# ADDENDUM 2.6-C

# SOIL MAPPING UNIT DESCRIPTIONS

**"A" - Almy sandy loam, 0 to 6 percent slope (Antelope Only)**

The Almy sandy loam mapping unit consists of very deep, well drained soils that developed in alluvium on alluvial fan aprons and fan piedmonts. It occurs at elevation ranges from 6,800 feet to 7,400 feet.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit. The frost-free season ranges from 80 to 100 days.

Slopes are both simple and complex and range from 0 to 15 percent. Parent materials are weathered from interbedded, red, fine sandstone and shale.

Permeability within the Almy soil is moderate or moderately slow. Runoff is slow on the gentler slopes and medium on the steeper slopes, and the water erosion hazard is severe. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are six plant species that are common to this map unit: Western wheatgrass, Needleandthread, Big sagebrush, Bluebunch wheatgrass, Indian ricegrass, and Douglasabbitbrush.

In a favorable year (above average moisture), the production is approximately 1,400 lbs/acres. In an unfavorable (drought) year, the production is approximately 600 lbs/acres.

This map unit is a good source for roadfill and topsoil according to NRCS information. This map unit is a fair source of overall reclamation material; limitations include water erosion and low organic matter content.

**"Bl" – Blackhall sandy loam, 0 to 6 percent slope (Jab Only)**
6800 to 7400 feet in the project areas and the mean annual precipitation is 8 to 10

The Blackhall sandy loam mapping unit consists of very shallow and shallow, well drained soils that developed in residuum derived from sandstone. It occurs on hills and ridges at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Cragosen gravelly loam and Carmody sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 3 inch brown sandy loam surface layer. The transition subsoil, if present, is brown sandy clay loam and is approximately 3 inches thick. The substratum is light yellowish brown to pale yellow sandy clay loam and extends 10 to 18 inches in depth.

Permeability within the Blackhall soil is moderate. The available water capacity is low. The effective rooting depth is approximately 10 to 20 inches. Runoff is rapid, and the water erosion hazard is severe. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are four plant species that are common to this map unit: Indian ricegrass, Needleandthread, Thickspike wheatgrass, and Big sagebrush.

In a favorable year (above average moisture), the production is approximately 1,200 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill and topsoil. The limiting feature is depth to bedrock. This map unit is a poor source of overall reclamation material; limitations include droughty potential and depth to bedrock.

**"Br" – Bluerim sandy loam, 0 to 6 percent slope (Antelope Only)**

The Bluerim sandy loam mapping unit consists of moderately deep, well drained soils that developed in residuum derived from sandstone. It occurs on hillslopes and ridges at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Cragosen gravelly loam and Blazon sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 4 inch brown sandy loam surface layer. The transition subsoil is brown sandy loam or loam and is approximately 11 inches thick. The substratum is light brown sandy loam and extends to approximately 30 inches in depth.

Permeability within the Bluerim soil is moderate. The available water capacity is low. The effective rooting depth is approximately 20 to 40 inches. Runoff is medium, and the water erosion hazard is moderate. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are nine plant species that are common to this map unit: Thickspike wheatgrass, Big sagebrush, Needleandthread, Pine needlegrass, Bluebunch wheatgrass, Cusick's bluegrass, Indian ricegrass, Prairie Junegrass, and Western wheatgrass

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill. The limiting feature is depth to bedrock. This map unit is a fair source for topsoil; limitations include slope, rock fragments, and depth to bedrock. This map unit is a fair source of overall reclamation material; limitations include low organic matter content, droughty potential, and depth to bedrock.

**"Br-NC" – Bluerim noncalcareous variant, 0 to 6 percent slope (Antelope and Jab)**

The Bluerim noncalcareous variant mapping unit consists of moderately deep, well drained soils that developed in residuum derived from sandstone. It occurs on hillslopes and ridges at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Cragosen gravelly loam and Blazon sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 4 inch brown sandy loam surface layer. The transition subsoil is brown sandy loam or loam and is approximately 11 inches thick. The substratum is light brown sandy loam and extends to approximately 30 inches in depth.

Permeability within the Bluerim soil is moderate. The available water capacity is low. The effective rooting depth is approximately 20 to 40 inches. Runoff is medium, and the water erosion hazard is moderate. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are nine plant species that are common to this map unit: Thickspike wheatgrass, Big sagebrush, Needleandthread, Pine needlegrass, Bluebunch wheatgrass, Cusick's bluegrass, Indian ricegrass, Prairie Junegrass, and Western wheatgrass

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill. The limiting feature is depth to bedrock. This map unit is a fair source for topsoil; limitations include slope, rock fragments, and depth to bedrock. This map unit is a fair source of overall reclamation material; limitations include low organic matter content, droughty potential, and depth to bedrock.

**"Br-NC" – Bluerim noncalcareous shallow variant, 0 to 6 percent slope (Antelope Only)**

The Bluerim noncalcareous shallow variant mapping unit consists of moderately deep, well drained soils that developed in residuum derived from sandstone. It occurs on hillslopes and ridges at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Cragosen gravelly loam and Blazon sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 4 inch brown sandy loam surface layer. The transition subsoil is brown sandy loam or loam and is approximately 11 inches thick. The substratum is light brown sandy loam and extends to approximately 30 inches in depth.

Permeability within the Bluerim soil is moderate. The available water capacity is low. The effective rooting depth is approximately 20 to 40 inches. Runoff is medium, and the water erosion hazard is moderate. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are nine plant species that are common to this map unit: Thickspike wheatgrass, Big sagebrush, Needleandthread, Pine needlegrass, Bluebunch wheatgrass, Cusick's bluegrass, Indian ricegrass, Prairie Junegrass, and Western wheatgrass

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill. The limiting feature is depth to bedrock. This map unit is a fair source for topsoil; limitations include slope, rock fragments, and depth to bedrock. This map unit is a fair source of overall reclamation material; limitations include low organic matter content, droughty potential, and depth to bedrock.

**"Bz-NC" – Blazon noncalcareous variant, 0 to 6 percent slope (Jab Only)**

The Blazon noncalcareous variant mapping unit consists of shallow and very shallow, well drained soils that developed in residuum derived from shale. It occurs on footslopes, backslopes, and shoulders of hills and ridges at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Blackhall sandy loam and Onason sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 2 inch light olive brown sandy loam surface layer. The substratum is light brownish gray sandy loam and extends to 14 inches in depth.

Permeability within the Blazon soil is moderate to moderately slow. The available water capacity is low. The effective rooting depth is approximately 4 to 20 inches. Runoff is rapid, and the water erosion hazard is severe. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are six plant species that are common to this map unit: Bluebunch wheatgrass, Western wheatgrass, Indian ricegrass, Bottlebrush squirreltail, Sandberg bluegrass, and Winterfat.

In a favorable year (above average moisture), the production is approximately 1,000 lbs/acres. In an unfavorable (drought) year, the production is approximately 500 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill. The limiting features are depth to bedrock, low strength, slope, and shrink-swell. This map unit is a poor source for topsoil; limitations include depth to bedrock, slope, too clayey, and rock fragments. This map unit is a poor source of overall reclamation material; limitations include depth to bedrock, droughty potential, low organic matter content, water erosion potential and too clayey.

**"Ca" – Carmody sandy loam, 0 to 6 percent slope (Antelope and Jab)**

The Carmody sandy loam mapping unit consists of moderately deep, well drained soils that developed in residuum derived from calcareous siltstone and fine grained sandstone. It occurs on hillslopes and ridges at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Cragosen gravelly loam and Carmody sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 3 inch yellowish brown sandy loam surface layer. The transition subsoil is light yellowish brown to yellowish brown sandy loam and is approximately 27 inches thick. The substratum is very pale brown sandy loam and extends to 40 inches in depth.

Permeability within the Carmody soil is moderate. The available water capacity is low. The effective rooting depth is approximately 20 to 40 inches. Runoff is rapid, and the water erosion hazard is severe. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are six plant species that are common to this map unit: Needleandthread, Thickspike wheatgrass, Indian ricegrass, Silver sagebrush, Fieldclustered sedge, and Bottlebrush squirreltail.

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

As for reclamation material, it is a fair source due to no organic matter (content low), water erosion, droughty potential, and depth to bedrock.

According to NRCS information, this map unit is a poor source for roadfill. The limiting features are depth to bedrock and slope. This map unit is a poor source for topsoil; limitations include depth to bedrock, rock fragments, and slope. This map unit is a fair source of overall reclamation material; limitations include low organic matter content, water erosion, droughty potential, and depth to bedrock.

**"Ca-NC" – Carmody noncalcareous variant, 0 to 6 percent slope (Antelope and Jab)**

The Carmody noncalcareous variant mapping unit consists of moderately deep, well drained soils that developed in residuum derived from calcareous siltstone and fine grained sandstone. It occurs on hillslopes and ridges at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Cragosen gravelly loam and Carmody sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 3 inch yellowish brown sandy loam surface layer. The transition subsoil is light yellowish brown to yellowish brown sandy loam and is approximately 27 inches thick. The substratum is very pale brown sandy loam and extends to 40 inches in depth.

Permeability within the Carmody soil is moderate. The available water capacity is low. The effective rooting depth is approximately 20 to 40 inches. Runoff is rapid, and the water erosion hazard is severe. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are six plant species that are common to this map unit: Needleandthread, Thickspike wheatgrass, Indian ricegrass, Silver sagebrush, Fieldclustered sedge, and Bottlebrush squirreltail.

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill. The limiting features are depth to bedrock and slope. This map unit is a poor source for topsoil; limitations include depth to bedrock, rock fragments, and slope. This map unit is a fair source of overall reclamation material; limitations include low organic matter content, water erosion, droughty potential, and depth to bedrock.

**"Ca-NC-D" – Carmody noncalcareous deep variant, 0 to 6 percent slope (Antelope Only)**

The Carmody noncalcareous deep variant mapping unit consists of moderately deep, well drained soils that developed in residuum derived from calcareous siltstone and fine grained sandstone. It occurs on hillslopes and ridges at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Cragosen gravelly loam and Carmody sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 3 inch yellowish brown sandy loam surface layer. The transition subsoil is light yellowish brown to yellowish brown sandy loam and is approximately 27 inches thick. The substratum is very pale brown sandy loam and extends to 40 inches in depth.

Permeability within the Carmody soil is moderate. The available water capacity is low. The effective rooting depth is approximately 20 to 40 inches. Runoff is rapid, and the water erosion hazard is severe. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are six plant species that are common to this map unit: Needleandthread, Thickspike wheatgrass, Indian ricegrass, Silver sagebrush, Fieldclustered sedge, and Bottlebrush squirreltail.

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill. The limiting features are depth to bedrock and slope. This map unit is a poor source for topsoil; limitations include depth to bedrock, rock fragments, and slope. This map unit is a fair source of overall reclamation material; limitations include low organic matter content, water erosion, droughty potential, and depth to bedrock.

**"Cr" – Cragosen sandy loam, 0 to 6 percent slope (Jab Only)**

The Cragosen sandy loam mapping unit consists of shallow and very shallow, well drained soils that developed in residuum derived from sandstone and conglomerate. It occurs on footslopes, backslopes, and shoulders of hills and ridges at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Blackhall sandy loam and Onason sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 2 inch brown sandy loam surface layer. The substratum is very pale brown to pale brown sandy loam and extends to 12 inches in depth.

Permeability within the Cragosen soil is moderate. The available water capacity is low. The effective rooting depth is approximately 10 to 20 inches. Runoff is rapid, and the water erosion hazard is severe. The hazard of wind erosion is slight.

**Productivity and Reclamation Potential**

There are five plant species that are common to this map unit: Bluebunch wheatgrass, Western wheatgrass, Black sagebrush, Needleandthread, and Indian ricegrass.

In a favorable year (above average moisture), the production is approximately 1,200 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill. The limiting features are depth to bedrock and slope. This map unit is a poor source for topsoil; limitations include depth to bedrock, rock fragments, sodium content, and slope. This map unit is a poor source of overall reclamation material; limitations include no organic matter, sodium content, droughty potential, and depth to bedrock.

**"Cr-NC" – Cragosen noncalcareous variant, 0 to 6 percent slope (Antelope Only)**

The Cragosen noncalcareous variant mapping unit consists of shallow and very shallow, well drained soils that developed in residuum derived from sandstone and conglomerate. It occurs on footslopes, backslopes, and shoulders of hills and ridges at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Blackhall sandy loam and Onason sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 2 inch brown sandy loam surface layer. The substratum is very pale brown to pale brown sandy loam and extends to 12 inches in depth.

Permeability within the Cragosen soil is moderate. The available water capacity is low. The effective rooting depth is approximately 10 to 20 inches. Runoff is rapid, and the water erosion hazard is severe. The hazard of wind erosion is slight.

**Productivity and Reclamation Potential**

There are five plant species that are common to this map unit: Bluebunch wheatgrass, Western wheatgrass, Black sagebrush, Needleandthread, and Indian ricegrass.

In a favorable year (above average moisture), the production is approximately 1,200 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill. The limiting features are depth to bedrock and slope. This map unit is a poor source for topsoil; limitations include depth to bedrock, rock fragments, sodium content, and slope. This map unit is a poor source of overall reclamation material; limitations include no organic matter, sodium content, droughty potential, and depth to bedrock.

**"Cu" – Cushool sandy loam, 0 to 6 percent slope (Jab Only)**

The Cushool sandy loam mapping unit consists of moderately deep, well drained soils that developed in residuum and colluvial slopewash derived from sandy shale and sandstone. It occurs on hillslopes and short fan aprons at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Cragosen gravelly loam, Blackhall sandy loam, and Diamondville sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 3 inch brown sandy loam surface layer. The transition subsoil, if present, is brown loam and is approximately 15 inches thick. The substratum is light yellowish brown to very pale brown sandy clay loam and extends to approximately 40 inches in depth.

Permeability within the Cushool soil is moderate. The available water capacity is low. The effective rooting depth is approximately 20 to 40 inches. Runoff is medium, and the water erosion hazard is moderate. The hazard of wind erosion is severe.

**Productivity and Reclamation Potential**

There are seven plant species that are common to this map unit: Needleandthread, Indian ricegrass, Thickspike wheatgrass, Silver sagebrush, Big sagebrush, Bluebunch wheatgrass, and Sandberg bluegrass.

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill. The limiting feature is depth to bedrock. This map unit is a fair source for topsoil; the limiting feature is depth to bedrock. This map unit is a fair source of overall reclamation material; limitations include low organic matter content, droughty potential, and depth to bedrock.

**"Cu-SH" – Cushool shallow variant, 0 to 6 percent slope (Jab Only)**

The Cushool shallow variant mapping unit consists of moderately deep, well drained soils that developed in residuum and colluvial slopewash derived from sandy shale and sandstone. It occurs on hillslopes and short fan aprons at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Cragosen gravelly loam, Blackhall sandy loam, and Diamondville sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 3 inch brown sandy loam surface layer. The transition subsoil, if present, is brown loam and is approximately 15 inches thick. The substratum is light yellowish brown to very pale brown sandy clay loam and extends to approximately 40 inches in depth.

Permeability within the Cushool soil is moderate. The available water capacity is low. The effective rooting depth is approximately 20 to 40 inches. Runoff is medium, and the water erosion hazard is moderate. The hazard of wind erosion is severe.

**Productivity and Reclamation Potential**

There are seven plant species that are common to this map unit: Needleandthread, Indian ricegrass, Thickspike wheatgrass, Silver sagebrush, Big sagebrush, Bluebunch wheatgrass, and Sandberg bluegrass.

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill. The limiting feature is depth to bedrock. This map unit is a fair source for topsoil; the limiting feature is depth to bedrock. This map unit is a fair source of overall reclamation material; limitations include low organic matter content, droughty potential, and depth to bedrock.

**"D" – Diamondville sandy loam, 0 to 6 percent slope (Jab Only)**

The Diamondville sandy loam mapping unit consists of moderately deep, well drained soils that developed in residuum derived from sandstone. It occurs on hillslopes at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Blackhall sandy loam, Carmody sandy loam, and Cushool sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 5 inch pale brown sandy loam surface layer. The transition subsoil, if present, is dark yellowish brown loam to sandy loam and is approximately 13 inches thick. The substratum is light yellowish brown loamy sand to sandy loam and extends to approximately 34 inches in depth.

Permeability within the Diamondville soil is moderate. The available water capacity is low. The effective rooting depth is approximately 20 to 40 inches. Runoff is medium, and the water erosion hazard is moderate. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are seven plant species that are common to this map unit: Western wheatgrass, Needleandthread, Big sagebrush, Bluebunch wheatgrass, Green needlegrass, and Douglas rabbitbrush.

In a favorable year (above average moisture), the production is approximately 700 lbs/acres. In an unfavorable (drought) year, the production is approximately 300 lbs/acres.

According to NRCS information, this map unit is a poor source for roadfill. The limiting feature is depth to bedrock. This map unit is a fair source for topsoil; the limiting feature is depth to bedrock. This map unit is a fair source of overall reclamation material; limitations include water erosion, low organic matter content, droughty potential, and depth to bedrock.

**"F" – Forelle sandy loam, 0 to 6 percent slope (Jab Only)**

The Forelle sandy loam mapping unit consists of deep, well drained soils that developed in residuum derived from various sources including sandstone. It occurs on wide ephemeral drainage bottoms at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Diamondville sandy loam, Carmody sandy loam, and Cushool sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 5 inch brown sandy loam surface layer. The transition subsoil, if present, is brown to pale brown loam to sandy clay loam and is approximately 19 inches thick. The substratum is light yellowish brown sandy loam and extends to approximately 46 inches in depth.

Permeability within the Forelle soil is moderately slow. The available water capacity is moderate. The effective rooting depth is greater than 60 inches. Runoff is medium, and the water erosion hazard is moderate. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are five plant species that are common to this map unit: Western wheatgrass, Green needlegrass, Big sagebrush, Indian ricegrass, and Douglas rabbitbrush.

In a favorable year (above average moisture), the production is approximately 700 lbs/acres. In an unfavorable (drought) year, the production is approximately 300 lbs/acres.

This map unit is a good source for roadfill according to NRCS information. This map unit is a good source for topsoil. This map unit is a fair source of overall reclamation material; limitations include water erosion and low organic matter content.

**"Gl" – Glendive sandy loam, 0 to 6 percent slope (Jab Only)**

The Glendive sandy loam mapping unit consists of deep, well drained soils that developed in residuum derived from various sources including sandstone. It occurs on wide ephemeral drainage bottoms at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Forelle sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 5 inch brown sandy loam surface layer. The transition subsoil, if present, is brown to pale brown loam to sandy clay loam and is approximately 19 inches thick. The substratum is light yellowish brown sandy loam and extends to approximately 46 inches in depth.

Permeability within the Glendive soil is moderately rapid. The available water capacity is moderate. The effective rooting depth is greater than 60 inches. Runoff is slow, and the water erosion hazard is slight. The hazard of wind erosion is severe.

**Productivity and Reclamation Potential**

There are nine plant species that are common to this map unit: Western wheatgrass, Green needlegrass, Little bluestem, Needleandthread, Prairie sandreed, Thickspick wheatgrass, Rose, Winterfat, Western snowberry, and Silver sagebrush.

In a favorable year (above average moisture), the production is approximately 1,800 lbs/acres. In an unfavorable (drought) year, the production is approximately 900 lbs/acres.

This map unit is a good source for roadfill according to NRCS information. This map unit is a fair source for topsoil. The limiting feature is rock fragments. This map unit is a fair source of overall reclamation material; limitations include water erosion and low organic matter content.

**"Gr" – Grieves sandy loam, 0 to 6 percent slope (Jab Only)**

The Grieves sandy loam mapping unit consists of well drained to some extent excessively drained soils. Grieves soils are on nearly level to sloping alluvial fans, footslopes or toeslopes occurring at elevation from 6,800 to 7,400 feet.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit. The frost-free season is 80 to 100 days.

Slopes are 0 to 40 percent. They formed in locally transported calcareous materials weathered from sandstone or sandstone interbedded with shale.

Permeability within the Grieves soil is moderately rapid. Runoff is slow, and the water erosion hazard is severe. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are four plant species that are common to this map unit: Needleandthread, Thickspike wheatgrass, Indian ricegrass, and Big sagebrush.

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

This map unit is a good source for roadfill according to NRCS information. This map unit is a fair source for topsoil. The limiting features are rock fragments and too sandy. This map unit is a fair source of overall reclamation material; limitations include water erosion, low organic matter content, and too sandy.

**"L" – Leckman sandy loam, 0 to 6 percent slope (Jab Only)**

The Leckman sandy loam mapping unit consists of well drained soils. Leckman soils are on alluvial fans and toe slopes of escarpments occurring at elevation from 6,800 to 7,400 feet.

The mean annual precipitation is 8 to 10 inches. The mean annual air temperature is 38 degrees Fahrenheit. The frost-free season is 80-110 days.

Slopes are 0 to 10 percent. The soils formed in alluvium.

Permeability within the Leckman soil is moderately rapid. Runoff is slow to medium. Some areas receive additional moisture from runoff from other areas. The water erosion hazard is slight. The hazard of wind erosion is severe.

**Productivity and Reclamation Potential**

There are four plant species that are common to this map unit: Needleandthread, Thickspike wheatgrass, Indian ricegrass, and Big sagebrush.

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

This map unit is a good source for roadfill and topsoil according to NRCS information. This map unit is a poor source of overall reclamation material; limitations include water erosion, too alkaline, and low organic matter content.

**"L-NC" – Leckman noncalcareous variant, 0 to 6 percent slope (Antelope and Jab)**

The Leckman noncalcareous variant mapping unit consists of well drained soils. Leckman soils are on alluvial fans and toe slopes of escarpments occurring at elevation from 6,800 to 7,400 feet.

