropriate explosion and fire detection systems and appropriate suppression systems. Related controls include limiting the presence of combustibles and flammable material in areas in which SNF or HLW are present. The design includes the means to control radioactive waste and radioactive effluents and to permit prompt termination of operations and evacuation of personnel during an emergency. These functions protect workers and the public from exposure to radiation.

The design process identifies those structures, systems, and components that are important to safe operation of the repository. The process also provides the assurance that the intended safety functions will be performed. Reliable and timely emergency power will be provided if there is a loss of primary electric power so that instruments, utility service systems, and functions important to safety will continue to operate. Redundant diesel generators and filtration systems are provided as needed to maintain, with adequate capacity, the continued operation of important safety functions.

**Retrievability**—NRC regulations require that the repository be designed to preserve the option of waste retrieval should conditions require it. The DOE has established a policy that any or all of the emplaced waste can be retrieved on a reasonable schedule starting at any time in the preclosure period. The design of the Yucca Mountain disposal system gives future generations the choice of either closing and sealing the underground facility as early as allowable under NRC regulations, or keeping it open and monitoring it for a longer time period, as permitted by the NRC. The design for the repository does not preclude the option for future generations to continue ventilation and monitoring of the repository until making decisions to close the underground facility.

### **3.1 PRECLOSURE SAFETY ANALYSIS**

**Preclosure Safety Analysis Methodology**—The preclosure safety analysis (PCSA) methodology examines the repository design for events that ultimately could lead to the release of radionuclides during operations and systematically examines the resulting event sequences, probabilities, and consequences involved. The initiating events include both internal events (e.g., the drop of a canister) and external events (e.g., an earthquake). Event sequences that might involve criticality are evaluated, and, if necessary, design features and procedural safety controls are implemented to ensure that criticality is prevented. The end products of the PCSA are calculated doses to worker and public groups identified in NRC regulations and a comparison to regulatory limits for maximum doses.

The identification of events involves the compilation of events that are applicable to the repository, including both internal and external events. Events with similar system response are grouped, and screening criteria are applied to eliminate the calculation of consequences for those of sufficiently low probability to be below regulatory concern. Next, event sequence diagrams are developed,

portraying the actions subsequent to an initiating event. An event sequence is a series of actions or occurrences that could potentially lead to exposure of individuals to radiation. An event sequence includes one or more initiating events and associated combinations of repository system component failures, including those produced by the action or inaction of operating personnel. Different sequences that could result are evaluated to determine probabilities of occurrence of the sequence of events. Once the probabilities have been determined, the sequences can be categorized by probability, and the consequences, expressed as doses, can be calculated. The categories include those event sequences that are expected to occur one or more times before permanent closure of the repository and those more rare occurrences that are not expected to occur but are analyzed to determine what the consequences would be. Doses are calculated for workers and members of the public for the first category and for the public for the second category.

Once the doses are determined, they are compared to regulatory limits. If the doses exceed the regulatory limits, event sequence prevention or mitigation strategies are used to refine the repository design, and the event sequences are reexamined. This is an important aspect of the preclosure design and assessment strategy. It allows the DOE to change the design in order to minimize the likelihood of or to prevent an event sequence that leads to doses to workers or the public. If the doses are below the regulatory limits, the parts of the repository system that are important to safety are then identified. Special care is taken in the construction and operation of these components that are important to safety to ensure that the repository is operated safely.

The PCSA considers event sequences that are anticipated to occur. Systems are made reliable enough to prevent the event that might initiate the sequence or to reduce the severity of the consequences in case the initiating event does occur. Additionally, through the identification of potential hazards, the structures and equipment are designed to prevent undesired outcomes. For example, cranes lifting waste containers are limited in their movements to prevent the waste container from being lifted too high and hitting the walls of the structures. In the unlikely event that a waste container is breached, the structure is built to confine the radioactive material within affected areas and to filter the air through HEPA filters to capture the radioactive materials. These structures are heavily shielded, and these types of operations are performed remotely. Used filters will be handled as radioactive wastes and will be properly disposed. Overall, a defense-in-depth approach is taken. This approach (1) seeks to prevent an entire potential chain of events, (2) prevents each step in such a potential chain of events individually, and (3) prepares to effectively mitigate the consequences of each event in that potential chain.

### **3.2 RESULTS OF THE PRECLOSURE SAFETY ANALYSIS**

The preclosure system safety evaluations show convincingly that the repository, if designed and operated as planned, will be safe and meet the applicable EPA standards and NRC regulations. Results of the PCSA in support of the license application show that the calculated potential doses are well below the limits allowable under the regulations. The results of the PCSA discussed below are summarized in Table 1 and represented in Figure 9.

#### ***Normal Operations***

The NRC has set maximum dose limits for normal operations, including limits to dose resulting from certain unexpected events that would be likely to occur during normal operations. The DOE has not identified any such unexpected events; however, as discussed below, the DOE has identified less frequent, abnormal events. The DOE has used conservative methods to evaluate potential doses such that the results overestimate the likely doses to be received during actual operations.

**On Site**—Radiation workers and onsite members of the public will receive only a small fraction of the dose limits permitted by NRC regulations. The NRC limits radiation worker and onsite public doses to the total normal operating dose and the annualized dose from any event likely to occur during normal operations. Because there is no likely event-sequence dose contribution, the NRC radiation worker limit of 5 rem per year is considerably more than the calculated dose of 1.3 rem per year as the maximum dose for a radiation worker within the geologic repository operations area. There will also be nonradiation workers that are in proximity to the repository. The NRC has set a limit of 100 mrem per year for these individuals, and it is calculated that a nonradiation worker could receive up to 78 mrem per year at the most exposed location.

Table 1. Summarized Results of Preclosure Safety Analysis

Person Exposed	Location	Type of Exposure	NRC Limit	Calculated Dose
Public	Site boundary	Normal operations and expected event sequences	15 mrem/yr	0.05 mrem/yr
		Abnormal events	5 rem (per event)	10 mrem
Radiation Worker	Within the geologic repository operations area	Normal operations and expected events sequences	5 rem/yr	1.3 rem/yr
Nonradiation worker (onsite member of the public)	Outside the repository fence, within the site boundary	Normal operations and expected event sequences	100 mrem/yr	10 mrem/yr (nominal) 78 mrem/yr (maximum)
Nevada Test Site and Nevada Test and Training Range (public)	Site boundary	Normal operations and expected event sequences	100 mrem/yr	0.11 mrem/yr
		Abnormal events	5 rem (per event)	30 mrem

**Offsite**—Normal operations associated with handling of radioactive material will contribute only a small fraction of the permitted dose limit to the public in the general environment (i.e., everywhere outside the site boundary, Nevada Test Site, and Nevada Test and Training Range). The NRC maximum limit to the public at the site boundary is 15 mrem per year. The calculated dose at the site boundary to the general environment (due entirely to normal operational releases) to a hypothetical member of the public is 0.05 mrem. The calculated dose of 0.11 mrem per year for a member of the public not in the general environment is a very small fraction of the NRC limit of 100 mrem per year.

### Abnormal Events

The NRC also has set maximum dose limits for abnormal events, and the DOE has identified and analyzed the consequences of infrequent, abnormal events. Because conservative methods were employed to evaluate the potential doses, the DOE believes that the results overestimate the likely doses to be received during actual operations.

**Offsite**—Even though it is possible to conclude that the need to consider certain accident events has been excluded by aspects of the design, the DOE has nonetheless considered and analyzed

these potential accidents to check that systems are in place in case the unexpected happens. This involves an analysis of assumed failures in the structures and equipment and of the systems designed to control releases from such events with a greater than 1 in 10,000 chance of occurrence over the operational period. The results of these analyses show the total dose per event could be up to approximately 10 mrem. Compared to an NRC limit of 5 rem (5,000 mrem) per event, this is a small fraction of the regulatory standard.

The DOE will also implement an Emergency Response Plan, which addresses responses to accidents that may cause a radioactive material release. It is important to note, however, that it is not expected that accidents that have been categorized as likely to occur during the operational period would require a response by an offsite response organization. Despite this expectation, the DOE will be prepared so that in case there is such an event, offsite response organizations will be notified and could be mobilized.

### **Comparative Doses**

The exposures associated with potential releases from the repository during operations and before permanent closure are well below the range of exposures people encounter every day and accept as part of their lives. An understanding of the magnitude of these exposures can be developed by comparing the potential releases from the repository to other similar exposures people encounter every day.

Normal operations associated with handling radioactive material lead to a calculated small dose to a person at the site boundary of 0.05 to 0.11 mrem per year. This is a small fraction of the NRC allowable limit, and an even smaller fraction of naturally occurring background radiation. Doses at this low level can be found in food, such as fruits and vegetables that contain potassium. The radiation dose from eating a banana with naturally occurring radioactive potassium is about 0.01 mrem. Therefore, the dose to the public from normal operations of the repository is about the same as eating five bananas in a year. In addition, the Health Physics Society recommends against quantitative estimation of health risks below an individual dose of 5,000 mrem in one year, or a lifetime dose of 10,000 mrem in addition to background radiation. 10,000 mrem in a 70-year lifetime is equivalent to about 150 mrem per year. The conservatively estimated offsite dose from normal operations is well below this level.

The potential radiation release due to an abnormal event or accident is higher but still below the range of risk routinely accepted by the public. The results of the analyses presented in the license application show the total dose per abnormal event or accident could result in approximately a 10 to 30 mrem dose at the site boundary. Naturally occurring background radiation in the United States is in the range of from about 200 to 300 mrem per year. Many locations in the United States have background radiation 100 mrem per year higher than this average. In other words, potential additional doses to the public from an abnormal event at the repository are comparable to those associated with a choice to live in a part of the country with higher background radiation.

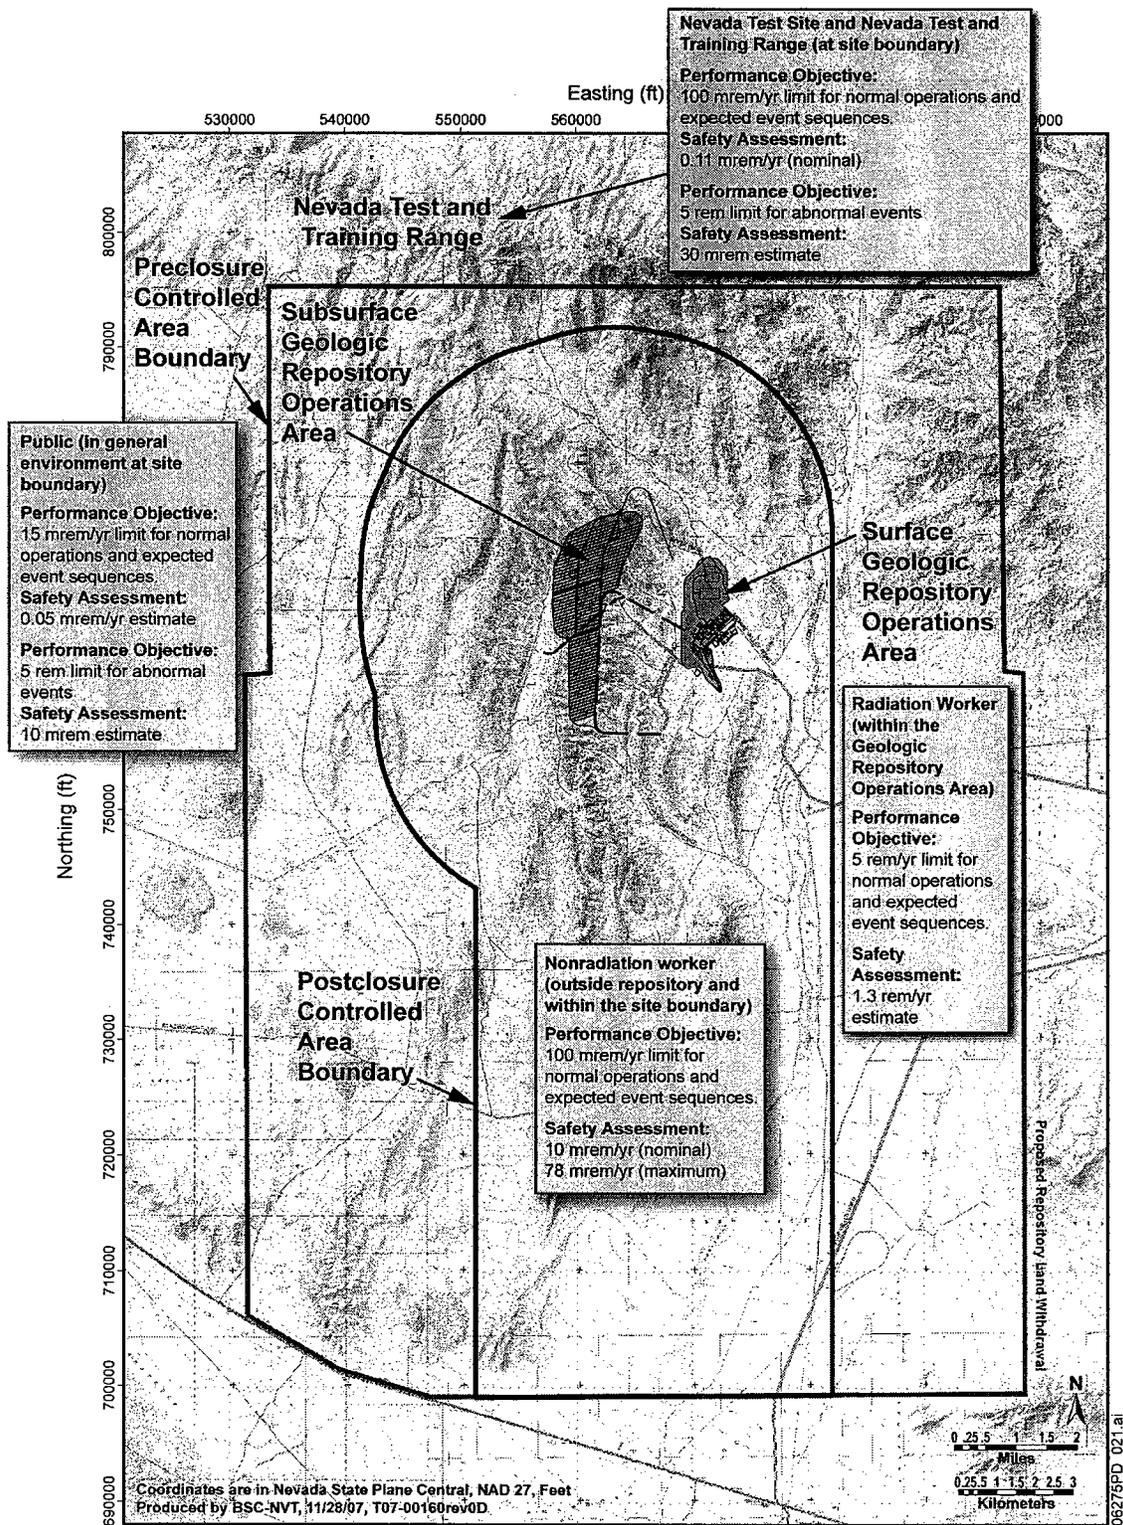

Figure 9. Summarized Results of Preclosure Safety Analysis Compared to Regulatory Performance Objectives at the Yucca Mountain Repository

## 4. SAFETY OF THE REPOSITORY AFTER PERMANENT CLOSURE

The safety of the repository at Yucca Mountain after permanent closure (postclosure) is ensured by the use of two safety principles. First, the engineered barrier system is designed so that, working in combination with the natural features of the site, potential, very distant future radiological doses to a reasonably maximally exposed individual described in the regulation are expected to be well below the limits specified by the NRC. In other words, the engineered components must be designed to take advantage of the characteristics of the natural features of the Yucca Mountain site.

**reasonably maximally exposed individual.** A hypothetical person, defined by regulation, who is likely to receive a greater radioactive exposure than the average person in the area because of the conservative way the regulations define the lifestyle characteristics.

The second safety principle is that the geologic repository includes multiple barriers, consisting of both natural barriers and an engineered barrier system. Geologic disposal of radioactive waste is predicated on the expectation that one or more features of the geologic setting will be capable of contributing to the isolation of radioactive waste, meaning it acts as a barrier to the movement of radionuclides out of the repository. While there is an extensive geologic record ranging from thousands to millions of years, this record includes many uncertainties. In addition, there are uncertainties in the isolation capability and performance of engineered barriers over very long timeframes. These two types of uncertainties are addressed by requiring that multiple barriers make up the repository system to ensure that repository performance is not wholly dependent on a single barrier. As a result, the system is more tolerant of failures and external challenges, such as earthquakes.

### 4.1 FEATURES OF THE REPOSITORY SYSTEM CONSIDERED IN ASSESSMENTS OF LONG-TERM PERFORMANCE

The combined geologic and engineered features that make up the postclosure repository system have several attributes that are important to keeping radionuclides away from humans. Because water is the primary medium by which radionuclides could be released from the repository, the beneficial characteristics of the system primarily relate to the ability of the site and the design to prevent or limit the movement of water. The system features are described here in the order that a drop of water would encounter them as it moved from the surface to the environment where the reasonably maximally exposed individual would live.

**capillary forces.** Forces caused by surface tension that cause liquids to be held in small-diameter pores. Capillary forces are a characteristic of unsaturated zone hydrology that cause water to be held in much the same way a sponge holds water until it is saturated. These forces limit the movement of water through the rock.

