After another quick look at the NYSDOH results, I found a couple more results of interest:

LAF-002 sample taken on 3/7/07. Positive Sr-90 @ 0.8 +/- 0.4 pCi/L.
MW-40-127 sample taken on 6/5/07. Positive Sr-90 @ 0.8 +/- 0.5 pCi/L.

Not right this second, but I did look up the NYSDOH lab results for their split samples at LaFarge on 6/7/07.

Their Sr-90 results for the LAF-001 and LAF-003 samples were non-detect at an MDC of 0.5, however, their result for LAF-002 was positive at 0.9 +/- 0.3 pCi/L.

Thanks – we had some low level hit(s) and recount at one of the boundary wells – do you have info on that?