The mean annual precipitation is 8 to 10 inches. The mean annual air temperature is 38 degrees Fahrenheit. The frost-free season is 80-110 days.

Slopes are 0 to 10 percent. The soils formed in alluvium.

Permeability within the Leckman soil is moderately rapid. Runoff is slow to medium. Some areas receive additional moisture from runoff from other areas. The water erosion hazard is slight. The hazard of wind erosion is severe.

**Productivity and Reclamation Potential**

There are four plant species that are common to this map unit: Needleandthread, Thickspike wheatgrass, Indian ricegrass, and Big sagebrush.

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

This map unit is a good source for roadfill and topsoil according to NRCS information. This map unit is a poor source of overall reclamation material; limitations include water erosion, too alkaline, and low organic matter content.

**"O" – Onason sandy loam, 0 to 6 percent slope (Antelope and Jab)**

The Onason sandy loam mapping unit consists of shallow and very shallow, well drained soils that developed in residuum derived from sandstone. It occurs on footslopes, backslopes, and shoulders of hills and ridges at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Cragosen gravelly loam and Blackhall sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 1 inch brown sandy loam surface layer. The substratum is very pale brown to pale brown sandy loam and extends to 12 inches in depth.

Permeability within the Onason soil is moderate. The available water capacity is low. The effective rooting depth is approximately 10 to 20 inches. Runoff is medium, and the water erosion hazard is moderate. The hazard of wind erosion is moderate.

**Productivity and Reclamation Potential**

There are twelve plant species that are common to this map unit: Indian ricegrass, Bluebunch wheatgrass, Needleandthread, Thickspike wheatgrass, Fieldclustered sedge, Prairie Junegrass, Sandberg bluegrass, Skunkbush sumac, Bottlebrush Squirreltail, Douglas rabbitbrush, Rubber rabbitbrush, and Winterfat.

In a favorable year (above average moisture), the production is not known. In an unfavorable (drought) year, the production is approximately 1,200 lbs/acres.

This map unit is a poor source for roadfill according to NRCS information. The limiting features are depth to bedrock and slope. This map unit is a poor source for topsoil. The limiting features are depth to bedrock, rock fragment, and slope. This map unit is a poor source of overall reclamation material; limitations include droughty potential, low organic matter content, and depth to bedrock.

**"Re" – Relsob sandy loam, 0 to 6 percent slope (Antelope and Jab)**

The Relsob sandy loam mapping unit consists of deep, well drained soils that developed in alluvium derived from sandstone. It occurs on fan aprons at elevations from 6,800 to 7,400.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Slopes range from 0 to 6 percent. Included in this unit are small areas of Bluerim sandy loam. These inclusions comprise less than 10 percent of the total acreage within this map unit.

A typical profile contains a 3 inch brown sandy loam surface layer. The transition subsoil is yellowish brown sandy clay loam or gravelly sandy clay loam and is approximately 9 inches thick. The substratum is light yellowish brown gravelly loamy sand and extends to 60 inches or more in depth.

Permeability within the Relsob soil is moderate. The available water capacity is low. The effective rooting depth is 60 inches or more. Runoff is slow, and the water erosion hazard is slight. The hazard of wind erosion is severe.

**Productivity and Reclamation Potential**

There are six plant species that are common to this map unit: Needleandthread, Thickspike wheatgrass, Indian ricegrass, Silver sagebrush, Fieldclustered sedge, and Bottlebrush squirreltail.

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

This map unit is a good source for roadfill according to NRCS information. This map unit is a poor source for topsoil. The limiting features are too sandy, hard to reclaim (rock fragments), and rock fragments. This map unit is a poor source of overall reclamation material; limitations include droughty potential, low organic matter content, and too sandy.

**"RO" – Rock Outcrop 0 to 6 percent slope (Antelope and Jab)**

The Rock Outcrop mapping unit is 90 percent barren rock and 10 percent Laporte and Rekop soil. The barren rock is limestone, hard sandstone, and gypsum of various geological formations. These rocks do not weather to large amounts of sediment. The elevation ranges from 6,800 to 7,400 feet.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual air temperature is approximately 38 degrees Fahrenheit, and the average frost-free season is approximately 80-100 days.

Laporte and Tilford soils, in places, furnish limited grazing, although the vegetation is sparse.

Regarding productivity, total dry-weight production for favorable and unfavorable year was not provided by the NRCS. Characteristic vegetation was not available for this map unit.

In regards to reclamation potential, the three areas that are considered for reclamation: topsoil, roadfill, and reclamation were not rated by the NRCS.

**"RP" - Ryan Park sandy loam, 0 to 6 percent slope (Antelope Only)**

The Ryan Park sandy loam mapping unit consists of well or somewhat excessively drained soils. Ryan Park soils are limited in extent and are on fan aprons, hillslopes, and toeslopes. The soils formed in moderately sandy sediments weathered from calcareous sandstone, eolian deposits, and residuum. Elevation is 6,800 to 7,400 feet.

The mean annual precipitation is about 8 to 10 inches and occurs mainly in the winter and spring. The mean annual temperature is 38 degrees Fahrenheit. The frost-free season is estimated to range from 80- 100 days depending upon air drainage, aspect, and elevation.

Slopes are 0 to 25 percent.

Permeability within the Ryan Park soil is moderately rapid. Runoff is slow, and the water erosion hazard is moderate. The hazard of wind erosion is severe.

**Productivity and Reclamation Potential**

There are seven plant species that are common to this map unit: Needleandthread, Indian ricegrass, Thickspike wheatgrass, Big sagebrush, Bluebunch wheatgrass, Bottlebrush squirreltail, and Douglas rabbitbrush.

In a favorable year (above average moisture), the production is approximately 700 lbs/acres. In an unfavorable (drought) year, the production is approximately 300 lbs/acres.

This map unit is a fair source for roadfill according to NRCS information. The limiting feature is depth to bedrock. This map unit is a fair source for topsoil. The limiting feature is sodium content. This map unit is a poor source of overall reclamation material; limitations include wind erosion, too alkaline, low organic matter content, sodium content, and water erosion.

**"RR" – Rock River sandy loam, 0 to 6 percent slope (Jab Only)**

The Rock River sandy loam mapping unit consists of well drained soils. Rock River soils are on alluvial fans, fan aprons, benches, hillslopes, and toeslopes. The soils formed in material weathered from calcareous sandstone, eolian deposits, and residuum. Elevation is 6,800 to 7,400 feet.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual temperature is approximately 38 degrees Fahrenheit. The frost-free season is about 80-100 days but varies according to aspect, elevation, and air drainage.

Slopes are 0 to 25 percent.

Permeability within the River Rock soil is moderate. Runoff is medium to rapid, and the water erosion hazard is moderate. The hazard of wind erosion is severe.

**Productivity and Reclamation Potential**

There are ten plant species that are common to this map unit: Needleandthread, Thickspike wheatgrass, Big sagebrush, Bluebunch wheatgrass, Cusick's bluegrass, Indian ricegrass, Bottlebrush squirreltail, Douglas rabbitbrush, Rubber rabbitbrush, and Fieldclustered sedge.

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

This unit is a good source for roadfill and topsoil. As for reclamation material, it is a fair source due to the organic matter (content low) feature.

This map unit is a good source for roadfill and topsoil according to NRCS information. This map unit is a fair source of overall reclamation material; the limiting feature is low organic matter content.

**"RR-NC" – Rock River noncalcareous variant, 0 to 6 percent slope (Jab Only)**

The Rock River noncalcareous variant mapping unit consists of well drained soils. Rock River soils are on alluvial fans, fan aprons, benches, hillslopes, and toeslopes. The soils formed in material weathered from calcareous sandstone, eolian deposits, and residuum. Elevation is 6,800 to 7,400 feet.

The mean annual precipitation is estimated to be 8 to 10 inches. The mean annual temperature is approximately 38 degrees Fahrenheit. The frost-free season is about 80-100 days but varies according to aspect, elevation, and air drainage.

Slopes are 0 to 25 percent.

Permeability within the River Rock soil is moderate. Runoff is medium to rapid, and the water erosion hazard is moderate. The hazard of wind erosion is severe.

**Productivity and Reclamation Potential**

There are ten plant species that are common to this map unit: Needleandthread, Thickspike wheatgrass, Big sagebrush, Bluebunch wheatgrass, Cusick's bluegrass, Indian ricegrass, Bottlebrush squirreltail, Douglas rabbitbrush, Rubber rabbitbrush, and Fieldclustered sedge.

In a favorable year (above average moisture), the production is approximately 1,500 lbs/acres. In an unfavorable (drought) year, the production is approximately 700 lbs/acres.

This map unit is a good source for roadfill and topsoil according to NRCS information. This map unit is a fair source of overall reclamation material; the limiting feature is low organic matter content.

LECKMAN SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "L"
Lab/BKS Sample ID: C07120023_112a
Typical Pedon: Leckman noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Leckman noncalcareous variant series consists of very deep, well drained soils formed in alluvium. Leckman soils are on alluvial fans and toeslopes and have slopes of 0 to 10 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-3 inches. Brown (10YR 4/3W) sandy loam, moist; weak medium platy structure breaks to weak fine crumbs; soft, very friable, nonsticky, nonplastic; neutral (pH 6.9), noneffervescent.

Bw – 3-13 inches. Yellowish brown (10YR 5/4D) sandy loam, dark yelllowish brown (10YR 4/4W) moist; weak coarse and medium prismatic structure that parts to weak medium subangular blocks; soft, very friable, nonsticky, nonplastic; slightly alkaline (pH 7.4), noneffervescent.

C1 – 13-22 inches. Yellowish brown (10YR 5/4D) loamy sand, moist; massive, soft very friable nonsticky, nonplastic, moderately alkaline (pH 8.1), noneffervescent.

C2 – 22-34 inches. Light yellowish brown (10YR 6/4D) sand, moist; massive, soft very friable nonsticky, nonplastic, moderately alkaline (pH 8.4), noneffervescent.

C3 – 34-50 inches. Very pale brown (10YR 7/4D) loamy sand, moist; massive, soft very friable nonsticky, nonplastic, moderately alkaline (pH 8.2), noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 112a on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature is about 43 to 47 degrees F. The mean summer soil temperature is 64 to 67 degrees F. Textures throughout the profile are fine sandy loam or sandy loam. Gravel content is generally less than 5 percent but can range from 0 to 15 percent.

The A horizons have hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4.

The C horizon has hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4. Reaction is moderately or strongly alkaline. Effervescence may be slight to violent.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is slightly calcareous in the A horizon and is strongly calcareous in the remaining horizons.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Typic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) – No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 13 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Leckman soils are on alluvial fans and toe slopes of escarpments. Slopes are 0 to 10 percent. The soils formed in alluvium. Elevation is 6,000 to 7,000 feet. The mean annual precipitation is 7 to 9 inches. The mean annual air temperature is 37 to 44 degrees F. The frost-free season is 80 to 110 days.

LECKMAN SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "L"
Lab/BKS Sample ID: C07120023_114
Typical Pedon: Leckman noncalcareous variant -rangeland. (Colors are for dry soil unless otherwise stated.)

The Leckman noncalcareous variant series consists of very deep, well drained soils formed in alluvium. Leckman soils are on alluvial fans and toeslopes and have slopes of 0 to 10 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-10 inches. Light grayish brown (10YR 6/2) sandy loam, moist; weak medium platy structure breaks to weak fine crumbs; soft, very friable, nonsticky, nonplastic; slightly alkaline (pH 7.7), noneffervescent.

C1 – 10-16 inches. Light grayish brown (10YR 6/2) sandy loam, moist; weak coarse and medium prismatic structure that parts to weak medium subangular blocks; soft, very friable, nonsticky, nonplastic; neutral (pH 6.9), noneffervescent.

C2 – 16-28 inches. Light grayish brown (10YR 6/2) sandy loam, moist; massive, soft very friable nonsticky, nonplastic, neutral (pH 6.9), noneffervescent.

C3 – 28-43 inches. Light grayish brown (10YR 6/2) sandy loam, moist; massive, soft very friable nonsticky, nonplastic, neutral (pH 7.0), noneffervescent.

C4 – 43-60 inches. Light grayish brown (10YR 6/2) loamy sand, moist; massive, soft very friable nonsticky, nonplastic, neutral (pH 7.3), noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 114 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature is about 43 to 47 degrees F. The mean summer soil temperature is 64 to 67 degrees F. Textures throughout the profile are fine sandy loam or sandy loam. Gravel content is generally less than 5 percent but can range from 0 to 15 percent.

The A horizons have hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4.

The C horizon has hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4. Reaction is moderately or strongly alkaline. Effervescence may be slight to violent.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is slightly calcareous in the A horizon and is strongly calcareous in the remaining horizons.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Typic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 10 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Leckman soils are on alluvial fans and toe slopes of escarpments. Slopes are 0 to 10 percent. The soils formed in alluvium. Elevation is 6,000 to 7,000 feet. The mean annual precipitation is 7 to 9 inches. The mean annual air temperature is 37 to 44 degrees F. The frost-free season is 80 to 110 days.

ALMY SERIES
SANDY LOAM

Soil Mapping Unit "A"
Lab/BKS Sample ID: C07120023_115
Typical Pedon: Almy fine sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Almy series consists of very deep, well drained soils that formed in alluvium on alluvial fan aprons and fan piedmonts. Permeability is moderate. Slopes are 0 to 15 percent. The mean annual precipitation is about 8 to 10 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 6 inches. Brown (10YR 4/3W) sandy loam, yellowish brown (10YR 5/4D) moist; moderate thin platy structure; soft, very friable, slightly sticky and slightly plastic; common fine tubular pores; slightly alkaline (pH 7.4); noneffervescent; clear wavy boundary. (3 to 6 inches thick)

B – 6-18 inches. Dark yellowish brown (10YR 4/4W) sandy loam, moist; weak medium prismatic structure parting to moderate fine subangular blocky; hard, friable, very sticky and plastic; common fine and medium roots; common fine tubular pores; continuous clay films on faces of peds and lining pores; slightly alkaline (pH 7.4); noneffervescent; clear wavy boundary. (The combined thickness of the Bt horizon is 6 to 15 inches.)

C – 18-25 inches. Light yellowish brown (10YR 6/4D) sandy loam; moist; moderate medium and fine subangular blocky structure; slightly hard, friable, sticky and plastic; few fine and medium roots; few fine tubular pores; calcium carbonate disseminated and as soft masses and filaments; slightly alkaline (pH 7.6); noneffervescent, gradual wavy boundary. (5 to 25 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 115 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - Depth to an accumulation of secondary calcium carbonates is 10 to 20 inches. The mean annual soil temperature is 42 to 46 degrees F. Rock fragments in the particle size control section range from 0 to 15 percent gravel. The moisture control section is usually dry. It is usually moist in April, May, and early June, and dry for 60 consecutive days during the 90 day period following the summer solstice.

The A horizon has hue of 10YR through 5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4 dry and moist. Reaction is neutral through moderately alkaline.

The Bt horizon has hue of 2.5YR or 5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 6 dry and moist. It is typically a clay loam but may be loam or sandy clay loam with 18 to 35 percent clay and less than 35 percent fine sandy or coarser. Reaction is mildly through strongly alkaline. EC is less than 8 mmhos.

The Bk horizon has hue of 7.5YR or 5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 6 dry and moist. Texture is loam, sandy clay loam, or clay loam. Some pedons have sandy loam textures in the lower Bk. EC is less than 8 mmhos. Calcium carbonate ranges from 4 to 12 percent.

The C horizon has hue of 7.5YR or 5YR, value of 4 through 7 dry, 4 through 6 moist, and chroma of 2 through 6 dry and moist. Texture is loam or fine sandy loam. Calcium carbonate ranges from 2 to 10 percent. EC is less than 8 mmhos throughout. Reaction is moderately through very strongly alkaline.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is typically calcareous in the Bk and C horizons.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) – No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 18 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Almy soils are on nearly level to moderately sloping alluvial fan aprons and fan piedmonts. Parent materials are weathered from interbedded, red, fine sandstone and shale. Slopes are both simple and complex and range from 0 to 15 percent. Elevation ranges from 5,400 feet to 7,800 feet. The mean annual precipitation is about 12 inches but ranges from 9 to 14 inches with over half falling in April, May, and June. The mean annual air temperature ranges from 42 to 46 degrees F. The frost-free season ranges from 60 to 110 days.

CARMODY SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Ca-NC"
Lab/BKS Sample ID: C07120023_116
Typical Pedon: Carmody noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Carmody noncalcareous variant series consists of well to somewhat excessively drained soils that are moderately deep to siltstone. These soils formed in material weathered from calcareous siltstone or fine grained sandstone. Carmody soils are on uplands of the cold intermountain basins. Slopes are 2 to 45 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 5 inches. Brown (10YR 4/3W) sandy loam, yellowish brown (10YR 5/4D) moist; weak fine and very fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; lime disseminated; slightly alkaline (pH 7.4); noneffervescent, gradual wavy boundary. (4 to 10 inches thick)

C1 - 5 to 20 inches. Brown (10YR 4/3W) sandy loam, moist; moderate medium and coarse prismatic structure; slightly hard, friable, slightly sticky; few fine and many medium roots; lime disseminated; slightly alkaline (pH 7.4); noneffervescent, abrupt wavy boundary. (16 to 30 inches thick)

C2 - 20 to 27 inches. Pale brown (10 YR 6/3D), calcareous siltstone containing loamy sand, slightly alkaline (pH 7.8); noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 116 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - Depth to a paralithic contact is 20 to 40 inches. Depth to uniformly calcareous material is 0 to 10 inches. The mean annual soil temperature ranges from about 40 to 47 degrees F., and the mean summer soil temperature ranges from about 59 to 63 degrees F. The control section is very fine sandy loam or fine sandy loam, averaging 10 to 18 percent clay and more than 15 percent fine sand or coarser. Flat fragments or fine pebbles range from 0 to 15 percent. Thin, discontinuous horizons of carbonate accumulation occur immediately above the paralithic contact in some pedons.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. EC is less than 2 mmhos. Reaction is mildly or moderately alkaline.

The C horizon has hue of 2.5Y or 10YR, value of 4 through 7 dry, 3 through 5 moist, and chroma of 2 through 6. EC is less than 2 mmhos. Reaction is moderately or strongly alkaline.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 5 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Carmody soils are on plateaus and hillslopes in intermountain basins. Slopes are 2 to 45 percent. The soils formed in calcareous material weathered from semiconsolidated fine grained sandstone or siltstone. The mean annual precipitation ranges from 10 to 17 inches of which about half falls as snow or rain in April, May, and early June. Elevation is 5,300 to 7,500 feet. The mean annual temperature is 39 to 45 degrees F., and the mean summer temperature is 58 to 65 degrees F. The frost-free season is 75 to 120 days depending upon aspect, elevation, and local air drainage.

RELSOB SERIES
SANDY LOAM

Soil Mapping Unit "Re"
Lab/BKS Sample ID: C07120023_117
Typical Pedon: Relsob sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Relsob series consists of deep, well drained soils formed in alluvium derived primarily from noncalcareous sandstone. These soils are on fan aprons and toeslopes of hills and ridges. Slopes are 0 to 15 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 7 inches. Dark Grayish Brown (10YR 4/2W) sandy loam, moist; moderate medium granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, and common medium roots; neutral (pH 7.2); noneffervescent; abrupt smooth boundary. (1 to 4 inches thick)

C1 - 7 to 19 inches. Yellowish brown (10YR 5/4D) sandy loam, moist; moderate medium prismatic structure parting to moderate medium subangular blocky; hard, friable, sticky and plastic; many very fine, fine and common medium roots; common thin clay films on faces of peds and as bridges between sand grains; slightly alkaline (pH 7.8); noneffervescent; clear wavy boundary.

C2 - 19 to 37 inches. Yellowish brown (10YR 5/4D) sandy clay loam, moist; strong medium prismatic structure parting to strong medium subangular blocky; slightly hard, friable, sticky and plastic; common very fine, fine, and medium roots; many moderately thick clay films on faces of peds; 15 percent pebbles; moderately alkaline (pH 7.9); noneffervescent; abrupt wavy boundary. (Combined thickness of Bt horizon is 11 to 17 inches.)

C3 - 37 to 52 inches. Very dark grayish brown (10YR 3/2D) sandy clay loam, moist; strong medium prismatic structure parting to strong medium subangular blocky; slightly hard, friable, sticky and plastic; common very fine, fine, and medium roots; many moderately thick clay films on faces of peds; 15 percent pebbles; slightly alkaline (pH 7.4); noneffervescent; abrupt wavy boundary. (Combined thickness of Bt horizon is 11 to 17 inches.)

C4 - 52 to 60 inches. Very pale brown (10YR 8/2D) sandy loam, moist; massive; slightly hard, very friable, nonsticky, nonplastic; few very fine, fine, and medium roots to 28 inches; 40 percent pebbles; neutral (pH 7.3); noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 117 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - Depth to the base of the argillic horizon and strongly contrasting coarse material is 12 to 20 inches. These soils are noncalcareous throughout. The mean annual soil temperature ranges from 36 to 46 degrees F., and the mean summer temperature is 59 to 62 degrees F. EC is less than 2 mmhos throughout the soil.

The A horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 or 3. Reaction is neutral through moderately alkaline (pH 6.6-8.0.)

The Bt (argillic) horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry, 4 or 5 moist, and chroma of 2 through 4. Texture is sandy clay loam or gravelly sandy clay loam with clay ranging from 20 to 35 percent, silt from 0 to 28 percent, and sand from 45 to 80 percent. Coarse fragments range from 0 to 20 percent and are fine or very fine pebbles. Reaction is neutral or mildly alkaline.