Above the repository, the important features are the nature of the site and its geologic character. The topography, rock, and soils at the surface of Yucca Mountain are the initial features that limit the movement of water into the mountain (Figure 10). Precipitation at Yucca Mountain is very low and is expected to remain low even during somewhat colder and wetter future climates associated with the

likely return of glacial conditions to North America. Runoff, evaporation, and plant transpiration combine to divert water and permit only a small fraction of the already-low expected precipitation at the site to infiltrate into the mountain. The volcanic tuffs in the unsaturated zone above the repository will further reduce the movement of water through the unsaturated zone. They divert

percolating water, attenuate or dampen pulses of infiltration, and limit seepage into the emplacement drift through capillary forces. The repository horizon is expected to remain well above the water table during wetter future climate conditions.

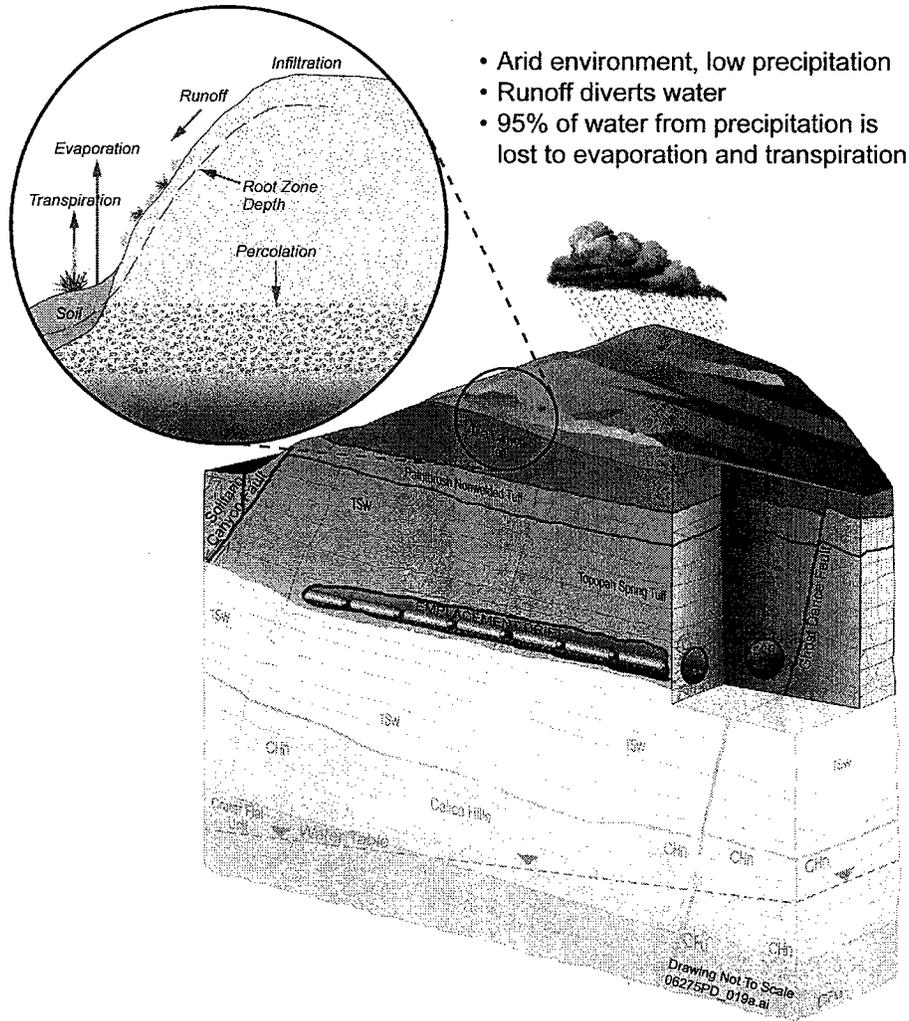

Figure 10. Features of the Repository above the Emplacement Horizon That Limit the Amount of Water That Can Contact the Waste

The features of the engineered barrier system have been designed to prevent or limit the movement of water and to prevent or substantially reduce the release of radionuclides from the waste. Figure 11 illustrates these features, which include the emplacement drift, the drip shield, the waste package, the waste form and other materials contained inside the waste package, the waste package pallet, and the drift invert. Because of capillary forces, most of the water moving in the unsaturated zone will be diverted around the emplacement drifts, and only a fraction will seep into the drifts. Structurally strong and highly corrosion-resistant titanium drip shields will prevent contact between seepage water and waste packages. These shields are expected to be intact for hundreds of thousands of years. Waste packages will be made with an outer cylinder of a highly corrosion-resistant nickel-based alloy known as Alloy 22, which will prevent any contact between water and the waste for as

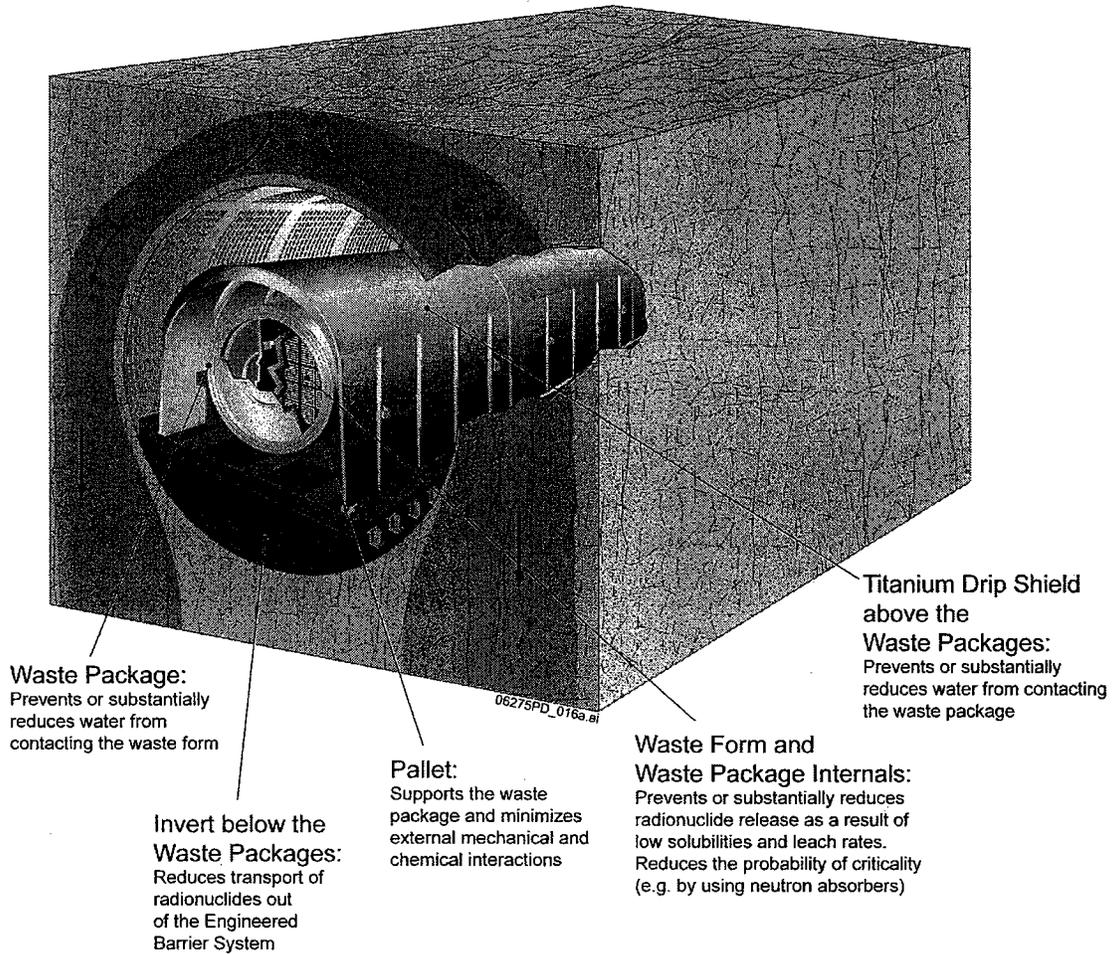

Figure 11. The Features of the Engineered Barrier System that Prevent or Limit the Movement of Water and Prevent or Substantially Reduce the Release of Radionuclides from the Waste

long as the waste packages remain intact, which is also expected to be for hundreds of thousands of years, absent unlikely seismic and igneous events. Stress corrosion cracking related to rockfall or in welds could potentially cause damage to drip shields and waste packages into thousands of years, but the size and characteristics of the cracks are not expected to allow the movement of water into the packages. Although breach of a waste package will permit the potential release of radionuclides, any such release will be impeded by the slow rate of waste form degradation. The waste forms are solid, and degradation will not begin until air and moisture contact the waste form.

**diffusion.** The spreading out of particles, such as radionuclides, as they move in water (e.g., how a drop of ink spreads in water).

Significant release of radionuclides can only occur if they are dissolved in water or attached to very small particles called colloids and if there are continuous liquid pathways into and leading out of the waste package through the invert and into the surrounding rock. Some minor gaseous releases will also occur, but they will disperse rapidly. Continuous pathways of flowing liquid water are not expected in the unsaturated repository environment, although limited diffusive transport may occur.

The amount of water in contact with the waste form is expected to be limited to a thin film on the waste form surface. The waste form will limit radionuclide release rates because most of the radionuclides are not very soluble in the water due to chemical conditions in the mountain. Both SNF and HLW glass will degrade and dissolve slowly in the repository environment.

**solubility.** A material is soluble if it dissolves readily in liquids that contact it. Solubility is controlled by chemistry and can be limited by the amount of material already dissolved.

**sorption.** Attraction of a radionuclide to an object, such as a molecule becoming attached to it.

Analogue evidence indicates that glass, metals, and ceramic materials may be preserved for thousands of years in the unsaturated zone underground. For example, there is volcanic glass in some Yucca Mountain rock that has been

there for more than 10 million years. Transport of radionuclides by water out of the engineered features of the repository will be further limited due to the small volumes of water and limited number of flow paths present in the unsaturated zone. The transport of many dissolved radionuclides, including those that are the greatest part of the total inventory of radionuclides, will be further retarded by sorption on iron corrosion products that form within the waste package once degradation begins. Waste package internal structures will begin to corrode before the waste form. Radionuclides transported in the water can also be trapped and retarded by sorption onto corrosion products.

Unlike other hazardous materials, the danger associated with radioactive materials naturally diminishes over time through a process known as radioactive decay. The half lives of the majority of the radionuclides stored at the repository are fairly short. About 1,000 years after repository closure, little more than 18% of the original amount of radioactivity emplaced in the repository would remain, and about 6% would remain after 10,000 years. Imagining the initial quantity of radioactivity emplaced in the repository as 1,500 marbles, natural radioactive decay would leave 270 marbles after 1,000 years and only 90 marbles after 10,000 years. By 100,000 years, there would only be eight marbles left. Finally, after 1 million years, just one marble out of the original 1,500 would remain—the amount of the original radioactivity remaining would be about 0.07%, and about 99.93% of the radioactivity originally placed in the repository would have decayed.

**half life.** The time it takes for a substance to lose one-half of its radioactivity.

Below the repository, the geologic layers are important features along the potential transport pathways from the repository to the environment. These include the unsaturated and saturated volcanic rocks immediately below and south of the repository, as well as alluvial deposits in the Amargosa Valley that will be encountered along the flow path approximately 6 to 9 miles south of Yucca Mountain (Figure 12). Any radionuclides that migrate down through the unsaturated zone to the water table must be transported through the saturated zone before they can reach the accessible environment. The transport of radionuclides will be limited by the rate at which water flows. In addition, several processes will cause the movement of radionuclides to be slower than the rate of movement of the water. These include diffusion into the porous matrix of fractured volcanic rocks, sorption of radionuclides onto mineral surfaces in both fractures and the porous rock matrix, and precipitation of minerals as chemical conditions change along the flow path.

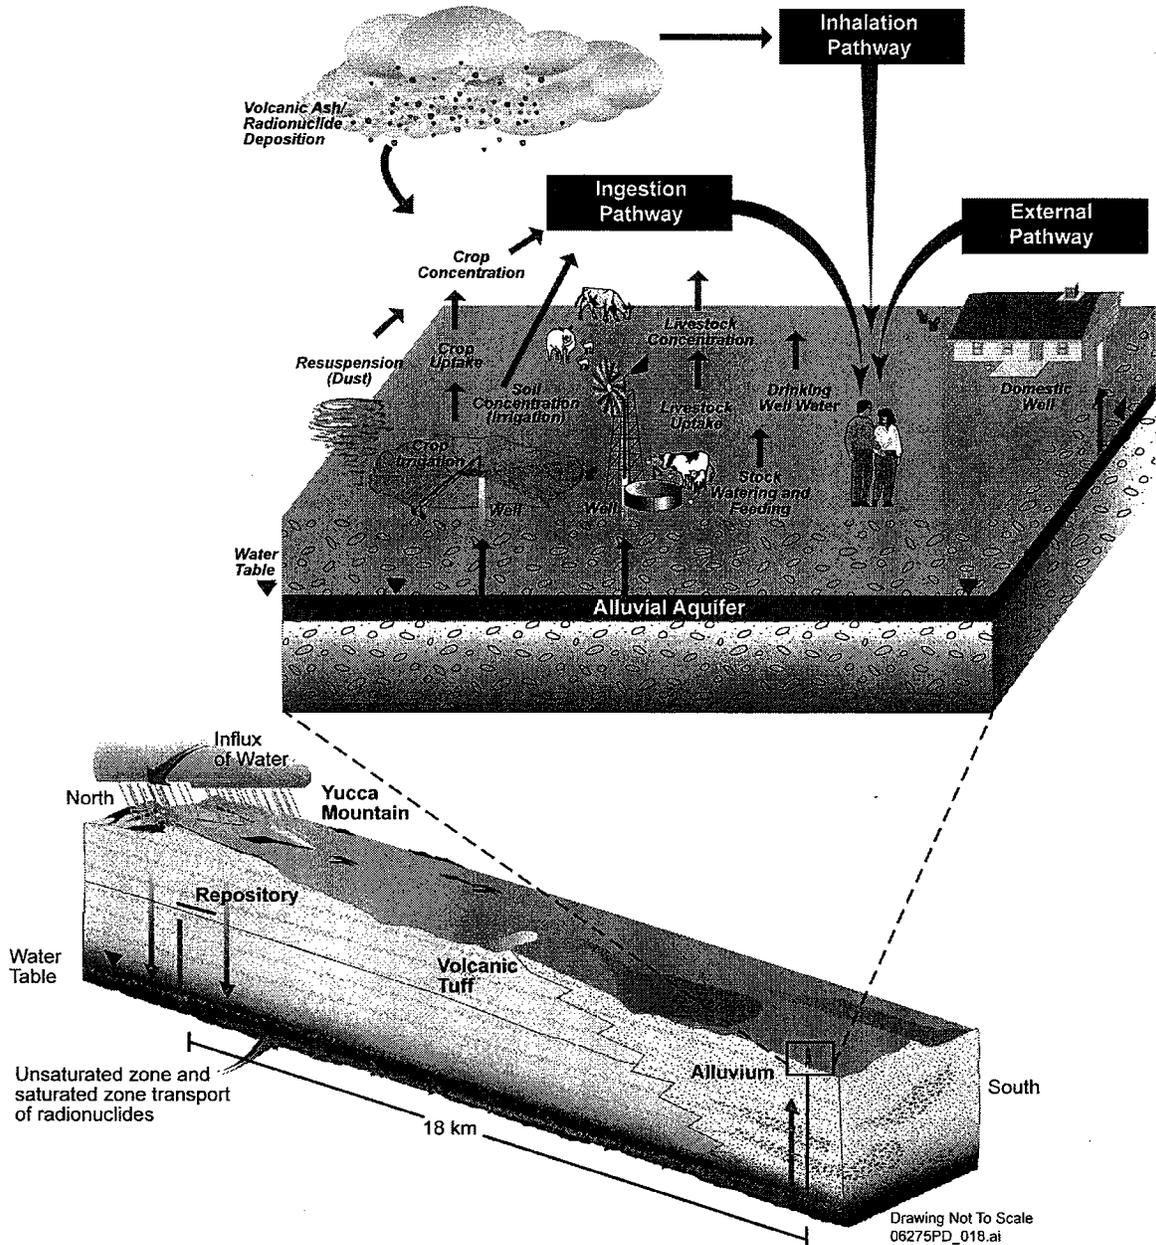

Figure 12. Location and Characteristics of the Reasonably Maximally Exposed Individual and the Features of the Natural System below the Repository That Limit Movement of Radionuclides to That Location

The final portion of the movement of water is to the humans that could use it. The reasonably maximally exposed individual is a hypothetical individual defined by regulations to exist in the accessible environment who draws water from a well centered in the potential contaminated groundwater coming from Yucca Mountain (Figure 12). The reasonably maximally exposed individual is defined by regulation in a way that makes sure that this person is more exposed than

can be expected for a real individual near the same location. This individual may be exposed to radiation from contaminated water in a number of ways, all of which are calculated.

## 4.2 TOTAL SYSTEM PERFORMANCE ASSESSMENT

The postclosure repository system is, by its nature, a passive system that requires no external actions or activities in order to perform its function; indeed, no human intervention is planned or necessary after closure. Given the time periods over which the repository must perform, neither automated nor active systems can be relied upon to reduce risk. Because the natural features important to isolating wastes are existing elements of the site and system, they must be used as they are. Safety after permanent closure (i.e., the postclosure period) is assessed by examining the features, events, and processes that could affect long-term performance. Features, events, and processes are the specific conditions or attributes of the geologic setting; the degradation, deterioration, or alteration processes of engineered barriers; and the interactions between the natural and engineered features that might affect performance of the geologic repository. The assessment method used is called total system performance assessment, and its approach is internationally accepted. For Yucca Mountain, the specific way in which it was performed is defined by the NRC regulations.

