

Non-Sensitive - Not For Public Disclosure

DAILY STAFF NOTES

REGION I

January 11, 2007

- On January 8, a teleconference was held with representatives of Indian Point (Entergy), the NRC Office of Research, the United States Geological Survey, the State of New York, Entergy's geological-hydrological contractor and Region I to discuss the results of Entergy's recently completed tests of a remediation pumping well of tritium-contaminated groundwater on a portion of the site. As a result of those discussions, Entergy has recognized a need for additional evaluations of the potential for cross-contamination from adjacent Unit 1 areas (which contain low levels of strontium-90) before making the Unit 2 remediation well operational.