The 2C horizon has hue of 2.5Y through 7.5YR, value of 5 through 8 dry, 4 through 7 moist, and chroma of 2 through 6. Texture of the matrix is sand or loamy sand modified with 0 to 60 percent fine pebbles. Reaction is neutral through moderately alkaline.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class - Fine-loamy over sandy or sandy-skeletal, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) – No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 7 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Relsob soils are on relict fan aprons and toeslopes of hills and ridges. These soils formed in alluvium derived primarily from noncalcareous sandstone. The finer sediments overlie strata of sand or gravel and sand mixtures. Slopes are 0 to 15 percent and typically simple. Elevation is 6,000 to 7,600 feet. The mean annual precipitation is about 12 inches and ranges from 10 to 14 inches with about half falling as snow or rain in April, May, and early June. The mean annual temperature is about 41 degrees F. and ranges from about 34 to 45 degrees

F. The frost-free season is estimated at 80 to 110 days; but, because of elevation, aspect, and air drainage, frost may occur at any time.

CRAGOSEN SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Cr" (Inclusion)
Lab/BKS Sample ID: C07120023_126
Typical Pedon: Cragosen noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Cragosen noncalcareous variant series consists of shallow, well drained soils that have bedrock at less than 20 inches. The soils formed in slopewash alluvium on fan aprons, footslopes, and shoulder, ridge, and hill crests. Slopes are from 0 to 60 percent and are both simple and complex. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Brown (10YR 4/3W) loamy sand, moist; moderate fine granular structure; soft, very friable, slightly sticky and slightly plastic; lime disseminated and as coatings on undersides of rock fragments; 25 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.4); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

B - 3 to 9 inches. Brown (7.5YR 4/4W) sandy loam, moist; slightly hard, very friable, slightly sticky and slightly plastic; lime disseminated and as thin coatings on all surfaces of rock fragments; 35 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.5); noneffervescent; clear wavy boundary. (4 to 14 inches thick)

C - 9 to 14 inches. Very pale brown (10YR 7/4D) loamy sand, moist; slightly hard, very friable, slightly sticky and slightly plastic; lime disseminated and as thin coatings on all surfaces of rock fragments; 35 percent pebbles and 10 percent cobbles; moderately alkaline (pH 8.1); noneffervescent; clear wavy boundary. (4 to 14 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 126 on map included in this report.

Range in Characteristics (According to Official Series Description) - Depth to bedrock ranges from 6 to 20 inches. Depth to uniformly calcareous material ranges from 0 to 6 inches. The mean annual soil temperature is about 44 degrees F. and ranges from 40 to 46 degrees F. The mean annual summer soil temperature ranges from 59 to 63 degrees F. EC ranges from 0 to 4 mmhos throughout the soil. Exchangeable sodium is estimated to be between 0 and 12 percent. The particle size control section matrix is loam, sandy loam, or sandy clay loam with 15 to 25 percent clay and 30 to 60 percent sand with 15 percent or more fine sand or coarser. Rock fragment content of the control section ranges from 25 to 45 percent pebbles and 5 to 15 percent cobble and averages over 35 percent.

The A horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction is neutral through strongly alkaline. Neutral and mildly alkaline reactions occur in the presence of gypsum that acts as a buffering agent.

The C or Bk horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction ranges from mildly through strongly alkaline. The mildly alkaline reaction occurs in the presence of gypsum. A Bw or Bk horizon may replace part or all of the C horizon but is not diagnostic of either a cambic or calcic horizon. The carbonate movement, while common in some pedons, is not consistent and, though pedogenic, does not meet the requirement for a diagnostic horizon.

The 2Cr horizon consists of varicolored shales interbedded with semiconsolidated siltstone and sandstone. The material is soft with thin, discontinuous lenses of consolidated rock.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons.

Taxonomic Class - Loamy-skeletal, mixed, superactive, calcareous, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 9 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - The Cragosen soils are on fan aprons, footslopes, shoulders, and crests of ridges and hills. These soils formed in slopewash alluvium over sandstone controlled uplands. Slopes range from 0 to 60 percent and are both simple and complex. Elevations range from 6,000 to 7,800 feet. The mean annual precipitation is about 12 inches but ranges from 9 to 14 inches with about half falling as snow and rain during April, May, and June. The mean annual temperature is about 40 degrees F. but ranges from 39 to 44 degrees F. The frost-free season is estimated to range from 60 to 100 days depending upon elevation, aspect, and air drainage.

RELSOB SERIES
SANDY LOAM

Soil Mapping Unit "Re"
Lab/BKS Sample ID: C07120023_127
Typical Pedon: Relsob sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Relsob series consists of deep, well drained soils formed in alluvium derived primarily from noncalcareous sandstone. These soils are on fan aprons and toeslopes of hills and ridges. Slopes are 0 to 15 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Brown (10YR 5/3) sandy loam, moist; moderate medium granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, and common medium roots; neutral (pH 6.6); noneffervescent; abrupt smooth boundary. (1 to 4 inches thick)

AB - 3 to 11 inches. Yellowish brown (10YR 5/4) sandy loam, moist; moderate medium prismatic structure parting to moderate medium subangular blocky; hard, friable, sticky and plastic; many very fine, fine and common medium roots; common thin clay films on faces of peds and as bridges between sand grains; neutral (pH 7.1); noneffervescent; clear wavy boundary.

Bt1 - 11 to 19 inches. Light yellowish brown (10YR 6/4) sandy clay loam, moist; strong medium prismatic structure parting to strong medium subangular blocky; slightly hard, friable, sticky and plastic; common very fine, fine, and medium roots; many moderately thick clay films on faces of peds; 15 percent pebbles; neutral (pH 7.0); noneffervescent; abrupt wavy boundary. (Combined thickness of Bt horizon is 11 to 17 inches.)

Bt2 - 19 to 27 inches. Light yellowish brown (10YR 6/4) sandy loam, moist; strong medium prismatic structure parting to strong medium subangular blocky; slightly hard, friable, sticky and plastic; common very fine, fine, and medium roots; many moderately thick clay films on faces of peds; 15 percent pebbles; neutral (pH 7.0); noneffervescent; abrupt wavy boundary. (Combined thickness of Bt horizon is 11 to 17 inches.)

C1 - 27 to 43 inches. Lightly yellowish brown (10YR 6/4) sandy loam, moist; massive; slightly hard, very friable, nonsticky, nonplastic; few very fine, fine, and medium roots to 28 inches; 40 percent pebbles; neutral (pH 7.2); noneffervescent.

C2 - 43 to 60 inches. Lightly yellowish brown (10YR 6/4) sandy loam, moist; massive; slightly hard, very friable, nonsticky, nonplastic; few very fine, fine, and medium roots to 28 inches; 40 percent pebbles; slightly alkaline (pH 7.5); noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 127 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - Depth to the base of the argillic horizon and strongly contrasting coarse material is 12 to 20 inches. These soils are noncalcareous throughout. The mean annual soil temperature ranges from 36 to 46 degrees F., and the mean summer temperature is 59 to 62 degrees F. EC is less than 2 mmhos throughout the soil.

The A horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 or 3. Reaction is neutral through moderately alkaline (pH 6.6-8.0.)

The Bt (argillic) horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry, 4 or 5 moist, and chroma of 2 through 4. Texture is sandy clay loam or gravelly sandy clay loam with clay ranging from 20 to 35 percent, silt from 0 to 28 percent, and sand from 45 to 80 percent. Coarse fragments range from 0 to 20 percent and are fine or very fine pebbles. Reaction is neutral or mildly alkaline.

The 2C horizon has hue of 2.5Y through 7.5YR, value of 5 through 8 dry, 4 through 7 moist, and chroma of 2 through 6. Texture of the matrix is sand or loamy sand modified with 0 to 60 percent fine pebbles. Reaction is neutral through moderately alkaline.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class - Fine-loamy over sandy or sandy-skeletal, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) – No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 27 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Relsob soils are on relict fan aprons and toeslopes of hills and ridges. These soils formed in alluvium derived primarily from noncalcareous sandstone. The finer sediments overlie strata of sand or gravel and sand mixtures. Slopes are 0 to 15 percent and typically simple. Elevation is

6,000 to 7,600 feet. The mean annual precipitation is about 12 inches and ranges from 10 to 14 inches with about half falling as snow or rain in April, May, and early June. The mean annual temperature is about 41 degrees F. and ranges from about 34 to 45 degrees F. The frost-free season is estimated at 80 to 110 days; but, because of elevation, aspect, and air drainage, frost may occur at any time.

BLUERIM SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Br-NC"
Lab/BKS Sample ID: C07120023_128
Typical Pedon: Bluerim noncalcareous variant-rangeland. The surface is covered with 15 percent very fine pebbles. (Colors are for dry soil unless otherwise stated.)

The Bluerim noncalcareous variant series consists of moderately deep, well drained soils that formed in material weathered from calcareous sandy shale interbedded with arkosic sandstone. Bluerim soils are on upland hillsides and have slopes of 3 to 20 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A – 0-4 inches. Brown (10YR 4/3W) loamy sand, moist; moderate medium and fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; moderately alkaline (pH 8.3), noneffervescent; clear smooth boundary.

Bt – 4-15 inches. Dark yellowish brown (10YR 4/4W) sandy loam, Yellowish brown (10YR 5/4D) moist; weak medium prismatic structure that parts to moderate medium angular blocky; hard, friable, sticky and plastic; many fine and medium roots; continuous thin clay films on faces of all peds; 10 percent very fine pebbles; moderately alkaline (pH 8.0), noneffervescent; clear smooth boundary.

C – 15-27 inches. Yellowish brown (10YR 5/4D) loamy sand, moist; moderate medium angular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few medium roots; continuous thin clay films on faces of peds; 10 percent very fine pebbles; moderately alkaline (pH 8.1), noneffervescent; gradual wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 128 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature ranges from 35 to 47 degrees F., and the mean summer soil temperature ranges from 59 to 62 degrees F. Depth to bedded sandy shale is 20 to 40 inches. The soils commonly are noncalcareous. Calcium carbonate accumulation in the lower part of the C horizon is weak and discontinuous. Very fine pebbles range from 0 to 15 percent throughout.

The A1 horizon has hue of 2.5Y or 10YR, value of 4 or 5 dry, 3 or 4 moist, and chroma of 2 through 4 dry and moist. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.
The Bt2 horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 3 or 4 dry and moist. Texture is sandy clay loam with 20 to 27 percent clay. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.
The C horizon has hue of 5Y through 10YR, value of 4 through 7 dry, 5 or 6 moist, and chroma of 2 through 4. It is sandy loam or sandy clay loam. EC is less than 4 mmhos. Reaction ranges from mildly alkaline through strongly alkaline. Visible accumulation of calcium carbonate is discontinuous.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 15 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Bluerim soils are on upland hillsides. Slopes are 3 to 20 percent. The soils formed in residuum weathered from calcareous sandy shales interbedded with arkosic sandstone. Elevation is 6,000 to 7,800 feet. The mean annual temperature is 34 to 45 degrees F. Precipitation is 10 to 14 inches. The growing season is 80 to 120 days but frost may occur in any month.

CRAGOSEN SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Cr" (Inclusion)
Lab/BKS Sample ID: C07120023_134
Typical Pedon: Cragosen noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Cragosen noncalcareous variant series consists of shallow, well drained soils that have bedrock at less than 20 inches. The soils formed in slopewash alluvium on fan aprons, footslopes, and shoulder, ridge, and hill crests. Slopes are from 0 to 60 percent and are both simple and complex. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 5 inches. Pale brown (10YR 6/3) sandy loam – sandy clay loam, moist; moderate fine granular structure; soft, very friable, slightly sticky and slightly plastic; lime disseminated and as coatings on undersides of rock fragments; 25 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.4); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

Bt - 5 to 14 inches; brown (10YR 5/3) sandy loam – sandy clay loam, moist; slightly hard, very friable, slightly sticky and slightly plastic; lime disseminated and as thin coatings on all surfaces of rock fragments; 35 percent pebbles and 10 percent cobbles; neutral (pH 7.3); noneffervescent; clear wavy boundary. (4 to 14 inches thick)

C – 14 to 19 inches; brown (10YR 5/3) sandy clay loam, moist; slightly hard, very friable, slightly sticky and slightly plastic; lime disseminated and as thin coatings on all surfaces of rock fragments; 35 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.5); noneffervescent; clear wavy boundary. (4 to 14 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 134 on map included in this report.

Range in Characteristics (According to Official Series Description) - Depth to bedrock ranges from 6 to 20 inches. Depth to uniformly calcareous material ranges from 0 to 6 inches. The mean annual soil temperature is about 44 degrees F. and ranges from 40 to 46 degrees F. The mean annual summer soil temperature ranges from 59 to 63 degrees F. EC ranges from 0 to 4 mmhos throughout the soil. Exchangeable sodium is estimated to be between 0 and 12 percent. The particle size control section matrix is loam, sandy loam, or sandy clay loam with 15 to 25 percent clay and 30 to 60 percent sand with 15 percent or

more fine sand or coarser. Rock fragment content of the control section ranges from 25 to 45 percent pebbles and 5 to 15 percent cobble and averages over 35 percent.

The A horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction is neutral through strongly alkaline. Neutral and mildly alkaline reactions occur in the presence of gypsum that acts as a buffering agent.

The C or Bk horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction ranges from mildly through strongly alkaline. The mildly alkaline reaction occurs in the presence of gypsum. A Bw or Bk horizon may replace part or all of the C horizon but is not diagnostic of either a cambic or calcic horizon. The carbonate movement, while common in some pedons, is not consistent and, though pedogenic, does not meet the requirement for a diagnostic horizon.

The 2Cr horizon consists of varicolored shales interbedded with semiconsolidated siltstone and sandstone. The material is soft with thin, discontinuous lenses of consolidated rock.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons.

Taxonomic Class - Loamy-skeletal, mixed, superactive, calcareous, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 14 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - The Cragosen soils are on fan aprons, footslopes, shoulders, and crests of ridges and hills. These soils formed in slopewash alluvium over sandstone controlled uplands. Slopes range from 0 to 60 percent and are both simple and complex. Elevations range from 6,000 to 7,800 feet. The mean annual precipitation is about 12 inches but ranges from 9 to 14 inches with about half falling as snow and rain during April, May, and June. The mean annual temperature is about 40 degrees F. but ranges from 39 to 44 degrees F. The frost-free season is estimated to range from 60 to 100 days depending upon elevation, aspect, and air drainage.

ONASON SERIES
SANDY LOAM

Soil Mapping Unit "O"
Lab/BKS Sample ID: C07120023_144
Typical Pedon: Onason sandy loam - rangeland. (Colors are for dry soil unless otherwise stated.)

The Onason series consists of well drained soils that are shallow and very shallow to soft sandstone. These soils formed in residuum and slopewash alluvium weathered from the underlying bedrock. Onason soils are on footslopes, backslopes, and shoulders of hills and ridges. Slopes range from 5 to 45 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.
A - 0-6 inches. Brown (10YR 4/3W) sandy loam, dark yellowish brown (10YR 4/6W) moist; weak very fine granular structure; slightly hard, very friable, nonsticky and nonplastic; many fine and few medium roots; 15 percent semirounded pebbles; moderately alkaline (pH 8.2), noneffervescent; clear smooth boundary.

C– 6-19 inches. Light yellowish brown (10YR 6/4D) loamy sand, yellowish brown (10YR 5/4W) moist; weak medium and coarse granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many fine and few medium roots; 15 percent semirounded pebbles; moderately alkaline (pH 8.1), noneffervescent; gradual wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 144 on map included in this report.

Range in Soil Characteristics(According to official series description) - Depth to the paralithic contact and bedrock ranges from 4 to 20 inches. These soils are noncalcareous throughout. The mean annual soil temperature is 36 to 45 degrees F., and the mean summer soil temperature is 59 to 62 degrees F. The particle size control section averages gravelly sandy loam or sandy loam throughout. Clay ranges from 8 to 18 percent and rock fragments of fine or very fine semirounded pebbles range from 0 to 35 percent. EC is less than 2 mmhos throughout.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Lag gravel covering up to 75 percent of the surface is common in some pedons. Reaction is neutral or mildly alkaline.
The C horizon has hue of 2.5Y or 10YR, value of 5 or 6 dry, 4 through 6 moist, and chroma of 2 through 4. A thin Bw horizon is present in some pedons. Reaction is neutral or mildly alkaline.

The Cr horizon consists of soft, noncalcareous, coarse- and medium-grained sandstone interbedded with thin lenses of shale and siltstone. The yellowish brown or brown sandstone may have discontinuous lenses of hard sandstone or shale in some pedons. The soil-bedrock interface is considered a paralithic contact and roots plane out at the contact.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class (According to official series description) - Loamy, mixed, superactive, nonacid, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 6 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Onason soils are on footslopes, backslopes, and shoulders of rolling and steep hills and ridges. These soils formed in residuum and slopewash alluvium weathered from the underlying noncalcareous sandstone. Slopes range from 5 to 45 percent. Elevations are 6,000 to 7,600 feet. The climate is cool, semiarid with moist springs and dry summers. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 34 to 44 degrees F. The estimated frost-free season is about 80 to 110 days, but frost may occur in any month.

ONASON SERIES
SANDY LOAM

Soil Mapping Unit "O"
Lab/BKS Sample ID: C07120023_145
Typical Pedon: Onason sandy loam - rangeland. (Colors are for dry soil unless otherwise stated.)

The Onason series consists of well drained soils that are shallow and very shallow to soft sandstone. These soils formed in residuum and slopewash alluvium weathered from the underlying bedrock. Onason soils are on footslopes, backslopes, and shoulders of hills and ridges. Slopes range from 5 to 45 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-6 inches. Brown (10YR 4/3W) sandy loam, yellowish brown (10YR 5/4D) moist; weak very fine granular structure; slightly hard, very friable, nonsticky and nonplastic; many fine and few medium roots; 15 percent semirounded pebbles; slightly alkaline (pH 7.8), noneffervescent; clear smooth boundary.

C– 6-15 inches. Dark yellowish brown (10YR 4/4W) loamy sand, moist; weak medium and coarse granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many fine and few medium roots; 15 percent semirounded pebbles; moderately alkaline (pH 8.0), noneffervescent; gradual wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 145 on map included in this report.

Range in Soil Characteristics(According to official series description) - Depth to the paralithic contact and bedrock ranges from 4 to 20 inches. These soils are noncalcareous throughout. The mean annual soil temperature is 36 to 45 degrees F., and the mean summer soil temperature is 59 to 62 degrees F. The particle size control section averages gravelly sandy loam or sandy loam throughout. Clay ranges from 8 to 18 percent and rock fragments of fine or very fine semirounded pebbles range from 0 to 35 percent. EC is less than 2 mmhos throughout.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Lag gravel covering up to 75 percent of the surface is common in some pedons. Reaction is neutral or mildly alkaline.
The C horizon has hue of 2.5Y or 10YR, value of 5 or 6 dry, 4 through 6 moist, and chroma of 2 through 4. A thin Bw horizon is present in some pedons. Reaction is neutral or mildly alkaline.

The Cr horizon consists of soft, noncalcareous, coarse- and medium-grained sandstone interbedded with thin lenses of shale and siltstone. The yellowish brown or brown sandstone may have discontinuous lenses of hard sandstone or shale in some pedons. The soil-bedrock interface is considered a paralithic contact and roots plane out at the contact.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class (According to official series description) - Loamy, mixed, superactive, nonacid, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 6 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Onason soils are on footslopes, backslopes, and shoulders of rolling and steep hills and ridges. These soils formed in residuum and slopewash alluvium weathered from the underlying noncalcareous sandstone. Slopes range from 5 to 45 percent. Elevations are 6,000 to 7,600 feet. The climate is cool, semiarid with moist springs and dry summers. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 34 to 44 degrees F. The estimated frost-free season is about 80 to 110 days, but frost may occur in any month.

LECKMAN SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "L"
Lab/BKS Sample ID: C07120023_147
Typical Pedon: Leckman noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Leckman noncalcareous variant series consists of very deep, well drained soils formed in alluvium. Leckman soils are on alluvial fans and toeslopes and have slopes of 0 to 10 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-4 inches. Light grayish brown (10YR 6/2) sandy loam, moist; weak medium platy structure breaks to weak fine crumbs; soft, very friable, nonsticky, nonplastic; slightly alkaline (pH 7.8), noneffervescent.

C1 – 4-11 inches. Light grayish brown (10YR 6/2) sandy loam, moist; weak coarse and medium prismatic structure that parts to weak medium subangular blocks; soft, very friable, nonsticky, nonplastic; slightly alkaline (pH 7.8), noneffervescent.

C2 – 11-24 inches. Light grayish brown (10YR 6/2) sandy loam, moist; massive, soft very friable nonsticky, nonplastic, slightly alkaline (pH 7.7), noneffervescent.

C3 – 24-36 inches. Light grayish brown (10YR 6/2) sandy loam, moist; massive, soft very friable nonsticky, nonplastic, slightly alkaline (pH 7.4), noneffervescent.

C4 – 36-42 inches. Light grayish brown (10YR 6/2) sandy clay loam, moist; massive, soft very friable nonsticky, nonplastic, neutral (pH 7.3), noneffervescent.

C5 – 42-48 inches. Light grayish brown (10YR 6/2) sandy loam, moist; massive, soft very friable nonsticky, nonplastic, neutral (pH 7.3), noneffervescent.

C6 – 48-60 inches. Light grayish brown (10YR 6/2) sandy loam, moist; massive, soft very friable nonsticky, nonplastic, neutral (pH 7.3), noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 147 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature is about 43 to 47 degrees F. The mean summer soil temperature is

64 to 67 degrees F. Textures throughout the profile are fine sandy loam or sandy loam. Gravel content is generally less than 5 percent but can range from 0 to 15 percent.

The A horizons have hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4.