### Total System Performance Assessment

**Methodology**—Total system performance assessment (TSPA) is a calculational tool that provides quantitative estimates of the long-term performance of the total repository system over a range of possible conditions using computer models that are based on site data and materials-testing data and accepted principles of physics and chemistry. A TSPA compiles analytic models of the engineered and natural system processes acting at the repository into an overall computer model of the repository and surrounding environment to assess overall repository performance. With the TSPA model, the DOE can estimate releases of radionuclides from the repository under a range of conditions over many thousands of years and estimate the potential doses to persons.

### **total system performance assessment.**

A risk assessment that quantitatively estimates how the proposed Yucca Mountain disposal system will perform in the future under the influence of specific features, events, and processes, incorporating uncertainty in the models and data.

The TSPA models are usually referred to as abstracted models and involve the extraction of essential information from large quantities of data. An abstracted model in a TSPA may take the form of something as simple as a table of values that were calculated using a complex computer model or of a fully three-dimensional computer simulation. These are the models used to evaluate system performance and estimate the likelihood that the performance will comply with regulations and ensure long-term safety. The responses of the total system extend over periods beyond those for which data have been or can be obtained; the TSPA models address this by treating the data as uncertain and evaluating the results in a probabilistic manner.

TSPA model development includes the compilation of a list of all possible features, events, and processes (FEPs) that could apply to the behavior of the system. The existence of a fault is an example of a feature. An example of an event is a seismic event (e.g., earthquake), and an example of a process is the gradual degradation of the waste package wall by general corrosion. The DOE used various types of analyses to determine the FEPs it should include in the modeling. The selected features, events, and processes are assembled into scenario classes, which describe expected situations and disruptive situations, such as seismicity and volcanism.

Estimates of doses are calculated using a probabilistic approach called Monte Carlo sampling. A value is selected for each of the uncertain data inputs, and the repository performance is simulated for 10,000 and 1 million years. This is repeated 300 times, and the maximum of the mean (average) value is identified for the 10,000-year performance standard. For the 1-million-year performance standard, the maximum of the median value is identified.

**Model Corroboration**—Confidence is also enhanced if differences in results are properly understood when there are independent evaluations of the same system. In 2002, an international group of experts was brought in to review the TSPA of that time. Their finding was that this assessment represented a competent modeling effort in keeping with international practice. Twenty-seven recommendations were made to improve the assessment, all of which have been addressed. Suggestions by several other external expert reviews have resulted in numerous improvements in the model.

In keeping with the requirements to provide a basis for confidence in the models used in TSPA, numerous sensitivity, uncertainty, and insight analyses were performed to enhance understanding of the models and to verify that what is calculated provides confidence from the standpoint of how the system ought to behave in response to changes. Insight analyses were single-realization analyses that focused on what appear to be outliers in the cluster of results from hundreds of probabilistic analyses. Knowing what combination of factors caused that outlier and understanding whether or not it makes sense from a scientific point of view further enhances confidence in the model.

There have been other quantitative models and evaluations of the repository system's potential safety. The DOE evaluated the differences in outcomes and understands them, adding confidence to its own modeling approaches at several levels. One example of a TSPA comparison done independently of DOE is the system analyses produced by the Electric Power Research Institute, using its independently developed model and software, IMARC. This comparison suggested that, to the degree that the Electric Power Research Institute approach may be more realistic, the DOE Yucca Mountain repository TSPA is conservative in that it likely overestimates dose projections. Other methods of evaluating the credibility of modeling results include a comparison to a simplified DOE TSPA analysis that was performed independently from the main TSPA effort. Another modeling effort involved removing some key conservatisms in a performance margin analysis. Each of these modeling efforts produced comparable results.

#### **4.3 RESULTS OF THE POSTCLOSURE TOTAL SYSTEM PERFORMANCE ASSESSMENT**

The postclosure system safety evaluations show convincingly that the repository is safe and meets the applicable EPA standards and NRC regulations. The regulations specify several measures for addressing the consequences of a repository at Yucca Mountain: radioactivity doses to humans and groundwater radioactivity content. The regulations prescribe the method for calculating dose to a hypothetical future human being in Amargosa Valley known as the reasonably maximally exposed individual. This hypothetical future individual is defined in such a way as to provide a conservative estimate of potential doses that could result from exposure to radionuclides carried from the repository in groundwater. Any real person living in the region would receive considerably less dose. The reasonably maximally exposed individual is specified to live approximately 11 miles south of the proposed repository. Summarized results for the TSPA are presented in Tables 2 and 3 and discussed in the text that follows.

Table 2. Postclosure Performance Results for the Individual Protection Standard and Human Intrusion Standard

	Mean	Median	95th Percentile
<b>Individual Protection Standard</b>	No more than 15 mrem	No more than 350 mrem <sup>a</sup>	None (95th percentile is provided here for comparison only)
First 10,000 years	0.24 mrem		0.67 mrem
Time of occurrence	10,000 years		10,000 years
Post-10,000 years <sup>b</sup>		0.9 mrem	9.1 mrem
Time of occurrence		~800,000 years	1,000,000 years
<b>Human Intrusion Standard</b>		No more than 350 mrem <sup>a</sup>	
Post-10,000 years <sup>b</sup>		0.01 mrem	
Time of occurrence		~202,000 years	

NOTE: <sup>a</sup>Proposed

<sup>b</sup>Within the proposed period of geologic stability, defined as 1 million years.

Table 3. Postclosure Performance Results for the Groundwater Protection Standard

	Combined <sup>226</sup> Ra and <sup>228</sup> Ra Concentration	Gross Alpha Activity Concentration	Dose from Combined Beta- and Photon-Emitting Radionuclides
<b>Groundwater Protection Standard:</b> Limit for Activity Concentration or Annual Dose	5 pCi/L	15 pCi/L	4 mrem
<b>Performance Results:</b> Projected Maximum Mean Activity Concentration or Annual Dose	<10 <sup>-6</sup> pCi/L	10 <sup>-4</sup> pCi/L	Whole body: ~0.06 mrem Thyroid: ~0.26 mrem
Natural Background Level	0.5 pCi/L	0.5 pCi/L	Background level excluded in regulatory requirement

The NRC regulations specify a maximum mean allowable annual radiological dose to the reasonably maximally exposed individual, for all scenarios combined (that is, including the effects of low probability events such as volcanism and seismicity) of no more than 15 mrem per year for the first 10,000 years. The mean value of the annual estimated dose to the reasonably maximally exposed individual is 0.24 mrem. Even if one considered the 95th percentile (95 out of every 100 simulations resulted in a dose level lower than this number), the value is 0.67 mrem. Both of these numbers are only a small fraction of the allowable limit. Proposed EPA standards and NRC regulations also specify a dose limit for the time from 10,000 years after closure through the period of geologic stability (defined as 1 million years). The regulations specify a maximum median allowable annual radiological dose to the reasonably maximally exposed individual, for all scenarios combined (i.e., including the effects of low probability events such as volcanism and seismicity) of no more than 350 mrem for this time period. The calculated median value of the annual estimated dose to the reasonably maximally exposed individual for all scenarios combined is 0.96 mrem. The 95th percentile value is 9.1 mrem. These numbers are an extremely small percentage of the allowable limit. Analyses against the groundwater protection and human intrusion standards result in comparable margins.

As noted, the reasonably maximally exposed individual is a hypothetical person defined in such a way to maximize dose to potential releases from the repository. People living in the Amargosa Valley would receive considerably less exposure because no real individual would exhibit all of the characteristics of the reasonably maximally exposed individual. People living farther from Yucca Mountain would be expected to receive even less exposure. Yucca Mountain is located in a closed groundwater basin, which ensures that, unless major geologic changes occurred, the radionuclides could not leave the basin.

### ***Comparative Doses***

The potential releases from the repository after permanent closure are also well below the ranges of exposures people encounter every day and accept as part of their lives. As previously noted, naturally occurring background radiation in the United States is in the range of from about 200 to 300 mrem per year. Many locations in the United States have background radiation 100 mrem per year higher than this. The Health Physics Society recommends against quantitative estimation of health risks below an individual dose of 5,000 mrem in 1 year or a lifetime dose of 10,000 mrem in addition to background radiation. A dose of 10,000 mrem over a 70-year lifetime is equivalent to about 150 mrem per year.

The estimated annual doses from the repository to the reasonably maximally exposed individual for both the 10,000-year and 1-million-year period are lower than 1 mrem. This is about the same radiation dose that is received in a two-hour flight on an airplane or from watching a color television over a year. This is a fraction of a percent of naturally occurring background radiation. The estimated 95th percentile level (i.e., the value at which 95% of the calculated doses are below this level) annual doses for the 1-million-year period is lower than 10 mrem. A comparable radiation risk is that received from a chest x-ray. The maximum calculated annual dose level is about 40 mrem. This reflects the extreme values of the parameter distributions. Comparable radiation risks are at a level of dose significantly less than that received annually by an airline flight crew. These are very small percentages of the naturally occurring background radiation, well below the variability across the United States and are not likely to lead to a significant increase in the risk of cancer. It is also important to note that these potential doses are calculated for the reasonably maximally exposed individual and include very low probability disruptive events (e.g., a volcano erupting through the repository). The actual doses to a real individual would be significantly lower, at a level not expected to meaningfully contribute to an annual dose already received from background radiation.

### ***Confidence in the Long-Term Safety Evaluations***

The estimated safety consequences shown are not predictions but are cautious and reasonable estimates of potential future performance. Nations with nuclear power programs are planning to pursue geologic disposal whether or not they are planning to recycle their SNF. Every nation actively involved in planning, finding a site for, or licensing a repository has done calculations broadly similar in scope to the TSPA performed by the DOE.

The NRC requires performance assessments to provide the information needed to make an informed licensing decision. Uncertainties are, however, inherent in evaluating a first of a kind facility like the repository and in estimating system performance over very long time periods (i.e., many tens of thousands of years). Thus, requirements are included to ensure that uncertainties inherent in any performance assessment are thoroughly articulated and evaluated. In addition, the DOE is required to show that all available, pertinent information has been taken into account and analyzed as a corroboration of the concepts and approach involved in the estimation of long-term system performance.

**Natural Analogue Studies**—Computer models show how a repository would most likely respond to changing conditions over a vast expanse of time, but there is no real way to test directly to see if events actually unfold as predicted. There are, however, examples and analogues of the kinds of climatic, geologic, and hydrologic processes that could affect repository performance. Scientists have studied information pertaining to different analogue sites throughout the world to gain a better understanding of the long-term processes that are relevant to Yucca Mountain.

By studying the past climates in an area, scientists can project the likely future climates. For example, sedimentary deposits in a dried lakebed at Owens Lake, California (about 100 miles west of Yucca Mountain) provide a nearly 425,000-year record of past climates in the region. This information, along with information from other climate analogues such as the 500,000-year record obtained from cores taken from the walls of a cave known as Devils Hole near Yucca Mountain, helps corroborate estimates of precipitation levels and atmospheric temperatures in the past, which, when coupled with information from the earth's orbit, can allow prediction of future climate states.

Scientists have also analyzed water movement in an ancient underground city in Kaymakli, Turkey (second century AD). The climate and type of rock are similar to those found at Yucca Mountain. In studying the Turkish site, scientists have observed very little water seeping into the deep underground excavations. Researchers believe that caves containing prehistoric paintings, such as those found in the Chauvet Cave in southern France, provide excellent natural analogues for the water flow at Yucca Mountain. The 30,000-year-old paintings in these caves were made with oxides of iron and small amounts of manganese, as well as clay, charcoal, and silica. None of these materials would survive long in the presence of abundant water. Yet many cave paintings have survived in locations far more humid, and with more than three times the rainfall than Yucca Mountain. Those paintings survived because water tends to flow around caves and tunnels, not into them, in part because of the comparative size of the different openings. In unsaturated rock, what little water is available in the pores and fractures has a tendency to remain there rather than flow into larger openings, such as caves or tunnels. These analogue studies suggest that seepage into repository tunnels will be minimal.

An important analogue site is a natural uranium deposit at Peña Blanca, Mexico, where the climate and rock are very similar to Yucca Mountain. The studies at this site focused on the migration of naturally occurring radioactive particles over millions of years. In these studies, scientists have observed that the particles migrated only a few yards along major fractures in the rock. The uranium deposits at Peña Blanca appear to have changed over millions of years in many of the same ways scientists expect that spent fuel rods would change within a repository at Yucca Mountain. Studies indicate radioactive particles similar to those that would exist in a repository at Yucca Mountain moved only a few yards from the ore deposit and in very low quantities.

