Spot films of the prostatic bed, portable technique, operative views.

AP and lateral views of the prostatic bed are available. Multiple seeds are identified.

It is difficult to get an exact count because of some overlap. In the AP projection I count 107 seeds. Apparently 112 were used. They all appear to be within the region of the prostatic bed.

On AP film taken at closing, I count 27 seeds in the region of the prostatic bed. Approximately 8 seeds have moved to a point in the right lower pelvis and 5 seeds have moved to a point in the left lower pelvis.