The C horizon has hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4. Reaction is moderately or strongly alkaline. Effervescence may be slight to violent.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is slightly calcareous in the A horizon and is strongly calcareous in the remaining horizons.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Typic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 4 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Leckman soils are on alluvial fans and toe slopes of escarpments. Slopes are 0 to 10 percent. The soils formed in alluvium. Elevation is 6,000 to 7,000 feet. The mean annual precipitation is 7 to 9 inches. The mean annual air temperature is 37 to 44 degrees F. The frost-free season is 80 to 110 days.

CRAGOSEN SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Cr"
Lab/BKS Sample ID: C07120023_158
Typical Pedon: Cragosen noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Cragosen noncalcareous variant series consists of shallow, well drained soils that have bedrock at less than 20 inches. The soils formed in slopewash alluvium on fan aprons, footslopes, and shoulder, ridge, and hill crests. Slopes are from 0 to 60 percent and are both simple and complex. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Brown (10YR 4/3) loamy sand, moist; moderate fine granular structure; soft, very friable, slightly sticky and slightly plastic; lime disseminated and as coatings on undersides of rock fragments; 25 percent pebbles and 10 percent cobbles; moderately alkaline (pH 7.9); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

C- 3 to 13 inches. Yellowish brown (10YR 5/6) loamy sand, moist; slightly hard, very friable, slightly sticky and slightly plastic; lime disseminated and as thin coatings on all surfaces of rock fragments; 35 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.8); noneffervescent; clear wavy boundary. (4 to 14 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 158 on map included in this report.

Range in Characteristics (According to Official Series Description) - Depth to bedrock ranges from 6 to 20 inches. Depth to uniformly calcareous material ranges from 0 to 6 inches. The mean annual soil temperature is about 44 degrees F. and ranges from 40 to 46 degrees F. The mean annual summer soil temperature ranges from 59 to 63 degrees F. EC ranges from 0 to 4 mmhos throughout the soil. Exchangeable sodium is estimated to be between 0 and 12 percent. The particle size control section matrix is loam, sandy loam, or sandy clay loam with 15 to 25 percent clay and 30 to 60 percent sand with 15 percent or more fine sand or coarser. Rock fragment content of the control section ranges from 25 to 45 percent pebbles and 5 to 15 percent cobble and averages over 35 percent.

The A horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction is neutral through strongly alkaline. Neutral and mildly alkaline reactions occur in the presence of gypsum that acts as a buffering agent.

The C or Bk horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction ranges from mildly through strongly alkaline. The mildly alkaline reaction occurs in the presence of gypsum. A Bw or Bk horizon may replace part or all of the C horizon but is not diagnostic of either a cambic or calcic horizon. The carbonate movement, while common in some pedons, is not consistent and, though pedogenic, does not meet the requirement for a diagnostic horizon.

The 2Cr horizon consists of varicolored shales interbedded with semiconsolidated siltstone and sandstone. The material is soft with thin, discontinuous lenses of consolidated rock.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons.

Taxonomic Class - Loamy-skeletal, mixed, superactive, calcareous, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 3 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - The Cragosen soils are on fan aprons, footslopes, shoulders, and crests of ridges and hills. These soils formed in slopewash alluvium over sandstone controlled uplands. Slopes range from 0 to 60 percent and are both simple and complex. Elevations range from 6,000 to 7,800 feet. The mean annual precipitation is about 12 inches but ranges from 9 to 14 inches with about half falling as snow and rain during April, May, and June. The mean annual temperature is about 40 degrees F. but ranges from 39 to 44 degrees F. The frost-free season is estimated to range from 60 to 100 days depending upon elevation, aspect, and air drainage.

RYAN PARK SERIES
SANDY LOAM

Soil Mapping Unit "RP"
Lab/BKS Sample ID: C07120023_163
Typical Pedon: Ryan Park loamy fine sand-rangeland. (Colors are for dry soil unless otherwise stated.)

The Ryan Park series consists of very deep, well or somewhat excessively drained soils that formed in moderately sandy sediments weathered from calcareous sandstone, eolian deposits, and residuum. Ryan Park soils are on fan aprons, pediments toeslopes, hillslopes, and relict alluvial fans. Slopes are 0 to 25 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 4 inches. Light brownish gray (10YR 6/2) sand, (10YR 4/2) moist; single grained, loose; slightly alkaline (pH 7.4); noneffervescent; clear smooth boundary. (4 to 6 inches thick)

Bt - 4 to 13 inches. Brown (10YR 5/3) sandy loam, moist; weak coarse prismatic structure parting to weak medium subangular blocky; slightly hard, very friable; slightly alkaline (pH 7.5); noneffervescent; clear smooth boundary. (0 to 4 inches thick)

BC - 13 to 22 inches. Brown (10YR 5/3) sandy loam, moist; moderate coarse prismatic structure parting to moderate coarse subangular blocky; hard, very friable; many thin clay films on all faces of peds and as bridges between sand grains; slightly alkaline (pH 7.7); noneffervescent; clear smooth boundary. (5 to 22 inches thick)

C1- 22 to 38 inches. Pale brown (10YR 6/3) loamy sand, moist; weak coarse prismatic structure parting to weak coarse subangular blocky; hard, very friable; common clay bridging between sand grains and few clay films on faces of peds; strongly effervescent, lime as few medium and fine soft rounded masses, threads, and seams; moderately alkaline (pH 8.1); noneffervescent; gradual wavy boundary. (0 to 8 inches thick)

C2 - 38 to 48 inches. Pale brown (10YR 6/3) sand, moist; massive; slightly hard, very friable; strongly effervescent, few medium and fine soft rounded masses, threads, and seams of secondary calcium carbonate; moderately alkaline (pH 8.1); moderately effervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 163 on map included in this report.

Range in Characteristics (According to Official Series Description) - Depth to continuous horizons of secondary calcium carbonate and the base of the B2t horizon is 10 to 30 inches. The mean annual soil temperature is about 40 to 46 degrees F., and the mean summer soil temperature is about 58 to 66 degrees F. Rock fragments range from 0 to 15 percent semirounded pebbles or channers.

The A horizon has hue of 2.5Y or 10YR, value of 5 through 7 dry 3 through 5 moist, and chroma of 2 through 4. Reaction is neutral or mildly alkaline.

The Bt horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 2 through 4. It is fine sandy loam or sandy loam, averages 8 to 18 percent clay, and has more than 35 percent fine or coarser sand. Reaction is mildly or moderately alkaline.

The Bk horizon has hue of 2.5Y through 7.5YR, value of 5 through 8 dry, 3 through 6 moist, and chroma of 1 through 4. Calcium carbonate equivalent ranges from 1 to 10 percent, about half of which is authigenic. Texture of the matrix is sandy loam, fine sandy loam, loamy fine sand, or loamy sand. Coarse fragments range from 0 to 25 percent. Reaction is moderately or strongly alkaline.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous for A, B, and C1 horizons. According to the NRCS soil series description, the soil profile is strongly calcareous in the Btk and Bk horizons.

Taxonomic Class - Coarse-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) – Marginal saturation percentage was found at a depth of 13-22 inches. An estimated stripping depth is 13 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Ryan Park soils are on fan aprons, pediments, hillslopes, toeslopes, terraces and alluvial fans. Slopes are 0 to 25 percent. The soils formed in moderately sandy sediments weathered from calcareous sandstone, eolian deposits, and residuum. Elevation is 5,800 to 7,800 feet. The mean annual precipitation is about 9 to 14 inches and occurs mainly in the winter and spring. The mean annual temperature is 37 to 45 degrees F. The frost-free season is estimated to range from 60 to 110 days depending upon air drainage, aspect, and elevation.

CRAGOSEN SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Cr"
Lab/BKS Sample ID: C07120023_167a
Typical Pedon: Cragosen noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Cragosen noncalcareous variant series consists of shallow, well drained soils that have bedrock at less than 20 inches. The soils formed in slopewash alluvium on fan aprons, footslopes, and shoulder, ridge, and hill crests. Slopes are from 0 to 60 percent and are both simple and complex. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 2 inches. Dark yellowish brown (10YR 4/4W) sandy loam, moist; moderate fine granular structure; soft, very friable, slightly sticky and slightly plastic; lime disseminated and as coatings on undersides of rock fragments; 25 percent pebbles and 10 percent cobbles; strongly alkaline (pH 8.6); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

C - 2 to 12 inches. Yellowish brown (10YR 5/4D) sand, moist; slightly hard, very friable, slightly sticky and slightly plastic; lime disseminated and as thin coatings on all surfaces of rock fragments; 35 percent pebbles and 10 percent cobbles; strongly alkaline (pH 8.6); noneffervescent; clear wavy boundary. (4 to 14 inches thick)

Type Location – Sweetwater County, Wyoming; refer to waypoint 167a on map included in this report.

Range in Characteristics (According to Official Series Description) - Depth to bedrock ranges from 6 to 20 inches. Depth to uniformly calcareous material ranges from 0 to 6 inches. The mean annual soil temperature is about 44 degrees F. and ranges from 40 to 46 degrees F. The mean annual summer soil temperature ranges from 59 to 63 degrees F. EC ranges from 0 to 4 mmhos throughout the soil. Exchangeable sodium is estimated to be between 0 and 12 percent. The particle size control section matrix is loam, sandy loam, or sandy clay loam with 15 to 25 percent clay and 30 to 60 percent sand with 15 percent or more fine sand or coarser. Rock fragment content of the control section ranges from 25 to 45 percent pebbles and 5 to 15 percent cobble and averages over 35 percent.

The A horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction is neutral through strongly alkaline. Neutral and mildly alkaline reactions occur in the presence of gypsum that acts as a buffering agent.

The C or Bk horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction ranges from mildly through strongly alkaline. The mildly alkaline reaction occurs in the presence of gypsum.

A Bw or Bk horizon may replace part or all of the C horizon but is not diagnostic of either a cambic or calcic horizon. The carbonate movement, while common in some pedons, is not consistent and, though pedogenic, does not meet the requirement for a diagnostic horizon.

The 2Cr horizon consists of varicolored shales interbedded with semiconsolidated siltstone and sandstone. The material is soft with thin, discontinuous lenses of consolidated rock.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons.

Taxonomic Class - Loamy-skeletal, mixed, superactive, calcareous, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal pH was found at depths of 0-2 and 2-12 inches. An estimated stripping depth is 0 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - The Cragosen soils are on fan aprons, footslopes, shoulders, and crests of ridges and hills. These soils formed in slopewash alluvium over sandstone controlled uplands. Slopes range from 0 to 60 percent and are both simple and complex. Elevations range from 6,000 to 7,800 feet. The mean annual precipitation is about 12 inches but ranges from 9 to 14 inches with about half falling as snow and rain during April, May, and June. The mean annual temperature is about 40 degrees F. but ranges from 39 to 44 degrees F. The frost-free season is estimated to range from 60 to 100 days depending upon elevation, aspect, and air drainage.

BLUERIM SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Br-NC"
Lab/BKS Sample ID: C07120023_168
Typical Pedon: Bluerim sandy loam-rangeland. The surface is covered with 15 percent very fine pebbles. (Colors are for dry soil unless otherwise stated.)

The Bluerim series consists of moderately deep, well drained soils that formed in material weathered from calcareous sandy shale interbedded with arkosic sandstone. Bluerim soils are on upland hillsides and have slopes of 3 to 20 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A – 0-9 inches. Brown (10YR 4/3W) sandy loam, brown (7.5YR 5/4D) moist; moderate medium and fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; moderately alkaline (pH 8.2), noneffervescent; clear smooth boundary.

Bt – 9-18 inches. Brown (10YR 5/4D) sandy loam, moist; weak medium prismatic structure that parts to moderate medium angular blocky; hard, friable, sticky and plastic; many fine and medium roots; continuous thin clay films on faces of all peds; 10 percent very fine pebbles; moderately alkaline (pH 7.9), noneffervescent; clear smooth boundary.

C – 18-24 inches. Brown (10YR 5/4D) sandy loam, moist; moderate medium angular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few medium roots; continuous thin clay films on faces of peds; 10 percent very fine pebbles; moderately alkaline (pH 7.9), noneffervescent; gradual wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 168 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature ranges from 35 to 47 degrees F., and the mean summer soil temperature ranges from 59 to 62 degrees F. Depth to bedded sandy shale is 20 to 40 inches. The soils commonly are noncalcareous. Calcium carbonate accumulation in the lower part of the C horizon is weak and discontinuous. Very fine pebbles range from 0 to 15 percent throughout.
The A1 horizon has hue of 2.5Y or 10YR, value of 4 or 5 dry, 3 or 4 moist, and chroma of 2 through 4 dry and moist. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.

The Bt2 horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 3 or 4 dry and moist. Texture is sandy clay loam with 20 to 27 percent clay. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.
The C horizon has hue of 5Y through 10YR, value of 4 through 7 dry, 5 or 6 moist, and chroma of 2 through 4. It is sandy loam or sandy clay loam. EC is less than 4 mmhos. Reaction ranges from mildly alkaline through strongly alkaline. Visible accumulation of calcium carbonate is discontinuous.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal saturation percentage was found at a depth of 18-24 inches. An estimated stripping depth is 18 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Bluerim soils are on upland hillsides. Slopes are 3 to 20 percent. The soils formed in residuum weathered from calcareous sandy shales interbedded with arkosic sandstone. Elevation is 6,000 to 7,800 feet. The mean annual temperature is 34 to 45 degrees F. Precipitation is 10 to 14 inches. The growing season is 80 to 120 days but frost may occur in any month.

BLUERIM SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Br-NC"
Lab/BKS Sample ID: C07120023_170
Typical Pedon: Bluerim noncalcareous variant-rangeland. The surface is covered with 15 percent very fine pebbles. (Colors are for dry soil unless otherwise stated.)

The Bluerim noncalcareous variant series consists of moderately deep, well drained soils that formed in material weathered from calcareous sandy shale interbedded with arkosic sandstone. Bluerim soils are on upland hillsides and have slopes of 3 to 20 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A – 0-3 inches. Brown (10YR 4/3W) sandy loam, yellowish brown (10YR 5/4D) moist; moderate medium and fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; moderately alkaline (pH 8.1), noneffervescent; clear smooth boundary.

AB – 3-11 inches. Dark yellowish brown (10YR 4/4W) sandy loam, moist; weak medium prismatic structure that parts to moderate medium angular blocky; hard, friable, sticky and plastic; many fine and medium roots; continuous thin clay films on faces of all peds; 10 percent very fine pebbles; slightly alkaline (pH 7.8), noneffervescent; clear smooth boundary.

B – 11-14 inches. Brown (7.5YR 5/4D) sandy loam, moist; moderate medium angular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few medium roots; continuous thin clay films on faces of peds; 10 percent very fine pebbles; slightly alkaline (pH 7.6), noneffervescent; gradual wavy boundary.

C - 14 to 20 inches. Pale red (2.5YR 6/2D) sandy clay loam, moist; weak medium angular blocky structure; slightly hard, very friable, slightly sticky and nonplastic; few medium roots; few thin clay films on faces of some peds; 10 percent very fine pebbles; moderately alkaline (pH 7.9); moderately effervescent; clear smooth boundary. (4 to 7 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 170 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature ranges from 35 to 47 degrees F., and the mean summer soil

temperature ranges from 59 to 62 degrees F. Depth to bedded sandy shale is 20 to 40 inches. The soils commonly are noncalcareous. Calcium carbonate accumulation in the lower part of the C horizon is weak and discontinuous. Very fine pebbles range from 0 to 15 percent throughout.

The A1 horizon has hue of 2.5Y or 10YR, value of 4 or 5 dry, 3 or 4 moist, and chroma of 2 through 4 dry and moist. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.

The Bt2 horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 3 or 4 dry and moist. Texture is sandy clay loam with 20 to 27 percent clay. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.

The C horizon has hue of 5Y through 10YR, value of 4 through 7 dry, 5 or 6 moist, and chroma of 2 through 4. It is sandy loam or sandy clay loam. EC is less than 4 mmhos. Reaction ranges from mildly alkaline through strongly alkaline. Visible accumulation of calcium carbonate is discontinuous.

Range in Characteristics (according to field observations, lab analysis): According to the NRCS soil series description, the soils commonly are noncalcareous. The soil profile based on field observations, the C horizon is moderately calcareous.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 14 inches due to the change in effervescent at the C horizon.

Geographic Setting (According to Official Series Description) - Bluerim soils are on upland hillsides. Slopes are 3 to 20 percent. The soils formed in residuum weathered from calcareous sandy shales interbedded with arkosic sandstone. Elevation is 6,000 to 7,800 feet. The mean annual temperature is 34 to 45 degrees F. Precipitation is 10 to 14 inches. The growing season is 80 to 120 days but frost may occur in any month.

BLUERIM SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Br-NC"
Lab/BKS Sample ID: C07120023_171
Typical Pedon: Bluerim noncalcareous variant-rangeland. The surface is covered with 15 percent very fine pebbles. (Colors are for dry soil unless otherwise stated.)

The Bluerim noncalcareous variant series consists of moderately deep, well drained soils that formed in material weathered from calcareous sandy shale interbedded with arkosic sandstone. Bluerim soils are on upland hillsides and have slopes of 3 to 20 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A – 0-3 inches. Brown (10YR 4/3W) sandy loam, moist; moderate medium and fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; moderately alkaline (pH 8.5), noneffervescent; clear smooth boundary.

B – 3-7 inches. Yellowish brown (10YR 5/4D) sandy loam, dark yellowish brown (10YR 4/4W) moist; weak medium prismatic structure that parts to moderate medium angular blocky; hard, friable, sticky and plastic; many fine and medium roots; continuous thin clay films on faces of all peds; 10 percent very fine pebbles; moderately alkaline (pH 8.1), noneffervescent; clear smooth boundary.

C– 7-13 inches. Very pale brown (10YR 7/4D) sandy loam, moist; moderate medium angular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few medium roots; continuous thin clay films on faces of peds; 10 percent very fine pebbles; slightly alkaline (pH 7.8), noneffervescent; gradual wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 171 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature ranges from 35 to 47 degrees F., and the mean summer soil temperature ranges from 59 to 62 degrees F. Depth to bedded sandy shale is 20 to 40 inches. The soils commonly are noncalcareous. Calcium carbonate accumulation in the lower part of the C horizon is weak and discontinuous. Very fine pebbles range from 0 to 15 percent throughout.

The A1 horizon has hue of 2.5Y or 10YR, value of 4 or 5 dry, 3 or 4 moist, and chroma of 2 through 4 dry and moist. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.
The Bt2 horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 3 or 4 dry and moist. Texture is sandy clay loam with 20 to 27 percent clay. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.
The C horizon has hue of 5Y through 10YR, value of 4 through 7 dry, 5 or 6 moist, and chroma of 2 through 4. It is sandy loam or sandy clay loam. EC is less than 4 mmhos. Reaction ranges from mildly alkaline through strongly alkaline. Visible accumulation of calcium carbonate is discontinuous.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) – Marginal pH was found at a depth of 0-3 and marginal saturation percentage was found at a depth of 7-13 inches. An estimated stripping depth is 0 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Bluerim soils are on upland hillsides. Slopes are 3 to 20 percent. The soils formed in residuum weathered from calcareous sandy shales interbedded with arkosic sandstone. Elevation is 6,000 to 7,800 feet. The mean annual temperature is 34 to 45 degrees F. Precipitation is 10 to 14 inches. The growing season is 80 to 120 days but frost may occur in any month.

ONASON SERIES
SANDY LOAM

Soil Mapping Unit "O"
Lab/BKS Sample ID: C07120023_173
Typical Pedon: Onason loamy sand - rangeland. (Colors are for dry soil unless otherwise stated.)

The Onason series consists of well drained soils that are shallow and very shallow to soft sandstone. These soils formed in residuum and slopewash alluvium weathered from the underlying bedrock. Onason soils are on footslopes, backslopes, and shoulders of hills and ridges. Slopes range from 5 to 45 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-3 inches. Brown (10YR 4/3W) loamy sand, moist; weak very fine granular structure; slightly hard, very friable, nonsticky and nonplastic; many fine and few medium roots; 15 percent semirounded pebbles; strongly alkaline (pH 8.7), noneffervescent; clear smooth boundary.

C– 3-19 inches. Yellowish brown (10YR 5/4D) sandy loam, dark yellowish brown (10YR 4/4W) moist; weak medium and coarse granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many fine and few medium roots; 15 percent semirounded pebbles; strongly alkaline (pH 8.6), noneffervescent; gradual wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 173 on map included in this report.

Range in Soil Characteristics(According to official series description) - Depth to the paralithic contact and bedrock ranges from 4 to 20 inches. These soils are noncalcareous throughout. The mean annual soil temperature is 36 to 45 degrees F., and the mean summer soil temperature is 59 to 62 degrees F. The particle size control section averages gravelly sandy loam or sandy loam throughout. Clay ranges from 8 to 18 percent and rock fragments of fine or very fine semirounded pebbles range from 0 to 35 percent. EC is less than 2 mmhos throughout.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Lag gravel covering up to 75 percent of the surface is common in some pedons. Reaction is neutral or mildly alkaline.

The C horizon has hue of 2.5Y or 10YR, value of 5 or 6 dry, 4 through 6 moist, and chroma of 2 through 4. A thin Bw horizon is present in some pedons. Reaction is neutral or mildly alkaline.
The Cr horizon consists of soft, noncalcareous, coarse- and medium-grained sandstone interbedded with thin lenses of shale and siltstone. The yellowish brown or brown sandstone may have discontinuous lenses of hard sandstone or shale in some pedons. The soil-bedrock interface is considered a paralithic contact and roots plane out at the contact.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab anaylsis and field observations.