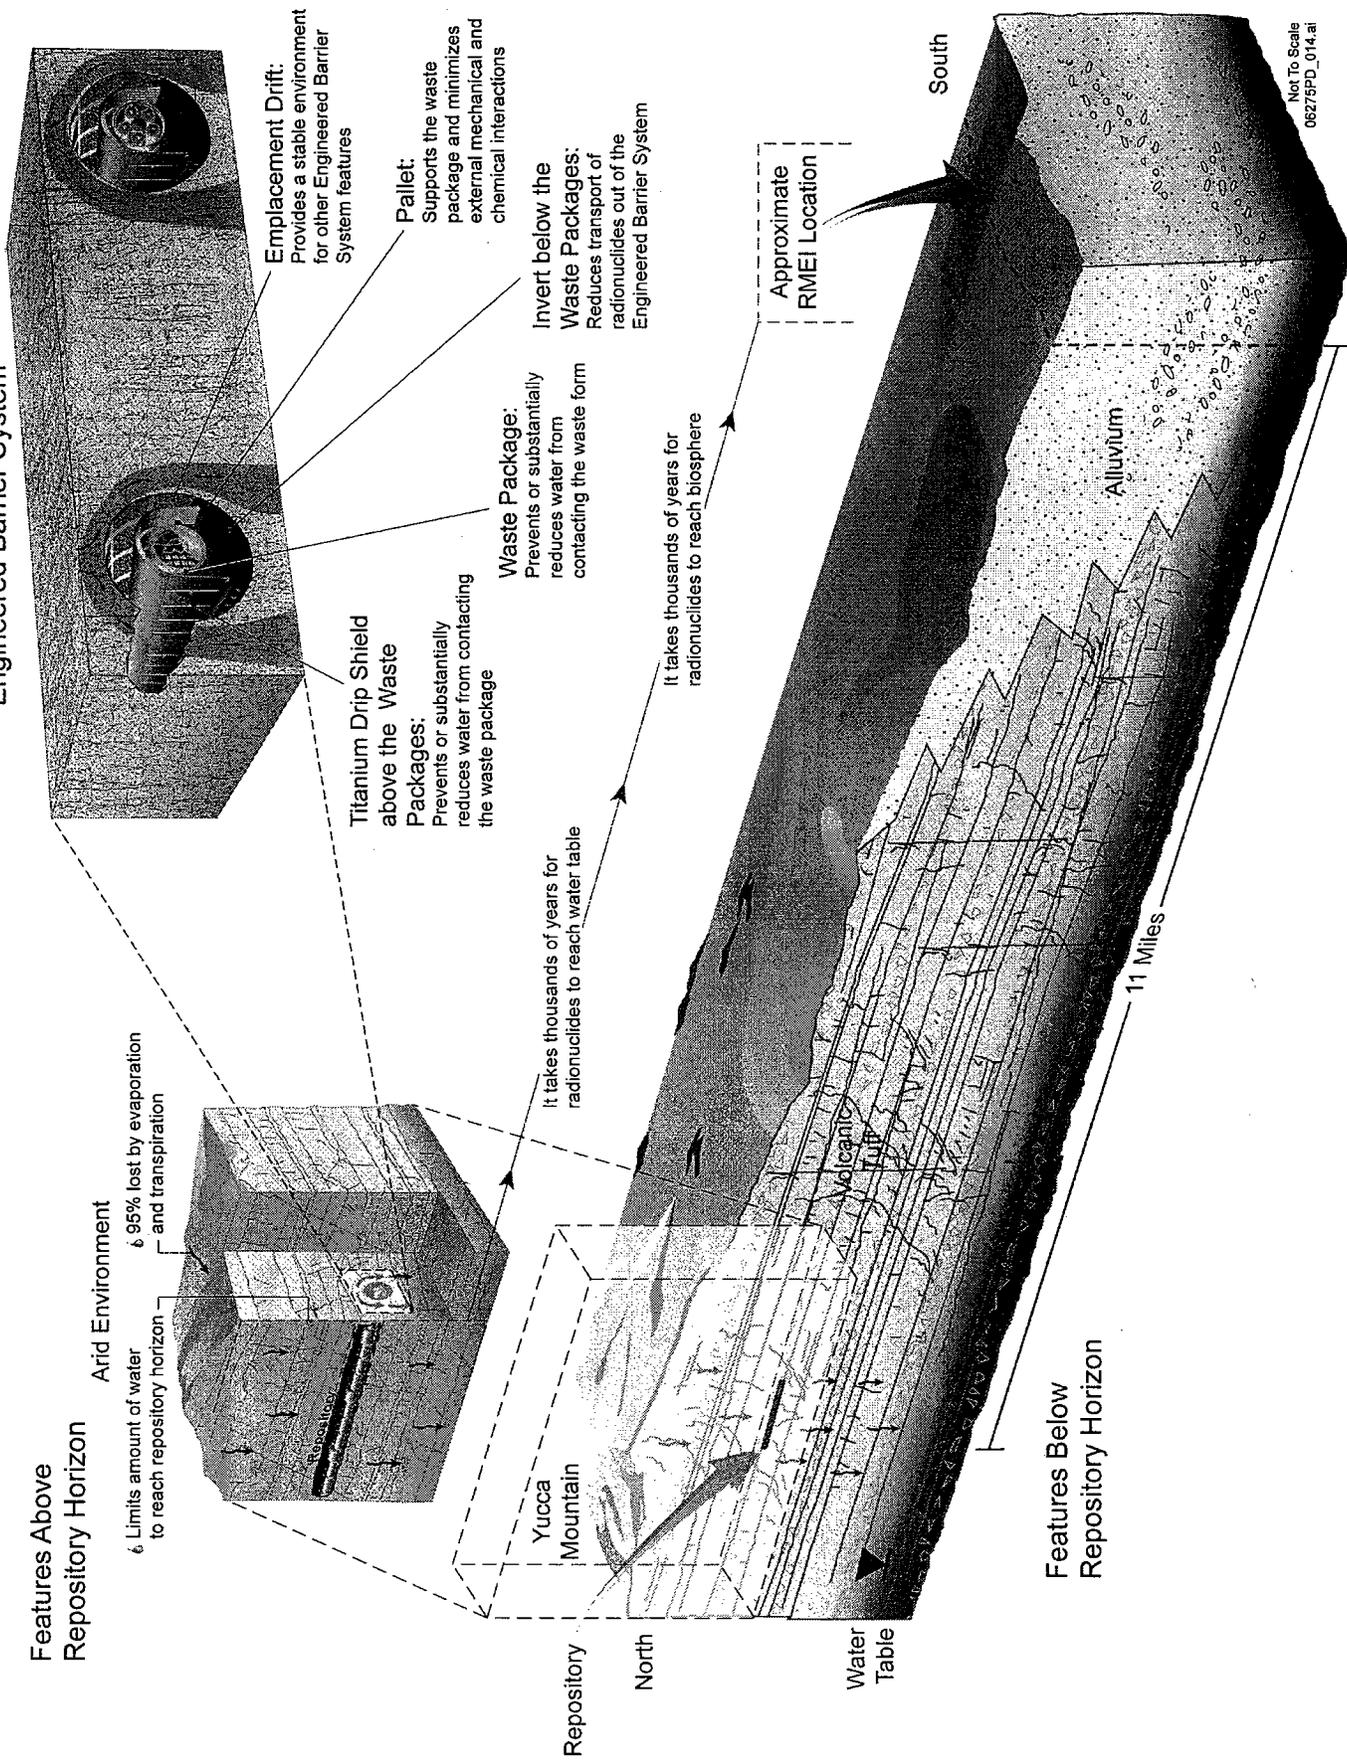

These and other studies are reported in the technical documents that support the license application, and in total they support a finding that there is a basis for having confidence in the results of the TSPA—sufficient confidence, the DOE believes, to support a decision to allow the repository project to move into its next phase: construction. Scientific studies will continue during construction and operations, and safety evaluations will be updated at each of the major decision points and at any other time as new information becomes available and needs to be evaluated in terms of system performance implications. In addition, the entire systems will be monitored until permanent closure, and following closure of the repository, the site will continue to be monitored for continued long-term scientific and safety evaluations.

## **5. CONCLUSIONS**

Technical analyses, based on approaches that are accepted internationally, provide the rationale for DOE conclusions that the repository can be built and operated safely and that the repository system will protect people far into the future. The analyses have been independently reviewed by experts, and the successive versions of the numerical models have benefited from constructive suggestions for improvement. The repository construction, operation, and performance are subject to oversight by independent regulatory agencies, and the DOE cannot construct the repository and begin operations unless the NRC finds that the repository can be operated safely and that it will protect humans far into the future. Those findings will be developed in hearings on the license application that will be open to the public and in which those who oppose the repository will have a full and fair opportunity to present any contrary evidence. The licensing hearing will be a rigorous in-depth review of the scientific and engineering support for DOE conclusions that the repository can be constructed and operated safely and will protect people far into the future, as required by EPA standards and NRC regulations.

In summary, the analyses detailed by the license application meet the applicable standards promulgated or proposed by the NRC for the construction, operation, and closure of a geologic repository at Yucca Mountain. The DOE has a valid basis for asserting that such analyses demonstrate this position. The DOE welcomes scrutiny of the license application as an opportunity to demonstrate the soundness of the science and design that underlie DOE's application to construct the repository. If the NRC eventually grants the DOE the authority to construct and operate the repository, the public can have full confidence that the repository is based on sound science and engineering and that the nation's inventory of SNF and HLW will be disposed of without unreasonable risk to the health and safety of the public.

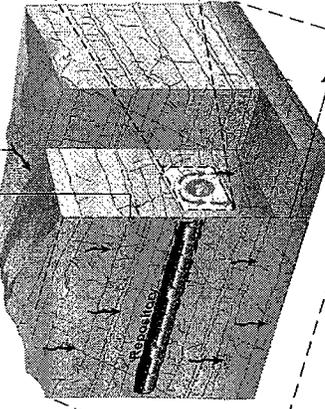

# Engineered Barrier System

Features Above Repository Horizon

Arid Environment

6 Limits amount of water to reach repository horizon and 95% lost by evaporation and transpiration

Emplacement Drift: Provides a stable environment for other Engineered Barrier System features

Titanium Drip Shield above the Waste Packages: Prevents or substantially reduces water from contacting the waste package

Waste Package: Prevents or substantially reduces water from contacting the waste form

Invert below the Waste Packages: Reduces transport of radionuclides out of the Engineered Barrier System

Pallet: Supports the waste package and minimizes external mechanical and chemical interactions

It takes thousands of years for radionuclides to reach water table

It takes thousands of years for radionuclides to reach biosphere

BEFORE THE U.S. NUCLEAR REGULATORY COMMISSION

_____ )	
In the Matter of )	
U.S. DEPARTMENT OF ENERGY )	Docket No. 63-001
License Application to Construct a )	
Geologic Repository at Yucca Mountain )	
_____ )	

**AFFIDAVIT OF PETER N. SWIFT**

I, Peter N. Swift, the undersigned affiant, do hereby make the following statements in support of the Department of Energy's (DOE) Answer to the State of Nevada's Petition to Intervene. This affidavit is based upon my own knowledge, information, and belief, review of Yucca Mountain Project records, and review of the State of Nevada's Petition.

1. My name is Peter N. Swift, and my curriculum vitae is attached to this Affidavit. I am an employee of Sandia Corporation, the management and operating contractor for Sandia National Laboratories (SNL). SNL is the DOE Office of Civilian Radioactive Waste Management's Lead Laboratory for Repository Systems ("the Lead Laboratory").

2. Since 2006, I have been the Lead Laboratory's Chief Scientist for the Yucca Mountain Project. The Lead Laboratory has responsibility for development of the Total System Performance Assessment (TSPA) model. Before that, I was the TSPA department manager for SNL from 2000 to 2006.

3. The TSPA provides quantitative estimates of the long-term performance of the Yucca Mountain disposal system over a range of possible conditions using a linked system of computer models that simulate processes, events, and features significant to the performance of the system, accounting for associated uncertainties.

4. Four iterations of the TSPA are relevant to this affidavit. One version, referred to as the TSPA-SR, was completed in 2001 to support the DOE's Yucca Mountain Site Recommendation in 2002. The TSPA-FEIS was prepared in connection with DOE's Final Environmental Impact Statement for the Yucca Mountain repository, also in 2002. A preliminary version of the TSPA supporting the License Application for construction authorization (TSPA-LA Model version 5.000) was completed in 2007 and was used to support the DOE's Draft Supplemental Environmental Impact Statement for the Yucca Mountain repository and portions of the Safety Analysis Report in the License Application and the DOE's Final Supplemental Environmental Impact Statement for the Yucca Mountain repository. A final version of the TSPA, TSPA-LA Model version 5.005, was completed in 2008, and was used to support both the Safety Analysis Report in the License Application and the DOE's Final Supplemental Environmental Impact Statement for the Yucca Mountain repository.

5. The State of Nevada requested a copy of the TSPA model and codes in 2003. *See* June 26, 2003 letter from Robert R. Loux to W. John Arthur (LSN Accession #DEN000758818). In response DOE provided the State of Nevada with a DVD that contained the requested model and related codes for the TSPA-SR. *See* August 8, 2003 letter from W. John Arthur to Robert R. Loux (LSN Accession #DN2002503623).

6. In response to that same request, DOE offered to provide the State a copy of the TSPA-FEIS. Nevada declined that offer. *See* June 26, 2003 letter from Robert R. Loux to W. John Arthur (LSN Accession #DEN000758818).

7. In October 2007, DOE gave Nevada an external hard drive that contained the TSPA-LA Model version 5.000 and related model codes. The external hard drive, which was prepared by the Lead Laboratory, contained approximately 150 Gigabytes of data files. These

data files constituted the GoldSim calculation files for TSPA-LA Model version 5.000. *See* October 12, 2007 letter from Jane R. Summerson to Christine L. Schulte, with copy to R.R. Loux and J.R. Egan (LSN Accession # DEN001600532).

8. In June 2008, DOE gave Nevada two external hard drives related to the TSPA-LA Model version 5.005. Those hard drives, which were prepared by the Lead Laboratory, contained the computer model files for the TSPA-LA Model version 5.005 that allow execution of the TSPA model. Those files included the appropriate TSPA-LA GoldSim model files, including limited intermediate results viewable within the GoldSim Player application, so as to facilitate Nevada's review.

9. In July 2008, DOE conducted a tutorial for Nevada's experts to explain differences between versions 5.000 and 5.005 of the TSPA-LA Model and to answer other questions regarding the TSPA's structure.

10. All of the versions of the TSPA model require the software program GoldSim. With the correct version of the GoldSim software and appropriate computer hardware, the computer model files that DOE has provided to Nevada in June 2008 would enable Nevada to run full and partial realizations of TSPA-LA Model version 5.005.

11. The TSPA analysis relies on supporting Analysis Model Reports (AMRs). These AMRs document models and analyses of the major processes relevant to repository performance, simplified abstractions of process models suitable for incorporation in the TSPA, or other data inputs that are used in the TSPA.

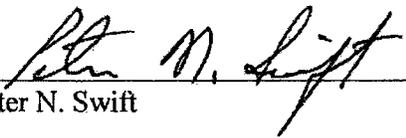

12. It is my understanding that the supporting AMRs are available on the Licensing Support Network (LSN).

13. I have reviewed the contentions filed by Nevada. There are many contentions in which Nevada has alleged the existence of errors or deficiencies in the implementation or execution of the TSPA, or in supporting AMRs or data on which the AMRs are based, but for which Nevada does not provide any quantitative or qualitative description of the effect on overall repository performance as a consequence of the alleged error or deficiency.

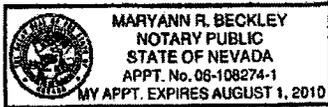

14. In my judgment, it would have been possible for Nevada to provide a qualitative and in many cases quantitative assessment of the effect of these alleged errors and deficiencies on the TSPA results or the model abstractions reflected in the AMRs. These assessments could have been based on interpretation of the TSPA-LA documentation, supporting AMRs and related files that are available on the LSN, and supplemental analyses using the TSPA computer files that DOE provided to Nevada.

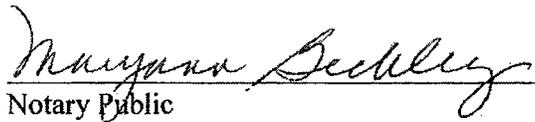

15. I have reviewed the recurring statement in Nevada's Petition that asserts that the TSPA is too complicated and difficult for Nevada to have provided any description of the effect of their asserted errors and deficiencies. I disagree with that statement. The TSPA-LA documentation, computer model files, and supporting AMRs to which Nevada has access, gives the State the ability to evaluate the significance of alleged errors and deficiencies qualitatively, and, in many cases, to perform supplemental analyses or assessments that would quantify the effect of the alleged error or deficiency, in general without undertaking a complete rerun of the TSPA-LA. By performing such qualitative and quantitative analyses, Nevada could have evaluated whether modifications to account for the alleged error or deficiency would have any significant effect on the TSPA-LA model and the estimates of regulatory performance resulting from that model.

16. I am aware of no reason why the State, if it believes that there is an error or deficiency in any model abstraction, input, assumption, or other aspect of the TSPA-LA or the supporting AMRs, could not have performed its own evaluations of the potential significance of these alleged errors and deficiencies, provided that the State's experts have the technical or scientific knowledge and understanding of the TSPA and the appropriate hardware and software to interpret and, as necessary, to run the TSPA-LA model.

  
Peter N. Swift

The above-named affiant personally appeared before me this 13<sup>th</sup> day of January, 2009, and executed this affidavit.

  
Notary Public

My Commission expires: August 1, 2010

#### **Radioactive Waste Disposal Programs**

October 2006 - present, Chief Scientist for the Department of Energy Office of Civilian Radioactive Waste Management's (DOE-OCRWM) Lead Laboratory for Repository Systems and Distinguished Member of the Technical Staff, Sandia National Laboratories (SNL).

Senior technical advisor to the Yucca Mountain Project Lead Laboratory Program Manager regarding adequacy and completeness of technical work supporting the Yucca Mountain project. Represent scientific activities supporting the national high-level waste disposal program to senior DOE management and external groups including the Nuclear Regulatory Commission (NRC), Nuclear Waste Technical Review Board (NWTRB), and the national and international peer community.

April - September 2008, Member of the Independent Expert Review Team (IERT) for the Draft Environmental Impact Statement for the West Valley Demonstration Project, New York.

Lead within the IERT for review of uncertainty and sensitivity analyses in the West Valley Long-Term Performance Assessment. The IERT was a ten-member panel convened by the New York State Energy Research and Development Authority to provide independent review of preliminary drafts of the DOE's draft environmental impact statement for the West Valley facility.

April 2006 - September 2006, Chief Scientist for SNL Yucca Mountain Transition Team.

Provided scientific leadership to the SNL team during the transition of repository postclosure science programs for the Yucca Mountain Project from the Bechtel SAIC Company (BSC) to SNL.

December 2000 - April 2006. Manager, Total System Performance Assessment Department, SNL, Albuquerque, NM, and Total System Performance Assessment Department Manager, BSC, Las Vegas, NV (March 2004-April 2006), Performance Assessment Strategy and Scope Subproject Manager, BSC (December 2001-March 2004), Total System Performance Assessment Process Model Report Manager, BSC (February 2001-December 2001).

At SNL, manager for approximately 15 technical staff members working on total system performance assessment for radioactive waste repositories. Within BSC, manager for approximately 50-60 technical and administrative personnel, management responsibility for designing, conducting and documenting total system performance assessment analyses for the Yucca Mountain license application, also management responsibility for analyses to identify and prioritize scientific and engineering work needed to support analyses of long-term performance of the proposed Yucca Mountain repository. Technical spokesperson for the Yucca Mountain project in interactions with DOE, NRC, NWTRB, and various other US and international groups.

June 2000 - February 2001. Deputy Department Manager-Albuquerque, Civilian Radioactive Waste Management System Management and Operating Contractor (CRWMS M&O) Performance Assessment Department, Yucca Mountain Project, USA, and Distinguished Member of the Technical Staff, Sandia National Laboratories, Albuquerque, NM.

Primary responsibility for technical work performed by the Albuquerque, NM staff of the CRWMS M&O Performance Assessment Department. Staff included approximately 35 technical and support personnel at SNL and Duke Engineering and Services, Albuquerque.

September 1998 - December 2000. Distinguished Member of the Technical Staff, Sandia National Laboratories, Albuquerque, NM.

Member of the CRWMS M&O Performance Assessment Department. Lead for modeling of consequences of disruptive events, including volcanism and seismicity, in the total system performance assessment for DOE's Yucca Mountain Project, 1999-2000. Lead for scenario development and screening of features, events, and processes, 1998-1999. Participated in technical exchanges with CRWMS M&O, DOE, and NRC staff on scenario development and disruptive events. Represented the DOE's approach to scenario development for performance assessment internationally.

October 1997 - September 1998. Principal Member of the Technical Staff, Sandia National Laboratories, Albuquerque, NM.

Lead for scenario development methodology for the Yucca Mountain Project total system performance assessment. Active in developing new business opportunities for SNL within the USA and internationally. Member of the Waste Isolation Pilot Plant (WIPP) Technical Integration and Compliance Departments. Lead for WIPP compliance application documentation, co-lead for far-field technical activities (site-related geology and hydrology).

September 1993 - October 1997. Senior Member of the Technical Staff, Sandia National Laboratories, Albuquerque, NM.

Member of the Waste Isolation Pilot Plant (WIPP) Performance Assessment and Technical Integration and Compliance Departments. Team Leader for Compliance Documentation. Acting Manager of the WIPP Compliance Department, January - March 1995. Acting Manager of WIPP Compliance Support Department, December 1994.

Lead responsibility for preparing contributions by SNL (Scientific Advisor for the WIPP) to the WIPP Compliance Certification Application, submitted to the U.S. Environmental Protection Agency (EPA) in October, 1996, and the No-Migration Variance Petition, submitted to the EPA in June, 1996. Integrated WIPP long-term performance assessment with SNL technical program and regulatory compliance activities coordinated by the DOE and Westinghouse Waste Isolation

Division. Participated in regulator and stakeholder interactions with the DOE, EPA, the State of New Mexico, the National Academy of Sciences, international review groups, and public groups. Represented WIPP Project to international technical audiences.

November 1989 - September 1993. Scientist III, Tech Repts, Inc., Albuquerque, New Mexico.

Contract member of the Performance Assessment Department at SNL evaluating compliance of the WIPP with EPA long-term regulations. Task leader for geology and climate-related studies and coordinator of technical documentation. Work included analysis of long-term climate variability at the WIPP and conceptual application of climatically-varying recharge to regional groundwater-flow model.

