Subject: renew indian point licence; we need the non carbon generating power given huge over-population

Sirs,

Although USA is now the second worst carbon polluter in the world, that honour of worst now going to China - it is clear that USA is in dire need of cheap non carbon emitting energy.

The fact is that mafia guys and garbage men from the 1920s onward have been dumping lead, mercury and all sorts of heavy metals into the Hudson. Thos materials will take thousands of years to decay. Radioactive materials like tritium coming from Indian Point, and which OCCUR in nature in any case, will not do much more damage than has already been done.

The fact is that 9 billion on the planet is about 8 billion too many and this century will see a massive culling as there is now not enought arable land left to feed so many. China and South Korea cannot feed themsleves and have been trying to buy up land in Africa and USA to produce food for their own people.

In the USA, hard hit by too much credit and its results, call it a depression if you wish, quibbling about a few fish in the Hudson iinstead of providing cheap power for the millions in New York City, is frankly like Nero fiddling while Rome burns.