Taxonomic Class (According to official series description): Loamy, mixed, superactive, nonacid, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1): Marginal pH was found at depths of 0-3 and 3-19 inches. An estimated stripping depth is 0 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Onason soils are on footslopes, backslopes, and shoulders of rolling and steep hills and ridges. These soils formed in residuum and slopewash alluvium weathered from the underlying noncalcareous sandstone. Slopes range from 5 to 45 percent. Elevations are 6,000 to 7,600 feet. The climate is cool, semiarid with moist springs and dry summers. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 34 to 44 degrees F. The estimated frost-free season is about 80 to 110 days, but frost may occur in any month.

CARMODY SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Ca-NC"
Lab/BKS Sample ID: C07120023_174
Typical Pedon: Carmody noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Carmody noncalcareous variant series consists of well to somewhat excessively drained soils that are moderately deep to siltstone. These soils formed in material weathered from calcareous siltstone or fine grained sandstone. Carmody soils are on uplands of the cold intermountain basins. Slopes are 2 to 45 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Brown (10YR 4/3W) loamy sand, moist; weak fine and very fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; lime disseminated; moderately alkaline (pH 8.4); noneffervescent, gradual wavy boundary. (4 to 10 inches thick)

C1 - 3 to 15 inches. Yellowish brown (10YR 5/4D) sandy loam, moist; moderate medium and coarse prismatic structure; slightly hard, friable, slightly sticky; few fine and many medium roots; lime disseminated; moderately alkaline (pH 8.3); noneffervescent, abrupt wavy boundary. (16 to 30 inches thick)

C2 - 15 to 29 inches. Light yellowish brown (10YR 6/4D) sandy loam, moderately alkaline (pH 8.4); noneffervescent.

C3k - 29 to 39 inches. Light reddish brown (2.5YR 6/4D) sandy loam, strongly alkaline (pH 8.7); strongly effervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 174 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - Depth to a paralithic contact is 20 to 40 inches. Depth to uniformly calcareous material is 0 to 10 inches. The mean annual soil temperature ranges from about 40 to 47 degrees F., and the mean summer soil temperature ranges from about 59 to 63 degrees F. The control section is very fine sandy loam or fine sandy loam, averaging 10 to 18 percent clay and more than 15 percent fine sand or coarser. Flat fragments or fine pebbles range from 0 to 15

percent. Thin, discontinuous horizons of carbonate accumulation occur immediately above the paralithic contact in some pedons.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. EC is less than 2 mmhos. Reaction is mildly or moderately alkaline.

The C horizon has hue of 2.5Y or 10YR, value of 4 through 7 dry, 3 through 5 moist, and chroma of 2 through 6. EC is less than 2 mmhos. Reaction is moderately or strongly alkaline.

Range in Characteristics (according to field observations, lab analysis): According to the NRCS soil series description, the soils are strongly calcareous for the A and C horizons. Based on field observations, the A, C1, and C2 horizons are noncalcareous.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal pH was found at a depth of 29-39 inches. An estimated stripping depth is 29 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Carmody soils are on plateaus and hillslopes in intermountain basins. Slopes are 2 to 45 percent. The soils formed in calcareous material weathered from semiconsolidated fine grained sandstone or siltstone. The mean annual precipitation ranges from 10 to 17 inches of which about half falls as snow or rain in April, May, and early June. Elevation is 5,300 to 7,500 feet. The mean annual temperature is 39 to 45 degrees F., and the mean summer temperature is 58 to 65 degrees F. The frost-free season is 75 to 120 days depending upon aspect, elevation, and local air drainage.

BLUERIM SERIES
SANDY LOAM

Soil Mapping Unit "Br"
Lab/BKS Sample ID: C07120023_178
Typical Pedon: Bluerim loamy sand-rangeland. The surface is covered with 15 percent very fine pebbles. (Colors are for dry soil unless otherwise stated.)

The Bluerim series consists of moderately deep, well drained soils that formed in material weathered from calcareous sandy shale interbedded with arkosic sandstone. Bluerim soils are on upland hillsides and have slopes of 3 to 20 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A – 0-3 inches. Brown (10YR 4/3) loamy sand, moist; moderate medium and fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; moderately alkaline (pH 8.2), noneffervescent; clear smooth boundary.

Bt – 3-15 inches. Dark yellowish brown (10YR 4/4) sandy loam, light reddish brown (2.5YR 6/3) moist; weak medium prismatic structure that parts to moderate medium angular blocky; hard, friable, sticky and plastic; many fine and medium roots; continuous thin clay films on faces of all peds; 10 percent very fine pebbles; moderately alkaline (pH 8.1), noneffervescent; clear smooth boundary.

Ck – 15-29 inches. Light reddish brown (2.5YR 7/3) loamy sand, moist; moderate medium angular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few medium roots; continuous thin clay films on faces of peds; 10 percent very fine pebbles; strongly alkaline (pH 8.6), strongly effervescent; gradual wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 178 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature ranges from 35 to 47 degrees F., and the mean summer soil temperature ranges from 59 to 62 degrees F. Depth to bedded sandy shale is 20 to 40 inches. The soils commonly are noncalcareous. Calcium carbonate accumulation in the lower part of the C horizon is weak and discontinuous. Very fine pebbles range from 0 to 15 percent throughout.

The A1 horizon has hue of 2.5Y or 10YR, value of 4 or 5 dry, 3 or 4 moist, and chroma of 2 through 4 dry and moist. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.
The Bt2 horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 3 or 4 dry and moist. Texture is sandy clay loam with 20 to 27 percent clay. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.
The C horizon has hue of 5Y through 10YR, value of 4 through 7 dry, 5 or 6 moist, and chroma of 2 through 4. It is sandy loam or sandy clay loam. EC is less than 4 mmhos. Reaction ranges from mildly alkaline through strongly alkaline. Visible accumulation of calcium carbonate is discontinuous.

Range in Characteristics (according to field observations, lab analysis): According to the NRCS soil series description, the soils commonly are noncalcareous. The soil profile based on field observations, the C horizon is strongly calcareous.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal pH was found at a depth of 15-29 inches. An estimated stripping depth is 15 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Bluerim soils are on upland hillsides. Slopes are 3 to 20 percent. The soils formed in residuum weathered from calcareous sandy shales interbedded with arkosic sandstone. Elevation is 6,000 to 7,800 feet. The mean annual temperature is 34 to 45 degrees F. Precipitation is 10 to 14 inches. The growing season is 80 to 120 days but frost may occur in any month.

RELSOB SERIES
SANDY LOAM

Soil Mapping Unit "Re"
Lab/BKS Sample ID: C07120023_183
Typical Pedon: Relsob sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Relsob series consists of deep, well drained soils formed in alluvium derived primarily from noncalcareous sandstone. These soils are on fan aprons and toeslopes of hills and ridges. Slopes are 0 to 15 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 5 inches. Brown (10YR 5/3) sandy loam, moist; moderate medium granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, and common medium roots; strongly alkaline (pH 8.5); noneffervescent; abrupt smooth boundary. (1 to 4 inches thick)

Bt1 - 5 to 18 inches. Yellowish brown (10YR 5/4) sandy loam, moist; moderate medium prismatic structure parting to moderate medium subangular blocky; hard, friable, sticky and plastic; many very fine, fine and common medium roots; common thin clay films on faces of peds and as bridges between sand grains; moderately alkaline (pH 8.1); noneffervescent; clear wavy boundary.

Bt2 - 18 to 34 inches. Light yellowish brown (10YR 6/4) sandy loam, moist; strong medium prismatic structure parting to strong medium subangular blocky; slightly hard, friable, sticky and plastic; common very fine, fine, and medium roots; many moderately thick clay films on faces of peds; 15 percent pebbles; moderately alkaline (pH 8.4); noneffervescent; abrupt wavy boundary. (Combined thickness of Bt horizon is 11 to 17 inches.)

Bt3 - 34 to 43 inches. Light yellowish brown (10YR 6/4) sandy loam, moist; strong medium prismatic structure parting to strong medium subangular blocky; slightly hard, friable, sticky and plastic; common very fine, fine, and medium roots; many moderately thick clay films on faces of peds; 15 percent pebbles; moderately alkaline (pH 8.1); noneffervescent; abrupt wavy boundary. (Combined thickness of Bt horizon is 11 to 17 inches.)

C - 43 to 56 inches. Lightly yellowish brown (10YR 6/4) sandy loam, moist; massive; slightly hard, very friable, nonsticky, nonplastic; few very fine, fine, and medium roots to 28 inches; 40 percent pebbles; moderately alkaline (pH 8.0); noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 183 on map included in this report.
Range in Soil Characteristics (According to Official Series Description) - Depth to the base of the argillic horizon and strongly contrasting coarse material is 12 to 20 inches. These soils are noncalcareous throughout. The mean annual soil temperature ranges from 36 to 46 degrees F., and the mean summer temperature is 59 to 62 degrees F. EC is less than 2 mmhos throughout the soil.

The A horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 or 3. Reaction is neutral through moderately alkaline (pH 6.6-8.0.)

The Bt (argillic) horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry, 4 or 5 moist, and chroma of 2 through 4. Texture is sandy clay loam or gravelly sandy clay loam with clay ranging from 20 to 35 percent, silt from 0 to 28 percent, and sand from 45 to 80 percent. Coarse fragments range from 0 to 20 percent and are fine or very fine pebbles. Reaction is neutral or mildly alkaline.

The 2C horizon has hue of 2.5Y through 7.5YR, value of 5 through 8 dry, 4 through 7 moist, and chroma of 2 through 6. Texture of the matrix is sand or loamy sand modified with 0 to 60 percent fine pebbles. Reaction is neutral through moderately alkaline.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class - Fine-loamy over sandy or sandy-skeletal, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) – Marginal pH was found at a depth of 0-5 inches. An estimated stripping depth is 0 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Relsob soils are on relict fan aprons and toeslopes of hills and ridges. These soils formed in alluvium derived primarily from noncalcareous sandstone. The finer sediments overlie strata of sand or gravel and sand mixtures. Slopes are 0 to 15 percent and typically simple. Elevation is 6,000 to 7,600 feet. The mean annual precipitation is about 12 inches and ranges from 10 to 14 inches with about half falling as snow or rain in April, May, and early June. The mean annual temperature is about 41 degrees F. and ranges from about 34 to 45 degrees

F. The frost-free season is estimated at 80 to 110 days; but, because of elevation, aspect, and air drainage, frost may occur at any time.

ONASON SERIES
SANDY LOAM

Soil Mapping Unit "O"
Lab/BKS Sample ID: C07120023_186
Typical Pedon: Onason loamy sand - rangeland. (Colors are for dry soil unless otherwise stated.)

The Onason series consists of well drained soils that are shallow and very shallow to soft sandstone. These soils formed in residuum and slopewash alluvium weathered from the underlying bedrock. Onason soils are on footslopes, backslopes, and shoulders of hills and ridges. Slopes range from 5 to 45 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-2 inches. Brown (10YR 5/3) loamy sand, moist; weak very fine granular structure; slightly hard, very friable, nonsticky and nonplastic; many fine and few medium roots; 15 percent semirounded pebbles; strongly alkaline (pH 8.6), noneffervescent; clear smooth boundary.

C - 2-10 inches. Yellowish brown (10YR 5/4) loamy sand, moist; weak medium and coarse granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many fine and few medium roots; 15 percent semirounded pebbles; moderately alkaline (pH 8.4), noneffervescent; gradual wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 186 on map included in this report.

Range in Soil Characteristics(According to official series description) - Depth to the paralithic contact and bedrock ranges from 4 to 20 inches. These soils are noncalcareous throughout. The mean annual soil temperature is 36 to 45 degrees F., and the mean summer soil temperature is 59 to 62 degrees F. The particle size control section averages gravelly sandy loam or sandy loam throughout. Clay ranges from 8 to 18 percent and rock fragments of fine or very fine semirounded pebbles range from 0 to 35 percent. EC is less than 2 mmhos throughout.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Lag gravel covering up to 75 percent of the surface is common in some pedons. Reaction is neutral or mildly alkaline.
The C horizon has hue of 2.5Y or 10YR, value of 5 or 6 dry, 4 through 6 moist, and chroma of 2 through 4. A thin Bw horizon is present in some pedons. Reaction is neutral or mildly alkaline.

The Cr horizon consists of soft, noncalcareous, coarse- and medium-grained sandstone interbedded with thin lenses of shale and siltstone. The yellowish brown or brown sandstone may have discontinuous lenses of hard sandstone or shale in some pedons. The soil-bedrock interface is considered a paralithic contact and roots plane out at the contact.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class (According to official series description) - Loamy, mixed, superactive, nonacid, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal pH was found at a depth of 0-2 inches. An estimated stripping depth is 0 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Onason soils are on footslopes, backslopes, and shoulders of rolling and steep hills and ridges. These soils formed in residuum and slopewash alluvium weathered from the underlying noncalcareous sandstone. Slopes range from 5 to 45 percent. Elevations are 6,000 to 7,600 feet. The climate is cool, semiarid with moist springs and dry summers. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 34 to 44 degrees F. The estimated frost-free season is about 80 to 110 days, but frost may occur in any month.

ONASON SERIES
GRAVELLY SANDY LOAM

Soil Mapping Unit "O"
Lab/BKS Sample ID: C07120023_187
Typical Pedon: Onason sandy loam - rangeland. (Colors are for dry soil unless otherwise stated.)

The Onason series consists of well drained soils that are shallow and very shallow to soft sandstone. These soils formed in residuum and slopewash alluvium weathered from the underlying bedrock. Onason soils are on footslopes, backslopes, and shoulders of hills and ridges. Slopes range from 5 to 45 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-2 inches. Brown (10YR 5/3) sandy loam, moist; weak very fine granular structure; slightly hard, very friable, nonsticky and nonplastic; many fine and few medium roots; 15 percent semirounded pebbles; strongly alkaline (pH 8.5), noneffervescent; clear smooth boundary.

C - 2-10 inches. Yellowish brown (10YR 5/4) loamy sand, moist; weak medium and coarse granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many fine and few medium roots; 15 percent semirounded pebbles; strongly alkaline (pH 8.6), noneffervescent; gradual wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 187 on map included in this report.

Range in Soil Characteristics(According to official series description) - Depth to the paralithic contact and bedrock ranges from 4 to 20 inches. These soils are noncalcareous throughout. The mean annual soil temperature is 36 to 45 degrees F., and the mean summer soil temperature is 59 to 62 degrees F. The particle size control section averages gravelly sandy loam or sandy loam throughout. Clay ranges from 8 to 18 percent and rock fragments of fine or very fine semirounded pebbles range from 0 to 35 percent. EC is less than 2 mmhos throughout.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Lag gravel covering up to 75 percent of the surface is common in some pedons. Reaction is neutral or mildly alkaline.
The C horizon has hue of 2.5Y or 10YR, value of 5 or 6 dry, 4 through 6 moist, and chroma of 2 through 4. A thin Bw horizon is present in some pedons. Reaction is neutral or mildly alkaline.

The Cr horizon consists of soft, noncalcareous, coarse- and medium-grained sandstone interbedded with thin lenses of shale and siltstone. The yellowish brown or brown sandstone may have discontinuous lenses of hard sandstone or shale in some pedons. The soil-bedrock interface is considered a paralithic contact and roots plane out at the contact.

Range in Characteristics (according to field observations, lab analysis): Lab texture for the A horizon is coarser than typical for the map unit.

Taxonomic Class (According to official series description) - Loamy, mixed, superactive, nonacid, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal pH was found at depths of 0-2 and 2-10 inches. An estimated stripping depth is 0 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Onason soils are on footslopes, backslopes, and shoulders of rolling and steep hills and ridges. These soils formed in residuum and slopewash alluvium weathered from the underlying noncalcareous sandstone. Slopes range from 5 to 45 percent. Elevations are 6,000 to 7,600 feet. The climate is cool, semiarid with moist springs and dry summers. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 34 to 44 degrees F. The estimated frost-free season is about 80 to 110 days, but frost may occur in any month.

BLUERIM SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Br-NC"
Lab/BKS Sample ID: C07120023_189
Typical Pedon: Bluerim noncalcareous variant-rangeland. The surface is covered with 15 percent very fine pebbles. (Colors are for dry soil unless otherwise stated.)

The Bluerim noncalcareous variant series consists of moderately deep, well drained soils that formed in material weathered from calcareous sandy shale interbedded with arkosic sandstone. Bluerim soils are on upland hillsides and have slopes of 3 to 20 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A – 0-3 inches. Brown (10YR 5/3) sandy loam, moist; moderate medium and fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; moderately alkaline (pH 8.2), noneffervescent; clear smooth boundary.

Bt – 3-12 inches. Brown (10YR 5/3) sandy loam, moist; weak medium prismatic structure that parts to moderate medium angular blocky; hard, friable, sticky and plastic; many fine and medium roots; continuous thin clay films on faces of all peds; 10 percent very fine pebbles; moderately alkaline (pH 8.0), noneffervescent; clear smooth boundary.

BC – 12-18 inches. Brown (10YR 5/3) loamy sand, moist; moderate medium angular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few medium roots; continuous thin clay films on faces of peds; 10 percent very fine pebbles; moderately alkaline (pH 8.0), noneffervescent; gradual wavy boundary.

C - 18 to 32 inches. Grayish brown (10YR 5/2) loamy sand, moist; weak medium angular blocky structure; slightly hard, very friable, slightly sticky and nonplastic; few medium roots; few thin clay films on faces of some peds; 10 percent very fine pebbles; moderately alkaline (pH 8.1); noneffervescent; clear smooth boundary. (4 to 7 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 189 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature ranges from 35 to 47 degrees F., and the mean summer soil

temperature ranges from 59 to 62 degrees F. Depth to bedded sandy shale is 20 to 40 inches. The soils commonly are noncalcareous. Calcium carbonate accumulation in the lower part of the C horizon is weak and discontinuous. Very fine pebbles range from 0 to 15 percent throughout.
The A1 horizon has hue of 2.5Y or 10YR, value of 4 or 5 dry, 3 or 4 moist, and chroma of 2 through 4 dry and moist. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.

The Bt2 horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 3 or 4 dry and moist. Texture is sandy clay loam with 20 to 27 percent clay. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.
The C horizon has hue of 5Y through 10YR, value of 4 through 7 dry, 5 or 6 moist, and chroma of 2 through 4. It is sandy loam or sandy clay loam. EC is less than 4 mmhos. Reaction ranges from mildly alkaline through strongly alkaline. Visible accumulation of calcium carbonate is discontinuous.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 18 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Bluerim soils are on upland hillsides. Slopes are 3 to 20 percent. The soils formed in residuum weathered from calcareous sandy shales interbedded with arkosic sandstone. Elevation is 6,000 to 7,800 feet. The mean annual temperature is 34 to 45 degrees F. Precipitation is 10 to 14 inches. The growing season is 80 to 120 days but frost may occur in any month.

GRIEVES SERIES
SANDY LOAM

Soil Mapping Unit "Gr" (Inclusion)
Lab/BKS Sample ID: C07120023_190
Typical Pedon: Grieves sandy loam – rangeland. (Colors are for dry soil unless otherwise stated.)

The Grieves series consists of very deep, well drained and somewhat excessively drained soils that formed in locally transported calcareous materials weathered from sandstone. Grieves soils are on fans, footslopes and toeslopes. Slopes range from 0 to 40 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Grayish brown (10YR 5/2) sandy loam, moist; moderate very fine granular structure; soft, very friable, slightly sticky, slightly plastic; many very fine, fine, and medium roots; moderately alkaline (pH 7.9); noneffervescent; clear wavy boundary. (2 to 5 inches thick)

AC - 3 to 13 inches. Pale brown (10YR 6/3) sandy loam, moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine, fine and medium roots to 12 inches; moderately alkaline (pH 8.2); noneffervescent; gradual wavy boundary. (0 to 8 inches thick)

C1 - 13 to 27 inches. Pale brown (10YR 6/3) sandy loam, moist; massive; soft, very friable, slightly sticky, slightly plastic; common very fine, fine, and medium roots to 35 inches; few very fine, fine, and medium roots to 60 inches; slightly alkaline (pH 7.4); strongly effervescent.

C2 - 27 to 54 inches. Pale brown (10YR 6/3) loamy sand, moist; massive; soft, very friable, slightly sticky, slightly plastic; common very fine, fine, and medium roots to 35 inches; few very fine, fine, and medium roots to 60 inches; slightly alkaline (pH 7.5); strongly effervescent.

C3 - 54 to 60 inches. Pale brown (10YR 6/3) loamy sand, moist; massive; soft, very friable, slightly sticky, slightly plastic; common very fine, fine, and medium roots to 35 inches; few very fine, fine, and medium roots to 60 inches; slightly alkaline (pH 7.5); strongly effervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 190 on map included in this report.

Range in Characteristics (According to Official Series Description) –
The mean annual soil temperature is about 43 degrees to 46 degrees F. The mean summer soil temperature is about 59 degrees to 62 degrees F. The control section is sandy loam or fine sandy loam averaging between 10 to 18 percent clay. Gravel ranges from 0 to 15 percent; up to 10 percent cobblestones are found in the very lower part of the control section.

The A horizon has hue of 2.5Y or 10YR; value of 5 or 6 dry, 3 through 5 moist; and chroma of 2 through 4. It is mildly or moderately alkaline. A Bw horizon is lacking in some pedons.
The C horizon has hue of 2.5Y or 10YR, value of 6 through 8, 4 or 5 moist, and chroma of 2 through 4. It is moderately or strongly alkaline.

Range in Characteristics (according to field observations, lab analysis): According to the NRCS soil series description, the soils are strongly calcareous. The soil profile based on field observations, the A horizon is noncalcareous.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) – No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 13 inches due to the change in effervescent at the C horizon.