### **Mineral Exploration**

July 1987 - August 1989. Exploration Geologist, Chevron, U.S.A., Denver and Houston.

Developed new oil and gas prospects and contributed to the structural analysis and seismic interpretation of existing prospects in southern Oklahoma. Served on a nine-member committee that assessed the teaching and practice of structural geology throughout the corporation.

April 1975 - July 1979. Various field operations in uranium exploration, Geomet Exploration, Inc., Boulder, Co, and North Park Uranium Associates, Rand, Colorado.

As staff member and later project leader for uranium exploration programs, participated in and directed radiation surveys at regional and local scales, directed claim-staking projects, and managed the field operations of two- to ten-person crews throughout the western United States.

### **Academic Teaching and Research**

January 1996 - May 1996 and January 1997 - May 1997. Instructor, Department of Civil Engineering, University of New Mexico, Albuquerque.

Co-taught two one-semester graduate courses in radioactive waste management, with Dr. Ruth Weiner.

August 1989 - December 1989. Instructor, Department of Geology, University of New Mexico, Albuquerque.

Taught a one-semester graduate seminar on basin analysis and sedimentary tectonics.

June 1980 - May 1987. Teaching Assistant and Research Aide for the Department of Geology and Geophysics, University of Wyoming; Teaching Associate and Research Associate for the Department of Geosciences, University of Arizona.

Taught undergraduates in mineral deposits, petroleum geology, structural geology, geophysics, and field methods. Conducted research in topics including uranium exploration and global tectonics.

## Education

University of Arizona, Tucson, Arizona  
Ph.D., Geosciences, tectonics program, May, 1987  
University of Wyoming, Laramie, Wyoming  
M.S., Geology, May, 1982  
B.S., with honors, Geology, December, 1980  
Yale University, New Haven, Connecticut  
B.A., English, May, 1974

## Professional Associations

American Geophysical Union, Geological Society of America, American Association for the Advancement of Science.

## Publications and Presentations

### Technical Reports

**ATTACHMENT NEV-SAFETY-01-1**

**Statement of Edward F. Sproat III, Director  
Office of Civilian Radioactive Waste Management  
U.S. Department of Energy  
Before the  
Subcommittee on Energy and Air Quality  
Committee on Energy and Commerce  
U.S. House of Representatives  
July 19, 2006**

Mr. Chairman and Members of the Committee, I appreciate the invitation to appear before the Committee to discuss the current status of the Yucca Mountain Project and my plans over the next two and one-half years.

It has been more than five years since I last appeared before this Committee as a vice president of Exelon Generation and testified about the Pebble Bed Modular Reactor (PBMR) project in South Africa. During 2002 I was in South Africa as the Chief Operating Officer of PBMR assisting the South Africans in determining the feasibility of commercializing that technology. I am pleased to report that the South African government has decided to proceed with demonstration and commercialization of the PBMR.

More recently, I was involved with forming a consortium to compete for the Next Generation Nuclear Plant project to demonstrate the cogeneration of electricity and hydrogen from the PBMR. While that technology and demonstration project holds much promise, I see a more urgent near-term need for this Nation's energy security; that is to move the issue of the disposition of spent nuclear fuel and high-level radioactive waste

forward with a sense of urgency. It is for that reason that I accepted President George W. Bush's appointment to serve as the Director of the Office of Civilian Radioactive Waste Management (OCRWM).

I have now been in my new position as Director for about five weeks. During this period I have been conducting a thorough assessment of the Yucca Mountain Project, and that assessment has not yet been completed. I continue to gather data on functional areas of the Project to determine the performance gaps between the current state and the levels of performance that will be necessary for the successful execution of this Project.

In order to expedite this assessment process, I have instructed my Office to issue Requests for Proposals for independent assessments of the draft License Application, the Quality Assurance programs and their implementation by DOE and its major contractor, and of the engineering processes and procedures being utilized by DOE and its major contractor. While I am not yet prepared to give you a full report of my assessment, I can tell you that there are a number of very good people working on this Project who can form the nucleus of a high-quality team needed to successfully design, license, build and operate the Yucca Mountain repository and the waste acceptance and transportation systems. I also can tell you that there are a number of process and organizational issues which must be addressed, all of which are correctable.

There are four strategic objectives that I intend to pursue and implement during my tenure as Director. Let me explain these objectives and why they are important.

My first objective is to submit a high-quality and docketable license application to the Nuclear Regulatory Commission (NRC) no later than Monday, June 30, 2008.

This objective is my first priority and will receive my full management attention.

Success in meeting this objective is not measured only by the calendar, but also by the quality and completeness of the application. Before I will allow the application to be submitted, I must be satisfied that:

1. There is a repository design which meets the licensing requirements;
2. The application accurately reflects the design;
3. The data which are used to justify the design in the application are accurate and were generated in compliance with Quality Assurance requirements;
4. The application adequately addresses all of the guidance of the *Yucca Mountain Review Plan* (NUREG 1804); and
5. The writers of the application have attested to the accuracy and completeness of their sections.

I am certain there will be those who will question how these criteria can be met with such an aggressive schedule. I can tell you unequivocally that the concepts of safety, quality and schedule discipline are not mutually exclusive. This concept is demonstrated by world class nuclear organizations on a daily basis and I intend to hold my organization and its contractors to the same standards.

With a license application submittal on June 30, 2008, the best-achievable schedule for Yucca Mountain would lead to receipt of a license to begin to receive and possess spent nuclear fuel and high-level radioactive waste at Yucca Mountain in 2017. Attached is a more detailed set of schedule milestones for your information.

Let me define what I mean by “best-achievable schedule.” The schedule after the Department submits the License Application is predicated on 1) appropriations consistent with the Administration’s requests and passage of our proposed legislation entitled the “Nuclear Fuel Management Disposal Act”; and 2) an NRC construction authorization decision that is consistent with the timelines contained in the Nuclear Waste Policy Act. There are a number of uncertainties currently beyond the control of the Department that have the potential to significantly delay the opening date for the repository and cannot be accurately predicted. The most important is the ability of the Department to have access to the Nuclear Waste Fund to support the cash flows needed to implement the Project. I respectfully ask Congress to pass the Administration’s proposed legislation to address this issue; access to the Fund is key to moving the Project forward.

Other factors that have the potential to delay the Project include: 1) the length and outcome of any derivative litigation, 2) Congressional approval of the permanent withdrawal of the lands needed for the operational area of the repository, and 3) obtaining any necessary Federal or state authorizations or permits for the repository and the transportation system. The Administration’s proposed legislation addresses most of these

uncertainties and will go a long way in reducing schedule risk and the cost uncertainties of the Yucca Mountain Project while still fully protecting public and worker health and safety.

My second objective is to design, staff, and train the OCRWM organization such that it has the skills and culture needed to design, license, and manage the construction and operation of the Yucca Mountain Project with safety, quality, and cost effectiveness.

I am still in the process of assessing the current state of my organization and the skill gaps that may exist compared to what is needed to meet this objective. I do know that additional skills and competencies are required to enhance the current organization and that attracting and retaining individuals with these skills will be a major challenge. I have been encouraged, however, by the Department's Office of Human Capital Management and its help in meeting this challenge.

My third objective is to address the Federal Government's mounting liability associated with unmet contractual obligations to move spent fuel from nuclear plant sites.

What seems to have been lost in the Yucca Mountain debate over the last several years is that the U.S. Government has legally binding contracts with all owners of nuclear power plants to take possession of and remove their spent fuel. There are two major implications of the Government's inability to perform per the contract requirements: 1) the financial liability borne by America's taxpayers for non-performance of the contract

continues to grow every year, and 2) the ability of this country to depend on nuclear energy as a strategic energy option for the long term is in jeopardy because spent fuel continues to accumulate at existing plants. There is no one solution to these problems. It will require a portfolio of legal and financial solutions to address these problems; but it can be done, and I intend to work with the Congress and the contract holders to try to break this impasse.

My fourth objective is to develop and begin implementation of a comprehensive national spent fuel transportation plan that accommodates state, local and tribal concerns and input to the greatest extent practicable.

I believe that the planning of the transportation system for the country's spent nuclear fuel and high-level radioactive waste has been underfunded and not given the attention and resources that it demands. The recent National Research Council's report on spent fuel transportation concluded that, while there are no technical barriers to the safe transportation of spent nuclear fuel, there are a number of social and institutional challenges that must be addressed before large-scale shipments commence. I agree with this conclusion and I intend to put into place processes which maximize the ability of the public to understand the risks and mitigating safety precautions, and to influence as appropriate the selection of transportation routes in their areas. Some work has already been done in this area with local planning groups, but much more needs to be done at an accelerated pace.

In summary, these four strategic objectives will form the basis of planning and resource allocation during my tenure. I believe that these areas must be addressed today to move forward on the issue of final disposal of spent nuclear fuel and to prepare the Project for long-term success in meeting the mandated direction of the Nuclear Waste Policy Act. I will do my best to make this a reality.

### **Yucca Mountain Repository Schedule**

<b>Milestone</b>	<b>Date</b>
Design for License Application Complete	30 November 2007
Licensing Support Network Certification	21 December 2007
Supplemental Environmental Impact Statement (EIS) Issued	30 May 2008
Final License Application Verifications Complete	30 May 2008
Final Rail Alignment EIS Issued	30 June 2008
License Application Submittal	30 June 2008
License Application Docketed by NRC	30 September 2008

### **Best-Achievable Repository Construction Schedule**

Start Nevada Rail Construction	5 October 2009
Construction Authorization	30 September 2011
Receive and Possess License Application Submittal to NRC	29 March 2013
Rail Access In-Service	30 June 2014
Construction Complete for Initial Operations	30 March 2016
Start up and Pre-Op Testing Complete	31 December 2016
Begin Receipt	31 March 2017

The schedule above is based on factors within the control of DOE, appropriations consistent with optimum Project execution, issuance of an NRC Construction Authorization consistent with the three year period specified in the Nuclear Waste Policy Act, and the timely issuance by the NRC of a Receive and Possess license. This schedule also is dependent on the timely issuance of all necessary other authorizations and permits, the absence of litigation related delays and the enactment of pending legislation proposed by the Administration.

**ATTACHMENT NEV-NEPA-16-1**

**U.S. DEPARTMENT OF ENERGY (DOE)  
TRANSPORTATION EXTERNAL COORDINATION  
WORKING GROUP (TEC) MEETING**

**September 20-21, 2005 Pueblo, Colorado**

**Meeting Notes**

**Day 1 (September 20)**

**Optional Tour of the Transportation Technology Center, Inc. (TTCI)**

In the morning, Ruben Peña, Manager of Business Development, TTCI, directed the tour of the site where 80 TEC participants visited the Rail Dynamics Laboratory, learned about its Emergency Response Training Center (ERTC) and observed the railcar designed and constructed by Private Fuel Storage, LLC (PFS) to carry shipments of spent nuclear fuel (SNF) to its temporary storage facility.

The TTC site is owned by the U.S. Department of Transportation (DOT), Federal Railroad Administration (FRA) and is operated and maintained by TTCI, a subsidiary of the Association of American Railroads (AAR). TTCI performs extensive technological research and development, as well as real-world testing. The 52 square mile facility offers an array of specialized testing facilities and tracks enabling testing of all types of freight and passenger rolling stock, vehicle and track components, and safety devices.

**TEC Welcome and Meeting Overview**

***Introduction***

*Judith Holm, Director, DOE/RW, Operations Development Division, Office of National Transportation*

Ms. Holm called the meeting to order and welcomed the participants. She reviewed the agenda and called special attention to the plenary sessions being held during the remainder of the day. Ms. Holm stated that the purpose of this meeting is for the participants to get immersed in rail. There will be opportunity for questions at the end of each presentation over the next two days.

## **Colorado Welcome**

*Jim Reed, Denver Office, National Conference of State Legislatures (NCSL)*

Mr. James Reed, Transportation Program Director, offered a special welcome, speaking on behalf of the State of Colorado and the NCSL. Mr. Reed noted that NCSL had been a participant in TEC since its inception. NCSL is headquartered in Denver, Colorado and represents state legislators from all states in a variety of issues on energy, environment, and transportation. Mr. Reed noted sites of interest in the Pueblo area and stated that the state of Colorado has beautiful scenery and architecture. He also mentioned that Pueblo was voted as one of the best places to live in 1988 and hosts the annual Colorado state fair.

## **Program Update from OCRWM's Office of Transportation**

*Moderated by Judith Holm and presented by Gary Lanthrum, Director, DOE/RW Office of National Transportation (ONT)*

Mr. Lanthrum provided an update of OCRWM's Office of National Transportation (ONT), followed by a more focused discussion of the DOE decision to use dedicated rail as the primary transportation mode for shipments to Yucca Mountain. Following Mr. Lanthrum's presentation, representatives from the AAR and FRA provided their perspectives on the decision.

**Key Accomplishments** — According to Mr. Lanthrum, recent accomplishments in the OCRWM transportation program include the following:

- On July 18, 2005 OCRWM's ONT announced its decision to use dedicated trains as the usual shipment mode.
- An Environmental Assessment (EA) was published as part of a Public Land Order submitted to the Department of the Interior through the Bureau of Land Management (BLM)

The benefits of the dedicated train service will enable OCRWM to better manage resources by avoiding lengthy "dwell times" in rail yards resulting in shorter transit time. In addition, there will be increased routing flexibility and operational control over shipments.

The Draft EA essentially extends part of the original land withdrawal and significantly reduces the right of way. The Draft EA on land withdrawal will provide BLM with documentation on mineral resources and socio-economic analyses; land use and ownership; public participation; and intergovernmental consultation.

**Funding and Priorities** — In regard to funding, Mr. Lanthrum noted that the development of the transportation system is directly linked to the development of the repository. The repository is currently going through the license process. ONT funding is tied to overall OCRWM funding and project status. In 2004, ONT funding was \$64 million and in 2005 there was no increase in funding. No appropriations have been made for 2006.

The priorities for 2006 include:

- Focus on completing the Draft Nevada Rail Alignment EIS
- Initiate first steps in acquisition of casks

- Continue to work with State Regional Groups (SRGs) and Tribes
- Coordinate with key stakeholders through TEC regarding route selection criteria, 180(c) development and security planning
- Update OCRWM section of Radioactive Material Transportation Practices Manual
- Conduct trade studies
- Differentiate between requirements and expectations

**Cask and Rolling Stock Acquisition** — ONT has a preference for cask systems that provide the maximum flexibility in terms of facility and fuel compatibility. DOE has been looking at cask size and how it affects system operation performance. Multiple cask procurements will be undertaken to accommodate differing inventories of waste, and differing facility capabilities.

For rolling stock acquisition, little has changed since the last TEC meeting. DOE has not yet made a decision either to procure a fleet of locomotives or to utilize locomotives supplied by the railroads. Prototypes will most likely be out in about five years.

**Nevada Rail Development** — DOE is in the process of completing technical data collection along the corridor. The technical data includes hydrological, geological, photogrammetry and terrain information. All of this data is being used to assess alignment options. The Draft Rail Alignment EIS should be issued in 2006 with the final EIS to be issued in 2007.

**Institutional/Operational Activities** — Mr. Lanthrum identified key Institutional activities underway or planned. They include the following:

- Develop and issue Section 180(c) Policy
- Work with SRGs to develop regional suite of routes
- Meet with individual Tribes to establish a consultation and coordination mechanism on topics like Section 180(c) and routing
- Update Radioactive Materials Transportation Practices Manual (DOE M 460.2-1)
- Develop information materials for use in exhibits, tours and by various organizations

He noted that the new OCRWM transportation brochure was available at the registration table.

Key Operations activities include the following:

- Develop the Classification Guide for Secure Transportation of Nuclear Waste
- International transportation sabotage studies
- Transportation logistics/routing models
- Operational and systems studies

Mr. Lanthrum concluded his presentation by stating that despite budgetary setbacks, ONT still continues to make significant progress, and infrastructure acquisition plans are moving forward.

### **Questions and Comments from the Audience**

A member of the audience asked if data being collected along the Caliente Corridor would be available to the public. Mr. Lanthrum said that, at some point, the information will be released but the reports are not final yet. He will look into portions of the information being released. A question was asked as to why there is still a two-percent grade restraintment. Mr. Lanthrum said that DOE prefers to keep a two-percent grade but that could be overcome if needed. Other

considerations are slower speeds, operations, and size of train. Another audience member noted that incremental funding is not consistent everywhere, and the comment was noted. A member asked if there was a formal decision and/or documentation for deciding to go with dedicated trains. Mr. Lanthrum said that although the decision was not published in the Federal Register, there was an official press release that was issued by DOE and sent out to the SRGs.

## ***Perspective of the American Association of Railroads (AAR)***

*Bob Fronczak, AAR*

Mr. Fronczak stated that AAR was delighted with DOE's decision to use dedicated trains. He pointed out that DOE focused on three areas in making this decision. These areas were safety, security and cost. In the area of security, using dedicated trains will provide better visibility, as the trains will be shorter. The dwell time in rail yards will be less, and experienced rail personnel will be a part of this process, minimizing injury.

### **Questions and Comments from the Audience**

An audience member asked Mr. Fronczak to clarify what, in AAR's view, are dedicated trains, and what are the implications of routing?

- Mr. Fronczak stated that a dedicated train is a train that goes from a point of origin to a destination and back again, carrying the same commodity each time. An example of this would be a coal train. Dedicated trains do not necessarily include locomotives because there is a need to give an electric signal to the brakes, and that cannot be done unless they have Electronically Controlled Pneumatic (ECP) brakes. For dedicated trains, there is no routing and no escorts through a classification yard. Cask cars are very heavy, and that has an effect on the train's dynamics.

## ***Perspective of the Federal Railroad Administration (FRA)***

*Kevin Blackwell, FRA*

Kevin Blackwell provided discussed FRA's *Dedicated Train Study (DTS)*. The DTS is expected to be provided in a Report to Congress shortly. Mr. Blackwell provided the timeline for finalizing the DTS Report to Congress, which is as follows:

- November 1, 2004 — FRA initially submitted the draft final *DTS Report to Congress* to the DOT Office of the Secretary (OST) for review and clearance.
- December 2004 — FRA received questions and comments from DOT OST and addressed them to the extent possible to facilitate the DOT OST clearance process.
- February 2005—FRA resubmitted the *DTS Report to Congress* back to DOT OST for clearance.
- June 2005 — the *DTS Report to Congress* was cleared by the Office of Management and Budget (OMB).

The *DTS Report to Congress* is currently with the DOT Secretary's staff waiting for clearance to deliver the report to Congress. When delivered to Congress, the study will be publicly available. FRA checks with OST on a weekly basis as to its status.

At this time, FRA does not have any formal position on the use of dedicated trains for the transportation of spent nuclear fuel or high level radioactive waste. FRA is cognizant of the fact that rail movements of this material have occurred over the past 40+ years in regular train service, and these movements have been done safely and securely. However, FRA also recognizes that there are operational efficiencies in the rail operating environment to be gained in using dedicated trains. These include: rail transit times, train dynamics, and the ability to further reduce the already low risk of radiation exposure to railroad personnel and the general public in incident free transportation, as well as in the event of an accident.

### **Questions and Comments from the Audience**

An audience member asked how FRA is going about ramping up responsibilities, and what are some concrete things being done to prepare for when DOE is ready to ship. Mr. Blackwell said that FRA is looking into increasing resources to make sure it can implement its responsibilities. FRA will inspect trucks as the shipments ramp up. FRA would like more state involvement and participation, but that is voluntary. He noted that the inspection program has grown stagnant in the last five to eight years. A question was raised as to whether FRA plans to ask for a budget increase. Mr. Blackwell said that FRA asks for a budget increase every year. He said that two years ago FRA asked for 50 new inspectors and ended up with funding for six new inspectors.

## **Program Update from EM/Office of Transportation**

*Moderated by Judith Holm, OCRWM/ONT*

### ***EM Transportation Overview***

*Ella McNeil, EM Office of Transportation*

Ms. McNeil provided an update on the continuing efforts for cleanup and waste disposition by the Office of Environmental Management (EM) and transportation activities. She said that the disposition of “orphan” or special waste streams is one of the remaining obstacles to site cleanup across the DOE Complex. DOE is working with sites to develop comprehensive lists of orphan streams and to identify the needed treatment and disposal options, including identification of disposal facilities. An accelerated cleanup schedule is dependent on the ability to ship and dispose of the waste safely.

The current DOE/EM Waste Management Policy is as follows:

- Low-level radioactive waste (LLW) and mixed low-level waste (MLLW) are disposed of at the generation site, if that is practical. If onsite disposal is not available, waste is disposed at another DOE facility. Commercial facilities can also be utilized for disposal if compliant, cost effective, and in the best interest of DOE.
- Transuranic (TRU) waste is handled in two ways. Defense-generated waste is disposed at the Waste Isolation Pilot Plant (WIPP) in Carlsbad, NM. Non-defense waste is placed in safe storage awaiting future disposition.
- High-level radioactive waste (HLW) and SNF is stabilized, if necessary, and placed in safe storage until a geologic repository is available.

FY 2005 accomplishments include the following:

- Increased volumes disposed with reduction in transportation incident rate
- Vast majority of stored legacy waste worked off
- Rocky Flats TRU and MLLW shipments completed
- Mound TRU shipments to Savannah River completed
- Large quantities of “orphan wastes” were resolved at closure sites
- Commercial receiver sites identified for Fernald Silo residues

Through July 2005, approximately 18,000 shipments were made with 15 incidents – this is compared with 23 incidents in FY 2004. A management review of incidents will be held in October. No major incidents have yet been reported in FY 2005. Savannah River, Rocky Flats, Brookhaven, Idaho, Portsmouth, Mound, Oak Ridge, and Ohio sites all reported incidents in 2005, ranging from drums shifting during transport to the side-swiping of a Fernald Silo 3 shipment. No contamination or release of materials from their packages resulted from these incidents.

Ms. McNeil cited some site-specific shipping details as follows:

- Rocky Flats: All buildings and structures have been removed. There will be 10 shipments in FY 2006. About 50 truck shipments and 150 railcars remain to be moved.
- Fernald Silo 3: Shipments should be complete by the end of CY 2005 (175 to 200 shipments total).
- Fernald Silo 1 and 2: Shipments will continue into CY 2006; 245 shipments completed (2,000 to 2,200 total shipments expected).
- Oak Ridge: Completed shipment of 4,396 cylinders of DUF6 (2,520 in FY 2005); 5,951 cylinders total. A haul road is scheduled for completion in February 2006. This will significantly reduce commercial shipments.
- Richland: Weekly shipments to Pacific EcoSolutions number between two and three. A decision on special nuclear material is pending.
- West Valley: Currently shipping LLW to Envirocare and Nevada Test Site (NTS).
- Savannah River: Shipments include LLW and MLLW to Envirocare and NTS, TRU to WIPP, and neptunium to INL.
- Brookhaven: LLW shipments to Envirocare will resume in 2007. Two Type B shipments were recently completed to Los Alamos National Laboratory.
- Mound: Closure is on track for 2006; TRU shipments to Savannah River completed; shipments to Envirocare and Nevada Test Site (NTS) continue.
- Columbus: Waste shipments will continue into FY 2006. A Supplement Analysis for TRU transport has been prepared (comment period closes October 11, 2005).

- Paducah/Portsmouth: Paducah has resumed shipping to NTS, Envirocare shipments continue. Portsmouth shipments to NTS continue as well.

In addition, more than 3,900 truck shipments of TRU waste from eight sites have been transported to WIPP. Eleven small quantity sites have been completed. Mound rail shipments of TRU waste were completed in August. Idaho National Laboratory (INL) is making about 11 shipments per week. NTS is expected to complete TRU shipments by the end of CY 2005. Savannah River, Hanford, and Los Alamos continue to make TRU shipments. Issuance of a Request for Proposal (RFP) for WIPP transportation services is expected in September 2005.

DOE sites have been donating liftliners, liftliner fixtures, loading frames, and light generator equipment to the Army Corps of Engineers in New Orleans, to support hurricane relief efforts.

There were no questions or comments from the audience.

## ***Rail Best Practices Review***

*Eric Huang, EM Office of Transportation*

DOE conducted a review May 18-19, 2005 in Oak Ridge, TN. The review focused on loading and securing of packages. Participants included EM generator and shipping sites, as well as receiver sites, suppliers, and rail carriers. Rail shipment incidents that led to the review included:

- Brookhaven shipment to Envirocare – railcars arrived with water (melted snow) leaking (March 2005)
- Portsmouth shipment to Envirocare – metal debris gondola car arrived with portion of burrito bag open (May 2005)
- Mound shipment to Envirocare – Utah NOV for railcar not in a strong tight condition due to breach of railcar liner (May 2005)

Activities during the review included an observation tour at East Tennessee Technology Park (ETTP), sessions where experiences and lessons learned were shared, and a brainstorming session of best practices for safe and compliant rail shipment.

- Fernald Best Practices: Key components included training and retraining of all personnel and taking advantage of unit train to optimize rail shipping schedule. Lessons learned included diligence, inspections, and contact with railroads and disposal sites.
- Brookhaven Best Practices: Loading best practices outlined were patch hole, use geotextile liners and super load wrappers, use double-wrapper for debris and soil around debris to avoid puncture, use absorbent inside package, use covers on all railcars, complete loading of railcar in one day, and DOE review of all waste management and railcar shipment checklists prior to shipment.
- Rocky Flats Best Practices: Loading best practices identified were to install geotextile liners on bottom of car and top of waste and to install tarp and bow system.

- Savannah River Best Practices: Loading best practices include use of polypropylene-coated fabric wrapper, use liner as shipping package, use 66-ft (110-ton) gondola cars, placement of four drums on pallet and band to pallet with four metal bands, use gondolas with hard tops, and use 85-gallon overpacks as the package.
- Oak Ridge Best Practices: Loading best practices included use multiple barriers in packaging with absorbent to solidify liquid from potential release point, use double layers of super load wrappers, use straps outside the wrappers to secure boxes and wooden bracing at the end of railcars, cover railcar with tarp, and make sure QA/QC engineer oversees work and verifies compliance.

The review identified top best practices during the planning phase, the pre-loading phase, the loading phase, and the post-loading phase.

#### Planning:

- Define scope of work and include railcar specifications and other requirements in the subcontract with railcar suppliers.
- Perform thorough options analyses.
- Use dedicated fleets with hard covers.
- Define training needs and ensure program is in place.
- Utilize lessons learned from others.

#### Pre-Loading:

- Conduct thorough inspection.
- Compile all relevant documents and procedures.

#### Loading:

- Define critical activities and perform multiple-step inspections.
- Layer load/material/waste to avoid puncture of liner.
- Prevent rain/snow from infiltrating railcars during loading and transit.
- Do prep work before entering contaminated area.

#### Post-Loading:

- Inspect! Inspect! Inspect!
- Photograph outside of railcars and photograph shipment before and after package closure.

### **Questions and Comments from the Audience**

Mr. Huang was asked how shipments with burrito bags are unloaded. He responded that Envirocare uses a tipping mechanism and that the liners are all one-time use equipment.

Another audience member asked how involved the States were in the review. Mr. Huang answered that in the future DOE will try to expand the type of people involved in such reviews.

## **DOE Practices Manual**

*Ella McNeil, EM Office of Transportation*

Ms. McNeil provided an overview of plans to revise DOE M 460.2-1, *Radioactive Material Transportation Practices Manual*.”

On August 3, 2005, EM held a kick-off meeting for the revision of the *Transportation Practices Manual*. An internal writing team has been assembled that is led by EM and includes representatives from the DOE Field Offices, Naval Reactors, National Nuclear Security Administration (NNSA), and OCRWM. The second conference call was held on September 8, 2005.

Ms. McNeil shared the proposed timeline for revision of the Manual. The new draft is scheduled for completion by January 2006; informal review by DOE will begin in February; and the draft revision will be provided to the SRGs for comment in April 2006. The projected timeframe for submittal of the Manual into the formal DOE Directives system is September 2006, with manual re-issuance anticipated in December 2006.

EM has been receiving questions as to why there will be no Protocol Topic Group for revision of the Manual. Work will parallel that of existing Topic Groups (rail, security, training), and those groups will feed input into the revision process. DOE wants to focus the energy and resources of TEC members on the resolution of new issues and another topic group could dilute participation in existing groups. TEC and the SRGs will be involved in revision through the comment process. This is the same process used for development of the Modular Emergency Response Radiological Transportation Training (MERRTT). The comment resolution matrix will once again be employed for the revised Manual.

Ms. McNeil also announced that the EM Office of Transportation website is being revised, and the Best Practices will be part of that site.

### **Questions and Comments from the Audience**

One audience member expressed disappointment in the perceived lack of outside review. A letter was sent to DOE three weeks ago by three of the SRGs requesting the Protocol Topic Group be revived during the revision process. The Protocols are seen by some as one of DOE’s most useful TEC-produced documents. Ms. McNeil responded that OCRWM and EM collectively decided (on the September 8<sup>th</sup> call) not to revive the Protocols group.

Another member of the audience said that there is not much interaction/review time if there are major changes to the Manual. Alex Thrower responded that OCRWM needs to review the questions in the letter from the SRGs and get back to them. He added that the Security Practices section of the Manual was written before ‘9/11’ and will probably need a complete rewrite.

On other matters, the attendees said that oversight is needed to prevent the situation last year with Paducah from recurring. Ms. McNeil said that new EM management is coming up to speed to ensure shipment safety and is having biweekly telecoms.

## **Flagstaff Commodity Flow Survey**

*Bill Spurgeon, EM Office of Transportation*

On August 10-11, 2005, EM conducted a 24-hour commodity flow survey focusing on hazardous material shipments in Flagstaff, AZ. Participants included the Arizona Department of Transportation, the Flagstaff Fire Department, and DOE staff. Survey participants examined truck shipping manifests at a Flagstaff rest area. A report should be available in the next couple of weeks. The placard identification count revealed no Number 7 (radioactive) placards. A disparity was noted in the weight and number of shipments, which consisted primarily of bulk cargo, liquid by weight. By count, gasoline shipments were numerous; by Emergency Response Guidebook numbers, flammable liquids. In the future, origin and destination information will be included.

### **Questions and Comments from the Audience**

When asked if railroad information such as the truck survey information is available, Mr. Spurgeon answered “Yes, it could be obtained.” One audience member asked if other sections of the country would be covered, and Mr. Spurgeon said that Oklahoma, Arizona, and Wyoming have responded that they would be interested in participating in future studies. A member of the Western Interstate Energy Board (WIEB) expressed surprise that DOE would offer a service that should be a DOT activity. Mr. Spurgeon replied that the survey was a public service and part of TRANSCAER outreach. Another audience member said that the survey might send a subliminal message like “What are you worried about our shipments for – look at this other stuff.” Still another member asked about the future of the program and questioned why no radioactive shipments showed up in the survey. Mr. Spurgeon replied that it was a real-time survey and the Department staff who conducted it was “letting the chips fall where they may” and that DOE has a vested interest in seeing how the Department’s shipments fall into the overall scheme of things.

## **Day 2 – Plenary Sessions (September 21)**

### **Plenary I– Rail Testing and Technology**

*Moderated by Gary Lanthrum, OCRWM/ONT*

#### **OCRWM/ONT Rolling Stock**

*Gary Lanthrum, OCRWM/ONT*

Mr. Lanthrum discussed rolling stock design and acquisition, interface with railroads and utilities, and cask procurement.

OCRWM rolling stock development strategies are based on AAR Standard 2043 and operating standards compliance. No buffer car/escort requirements have yet been established. OCRWM is working toward approval to develop conceptual design work for a single car design based on the best of existing technology. In the past, security cars were converted cabooses, which proved to

be very uncomfortable for the escort staff. A new escort car design will be developed. A unique train will be designed to afford the ultimate in safety, security, and performance for DOE shipments to Yucca Mountain.

**Rolling Stock Strategy** — DOE has been meeting with rail car manufacturers and will need a fleet of about 140 cars to meet its spent fuel transportation needs. Feedback includes a statement that AAR S-2043 requires trains be tested as a whole and all cars should subsequently come from the same vendor. There is a 6-year window for getting to the actual construction of railcars.

**Performance Requirements Evaluation** — ONT has engaged the Transportation Technology Center, Inc., (TTCI) to provide preliminary evaluation of several standard and premium railcar truck designs. Both long and short cars are being considered.

**Custom Cask Car Development** — DOE will be buying U.S. Nuclear Regulatory Commission (NRC)-certified casks and would like to have a single cask car design. A skid that would minimize handling is also desired. DOE does not yet have the appropriation necessary for acquisition of railcars.

**Custom Buffer Car Development** — The purpose of a buffer car is to provide spacing between cask cars and escort cars. DOE wants to minimize exposure to crew members (one reason for deciding to use dedicated trains for the shipments). Buffer cars are flat cars with an option to carry a standard 20-foot container. They also carry spare parts and cask support equipment and may require additional weight or ballast.

**Custom Escort Car Development** — Ride quality differs in passenger car designs by different manufacturers. DOE is looking at passenger car experience and will add security requirements to the design of the escort car. The car is expected to be a bi-level design that provides operations and communications workspace, living and storage space, bunk rooms, bathrooms and a shower, kitchen and dining area, and a common lounge area. Systems for the car will include air conditioning, potable water and wastewater, storage, diesel generator, and electrical and lighting equipment.

**Standard Locomotive** — On-line real-time monitoring and braking systems will be important in the locomotive design. Each spent fuel train will use two locomotive units (expected to be 4,000 horsepower each) with electronically controlled pneumatic brake systems. A buy/lease analysis is planned by OCRWM.

**ONT's Rolling Stock Acquisition Plan** — ONT continues to develop a two-part procurement: conceptual design and final design, prototype and fabrication from a single vendor lead team. The plan is to purchase 120 cask cars, 60 buffer cars, and 30 escort cars. Production will be tied to repository waste throughput.

**Interface with Utilities** — DOE is experiencing an awkward interface with the utilities due to the numerous lawsuits against DOE. ONT plans to match rolling stock and casks with utility needs and capabilities, and plans to discuss preferences for shipping cask options with the utilities.

**Cask and Rolling Stock Interface** — Cask-to-cradle-to-car designs must be integrated. Efforts are underway to standardize the interface between the transfer skid and the cask cars.

**Transportation Cask Acquisition** — Thirty-percent of the material to be shipped can be covered by existing casks. DOE will be developing a conceptual design in the next year or so. Dual-purpose (storage and transport) casks do exist that meet requirements of 10 Code of Federal Regulations (CFR) Part 71 and Part 63 requirements.

**Summary** – Mr. Lanthrum wrapped up by saying that DOE does not have the rolling stock to meet S-2043 standards, but there is time to procure that stock if the money is available.