Geographic Setting (According to Official Series Description) - Grieves soils are on nearly level to sloping alluvial fans, footslopes or toeslopes. Slopes are 0 to 40 percent. They formed in locally transported calcareous materials weathered from sandstone or sandstone interbedded with shale. Elevation is 5800 to 7,200 feet. The mean annual precipitation is 9 to 14 inches, which occurs mainly in the winter and spring. The mean annual air temperature is 39 degrees to 45 degrees F. The mean summer temperature is 58 degrees to 65 degrees F. The frost-free season is 60 to 100 days.

LECKMAN SERIES

Soil Mapping Unit "L"
Lab/BKS Sample ID: G07120056_2
Typical Pedon: Leckman loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Leckman series consists of very deep, well drained soils formed in alluvium. Leckman soils are on alluvial fans and toeslopes and have slopes of 0 to 10 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-5 inches. Light grayish brown (10YR 6/2) loam, moist; weak medium platy structure breaks to weak fine crumbs; soft, very friable, nonsticky, nonplastic; neutral (pH 6.8), noneffervescent.

C1 – 5-15 inches. Light grayish brown (10YR 6/2) loam, moist; weak coarse and medium prismatic structure that parts to weak medium subangular blocks; soft, very friable, nonsticky, nonplastic; slightly alkaline (pH 7.6), moderately effervescent.

C2 – 15-29 inches. Light grayish brown (10YR 6/2) sandy loam, moist; massive, soft very friable nonsticky, nonplastic, slightly alkaline (pH 7.8), moderately effervescent.

C3 – 29-48 inches. Light grayish brown (10YR 6/2) sandy loam, moist; massive, soft very friable nonsticky, nonplastic, moderately alkaline (pH 8.0), noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 2 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature is about 43 to 47 degrees F. The mean summer soil temperature is 64 to 67 degrees F. Textures throughout the profile are fine sandy loam or sandy loam. Gravel content is generally less than 5 percent but can range from 0 to 15 percent.

The A horizons have hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4.

The C horizon has hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4. Reaction is moderately or strongly alkaline. Effervescence may be slight to violent.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A and C3 horizons and is moderately calcareous in the C1 and C2 horizons. According to the NRCS soil series description, the soil profile is slightly calcareous in the A horizon and is strongly calcareous in the remaining horizons.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Typic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 5 inches due to the change in effervescent at the C1 horizon.

Geographic Setting (According to Official Series Description) - Leckman soils are on alluvial fans and toe slopes of escarpments. Slopes are 0 to 10 percent. The soils formed in alluvium. Elevation is 6,000 to 7,000 feet. The mean annual precipitation is 7 to 9 inches. The mean annual air temperature is 37 to 44 degrees F. The frost-free season is 80 to 110 days.

BLUERIM SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Br-NC"
Lab/BKS Sample ID: G07120056_7
Typical Pedon: Bluerim noncalcareous variant-rangeland. The surface is covered with 15 percent very fine pebbles. (Colors are for dry soil unless otherwise stated.)

The Bluerim noncalcareous variant series consists of moderately deep, well drained soils that formed in material weathered from calcareous sandy shale interbedded with arkosic sandstone. Bluerim soils are on upland hillsides and have slopes of 3 to 20 percent. The mean annual precipitation is 8 to 10 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A – 0-3 inches. Brown (10YR 5/3) loam, moist; moderate medium and fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; moderately acid (pH 5.7), noneffervescent; clear smooth boundary.

Bt1 – 3-12 inches. Brown (10YR 5/3) loam, moist; weak medium prismatic structure that parts to moderate medium angular blocky; hard, friable, sticky and plastic; many fine and medium roots; continuous thin clay films on faces of all peds; 10 percent very fine pebbles; neutral (pH 7.0), noneffervescent; clear smooth boundary.

Bt2 – 12-20 inches. Brown (10YR 5/3) loam, moist; moderate medium angular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few medium roots; continuous thin clay films on faces of peds; 10 percent very fine pebbles; neutral (pH 7.2), noneffervescent; gradual wavy boundary.

C – 20-30 inches. Light olive brown (2.5Y 5/4) sandy loam, moist; neutral (pH 7.2), noneffervescent; gradual wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 7 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature ranges from 35 to 47 degrees F., and the mean summer soil temperature ranges from 59 to 62 degrees F. Depth to bedded sandy shale is 20 to 40 inches. The soils commonly are noncalcareous. Calcium carbonate accumulation in the lower part of the C horizon is weak and discontinuous. Very fine pebbles range from 0 to 15 percent throughout.

The A1 horizon has hue of 2.5Y or 10YR, value of 4 or 5 dry, 3 or 4 moist, and chroma of 2 through 4 dry and moist. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.

The Bt2 horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 3 or 4 dry and moist. Texture is sandy clay loam with 20 to 27 percent clay. EC is less than 2 mmhos. Reaction is neutral or mildly alkaline.

The C horizon has hue of 5Y through 10YR, value of 4 through 7 dry, 5 or 6 moist, and chroma of 2 through 4. It is sandy loam or sandy clay loam. EC is less than 4 mmhos. Reaction ranges from mildly alkaline through strongly alkaline. Visible accumulation of calcium carbonate is discontinuous.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 20 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Bluerim soils are on upland hillsides. Slopes are 3 to 20 percent. The soils formed in residuum weathered from calcareous sandy shales interbedded with arkosic sandstone. Elevation is 6,000 to 7,800 feet. The mean annual temperature is 34 to 45 degrees F. Precipitation is 10 to 14 inches. The growing season is 80 to 120 days but frost may occur in any month.

ONASON SERIES

Soil Mapping Unit "O"
Lab/BKS Sample ID: G07120056_9
Typical Pedon: Onason sandy loam - rangeland. (Colors are for dry soil unless otherwise stated.)

The Onason series consists of well drained soils that are shallow and very shallow to soft sandstone. These soils formed in residuum and slopewash alluvium weathered from the underlying bedrock. Onason soils are on footslopes, backslopes, and shoulders of hills and ridges. Slopes range from 5 to 45 percent. The mean annual precipitation is 8 to 10 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-2 inches. Brown (10YR 5/3) sandy loam, moist; weak very fine granular structure; slightly hard, very friable, nonsticky and nonplastic; many fine and few medium roots; 15 percent semirounded pebbles; moderately acid (pH 5.8), noneffervescent; clear smooth boundary.

AC – 2-10 inches. Yellowish brown (10YR 5/4) sandy loam, moist; weak medium and coarse granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many fine and few medium roots; 15 percent semirounded pebbles; neutral (pH 6.6), noneffervescent; gradual wavy boundary.

C1 – 10-16 inches. Light yellowish brown (2.5Y 6/4) sandy clay loam, moist; massive; soft, very friable, nonsticky and nonplastic; many fine and few medium roots; 15 percent semirounded pebbles; neutral (pH 6.6); noneffervescent; abrupt wavy boundary. (3 to 14 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 9 on map included in this report.

Range in Soil Characteristics(According to official series description) - Depth to the paralithic contact and bedrock ranges from 4 to 20 inches. These soils are noncalcareous throughout. The mean annual soil temperature is 36 to 45 degrees F., and the mean summer soil temperature is 59 to 62 degrees F. The particle size control section averages gravelly sandy loam or sandy loam throughout. Clay ranges from 8 to 18 percent and rock fragments of fine or very fine semirounded pebbles range from 0 to 35 percent. EC is less than 2 mmhos throughout.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Lag gravel covering up to 75 percent of the surface is common in some pedons. Reaction is neutral or mildly alkaline.

The C horizon has hue of 2.5Y or 10YR, value of 5 or 6 dry, 4 through 6 moist, and chroma of 2 through 4. A thin Bw horizon is present in some pedons. Reaction is neutral or mildly alkaline.

The Cr horizon consists of soft, noncalcareous, coarse- and medium-grained sandstone interbedded with thin lenses of shale and siltstone. The yellowish brown or brown sandstone may have discontinuous lenses of hard sandstone or shale in some pedons. The soil-bedrock interface is considered a paralithic contact and roots plane out at the contact.

Range in Characteristics (according to field observations, lab analysis): There were no variations from the typical soil profile according to lab analysis and field observations.

Taxonomic Class (According to official series description): Loamy, mixed, superactive, nonacid, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1): No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 10 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Onason soils are on footslopes, backslopes, and shoulders of rolling and steep hills and ridges. These soils formed in residuum and slopewash alluvium weathered from the underlying noncalcareous sandstone. Slopes range from 5 to 45 percent. Elevations are 6,000 to 7,600 feet. The climate is cool, semiarid with moist springs and dry summers. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 34 to 44 degrees F. The estimated frost-free season is about 80 to 110 days, but frost may occur in any month.

BLACKHALL SERIES

Soil Mapping Unit "Bl"
Lab/BKS Sample ID: G07120056_10
Typical Pedon: Blackhall sandy clay loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Blackhall series consists of very shallow and shallow, well drained soils that formed in material weathered from sandstone. Blackhall soils are on hills and ridges. Slopes are 3 to 65 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual air temperature is about 38 degrees F.

A - 0-4 inches. Light yellowish brown (2.5Y 6/3) sandy clay loam, moist; moderate very fine granular structure; soft, very friable; few soft sandstone fragments; neutral (pH 6.8), noneffervescent.

AC - 4-14 inches. Light yellowish brown (2.5Y 6/3) clay - clay loam, moist moderate very fine granular structure; soft, very friable; few soft sandstone fragments; slightly alkaline (pH 7.7), noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 10 on map included in this report.

Range in Soil Characteristics (According to official series description) - Depth to a paralithic contact and bedrock is 6 to 20 inches. The mean annual soil temperature is about 40 to 45 degrees F., and the mean summer soil temperature is about 59 to 66 degrees F. The control section averages 5 to 18 percent clay and has more than 35 percent fine or coarser sand. Sandstone fragments range from 0 to 35 percent and are less than 3 inches in diameter. Textures are sandy loam, fine sandy loam, or very fine sandy loam. The moisture control section is usually dry, but is moist in April, May, and early June.

The A horizon has hue of 2.5Y or 10YR, value of 5 or 7 dry, 3 through 6 moist, and chroma of 2 through 6. It is neutral through moderately alkaline.

The C horizon has hue of 5Y through 10YR, value of 5 through 7 dry, 3 through 6 moist, and chroma of 2 through 6. It is mildly through strongly alkaline. A Bk or Bw horizon may be present but is nondiagnostic.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A and AC horizons. According to the NRCS soil series

description, the soil profile is slightly calcareous in the A horizon and is strongly calcareous in the remaining horizons.

Taxonomic Class - Loamy, mixed, superactive, calcareous, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal texture was found at a depth of 4-14 inches. An estimated stripping depth is 4 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Blackhall soils are on hills and ridges Slopes are 3 to 65 percent. These soils formed in colluvium, alluvium and residuum weathered from sandstone. Elevations are 4200 to 7,800 feet. The mean annual precipitation ranges from 10 to 14 inches of which half falls as snow and rain during April, May, and June. The mean annual temperature is about 39 to 45 degrees F., and the mean summer temperature is 58 to 65 degrees F. The frost-free season is 60 to 110 days.

DIAMONDVILLE SERIES

Soil Mapping Unit "D"
Lab/BKS Sample ID: G07120056_11
Typical Pedon: Diamondville sandy clay loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Diamondville series consists of moderately deep, well drained soils that formed in alluvium and residuum weathered from calcareous loamstone and sandstone. Diamondville soils are on fan remnants, plateaus, hills and ridges of cold intermountain basins and have slopes of 0 to 15 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-4 inches. Light brownish gray (10YR 6/2) sandy clay loam, moist; strong fine granular structure; soft, very friable, slightly sticky and slightly plastic; slightly acid (pH 6.5), noneffervescent; clear smooth boundary.

Bt1 - 4-11 inches. Brown (10YR 5/3) clay loam, moist; moderate fine subangular blocky parting to fine granular structure; slightly hard, very friable, slightly sticky and slightly plastic; few faint clay films on faces of some peds; 2 percent gravel; neutral (pH 6.8), noneffervescent; clear smooth boundary.

Bt2 – 11-17 inches. Brown (10YR 5/3) clay loam, moist; moderate medium prismatic structure parting to moderate medium subangular blocky; hard, very friable, sticky and plastic; many prominent clay films on faces of peds and in root channels; neutral (pH 7.3), noneffervescent; gradual wavy boundary.

Btk - 17-24 inches. Brown (10YR 5/3) clay, moist; weak medium subangular blocky structure; hard, friable, sticky and plastic; common distinct clay films on faces of peds and on inside of root channels; common distinct soft, rounded masses, seams, and threads of secondary calcium carbonate; slightly alkaline (pH 7.7), strongly effervescent.

Ck - 24-32 inches. Light yellowish brown (2.5Y 6/3) clay, moist; massive structure; soft, friable, nonsticky, nonplastic; moderately alkaline (pH 7.9), strongly effervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 11 on map included in this report.

Range in Soil Characteristics (According to official series description) - Depth to a paralithic contact is 20 to 40 inches. Depth to uniformly calcareous material ranges from 3 to 20 inches. The mean annual soil temperature ranges from 40 to 47 degrees F. The

mean summer soil temperature ranges from 59 to 66 degrees F. Rock fragments range from 0 to 15 percent and are either gravel or channers.

The A horizon has hue of 5Y through 7.5YR, value of 4 to 6 dry, 3 to 6 moist, and chroma of 2 or 3. It is neutral through moderately alkaline.

The Bt horizon has hue of 5Y through 7.5YR, value of 4 to 6 dry, 4 or 5 moist, and chroma of 2 to 4. It is loam, clay loam, or sandy clay loam, averaging 18 to 35 percent clay and less than 35 percent fine or coarser sand. It is neutral through moderately alkaline.

The Bk horizon has hue of 5Y through 7.5YR, value of 5 to 8 dry, 4 to 7 moist, and chroma of 2 through 4. It is clay loam, loam, or sandy clay loam. Calcium carbonate equivalent ranges from 4 to 14 percent. This horizon is moderately or strongly alkaline. In some pedons the Bk horizon has textures of fine sandy loam or very fine sandy loam.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A, Bt1, and Bt2 horizons and strongly calcareous in Btk and Ck. According to the NRCS soil series description, the soil profile is strongly to violently calcareous in the B horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil - Marginal texture was found at depths of 17-24 and 24-32 inches. An estimated stripping depth is 17 inches based on laboratory analysis.

Geographic Setting (According to official series description) - Diamondville soils are on fan remnants, plateaus, hills and ridges of cold intermountain basins. Slopes are 0 to 15 percent. The soils formed in material weathered from soft, calcareous loamstone and sandstone. Elevations are 4,600 to 7,500 feet. The mean annual precipitation is 10 to 15 inches of which about half occurs mainly in the spring. The mean annual temperature is about 39 to 45 degrees F., and the mean summer temperature is 58 to 65 degrees F. The frost-free season is 80 to 120 days.

ROCK RIVER SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "RR-NC" (Inclusion)
Lab/BKS Sample ID: G07120056_14
Typical Pedon: Rock River noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Rock River noncalcareous variant series consists of very deep, well drained soils that formed in calcareous alluvium derived mainly from sandstone, eolian deposits, and residuum. Rock River soils are on alluvial fan aprons, relict terraces, benches, hillslopes, and areas of valley fill. Slopes are 0 to 25 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 4 inches. Light brownish gray (10YR 6/2) silty loam, moist; hard crust that parts to weak fine granular; hard, very friable, slightly sticky and slightly plastic; many fine and medium roots; slightly acid (pH 6.1); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

B1 - 4 to 11 inches. Yellowish brown (10YR 5/4) sandy loam, moist; weak medium prismatic structure parting to moderate medium angular blocky; hard, firm sticky and plastic; few fine and many medium roots; continuous thin clay films on faces of peds; neutral (pH 6.9); noneffervescent; clear smooth boundary.

B2 - 11 to 18 inches. Yellowish brown (10YR 5/4) sandy loam, moist; moderate medium prismatic structure parting to moderate fine and medium angular blocky; hard, firm, sticky and plastic; few coarse roots; continuous, thin clay films on faces of peds; neutral (pH 6.7); noneffervescent; clear smooth boundary. (The Bt horizon is 8 to 20 inches thick.)

C1 - 18 to 38 inches. Yellowish brown (10YR 5/4) loamy sand, moist; weak medium angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common thin clay films on faces of peds; lime as many fine and medium soft masses and threads; 10 percent pebbles 1/4 to 3/4 inch in diameter; neutral (pH 7.2); strong effervescent; clear smooth boundary. (0 to 8 inches thick)

C2 - 38 to 60 inches. Light brownish gray (10YR 6/2) sandy loam, moist; massive; soft, very friable, nonsticky and nonplastic; lime as many soft masses; many fine soft masses and threads of secondary calcium carbonate; 15 percent lime-coated angular gravel 1/4 to 3/4 inch in diameter; slightly alkaline (pH 7.6); strong effervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 14 on map included in this report.
Range in Soil Characteristics (According to Official Series Description) - Depth to continuous horizons of calcium carbonate accumulation is 13 to 30 inches. Depth to the base of the argillic horizon is 12 to 34 inches. The mean annual soil temperature ranges from 43 to 46 degrees F., and the mean summer soil temperature ranges from 59 to 65 degrees F. EC is less than 4 mmhos throughout. The rock fragments in the soil are less than 3/4 inch in diameter.

The A horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Reaction is neutral through moderately alkaline.

The Bt horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 2 through 6. Texture is sandy clay loam or gravelly sandy clay loam, averaging 20 to 35 percent clay and has more than 35 percent fine or coarser sand. Rock fragments range from 0 to 25 percent pebbles. Reaction is neutral through moderately alkaline.

The Bk horizon has hue of 2.5Y through 7.5YR, value of 5 through 8 dry, 4 through 7 moist, and chroma of 2 through 6. Texture is sandy clay loam, sandy loam, or fine sandy loam modified with from 0 to 30 percent pebbles. Some pedons have textures of loamy sand or coarser below 40 inches. It has accumulation of secondary calcium carbonate that ranges from 1 through 14 percent. Reaction is moderately or strongly alkaline. Some pedons have a C horizon.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A, B1, and B2 horizons and strongly calcareous in C1 and C2. According to the NRCS soil series description, the soil profile is strongly to violently calcareous in the B horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 18 inches due to the change in effervescent in the C horizon.

Geographic Setting (According to Official Series Description): Rock River soils are on alluvial fans, fan aprons, benches, hillslopes, and toeslopes. The soils formed in material weathered from calcareous sandstone, eolian deposits, and residuum. Slopes are 0 to 25 percent. Elevation is 5,900 to 7,800 feet. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The

mean annual temperature is about 41 to 45 degrees F., and the mean summer temperature is 59 to 63 degrees F. The frost-free season is about 75 to 110 days but varies according to aspect, elevation, and air drainage.

CARMODY SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Ca-NC"
Lab/BKS Sample ID: G07120056_15
Typical Pedon: Carmody sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Carmody series consists of well to somewhat excessively drained soils that are moderately deep to siltstone. These soils formed in material weathered from calcareous siltstone or fine grained sandstone. Carmody soils are on uplands of the cold intermountain basins. Slopes are 2 to 45 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Light brownish gray (10YR 6/2) sandy loam, moist; weak fine and very fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; lime disseminated; slightly acid (pH 6.3); noneffervescent, gradual wavy boundary. (4 to 10 inches thick)

C1 - 3 to 18 inches. Light brownish gray (10YR 6/2) sand, moist; moderate medium and coarse prismatic structure; slightly hard, friable, slightly sticky; few fine and many medium roots; lime disseminated; neutral (pH 6.9); noneffervescent, abrupt wavy boundary. (16 to 30 inches thick)

C2 - 18 to 29 inches. Light brownish gray to white, calcareous siltstone containing sand, slightly alkaline (pH 7.6); noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 15 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - Depth to a paralithic contact is 20 to 40 inches. Depth to uniformly calcareous material is 0 to 10 inches. The mean annual soil temperature ranges from about 40 to 47 degrees F., and the mean summer soil temperature ranges from about 59 to 63 degrees F. The control section is very fine sandy loam or fine sandy loam, averaging 10 to 18 percent clay and more than 15 percent fine sand or coarser. Flat fragments or fine pebbles range from 0 to 15 percent. Thin, discontinuous horizons of carbonate accumulation occur immediately above the paralithic contact in some pedons.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. EC is less than 2 mmhos. Reaction is mildly or moderately alkaline.
The C horizon has hue of 2.5Y or 10YR, value of 4 through 7 dry, 3 through 5 moist, and chroma of 2 through 6. EC is less than 2 mmhos. Reaction is moderately or strongly alkaline.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A and C horizons. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 3 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Carmody soils are on plateaus and hillslopes in intermountain basins. Slopes are 2 to 45 percent. The soils formed in calcareous material weathered from semiconsolidated fine grained sandstone or siltstone. The mean annual precipitation ranges from 10 to 17 inches of which about half falls as snow or rain in April, May, and early June. Elevation is 5,300 to 7,500 feet. The mean annual temperature is 39 to 45 degrees F., and the mean summer temperature is 58 to 65 degrees F. The frost-free season is 75 to 120 days depending upon aspect, elevation, and local air drainage.

CRAGOSEN SERIES
GRAVELLY SANDY LOAM

Soil Mapping Unit "Cr"
Lab/BKS Sample ID: G07120056_17
Typical Pedon: Cragosen sandy clay loam -rangeland. (Colors are for dry soil unless otherwise stated.)