### **Questions and Comments from the Audience**

A member of the audience asked if the information from the utilities would be shared with the States. Mr. Lanthrum replied that some of the information could be proprietary. Another member said that most accidents are related to human factors and railbed conditions and asked what DOE is doing to make sure railbeds are safe. Mr. Lanthrum answered that the FRA is responsible for inspecting railbeds and an FRA representative said that FRA and the railroads share the responsibility. FRA will work with the railroad to inspect the tracks. He stated that DOE would own the track from Caliente to the repository at Yucca Mountain. He was then asked if track is ready now; and replied that spent fuel is being shipped now. On another note, Mr. Lanthrum made a clarification that electro-pneumatic brakes also provide part of the communication function for a train. Someone then asked if the casks would be capable of transporting canistered and bare fuel, to which DOE staff responded that DOE would have casks with both capabilities. Mr. Lanthrum said that the capability exists for canisterized fuel, but it is not currently part of the contract. Another individual asked how DOE is going to handle the fuel from Utah. Mr. Lanthrum responded that the Utah fuel is not part of the plan yet. The last question posed by the audience was if escort car and communications equipment would be interoperable with emergency responders. Mr. Lanthrum said yes, but there will be a security aspect that will not be interoperable.

### ***Testing at the Transportation Technology Center, Inc. (TTCI)***

*Rubin Peña, TTCI*

Mr. Peña provided an overview of testing activities at TTCI. TTCI is owned by AAR and has DOT/FRA for a landlord. The Center's core competencies are driven by the railroads and include safety, reliability, efficiency, and independent assessment. Basic capabilities include research, development and testing; rail security; emergency response training; and technology development. The facility features 48 miles of dedicated track and has the largest crash wall in the United States. The Center is looking into building a passenger car training facility and aboveground tunnel to test transit and freight vehicles. TTCI conducts tests to the worst-case scenario.

**Railcar Safety Criteria** — The goals of railcar safety standards are to provide an unbiased and consistent method to evaluate proposed designs, publish evaluation regimes and success criteria, shorten the time needed to introduce new products, and to improve fleet efficiency and reliability. These criteria are used in derailment studies, product development, and to focus on past problem areas. Freight railroad standards are established by the Equipment Engineering Committee, through which certification must be obtained.

Freight car safety standards now in effect include:

- Chapter XI, which covers vehicle dynamics and derailment and theoretical analyses and tests;
- M965 that applies to 100 ton trucks only;
- S286/M976 for cars that weigh between 268,000 and 286,000 pounds;
- Chapter VII for intermodal cars; and
- S-2043, safety performance specifications for trains carrying high-level radioactive waste (HLW).

M976 and S-2043 standard requirements are similar. S-2043 is more comprehensive than Chapter XI. All criteria are based on extensive test analyses.

S-2043 became effective in 2000 and requires three types of cars used in a train carrying HLW: locomotives, buffer cars, and cask cars. It also requires the use of electronically controlled pneumatic brakes, onboard monitoring of every car, crew onboard a dedicated train and a buffer car between the waste and people.

Once individual cars have been tested to standards, multi-car, unit train testing will be required.

There were no comments or questions from the audience.

## **Plenary II – Rail Operations and Safety Standards**

*Moderated by Jay Jones, OCRWM/ONT*

### ***Safety and Operational Standards***

*Bob Fronczak, Association of American Railroads (AAR)*

Mr. Fronczak stressed the importance of railroad safety and informed the audience that AAR safety briefings are conducted prior to the beginning of all meetings. He cited dramatically improved safety conditions for railroads which compare favorably with other industries since the benchmark year was established in 1980. The year of 1980 was established as the benchmark because of the passage of the Staggers Act which deregulated the railroad industry. Mr. Fronczak detailed areas of improvement, including grade crossings, train accidents, trespass fatalities, mainline train collisions, etc. He stated that human factors account for 48-percent of all railroad related accidents. The current trend indicates a flattening instead of continued improvement, and this has the industry concerned. Increased awareness and continuing safety training regimen are being given serious consideration within the industry. A railroad employee is currently in a safer working environment than a hotel, farm, or airline worker. He asserted that North American railroad working conditions compare favorably with railroad working environments in other countries.

Statistics were provided to the group indicating HazMat accidents have decreased significantly (90-percent since 1980), with only one percent of train accidents involving the release of a HazMat material. Improved technology and rolling stock equipment (redesigned rail axle and trucks, acoustic bearing wayside detectors, head shields and shelf couplers, thermal insulation on tank cars and thicker skid plates on the bottom of tank cars to protect valves) have greatly contributed to the worker and the general public's safety within the industry.

Mr. Fronczak informed the group that in the past the AAR has assisted in the safety training of over 20,000 emergency first responders. AAR coordinates this activity with the carriers in providing HazMat and safety information and training. Safety training and guidance encompasses: Crew Resource Management, the operation of Remote-Controlled Locomotives, locomotive simulator and interactive video training, continuing participation in Operation Lifesaver in conjunction with the rail carriers and various community stakeholders, and grade crossing improvements.

Since 1980, AAR has provided \$232 billion to upgrade existing track grade crossings and laid 5.7 million tons of new quarter-mile rail.

### **Questions and Comments from the Audience**

A DOE member of the audience inquired about the general financial condition of the rail carrier industry. Mr. Fronczak responded that the carriers are doing well since they recently have added fuel surcharges to their general contracts allowing for continuing fluctuations in diesel fuel prices. Union Pacific railroad is the single largest diesel fuel user in the USA.

Another questioner requested information on the miles of new rail track laid in 2005. Again, Union Pacific responded that 850 miles of replacement track were laid on their system in 2005.

### ***Train Operators' View of Rail Operations and Safety***

*Scott Palmer, Brotherhood of Locomotive Engineers and Trainmen*

Mr. Palmer's opening statement declared that the rail industry and its workers and the nuclear industry do not understand each other.

As background information to the audience, new hire training for Burlington Northern Santa Fe (BNSF) railroad incorporates a 15-week training program. When employees finish the training, pending an open-book examination on the railroad's operating rules and safety; employees are qualified to work as brakemen and switchmen. After 2-4 years of operating experience, they can qualify to enter the Locomotive Training Program. This training comprises 5 months of study involving the Book of Rules, simulator training, and territory qualifying real-time runs. Engineers are re-certified every three years, including vision and hearing tests and a background Department of Motor Vehicle (DMV) search for Driving Under the Influence (DUI) violations. Employees must attain a 90-percent test score with an instructor's test ride to remain a carrier qualified engineer.

SNF trains pose a unique problem to the train crews. Municipal or local first responders receive mandatory HazMat basic training to prepare them to help reduce exposure and provide dose rate background information. Train crews do not understand what the risks and the anti-contamination procedures are with SNF shipments. There are no recognized preferred rail routes. Issues remain as to who will receive HazMat training along the rail route, and who is called in cases involving an SNF train accident?

**Health and Safety Concerns** – Mr. Palmer stated that there are currently no Radiation Protection Training Programs in place within the rail industry and no training sessions are scheduled to be conducted in the foreseeable future. At issue is which Federal agency will make that recommendation, and which agency will enforce those regulations. Mr. Palmer remarked that

train crews will have a potential for higher dosage risk than the general public in exposure regarding SNF shipments. He suggested that dosimetry equipment be provided to monitor train crew members' health.

The current locomotive cab safety environment does not include air conditioning, does not protect crew members from small gunfire via bullet-proof windows, or provide an air-tight environment (smoke or air contaminates). Communication problems will have to be resolved prior to the SNF shipments. Cellular coverage is poor or non-existent over many isolated rail corridors. The Security Escort Force and the train crew will need to maintain constant contact while en route. New communication equipment will have to be implemented in the locomotive cab and rail Operations Centers prior to the start of SNF shipments. The ever-present Rail Fan will track and report (via the internet) all SNF train movements. Rail communication transmissions will be intercepted and reported by fan members. The issue of operating rail safety was addressed as the technology and configuration of main-line rail switch and lock keys has not been altered in decades. These keys can be purchased by the general public at various rail fan venues making it relatively easy to stop trains by throwing the main-line switches. Once a train has been stopped, it is difficult to protect the train from trespassers.

There were no questions or comments from the audience.

## ***Operations and Short Line Railroads – Interchange and Other Issues***

*Keith Borman, the American Short Line and Regional Railroad Association (ASLRRA)*

Mr. Borman provided the TEC group with the following background information: Short Lines are normally the originating carrier in the movement of rail shipments. Short Lines began as corporate or industry-owned railroads prior to the enactment of the Staggers Act in 1980. After 1980, some branch lines operated by the Class I carriers became “unprofitable” (by Class I standards) and, instead of being abandoned by those Class I railroads, the lines were either “sold” (substantially reduced price) or donated to a Short Line carrier.

Total Short Line trackage is 46,474 miles, which comprises one third of the available U.S. rail network. The average Short Line (545 railroads at Class II and III level) maintains 82 miles of rail track. The Short Line industry employs approximately 25,000 people and serves over 11,000 customers who employ another 1.2 million workers. Over 25-percent of all rail interchanges involve movements that involve the origination or delivery of Short Line shipments. Regarding HazMat shipments, the Short Lines handle over 50-percent of these movements.

The Short Lines do not have the financial “deep pockets” that the Class I carriers possess. Short Line industry capital expenditures were \$300 million, and maintenance expenditures were \$460 million in the previous year. But the Short Lines have to meet the same safety and track maintenance standards as the larger and more profitable Class I carriers. The average annual salary for a Short Line employee including benefits is \$54,000. The Class II and III carriers are every bit as safe as their larger Class I cousins with 1 rail related worker fatality in 2004.

A growing concern within the Short Line industry is the looming “286K” (where the loaded gross maximum car weight is 286,000 lbs.) initiative in rail car handling. Some of the larger Regional railroads and Short Line carriers are currently in compliance with the track regulations, some Class II's and III's will require 286,000 lb. shipments to move at restricted speeds, and some of

the Short Lines will not be able to accommodate shipments whose combined gross car and commodity weight exceed 286,000 lbs (SNF shipments will exceed those weight parameters).

**Funding Rail Infrastructure Upgrades** — Short Lines contract with the Class I's to provide employee training and qualification for new hiring candidates. I.R.C. 45G SHORT LINE TAX CREDIT, this three year statute, states that the Short Lines can use 50-percent of their cost for Track Infrastructure upgrades as a tax credit. Mr. Borman suggested to the group that they promote the extension of this tax statute to keep the Short Lines solvent in the foreseeable future. State grants and Federal grants go to the highways, not the rail carriers. He requested that DOE look into providing Federal grants to the Short Lines as an investment in those carriers's future.

### **Questions and Comments from the Audience**

A question was asked about the progress on the 286K initiative Mr. Borman reiterated that this is an ongoing and individual carrier effort and stated that the existing tax credit is assisting in the progress of Short Line's meeting the requirements to handle 286,000 lb. shipments.

## **Plenary III – Shipping Experience of Spent Fuel by Rail**

*Moderated by Kevin Blackwell, FRA*

### ***Progress Energy's Shipping Experience in North and South Carolina***

*Steve Edwards, Progress Energy*

Mr. Edwards' presentation was based on the experiences of Progress Energy with SNF transportation in and throughout the States of North and South Carolina. His focus was on the success factors related to Progress Energy's effective and secure SNF shipment record. During his introduction, Mr. Edwards noted the importance of public information management as an essential part of their shipment strategy.

Progress Energy has managed almost 200 shipments without measurable radiological exposures to train workers or members of the general public. Mr. Edwards attributed this success to: robust package design; nuclear safety focus; identified accountabilities; and quality maintenance. Progress Energy uses the same people to run the transportation program as those who work at its reactors. All shipping and cask related activities are conducted by Progress Energy. There are established clear roles and responsibilities and dedicated crews for all SNF activities. Most security aspects of SNF shipments cannot be discussed; however, Progress Energy believes that dedicated trains are necessary for security and safety. Mr. Edwards noted that express shipment information is held "close to the vest," until just in advance of shipment. Continuous remote monitoring of all shipments is expressly controlled by Progress Energy, rather than through organizations. Detailed procedures have been developed and are followed by all Progress Energy personnel associated with loading, unloading, shipment preparations, security, all equipment use, and routine and emergency transportation.

Progress Energy has a well defined shipment organization which includes escorts who accompany all shipments and possess knowledge and experience with radiological and mechanical aspects of the system. Three methods of communications are employed for all

shipments: GPS; radio; and phone. In addition, there are plant locators and responders at each site who can be dispatched to any shipment should any irregularity occur. Response Managers are assigned to each shipment to respond to any questions the public or others may have. Progress Energy has scenarios against which all crews are trained, and who have available to them continuously recorded current radiological and all hazards information. Progress Energy has held meetings with local communities through which shipments travel, and adheres to advance notification requirements of NRC, the States, and counties.

In sum, Mr. Edwards said that he believes on the commercial side, there is a fair amount of experience in shipping SNF, and there are a number of lessons that can be provided by Progress Energy. Generally, Mr. Edwards noted that Progress Energy abides by the philosophy that with every shipment there is an opportunity to do something better than in any previous shipments.

There were no questions or comments from the audience.

## ***A Perspective on DOE's Dedicated Train Decision***

*Joe Grumski, MHF Logistical Solutions*

The focus of Mr. Grumski's presentation was on the DOE decision to shipment nuclear waste via dedicated trains. The premise is that dedicated trains have a positive impact on safety, security, economics, rail logistics, and scheduling. Key benefits include:

- Safety — Lower risk to public, operational personnel, and equipment
- Security — Ability to change routing, better observation, significantly less time in public sector
- Lower Packaging and Equipment Costs — Less railcars, casks, and operation personnel
- Contracting — More simplified

Mr. Grumski suggested that a life-cycle implementation program is needed for transportation equipment and packaging systems utilizing the dedicated trains. He said that quantitative numbers are needed to support the justification to implement the policy. There were no questions following his presentation.

There were no questions or comments from the audience.

## ***Ohio Inspection Experiences***

*Brent Kiser, State Inspection Program, Public Utilities Commission of Ohio*

Mr. Kiser discussed his Ohio inspection experiences. Ohio uses TRANSCOM to track shipments, including, for example, those from Portsmouth. The view of the Public Utilities Commission is that it will inspect all radiological shipments throughout Ohio. There are 14 rail shipment inspectors and 25 HazMat specialists employed by the State of Ohio. As a HazMat specialist, one can stop and inspect a vehicle on the road side. HazMat specialists are in marked cars. After inspection, the HazMat specialists will note violations on inspection reports and will assess civil penalties for violations—revenues obtained from citations are distributed in part to the general fund and in part to training for first responders, not to augment inspection activities. Once a citation is issued, a windshield sticker is issued that prevents shippers from continuing to

transport until the violation is corrected. Among the types of information reviewed by inspectors are: driver qualifications; hours of service; maintenance; security; new entrant safety audits; etc

Mr. Kiser recommended that, given the importance of training, 180(c) grants should stipulate standard training, such as provided at TTCI, for all State and local inspectors. All shipments with radioactive materials traversing the State are inspected by Ohio inspectors. Mr. Kiser stated that, most commonly, the weak link identified in shipments results from defects in carrier equipment. Mr. Kiser noted that some highway shipments might more efficiently be handled by rail, though he mentioned rail equipment defects have also been revealed through inspections. No matter which modality, Mr. Kiser said that inspectors can and do stop shipments, having found defects even on new transporters.

Mr. Kiser related various experiences in surveys and inspections throughout the State of Ohio, especially related to Portsmouth, Fernald, and Mound. Mr. Kiser complimented Fernald for its management of shipments where inspectors are allowed on site to perform inspections. Mr. Kiser said that radioactive material shipments are generally safer than petrol and other shipments. Mr. Kiser stressed that Ohio is interested in all HazMat and radioactive material shipments and that they will *all* be inspected. If necessary, inspectors will travel out of State to ensure that once a shipment enters and travels through Ohio, it is safe.

As an enforcement agency, inspectors from Ohio demand to see security plans. Ohio issues Commercial Vehicle Safety Alliance (CVSA) stickers so that other States can recognize that Level I inspections have been conducted. Mr. Kiser suggested that rail may want to adopt this practice.

### **Questions and Comments from the Audience**

A TEC member asked how to encourage States to become more involved in inspections. Mr. Kiser said he could only address HazMat, and he finds that Federal, State, and local jurisdictions work well together in Ohio. Mr. Blackwell mentioned that due to funding cuts, there are limited activities, predominantly training, that can be supported by the Federal Rail Administration (FRA). In most cases, he said that Federal and State jurisdictions work well together. In hazardous materials, he noted there are only 25 FRA inspectors nationwide; in Ohio, there are only three inspectors that are trained to conduct FRA and hazardous materials shipments. Ohio is the second largest inspection regime behind California, which has the largest, in the United States.

A member asked for clarification whether the jurisdiction of FRA-certified inspectors was limited to areas within a State's lines. Mr. Blackwell deferred the specifics of the answer to Mr. Calhoun, who was not in attendance, and committed to reply at a later time. Mr. Kiser reiterated that Ohio inspectors will travel out of State when a shipment will be traversing Ohio, and they will issue citations as necessary.

### ***Union Pacific Rail Transportation***

*Rodger Dolson, Union Pacific Railroad*

Mr. Dolson introduced his presentation by providing a description of the Union Pacific Railroad and its current operating structure. He discussed the relevance of this structure to the role that Union Pacific (UP) will play in future shipments of SNF and HLW under the OCRWM program.