The Cragosen series consists of shallow, well drained soils that have bedrock at less than 20 inches. The soils formed in slopewash alluvium on fan aprons, footslopes, and shoulder, ridge, and hill crests. Slopes are from 0 to 60 percent and are both simple and complex. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 4 inches. Pale brown (10YR 6/3) sandy clay loam, moist; moderate fine granular structure; soft, very friable, slightly sticky and slightly plastic; lime disseminated and as coatings on undersides of rock fragments; 25 percent pebbles and 10 percent cobbles; neutral (pH 6.8); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

AC - 4 to 9 inches; brown (10YR 5/3) sandy clay loam, moist; slightly hard, very friable, slightly sticky and slightly plastic; lime disseminated and as thin coatings on all surfaces of rock fragments; 35 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.6); strongly effervescent; clear wavy boundary. (4 to 14 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 17 on map included in this report.

Range in Characteristics (According to Official Series Description) - Depth to bedrock ranges from 6 to 20 inches. Depth to uniformly calcareous material ranges from 0 to 6 inches. The mean annual soil temperature is about 44 degrees F. and ranges from 40 to 46 degrees F. The mean annual summer soil temperature ranges from 59 to 63 degrees F. EC ranges from 0 to 4 mmhos throughout the soil. Exchangeable sodium is estimated to be between 0 and 12 percent. The particle size control section matrix is loam, sandy loam, or sandy clay loam with 15 to 25 percent clay and 30 to 60 percent sand with 15 percent or more fine sand or coarser. Rock fragment content of the control section ranges from 25 to 45 percent pebbles and 5 to 15 percent cobble and averages over 35 percent.

The A horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction is neutral through strongly alkaline. Neutral and mildly alkaline reactions occur in the presence of gypsum that acts as a buffering agent.

The C or Bk horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction ranges from mildly through strongly alkaline. The mildly alkaline reaction occurs in the presence of gypsum. A Bw or Bk horizon may replace part or all of the C horizon but is not diagnostic of either a cambic or calcic horizon. The carbonate movement, while common in some pedons, is not consistent and, though pedogenic, does not meet the requirement for a diagnostic horizon.

The 2Cr horizon consists of varicolored shales interbedded with semiconsolidated siltstone and sandstone. The material is soft with thin, discontinuous lenses of consolidated rock.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A horizon. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons. Lab texture for the A horizon is coarser than typical for the map unit.

Taxonomic Class - Loamy-skeletal, mixed, superactive, calcareous, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 4 inches due to the change in effervescent in the AC horizon.

Geographic Setting (According to Official Series Description) - The Cragosen soils are on fan aprons, footslopes, shoulders, and crests of ridges and hills. These soils formed in slopewash alluvium over sandstone controlled uplands. Slopes range from 0 to 60 percent and are both simple and complex. Elevations range from 6,000 to 7,800 feet. The mean annual precipitation is about 12 inches but ranges from 9 to 14 inches with about half falling as snow and rain during April, May, and June. The mean annual temperature is about 40 degrees F. but ranges from 39 to 44 degrees F. The frost-free season is estimated to range from 60 to 100 days depending upon elevation, aspect, and air drainage.

CARMODY SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Ca-NC"
Lab/BKS Sample ID: G07120056_19
Typical Pedon: Carmody noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Carmody noncalcareous variant series consists of well to somewhat excessively drained soils that are moderately deep to siltstone. These soils formed in material weathered from calcareous siltstone or fine grained sandstone. Carmody soils are on uplands of the cold intermountain basins. Slopes are 2 to 45 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 6 inches. Light brownish gray (10YR 6/2) sandy loam, moist; weak fine and very fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; lime disseminated; slightly acid (pH 6.4); noneffervescent, gradual wavy boundary. (4 to 10 inches thick)

C1 - 6 to 14 inches. Light brownish gray (10YR 6/2) sandy loam, moist; moderate medium and coarse prismatic structure; slightly hard, friable, slightly sticky; few fine and many medium roots; lime disseminated; neutral (pH 7.2); noneffervescent, abrupt wavy boundary. (16 to 30 inches thick)

C2 - 14 to 20 inches. Light brownish gray to white, calcareous siltstone containing sandy loam, slightly alkaline (pH 7.6); noneffervescent.

C3 - 20 to 31 inches. Light brownish gray to white, calcareous siltstone containing loamy sand, slightly alkaline (pH 7.8); noneffervescent.

Type Location - 19

Range in Soil Characteristics (According to Official Series Description) - Depth to a paralithic contact is 20 to 40 inches. Depth to uniformly calcareous material is 0 to 10 inches. The mean annual soil temperature ranges from about 40 to 47 degrees F., and the mean summer soil temperature ranges from about 59 to 63 degrees F. The control section is very fine sandy loam or fine sandy loam, averaging 10 to 18 percent clay and more than 15 percent fine sand or coarser. Flat fragments or fine pebbles range from 0 to 15 percent. Thin, discontinuous horizons of carbonate accumulation occur immediately above the paralithic contact in some pedons.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. EC is less than 2 mmhos. Reaction is mildly or moderately alkaline.

The C horizon has hue of 2.5Y or 10YR, value of 4 through 7 dry, 3 through 5 moist, and chroma of 2 through 6. EC is less than 2 mmhos. Reaction is moderately or strongly alkaline.

Range in Characteristics (according to field observations, lab analysis): Lab texture for the A horizon is finer than typical for the map unit. Textures throughout the profile are finer than a typical Carmody.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A and C horizons. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 6 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Carmody soils are on plateaus and hillslopes in intermountain basins. Slopes are 2 to 45 percent. The soils formed in calcareous material weathered from semiconsolidated fine grained sandstone or siltstone. The mean annual precipitation ranges from 10 to 17 inches of which about half falls as snow or rain in April, May, and early June. Elevation is 5,300 to 7,500 feet. The mean annual temperature is 39 to 45 degrees F., and the mean summer temperature is 58 to 65 degrees F. The frost-free season is 75 to 120 days depending upon aspect, elevation, and local air drainage.

ROCK RIVER SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "RR-NC"
Lab/BKS Sample ID: G07120056_20
Typical Pedon: Rock River noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Rock River noncalcareous variant series consists of very deep, well drained soils that formed in calcareous alluvium derived mainly from sandstone, eolian deposits, and residuum. Rock River soils are on alluvial fan aprons, relict terraces, benches, hillslopes, and areas of valley fill. Slopes are 0 to 25 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 4 inches. Light brownish gray (10YR 6/2) sandy loam, moist; hard crust that parts to weak fine granular; hard, very friable, slightly sticky and slightly plastic; many fine and medium roots; moderately acid (pH 5.8); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

Bt1 - 4 to 19 inches. Yellowish brown (10YR 5/4) sandy loam, moist; weak medium prismatic structure parting to moderate medium angular blocky; hard, firm sticky and plastic; few fine and many medium roots; continuous thin clay films on faces of peds; neutral (pH 6.7); noneffervescent; clear smooth boundary.

C1 - 19 to 29 inches. Yellowish brown (10YR 5/4) loamy sand, moist; moderate medium prismatic structure parting to moderate fine and medium angular blocky; hard, firm, sticky and plastic; few coarse roots; continuous, thin clay films on faces of peds; slightly alkaline (pH 7.4); noneffervescent; clear smooth boundary. (The Bt horizon is 8 to 20 inches thick.)

C2 - 29 to 44 inches. Yellowish brown (10YR 5/4) loamy sand, moist; weak medium angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common thin clay films on faces of peds; lime as many fine and medium soft masses and threads; 10 percent pebbles 1/4 to 3/4 inch in diameter; slightly alkaline (pH 7.8); noneffervescent; clear smooth boundary. (0 to 8 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 20 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - Depth to continuous horizons of calcium carbonate accumulation is 13 to 30 inches. Depth to the

base of the argillic horizon is 12 to 34 inches. The mean annual soil temperature ranges from 43 to 46 degrees F., and the mean summer soil temperature ranges from 59 to 65 degrees F. EC is less than 4 mmhos throughout. The rock fragments in the soil are less than 3/4 inch in diameter.

The A horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Reaction is neutral through moderately alkaline.

The Bt horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 2 through 6. Texture is sandy clay loam or gravelly sandy clay loam, averaging 20 to 35 percent clay and has more than 35 percent fine or coarser sand. Rock fragments range from 0 to 25 percent pebbles. Reaction is neutral through moderately alkaline.

The Bk horizon has hue of 2.5Y through 7.5YR, value of 5 through 8 dry, 4 through 7 moist, and chroma of 2 through 6. Texture is sandy clay loam, sandy loam, or fine sandy loam modified with from 0 to 30 percent pebbles. Some pedons have textures of loamy sand or coarser below 40 inches. It has accumulation of secondary calcium carbonate that ranges from 1 through 14 percent. Reaction is moderately or strongly alkaline. Some pedons have a C horizon.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly to violently calcareous in the B horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 19 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description): Rock River soils are on alluvial fans, fan aprons, benches, hillslopes, and toeslopes. The soils formed in material weathered from calcareous sandstone, eolian deposits, and residuum. Slopes are 0 to 25 percent. Elevation is 5,900 to 7,800 feet. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 41 to 45 degrees F., and the mean summer temperature is 59 to 63 degrees F. The frost-free season is about 75 to 110 days but varies according to aspect, elevation, and air drainage.

ROCK RIVER SERIES
SANDY LOAM

Soil Mapping Unit "RR"
Lab/BKS Sample ID: G07120056_23
Typical Pedon: Rock River sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Rock River series consists of very deep, well drained soils that formed in calcareous alluvium derived mainly from sandstone, eolian deposits, and residuum. Rock River soils are on alluvial fan aprons, relict terraces, benches, hillslopes, and areas of valley fill. Slopes are 0 to 25 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Light brownish gray (10YR 6/2) sandy loam, moist; hard crust that parts to weak fine granular; hard, very friable, slightly sticky and slightly plastic; many fine and medium roots; slightly acid (pH 6.4); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

BA - 3 to 9 inches. Yellowish brown (10YR 5/4) sandy loam, moist; weak medium prismatic structure parting to moderate medium angular blocky; hard, firm sticky and plastic; few fine and many medium roots; continuous thin clay films on faces of peds; slightly alkaline (pH 7.4); noneffervescent; clear smooth boundary.

Bt - 9 to 19 inches. Yellowish brown (10YR 5/4) sandy loam, moist; moderate medium prismatic structure parting to moderate fine and medium angular blocky; hard, firm, sticky and plastic; few coarse roots; continuous, thin clay films on faces of peds; slightly alkaline (pH 7.7); noneffervescent; clear smooth boundary. (The Bt horizon is 8 to 20 inches thick.)

Btk - 19 to 28 inches. Yellowish brown (10YR 5/4) loam, moist; weak medium angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common thin clay films on faces of peds; lime as many fine and medium soft masses and threads; 10 percent pebbles 1/4 to 3/4 inch in diameter; slightly alkaline (pH 7.7); strongly effervescent; clear smooth boundary. (0 to 8 inches thick)

C1k - 28 to 48 inches. Light brownish gray (10YR 6/2) loam, moist; massive; soft, very friable, nonsticky and nonplastic; lime as many soft masses; many fine soft masses and threads of secondary calcium carbonate; 15 percent lime-coated angular gravel 1/4 to 3/4 inch in diameter; slightly alkaline (pH 7.7); strongly effervescent.

C2 - 48 to 58 inches. Light brownish gray (10YR 6/2) sandy loam – sandy clay loam, moist; massive; soft, very friable, nonsticky and nonplastic; lime as many soft masses; many fine soft masses and threads of secondary calcium carbonate; 15 percent lime-coated angular gravel 1/4 to 3/4 inch in diameter; slightly alkaline (pH 7.7); moderately effervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 23 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - Depth to continuous horizons of calcium carbonate accumulation is 13 to 30 inches. Depth to the base of the argillic horizon is 12 to 34 inches. The mean annual soil temperature ranges from 43 to 46 degrees F., and the mean summer soil temperature ranges from 59 to 65 degrees F. EC is less than 4 mmhos throughout. The rock fragments in the soil are less than 3/4 inch in diameter.

The A horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Reaction is neutral through moderately alkaline.

The Bt horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 2 through 6. Texture is sandy clay loam or gravelly sandy clay loam, averaging 20 to 35 percent clay and has more than 35 percent fine or coarser sand. Rock fragments range from 0 to 25 percent pebbles. Reaction is neutral through moderately alkaline.

The Bk horizon has hue of 2.5Y through 7.5YR, value of 5 through 8 dry, 4 through 7 moist, and chroma of 2 through 6. Texture is sandy clay loam, sandy loam, or fine sandy loam modified with from 0 to 30 percent pebbles. Some pedons have textures of loamy sand or coarser below 40 inches. It has accumulation of secondary calcium carbonate that ranges from 1 through 14 percent. Reaction is moderately or strongly alkaline. Some pedons have a C horizon.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in BA and Bt horizons. According to the NRCS soil series description, the soil profile is strongly to violently calcareous in the B horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 19 inches due to the change in effervescent in the B horizon.

Geographic Setting (According to Official Series Description): Rock River soils are on alluvial fans, fan aprons, benches, hillslopes, and toeslopes. The soils formed in material weathered from calcareous sandstone, eolian deposits, and residuum. Slopes are 0 to 25 percent. Elevation is 5,900 to 7,800 feet. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 41 to 45 degrees F., and the mean summer temperature is 59 to 63 degrees F. The frost-free season is about 75 to 110 days but varies according to aspect, elevation, and air drainage.

CARMODY SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Ca-NC" (Inclusion)
Lab/BKS Sample ID: G07120056_25
Typical Pedon: Carmody noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Carmody noncalcareous variant series consists of well to somewhat excessively drained soils that are moderately deep to siltstone. These soils formed in material weathered from calcareous siltstone or fine grained sandstone. Carmody soils are on uplands of the cold intermountain basins. Slopes are 2 to 45 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 2 inches. Light brownish gray (10YR 6/2) sandy loam, moist; weak fine and very fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; lime disseminated; moderately acid (pH 6.0); noneffervescent, gradual wavy boundary. (4 to 10 inches thick)

C1 - 2 to 13 inches. Light brownish gray (10YR 6/2) sandy loam, moist; moderate medium and coarse prismatic structure; slightly hard, friable, slightly sticky; few fine and many medium roots; lime disseminated; neutral (pH 7.1); noneffervescent, abrupt wavy boundary. (16 to 30 inches thick)

C2 - 13 to 21 inches. Light brownish gray to white, calcareous siltstone containing sandy loam, slightly alkaline (pH 7.4); noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 25 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - Depth to a paralithic contact is 20 to 40 inches. Depth to uniformly calcareous material is 0 to 10 inches. The mean annual soil temperature ranges from about 40 to 47 degrees F., and the mean summer soil temperature ranges from about 59 to 63 degrees F. The control section is very fine sandy loam or fine sandy loam, averaging 10 to 18 percent clay and more than 15 percent fine sand or coarser. Flat fragments or fine pebbles range from 0 to 15 percent. Thin, discontinuous horizons of carbonate accumulation occur immediately above the paralithic contact in some pedons.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. EC is less than 2 mmhos. Reaction is mildly or moderately alkaline.
The C horizon has hue of 2.5Y or 10YR, value of 4 through 7 dry, 3 through 5 moist, and chroma of 2 through 6. EC is less than 2 mmhos. Reaction is moderately or strongly alkaline.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal coarse fragments was found at a depth of 13-21 inches. An estimated stripping depth is 13 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Carmody soils are on plateaus and hillslopes in intermountain basins. Slopes are 2 to 45 percent. The soils formed in calcareous material weathered from semiconsolidated fine grained sandstone or siltstone. The mean annual precipitation ranges from 10 to 17 inches of which about half falls as snow or rain in April, May, and early June. Elevation is 5,300 to 7,500 feet. The mean annual temperature is 39 to 45 degrees F., and the mean summer temperature is 58 to 65 degrees F. The frost-free season is 75 to 120 days depending upon aspect, elevation, and local air drainage.

BLAZON SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Bz-NC"
Lab/BKS Sample ID: G07120056_26
Typical Pedon: Blazon noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Blazon noncalcareous variant series consists of well drained soils that are shallow to shale. These soils formed in slope alluvium over residuum derived from shale interbedded with sandstone, loamstone, and siltstone. Blazon soils are on pediments, hillslopes, plateaus and ridges. Slopes range from 0 to 60 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

TAXONOMIC CLASS: Loamy, mixed, superactive, calcareous, frigid, shallow Ustic Torriorthents

A - 0 to 6 inches. Light brownish gray (2.5Y 6/2) clay - clay loam, moist; strong fine granular structure; slightly hard, very friable, moderately sticky and moderately plastic; few fine and very fine roots; calcium carbonate disseminated; 2 percent fine gravel; slightly alkaline (pH 7.8); noneffervescent, gradual smooth boundary. (0 to 6 inches thick)

AC - 6 to 17 inches. Light brownish gray (2.5Y 6/2) clay loam, moist; massive with 70 percent soft rock structure as thin plates; very hard, firm, moderately sticky and moderately plastic; few fine and very fine roots; calcium carbonate disseminated and as few fine filaments and threads on platelets; slightly alkaline (pH 7.7); noneffervescent, gradual wavy boundary. (2 to 17 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 26 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The soil moisture control section is usually dry and is dry less than 90 days from June 10 to October 10 in normal years. The mean annual soil temperature is 40 to 47 degrees F. The mean annual summer soil temperature is 59 to 63 degrees F. The depth to paralithic contact is 4 to 20 inches The soil is typically calcareous throughout but may be leached in some pedons through the A horizon.

Gravel lag is common on many surfaces. The particle-size control section is 18 to 35 percent clay and more than 15 percent fine or coarser sand, 0 to 35 percent angular gravel, channers, or cobbles. Many coarse fragments will break down with pretreatment and would be considered as pararock fragments. Regarding the A horizon, the hue is 7.5YR 5Y. The value is 4 through 6 dry, 3 through 5 moist. The chroma is 2 through 4. The texture is clay loam, silt loam, or gravelly silt loam. The EC is 0 through 4 mmhos. The reaction is slightly alkaline through strongly alkaline.

Regarding the C horizon, the hue is 7.5YR through 5Y. The value is 5 through 7 dry, 3 through 6 moist. The chroma is 2 through 6. The texture is clay loam, silt loam, or gravelly silt loam. The EC is 0 through 4 mmhos. The reaction is moderately or strongly alkaline

A thin Bw or Bk horizon may be present in some pedons but is not diagnostic.

The Cr horizon consists of interbedded, semiconsolidated shale, sandstone, and loamstone. The majority of this material will break down with pretreatment.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons.

Taxonomic Class - Loamy, mixed, superactive, calcareous, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal texture was found at a depth of 0-6 inches. An estimated stripping depth is 0 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) – The parent material is slope alluvium over residuum derived from interbedded, shale, sandstone, loamstone and siltstone. The landform is pediments, hillslopes, plateaus and ridges. The slopes are 0 to 60 percent. The elevation is 5,300 to 8,400 feet. The mean annual temperature: 39 to 45 degrees F. The mean annual precipitation is 9 to 15 inches of which about half falls as snow or rain in April, May, and June.

DIAMONDVILLE SERIES
SANDY LOAM

Soil Mapping Unit "D"
Lab/BKS Sample ID: G07120056_27
Typical Pedon: Diamondville clay loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Diamondville series consists of moderately deep, well drained soils that formed in alluvium and residuum weathered from calcareous loamstone and sandstone. Diamondville soils are on fan remnants, plateaus, hills and ridges of cold intermountain basins and have slopes of 0 to 15 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-3 inches. Light brownish gray (10YR 6/2) clay loam, moist; strong fine granular structure; soft, very friable, slightly sticky and slightly plastic; neutral (pH 6.7), noneffervescent; clear smooth boundary.

Bt - 3-12 inches. Brown (10YR 5/3) clay loam, moist; moderate fine subangular blocky parting to fine granular structure; slightly hard, very friable, slightly sticky and slightly plastic; few faint clay films on faces of some peds; 2 percent gravel; slightly alkaline (pH 7.5), noneffervescent; clear smooth boundary.

Btk – 12-24 inches. Brown (10YR 5/3) clay loam, moist; moderate medium prismatic structure parting to moderate medium subangular blocky; hard, very friable, sticky and plastic; many prominent clay films on faces of peds and in root channels; slightly alkaline (pH 7.8), strongly effervescent; gradual wavy boundary.

C1k - 24-33 inches. Light yellowish brown (2.5Y 6/3) sandy loam – sandy clay loam, moist; massive structure; soft, friable, nonsticky, nonplastic; slightly alkaline (pH 7.8), strongly effervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 27 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - Depth to a paralithic contact is 20 to 40 inches. Depth to uniformly calcareous material ranges from 3 to 20 inches. The mean annual soil temperature ranges from 40 to 47 degrees F. The mean summer soil temperature ranges from 59 to 66 degrees F. Rock fragments range from 0 to 15 percent and are either gravel or channers.

The A horizon has hue of 5Y through 7.5YR, value of 4 to 6 dry, 3 to 6 moist, and chroma of 2 or 3. It is neutral through moderately alkaline.

The Bt horizon has hue of 5Y through 7.5YR, value of 4 to 6 dry, 4 or 5 moist, and chroma of 2 to 4. It is loam, clay loam, or sandy clay loam, averaging 18 to 35 percent clay and less than 35 percent fine or coarser sand. It is neutral through moderately alkaline.

The Bk horizon has hue of 5Y through 7.5YR, value of 5 to 8 dry, 4 to 7 moist, and chroma of 2 through 4. It is clay loam, loam, or sandy clay loam. Calcium carbonate equivalent ranges from 4 to 14 percent. This horizon is moderately or strongly alkaline. In some pedons the Bk horizon has textures of fine sandy loam or very fine sandy loam.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous for the A and Bt horizons and strongly calcareous for the remaining horizons. According to the NRCS soil series description, the soil profile is violently calcareous in the Bk horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 12 inches due to the change in effervescent in the B horizon.