One significant point made by Mr. Dolson related to UP's steady and increasing demand for rail services, especially from El Paso to California, and to Mexico. As a result, UP has developed a velocity improvement strategy to free up train and track capacity. Mr. Dolson said this strategy was necessary because, among other factors, one mile per hour in speed frees up 5,000 rail cars, having a significant impact on UP resources. Other areas that UP is studying include a unified plan and the LEAN initiative to improve rail services. Also, UP has underway a capital improvement plan which is represented by the over \$2.8 billion investment in 2005, by which UP is relaying and improving 850 miles of rail and 4.4 million ties. In addition, UP is making terminal and siding improvements throughout the nation and investing in other equipment and leases to improve UP capacity. Mr. Dolson noted that in making these improvements UP is sending a message to its customers that UP is positioning itself well to handle increased demand for services, including SNF and HLW shipments.

Mr. Dolson described UP's record for handling hazardous materials, of which 15-percent represents Class 7 materials. In general, UP has normal handling, with manifest service, for hazardous materials. UP employs specific protocols for handling hazardous materials and security plans. In Omaha, UP manages a Response Management Control Center (RMCC) which coordinates with the National Incident Management System (NIMS). As an example of routine UP operations, Mr. Dolson described its nationwide chemical transportation safety management structure. This structure includes managers and special agents throughout the UP system.

Mr. Dolson recommended that routing of SNF and HLW shipments to UP be conducted through Kansas City, and through Wyoming to Yucca Mountain. Rather than passing through Nebraska where 150 trains pass a day, or along high-volume Southern routes, UP prefers that dedicated train SNF and HLW shipments take a northern route. Mr. Dolson noted that UP recommends that these shipments not travel through Colorado via the Moffat Tunnel.

As a common carrier, UP supports the shipper's choice to employ dedicated trains, and Mr. Dolson expressed support for the safety and security factors affecting the decision to use dedicated trains for SNF and HLW shipments. In summary, Mr. Dolson stated that UP is a safe option for handling SNF and HLW shipments based on its success and experience.

There were no questions or comments from the audience.

## **Plenary IV – U.S. Department of Energy Rail Shipments**

*Moderated by Ella McNeil, EM/OT*

### ***FRR SNF Rail Shipment to Idaho***

*Mark Arenaz, DOE/ID*

Mr. Arenaz provided some insight from the first shipment of foreign research reactor fuel (FRR) spent nuclear fuel (SNF) that originated in South Korea and was transported by ship to the Naval Weapons Station-Concord in California. The SNF was then shipped by dedicated train to the Idaho National Laboratory (INL) site. The shipment took place in 1998 and involved 3 NAC-LWT casks placed in ISO containers; 2 locomotives; 4 rail cars; and 2 cabooses. No additional FRR SNF rail shipments have been made from the west coast.

The Operational Plan was a key document in the success of this shipment. It identified roles and responsibilities for personnel, detailed instructions and timelines, and other important activities related to the transport of the SNF. A total of 69 meetings were held with corridor states: CA, UT, NV, and ID.

**Lessons Learned** — There was minimal impact from this shipment. Public awareness benefited from a public education trailer with dummy fuel rods and other information. Some difficulties were experienced with TRANSCOM reception. The shipment took about 34 hours. Areas of improvement included: more support of implementation of the Institutional Plan is needed from DOE HQ. It was unclear who had the decision-making lead (HQ or the Field). There were stakeholder misconceptions due to the title of the program and a redundancy related to notification timing.

### **Questions and Comments from the Audience**

One audience member commented that if DOE had not gone the extra mile in CA regarding public contact there could have been some problems. Another commenter said that Yucca Mountain shipments will require DOE to do things they don't think they have to do. For the Concord shipment, DOE went beyond what was required. For example, Rick Fawcett brought the Pyramid Lake Paiute Tribe into the process. Yet another commenter said that the shipping campaign went well. If the planning and institutional training had not been done so well, the "snafus" could have proven fatal. Someone asked how redundancy in the monitoring of radiation can be avoided or reduced? Mr. Arenaz answered that trust plays a big role. Someone else mentioned the excellent cooperation between DOE and the States and locals. The Western Governors' Association (WGA) was involved from the beginning and that smoothed the waters for States in dealing with the Department. DOE did a good job in providing radiological impact data and conducting institutional relations activities, in a shipment involving National Security implications.

### ***Fernald Closure Project Rail Status***

*Dave Lojek, DOE/Fernald*

Fernald is located 18 miles northwest of Cincinnati, OH. It was a uranium foundry that ended operations in 1989 and was decommissioned as a Superfund site. Uranium and thorium are the major concerns. The first rail shipment took place in 1999 (54 railcars) following a 4-year planning process. To date, 158 unit trains have shipped, including over 8,000 railcars and a total of over 1 million tons of waste.

The Waste Pit Project (low-level waste, LLW) involved 100 million tons of soil-like waste in 6 waste pits that was sent to Envirocare for disposal.

The Silos Project is 80-percent complete. Truck shipments of thorium residue are now being bagged into Sealand containers and shipped to Envirocare.

Approximately 100,000 tons of soil materials remain to be shipped out by train; another year's worth of rail shipments to Envirocare. More than 2 billion ton miles of shipments (.75 million train miles) have been made without incident. The railcars are sealed with polyurethane lines. There are 250 railcars in service; DOE owned 190 of those. Hard fiberglass covers are placed on each railcar after the waste is packaged in 6-mil plastic baggies, loaded, and staked down.

An exemption has been filed with DOT to allow operations to ship Low Specific Activity (LSA-2) levels of contamination.

There were no questions or comments from the audience.

## ***Fernald Closure Project – Rail Operations Overview***

*Jeff Rowe, Fluor Fernald, Inc.*

Training is the key to safety. People are retrained every year. The shipments from Fernald use 110-ton gondola cars.

Lessons Learned from the shipments include:

- Diligence
- Inspections
- Contact with railroads (railroad notifications: 2 weeks, 48 hours, and 24-hour confirmation of shipments)
- Contact with disposal sites, advance notification

Inspection of railcars is very important for finding damage such as clamp failure and defective casting on bolsters. Rail inspections are key to identifying locations of heat kinks in the rails.

### **Questions and Comments from the Audience**

Mr. Rowe was asked how standing water could be avoided in the liners. He replied that the lids/covers stay on the cars.

## ***West Valley SNF Shipment***

*John Chamberlain, West Valley Nuclear Services Company*

This shipment was successfully completed in 4 days (July 13-17, 2003). DOE selected the 2,300-mile-long-route for a dedicated train comprised of 2 locomotives, 2 cask cars, 3 buffer cars, and 1 passenger car. The waste was shipping in NRC-licensed shipping casks. Planning and conduct of the shipment were in accordance with the DOE Radioactive Material Transportation Practices Manual (460.2-1). DOE-owned commercial fuel (85 boiling water reactor assemblies and 40 pressurized water reactor assemblies) were shipped from West Valley in western New York State to Idaho. Stakeholder involvement included 2 Tribes, 11 States, 4 railroads, and 5 FRA regions.

The Transportation Plan included emergency preparedness; each of the four railroads provided an emergency plan. Train-the-trainer sessions were conducted for Tribes and States along the route. Communications, tracking, security, preshipment and enroute radiological inspections were all coordinated with corridor Tribes and States.

Due to security implications, no press releases were prepared. The media and the public learned of the shipment through local emergency responder preparations.

There were no significant negative results. The press was overwhelmingly neutral to positive about the shipments. Electronic information was key: three fact sheets were developed and distributed with route maps drawn by State.

The shipment was tracked by TRANSCOM (shipping, tracking and communications system).

There were no comments or questions from the audience on this presentation.

## **Topic Group Updates**

*Moderated by Judith Holm, OCRWM/ONT*

### **180(c) Topic Group**

*Corinne Macaluso, OCRWM/ONT*

Ms. Macaluso started with a brief history of the topic group. The work for this topic group began in July 2004, and the group has met on a monthly basis since that time. Membership includes various individuals and representatives from DOE's Office of National Transportation, State Regional Groups, Oneida Nation, Umatilla Tribe, International Association of Emergency Managers, Illinois Fire Chiefs' Association, National Association of Counties, and American College of Emergency Physicians. The purpose of this topic group is to provide stakeholder input into Department of Energy's (DOE) development of policy and procedures, grant application process and package, and pilot program (which has not yet begun).

The goals of this topic group include:

- Identifying and developing issues associated with Section 180(c) policy development
- Discussing each implementation issue, options and considerations
- Developing issue papers on specific implementation issues with recommendations to the Office of Civilian Radioactive Waste Management (OCRWM)

Issue papers were a tool to help the members capture conversations and frame opinions.

The outcome of these activities by the topic group helped identify twelve issues and as a result twelve issue papers were written to reflect these discussions. From these twelve issues, the topic group was able to reach consensus on nine issues.

The nine consensus issues include:

- Proposed policy statement
- Funding distribution
- Timing and eligibility
- Allowable activities
- Pass-through of funds
- Definition of public safety official to include hospital personnel
- Contingency routing
- Rulemaking
- Matching funds

There were three non-consensus issues concerning funding allocation, state fees and funding operational activities. DOE has not announced a position on these issues at this time.

Another outcome of the topic group's activities is the grant application package. Work continues on this outcome to further refine the program goals, merit review criteria and guidance documents for the grant application package.

The next steps for this topic group are to discuss the grant application package in more detail at the topic group working session on September 22, 2005. Draft Federal Register Notices are entering the DOE concurrence process with publication to be scheduled for December 2005. Until the Draft Federal Register Notices are published, the Section 180(c) topic Group will go on a hiatus and resume after the Federal Register Notices publication. The final Federal Register Notices are scheduled for publication in the fall of 2006. The pilot program is scheduled for 2007.

### **Question and Answer Session**

A member asked if the 180(c) issue papers are available to the public at this point. Ms. Macaluso responded that there should be no reason why the issue papers could not be available for the public, but she would have to check to see where the issue papers could be posted.

### ***Rail Topic Group***

*Jay Jones, OCRWM/ONT*

Mr. Jones provided a brief summary of the topic group's activities from the last TEC meeting. Over the past year, the topic group has recommended and requested that the Office of National Transportation wait for the State Regional Groups (SRGs) to submit individual routing recommendations.

Other recommendations from the topic group include:

- Identify the need for Federal Railroad Administration (FRA) and the Association of American Railroads (AAR) to provide input into the process
- Determine the appropriate number for a suite of routes
- Integrate SRGs input on routing criteria

On August 30, 2005, Mr. Jones and various other representatives from OCRWM held a meeting with the railroad industry to discuss the OCRWM rail routing process. The purpose of the meeting was to provide an overview of the OCRWM Program and transportation planning and define and discuss information needs to develop an effective routing process. The meeting was productive allowing discussion among participants on various routing issues. It is anticipated that there will be future meetings with DOE, SRGs and railroad companies.

Recently, the topic group has reached a consensus on four activities the topic group will be pursuing in greater detail. These four activities are: inspections (States and Tribes); escorts; tracking and radiation monitoring; and rail planning process, protocols, and guidance. Additional activities are being considered.

The next steps for the Rail Topic group are:

- Prioritize the order for addressing the activities
- Develop, revise and finalize the task plan for the Rail Topic Group
- Receive input from SRGs on their specific rail routing analysis exercise at upcoming fall meetings

### **Question and Answer Session**

A member asked if barging will be included. Mr. Jones replied that the CSG/NE and SSEB SRGs are looking at that particular mode of transportation. It is still an option in the EIS, but ONT is not actively conducting any studies pertaining to barging.

A comment was made that the escort issue is not clear. There are operational components with the issue of escorts -- how are they addressed? Mr. Jones said that the issue of escorts will be deferred to the Security Topic Group.

A member commented that there could be an access issue since there are 24 reactor sites. Truck and barge may need to be used. The comment was noted. For sites that don't have rail route access, utilities will be able to specify the type of cask to be delivered to them.

A member asked for clarification on "suite of routes" versus "preferred routes." Mr. Jones replied that DOE is identifying a "suite of routes." The SRGs will identify their regional routes. A member suggested that the term "optimum routes" be used in place of "preferred routes."

### ***Security Topic Group***

*Alex Thrower, OCRWM/ONT*

Mr. Thrower has just recently been asked to lead this topic group. Previously, the topic group has concentrated on best practices. Now the topic group will begin to focus its attention on developing the process into a security plan.

With regard to information security, the topic group has identified several tasks:

- Assemble lessons learned from DOE nuclear waste shipments pertaining to protocols and procedures adopted on information sharing and graded information protection strategies. Include lessons learned from industry.
- Obtain experiences on training from State, Tribal and local representatives for handling sensitive information, especially on command and control.
- Develop a matrix identifying State, Tribal and local government authorities and human resources available for security consideration, jurisdictional interfaces, and roles.

With regard to operations security, the topic group has identified the following tasks:

- Examine security practices of railroad, truck and barge operators and determine how to apply them to Federal, State, Tribal or local nuclear waste shipping practices
- Document State, Tribal and local capabilities, human resources, laws, and roles and responsibilities on shipment security
- Evaluate Rail Topic Group recommendations related to Federal or State inspections and security of rail shipments, and identify inspector and security escort roles

- Review and comment on security “protocol” in DOE Practices Manual

There were no questions on this presentation.

## ***Tribal Topic Group***

*Jay Jones, OCRWM/ONT*

Mr. Jones presented the major priorities and activities of the Tribal Topic Group. The 2005 Tribal program priorities were:

- Initiate consultation with Native American Tribes along potential transportation corridors
- Work with Tribes, in addition to States and stakeholders, to develop the transportation system

Some of the Tribal topics to be included:

Approaches for engaging Tribes along potential transportation routes

- Distribution and allocation methods for providing technical assistance and funds for emergency response training
- Routing methodology and route identification

Several meetings and conference calls have been held with the Tribal Topic Group. In April 2005, a meeting was held that provided an overview of the transportation program. Financial and technical assistance implementation was discussed. OCRWM has distributed notification letters to 39 tribes that have reservations on or near potential routes to Yucca Mountain. On August 24, 2005 a teleconference was held to welcome new members to the Tribal Topic Group. The next teleconference will be in the fall of 2005.

Some of the Tribal Topic Group recommendation from the Spring 2005 TEC meeting included:

In the area of outreach:

- Inform Tribes before decisions are made
- Explore regional/national meetings for 39 Tribes
- Develop a Tribal outreach strategy
- Solicit greater participation of Tribes in the Topic Group

In the area of funding:

- Develop Assessment Plan for Tribal priorities for funding
- Create a simple application process
- Appoint Tribal representatives to application review board

The next steps for this topic group will be expanding DOE’s interactions with Tribes along potential transportation routes. Some of the approaches that could be taken could include:

- Evaluate existing Federal working relationships with Tribes
- Hold discussions and/or meetings to explore Tribal government preferences of what and how they want to be involved
- Develop a national and build on the current Nevada approach to consultation processes and day-to-day working relationships
- Address Tribal governments’ concerns

## **Question and Answer Session**

A member asked how many responses have been received from the initial letter. Mr. Jones replied that not many responses have been received. As part of the follow-up to the letter, DOE re-faxed letters and called Tribes to confirm receipt.

A suggestion was made that DOE go in person to these Tribes and find out who the correct point of contact should be for the Tribe. Mr. Jones said that DOE is planning on more one-on-one consultations.

## **Summary, Action Items, Next TEC, Wrap Up**

*Judith Holm, OCRWM/ONT*

Judith Holm concluded the meeting by announcing that the next TEC meeting would tentatively be scheduled for early March 2006 in the Washington, DC area. The meeting would have a Topic Group focus with only the Topic Groups meeting and there would be no plenary sessions. Judith announced that there were no action items since the Topic Groups were meeting the following day and would be working on their next steps forward as Topic Groups. Judith thanked the participants for coming and looked forward to seeing everyone at the next TEC meeting.

## **Summary of Evaluations**

A total of 49 evaluation forms were received (38 percent of the participants). The overall rating for the September 2005 TEC meeting was “good.” The majority of the agenda sessions were closely ranked between “Very Useful” to “Somewhat Useful.” However, the overall rating of the Topic Group Updates was “Somewhat Useful,” 22 percent rated them as “Not Useful.” In response to the question on what they liked about the meeting, over 30 percent of the respondents liked the TTCI Tour and remarked that it was “Very Useful.” Also, Scot Palmer’s presentation about the Brotherhood of Railroad Engineers & Trainmen was mentioned as “interesting,” “valuable,” and “compelling” by several respondents. Overall, the group liked the emphasis on rail. In answer to what they disliked about the meeting, respondents commented several presentations were “dog and pony” shows that did not belong at TEC, presentations did not offer in-depth or new information, and the program reviews were redundant. Evaluations also mentioned that no action items were generated in 2 days.

Suggestions for emerging issues included Private Fuel Storage activities concerning DOE and States, communications between Federal, State, Tribal, and local responders to the communities through which spent nuclear fuel trains will pass through, the dispute between Utah and Yucca Mountain, timelines for waste deposits and project startup, scheduling and budgets, industry and public concerns, and routing and inspections.

The respondents suggested several areas for TEC to focus on next including specific technical information about the railroads regarding transportation safety and security for shipments, revision of the *Transportation Manual*, rail routing (i.e., having rail representatives participate in Q&A sessions); lessons learned from large scale disaster responses – how systems are being improved after significant rail accidents; hurricane Katrina; accident and security technology demonstrations; interaction with local governments, city councils, mayors, county

commissioners, emergency management technicians, police, etc.; make “working group” concept a priority again, clarify funding for States and Tribes, and more Tribal involvement.

Overall, the pre-meeting announcements, registrations and information worked well for the respondents. Suggestions for improvement were to have the agenda distributed earlier, post TEC activities and updates on the TEC website, and provide better communication regarding the topic group sessions. Although most respondents were generally satisfied with the location, and it was understood the venue was selected because of the TTCI tour, preference would be to locate meetings closer to a major airport, locate guest rooms within walking distance of the meeting rooms, and to have Government per diem for lodging.