Geographic Setting (According to official series description) - Diamondville soils are on fan remnants, plateaus, hills and ridges of cold intermountain basins. Slopes are 0 to 15 percent. The soils formed in material weathered from soft, calcareous loamstone and sandstone. Elevations are 4,600 to 7,500 feet. The mean annual precipitation is 10 to 15 inches of which about half occurs mainly in the spring. The mean annual temperature is about 39 to 45 degrees F., and the mean summer temperature is 58 to 65 degrees F. The frost-free season is 80 to 120 days.

CUSHOOL SERIES
NONCALCAREOUS SHALLOW VARIANT

Soil Mapping Unit "Cu-SH"
Lab/BKS Sample ID: G07120056_28
Typical Pedon: Cushool noncalcareous shallow variant -rangeland. (Colors are for dry soil unless otherwise stated.)

The Cushool noncalcareous shallow variant series consists of well drained soils that are moderately deep to soft sandstone. They formed in slope alluvium and colluvium over residuum weathered from sandy shale and sandstone. Cushool soils are on rock-controlled hills, pediments, structural benches, ridges, and short fan aprons. Slopes are 0 to 50 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Grayish brown (10YR 5/2) sandy loam, moist; moderate fine granular structure; soft, very friable, nonsticky and nonplastic; common fine and very fine roots; slightly acid (pH 6.2); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

Bt - 3 to 12 inches. Brown (10YR 5/3) sandy loam - sandy clay loam, moist; moderate medium subangular blocky structure parting to moderate medium granular; slightly hard, very friable, slightly sticky and slightly plastic; common fine and medium roots; few distinct clay films on faces of peds and inside root channels; neutral (pH 7.1); noneffervescent; clear smooth boundary.

C - 12 to 17 inches. Yellowish brown (10YR 5/4) sandy clay loam, moist; moderate medium prismatic structure parting to moderate medium subangular blocky; slightly hard, very friable, slightly sticky and slightly plastic; common fine and medium roots; many clay films on faces of peds and in root channels; slightly alkaline (pH 7.4); moderately effervescent (Combined thickness of the Bt horizons is 9 to 23 inches.)

Type Location - Sweetwater County, Wyoming; refer to waypoint 28 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) –
The mean annual soil temperature ranges from 41 to 47 degrees F. The mean summer temperature is 59 to 63 degrees F. The depth to calcic horizon is 11 to 34 inches. The depth to paralithic contact is 20 to 40 inches shale interbedded with sandstone. These soils are typically free of carbonates through the upper part of the Bt horizon. Rock fragments range from 0 to 30 percent throughout the whole soil and are pebbles or

channers. Exchangeable sodium ranges from 0 to 15 percent throughout the argillic horizon and Bk horizons. EC ranges from 0 to 4 mmhos throughout.

Regarding the A horizon, the hue is 7.5YR to 5Y. The value is 4 through 7 dry, 3 through 5 moist. The chroma is 2 through 6 dry or moist. The calcium carbonate equivalent is 0 to 5 percent. The reaction is neutral through moderately alkaline

Regarding Bt horizon, the hue is 7.5YR to 5Y. The value is 4 through 6 dry, 3 or 4 moist. The chroma is 2 through 6 dry or moist. The texture is sandy clay loam, fine sandy loam, or sandy loam with 18 to 35 percent clay, 0 to 28 percent silt, and 45 to 80 percent sand with more than 35 percent being fine sand or coarser. The calcium carbonate equivalent is 0 to 5 percent. The reaction is neutral through moderately alkaline. The Btk horizon when present is moderately or strongly alkaline.

Regarding Bk horizon, the hue is 7.5YR to 5Y. The value is 5 through 7 dry, 4 through 7 moist. The chroma is 2 through 6 dry or moist. The texture is loamy fine sand, sandy loam, fine sandy loam. The calcium carbonate equivalent is 5 to 15 percent. The reaction is moderately or strongly alkaline. A thin C horizon is present in some pedons.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous for the A and B horizons and moderately calcareous for the C horizon. According to the NRCS soil series description, the soil profile is strongly calcareous in the B horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 12 inches due to the change in effervescent in the C horizon.

Geographic Setting (According to official series description) – The parent material is slope alluvium and colluvium over residuum weathered from sandy shale and sandstone. The landform is rock-controlled hill and ridge slopes, fan aprons, pediments, and structural benches. The slopes are 0 to 50 percent. The elevations are 5,300 to 7,800 feet. The mean annual precipitation is about 12 inches but ranges from 9 to 14 inches of which about half falls as snow and rain in April, May, and early June. The mean annual temperature: is about 41 degrees F. and ranges from 39 to 45 degrees F. The frost-free season is 75 to 110 days depending upon elevation, aspect, and air drainage.

ROCK RIVER SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "RR-NC"
Lab/BKS Sample ID: G07120056_31
Typical Pedon: Rock River noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Rock River noncalcareous variant series consists of very deep, well drained soils that formed in calcareous alluvium derived mainly from sandstone, eolian deposits, and residuum. Rock River soils are on alluvial fan aprons, relict terraces, benches, hillslopes, and areas of valley fill. Slopes are 0 to 25 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 4 inches. Light brownish gray (10YR 6/2) loam, moist; hard crust that parts to weak fine granular; hard, very friable, slightly sticky and slightly plastic; many fine and medium roots; slightly acid (pH 6.3); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

Bt1 - 4 to 16 inches. Yellowish brown (10YR 5/4) clay loam, moist; weak medium prismatic structure parting to moderate medium angular blocky; hard, firm sticky and plastic; few fine and many medium roots; continuous thin clay films on faces of peds; neutral (pH 7.1); noneffervescent; clear smooth boundary.

Bt2 - 16 to 27 inches. Yellowish brown (10YR 5/4) sandy loam – sandy clay loam, moist; moderate medium prismatic structure parting to moderate fine and medium angular blocky; hard, firm, sticky and plastic; few coarse roots; continuous, thin clay films on faces of peds; neutral (pH 7.1); noneffervescent; clear smooth boundary. (The Bt horizon is 8 to 20 inches thick.)

BC - 27 to 31 inches. Yellowish brown (10YR 5/4) sandy loam, moist; weak medium angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common thin clay films on faces of peds; lime as many fine and medium soft masses and threads; 10 percent pebbles 1/4 to 3/4 inch in diameter; neutral (pH 7.3); noneffervescent; clear smooth boundary. (0 to 8 inches thick)

C - 31 to 41 inches. Light brownish gray (10YR 6/2) sandy loam, moist; massive; soft, very friable, nonsticky and nonplastic; lime as many soft masses; many fine soft masses and threads of secondary calcium carbonate; 15 percent lime-coated angular gravel 1/4 to 3/4 inch in diameter; slightly alkaline (pH 7.6); noneffervescent;

Type Location - Sweetwater County, Wyoming; refer to waypoint 31 on map included in this report.
Range in Soil Characteristics (According to Official Series Description) - Depth to continuous horizons of calcium carbonate accumulation is 13 to 30 inches. Depth to the base of the argillic horizon is 12 to 34 inches. The mean annual soil temperature ranges from 43 to 46 degrees F., and the mean summer soil temperature ranges from 59 to 65 degrees F. EC is less than 4 mmhos throughout. The rock fragments in the soil are less than 3/4 inch in diameter.

The A horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Reaction is neutral through moderately alkaline.

The Bt horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 2 through 6. Texture is sandy clay loam or gravelly sandy clay loam, averaging 20 to 35 percent clay and has more than 35 percent fine or coarser sand. Rock fragments range from 0 to 25 percent pebbles. Reaction is neutral through moderately alkaline.

The Bk horizon has hue of 2.5Y through 7.5YR, value of 5 through 8 dry, 4 through 7 moist, and chroma of 2 through 6. Texture is sandy clay loam, sandy loam, or fine sandy loam modified with from 0 to 30 percent pebbles. Some pedons have textures of loamy sand or coarser below 40 inches. It has accumulation of secondary calcium carbonate that ranges from 1 through 14 percent. Reaction is moderately or strongly alkaline. Some pedons have a C horizon.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly to violently calcareous in the B horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 31 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description): Rock River soils are on alluvial fans, fan aprons, benches, hillslopes, and toeslopes. The soils formed in material weathered from calcareous sandstone, eolian deposits, and residuum. Slopes are 0 to 25 percent. Elevation is 5,900 to 7,800 feet. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 41 to 45 degrees F., and the mean summer temperature

is 59 to 63 degrees F. The frost-free season is about 75 to 110 days but varies according to aspect, elevation, and air drainage.

LECKMAN SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "L"
Lab/BKS Sample ID: G07120056_32
Typical Pedon: Leckman noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Leckman noncalcareous variant series consists of very deep, well drained soils formed in alluvium. Leckman soils are on alluvial fans and toeslopes and have slopes of 0 to 10 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-6 inches. Light grayish brown (10YR 6/2) sandy loam, moist; weak medium platy structure breaks to weak fine crumbs; soft, very friable, nonsticky, nonplastic; moderately acid (pH 5.7), noneffervescent.

C1 – 6-19 inches. Light grayish brown (10YR 6/2) sandy loam, moist; weak coarse and medium prismatic structure that parts to weak medium subangular blocks; soft, very friable, nonsticky, nonplastic; moderately acid (pH 5.8), noneffervescent.

C2 – 19-32 inches. Light grayish brown (10YR 6/2) loamy sand, moist; massive, soft very friable nonsticky, nonplastic, moderately acid (pH 5.9), noneffervescent.

C3 – 32-40 inches. Light grayish brown (10YR 6/2) sandy loam, moist; massive, soft very friable nonsticky, nonplastic, moderately acid (pH 5.8), noneffervescent.

C4 – 40-60 inches. Light grayish brown (10YR 6/2) sandy loam, moist; massive, soft very friable nonsticky, nonplastic, slightly acid (pH 6.1), noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 32 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature is about 43 to 47 degrees F. The mean summer soil temperature is 64 to 67 degrees F. Textures throughout the profile are fine sandy loam or sandy loam. Gravel content is generally less than 5 percent but can range from 0 to 15 percent.

The A horizons have hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4.

The C horizon has hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4. Reaction is moderately or strongly alkaline. Effervescence may be slight to violent.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is slightly to strongly calcareous in the A horizon.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Typic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 6 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Leckman soils are on alluvial fans and toe slopes of escarpments. Slopes are 0 to 10 percent. The soils formed in alluvium. Elevation is 6,000 to 7,000 feet. The mean annual precipitation is 7 to 9 inches. The mean annual air temperature is 37 to 44 degrees F. The frost-free season is 80 to 110 days.

ROCK RIVER SERIES
SANDY LOAM

Soil Mapping Unit "RR"
Lab/BKS Sample ID: G07120056_33
Typical Pedon: Rock River sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Rock River series consists of very deep, well drained soils that formed in calcareous alluvium derived mainly from sandstone, eolian deposits, and residuum. Rock River soils are on alluvial fan aprons, relict terraces, benches, hillslopes, and areas of valley fill. Slopes are 0 to 25 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 4 inches. Light brownish gray (10YR 6/2) sandy loam, moist; hard crust that parts to weak fine granular; hard, very friable, slightly sticky and slightly plastic; many fine and medium roots; slightly acid (pH 6.2); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

B - 4 to 15 inches. Yellowish brown (10YR 5/4) sandy loam, moist; weak medium prismatic structure parting to moderate medium angular blocky; hard, firm sticky and plastic; few fine and many medium roots; continuous thin clay films on faces of peds; common mildly alkaline (pH 7.1); noneffervescent; clear smooth boundary.

BC - 15 to 22 inches. Yellowish brown (10YR 5/4) sandy loam, moist; moderate medium prismatic structure parting to moderate fine and medium angular blocky; hard, firm, sticky and plastic; few coarse roots; continuous, thin clay films on faces of peds; slightly alkaline (pH 7.7); noneffervescent; clear smooth boundary. (The Bt horizon is 8 to 20 inches thick.)

C1k - 22 to 36 inches. Yellowish brown (10YR 5/4) sandy loam, moist; weak medium angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common thin clay films on faces of peds; lime as many fine and medium soft masses and threads; 10 percent pebbles 1/4 to 3/4 inch in diameter; slightly alkaline (pH 7.8); noneffervescent; clear smooth boundary. (0 to 8 inches thick)

C2k - 36 to 46 inches. Light brownish gray (10YR 6/2) sandy clay loam, moist; massive; soft, very friable, nonsticky and nonplastic; lime as many soft masses; many fine soft masses and threads of secondary calcium carbonate; 15 percent lime-coated angular gravel 1/4 to 3/4 inch in diameter; slightly alkaline (pH 7.8); noneffervescent;

Type Location - Sweetwater County, Wyoming; refer to waypoint 33 on map included in this report.
Range in Soil Characteristics (According to Official Series Description) - Depth to continuous horizons of calcium carbonate accumulation is 13 to 30 inches. Depth to the base of the argillic horizon is 12 to 34 inches. The mean annual soil temperature ranges from 43 to 46 degrees F., and the mean summer soil temperature ranges from 59 to 65 degrees F. EC is less than 4 mmhos throughout. The rock fragments in the soil are less than 3/4 inch in diameter.

The A horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Reaction is neutral through moderately alkaline.

The Bt horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 2 through 6. Texture is sandy clay loam or gravelly sandy clay loam, averaging 20 to 35 percent clay and has more than 35 percent fine or coarser sand. Rock fragments range from 0 to 25 percent pebbles. Reaction is neutral through moderately alkaline.

The Bk horizon has hue of 2.5Y through 7.5YR, value of 5 through 8 dry, 4 through 7 moist, and chroma of 2 through 6. Texture is sandy clay loam, sandy loam, or fine sandy loam modified with from 0 to 30 percent pebbles. Some pedons have textures of loamy sand or coarser below 40 inches. It has accumulation of secondary calcium carbonate that ranges from 1 through 14 percent. Reaction is moderately or strongly alkaline. Some pedons have a C horizon.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly to violently calcareous in the B horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 22 inches due to the presence of the C horizon..

Geographic Setting (According to Official Series Description): Rock River soils are on alluvial fans, fan aprons, benches, hillslopes, and toeslopes. The soils formed in material weathered from calcareous sandstone, eolian deposits, and residuum. Slopes are 0 to 25 percent. Elevation is 5,900 to 7,800 feet. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 41 to 45 degrees F., and the mean summer temperature

is 59 to 63 degrees F. The frost-free season is about 75 to 110 days but varies according to aspect, elevation, and air drainage.

CUSHOOL SERIES
SANDY LOAM

Soil Mapping Unit "Cu"
Lab/BKS Sample ID: G07120056_36
Typical Pedon: Cushool loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Cushool series consists of well drained soils that are moderately deep to soft sandstone. They formed in slope alluvium and colluvium over residuum weathered from sandy shale and sandstone. Cushool soils are on rock-controlled hills, pediments, structural benches, ridges, and short fan aprons. Slopes are 0 to 50 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 7 inches. Grayish brown (10YR 5/2) loam, moist; moderate fine granular structure; soft, very friable, nonsticky and nonplastic; common fine and very fine roots; neutral (pH 7.0); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

Bt - 7 to 15 inches. Brown (10YR 5/3) clay loam - loam, moist; moderate medium subangular blocky structure parting to moderate medium granular; slightly hard, very friable, slightly sticky and slightly plastic; common fine and medium roots; few distinct clay films on faces of peds and inside root channels; slightly alkaline (pH 7.5); noneffervescent; clear smooth boundary.

Btk- 15 to 26 inches. Yellowish brown (10YR 5/4) sandy clay loam, moist; moderate medium prismatic structure parting to moderate medium subangular blocky; slightly hard, very friable, slightly sticky and slightly plastic; common fine and medium roots; many clay films on faces of peds and in root channels; slightly alkaline (pH 7.8); strongly effervescent (Combined thickness of the Bt horizons is 9 to 23 inches.)

Type Location - Sweetwater County, Wyoming; refer to waypoint 36 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) –
The mean annual soil temperature ranges from 41 to 47 degrees F. The mean summer temperature is 59 to 63 degrees F. The depth to calcic horizon is 11 to 34 inches. The depth to paralithic contact is 20 to 40 inches shale interbedded with sandstone. These soils are typically free of carbonates through the upper part of the Bt horizon. Rock fragments range from 0 to 30 percent throughout the whole soil and are pebbles or channers. Exchangeable sodium ranges from 0 to 15 percent throughout the argillic horizon and Bk horizons. EC ranges from 0 to 4 mmhos throughout.

Regarding the A horizon, the hue is 7.5YR to 5Y. The value is 4 through 7 dry, 3 through 5 moist. The chroma is 2 through 6 dry or moist. The calcium carbonate equivalent: 0 to 5 percent. The reaction is neutral through moderately alkaline.

Regarding the Bt horizon, the hue is 7.5YR to 5Y. The value is 4 through 6 dry, 3 or 4 moist. The chroma is 2 through 6 dry or moist. The texture is sandy clay loam, fine sandy loam, or sandy loam with 18 to 35 percent clay, 0 to 28 percent silt, and 45 to 80 percent sand with more than 35 percent being fine sand or coarser. Calcium carbonate equivalent is 0 to 5 percent. The reaction is neutral through moderately alkaline. The Btk horizon when present is moderately or strongly alkaline.

Regarding the Bk horizon, the hue is 7.5YR to 5Y. The value is 5 through 7 dry, 4 through 7 moist. The chroma is 2 through 6 dry or moist. The texture is loamy fine sand, sandy loam, fine sandy loam. The calcium carbonate equivalent is 5 to 15 percent. The reaction: is moderately or strongly alkaline.

A thin C horizon is present in some pedons.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A and Bt horizons.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 15 inches due to a change in effervescent in the B horizon.

Geographic Setting (According to official series description) – The parent material is slope alluvium and colluvium over residuum weathered from sandy shale and sandstone. The landform is rock-controlled hill and ridge slopes, fan aprons, pediments, and structural benches. Slopes are 0 to 50 percent. Elevations are 5,300 to 7,800 feet. Mean annual precipitation is about 12 inches but ranges from 9 to 14 inches of which about half falls as snow and rain in April, May, and early June. Mean annual temperature is about 41 degrees F. and ranges from 39 to 45 degrees F. Frost-free season is 75 to 110 days depending upon elevation, aspect, and air drainage.

CRAGOSEN SERIES
SANDY LOAM

Soil Mapping Unit "Cr"
Lab/BKS Sample ID: G07120056_38
Typical Pedon: Cragosen sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Cragosen series consists of shallow, well drained soils that have bedrock at less than 20 inches. The soils formed in slopewash alluvium on fan aprons, footslopes, and shoulder, ridge, and hill crests. Slopes are from 0 to 60 percent and are both simple and complex. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 2 inches. Pale brown (10YR 6/3) sandy loam, moist; moderate fine granular structure; soft, very friable, slightly sticky and slightly plastic; lime disseminated and as coatings on undersides of rock fragments; 25 percent pebbles and 10 percent cobbles; moderately acid (pH 5.8); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

C1 - 2 to 11 inches. Brown (10YR 5/3) sandy loam, moist; slightly hard, very friable, slightly sticky and slightly plastic; lime disseminated and as thin coatings on all surfaces of rock fragments; 35 percent pebbles and 10 percent cobbles; neutral (pH 7.1); noneffervescent; clear wavy boundary. (4 to 14 inches thick)

C2k - 11 to 18 inches. Soft sandy loam, calcareous shale interbedded with siltstone and thin lenses of sandstone; slightly alkaline (pH 7.8); strongly effervescent;

Type Location - Sweetwater County, Wyoming; refer to waypoint 38 on map included in this report.

Range in Characteristics (According to Official Series Description) - Depth to bedrock ranges from 6 to 20 inches. Depth to uniformly calcareous material ranges from 0 to 6 inches. The mean annual soil temperature is about 44 degrees F. and ranges from 40 to 46 degrees F. The mean annual summer soil temperature ranges from 59 to 63 degrees F. EC ranges from 0 to 4 mmhos throughout the soil. Exchangeable sodium is estimated to be between 0 and 12 percent. The particle size control section matrix is loam, sandy loam, or sandy clay loam with 15 to 25 percent clay and 30 to 60 percent sand with 15 percent or more fine sand or coarser. Rock fragment content of the control section ranges from 25 to 45 percent pebbles and 5 to 15 percent cobble and averages over 35 percent.

The A horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction is neutral through strongly alkaline. Neutral and mildly alkaline reactions occur in the presence of gypsum that acts as a buffering agent.

The C or Bk horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction ranges from mildly through strongly alkaline. The mildly alkaline reaction occurs in the presence of gypsum. A Bw or Bk horizon may replace part or all of the C horizon but is not diagnostic of either a cambic or calcic horizon. The carbonate movement, while common in some pedons, is not consistent and, though pedogenic, does not meet the requirement for a diagnostic horizon.

The 2Cr horizon consists of varicolored shales interbedded with semiconsolidated siltstone and sandstone. The material is soft with thin, discontinuous lenses of consolidated rock.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A and C1 horizons and strongly calcareous in the C2k. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons.

Taxonomic Class - Loamy-skeletal, mixed, superactive, calcareous, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 2 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - The Cragosen soils are on fan aprons, footslopes, shoulders, and crests of ridges and hills. These soils formed in slopewash alluvium over sandstone controlled uplands. Slopes range from 0 to 60 percent and are both simple and complex. Elevations range from 6,000 to 7,800 feet. The mean annual precipitation is about 12 inches but ranges from 9 to 14 inches with about half falling as snow and rain during April, May, and June. The mean annual temperature is about 40 degrees F. but ranges from 39 to 44 degrees F. The frost-free season is estimated to range from 60 to 100 days depending upon elevation, aspect, and air drainage.

LECKMAN
NONCLACAREOUS VARIANT

Soil Mapping Unit "L"
Lab/BKS Sample ID: G07120056_39
Typical Pedon: Leckman clay loam - loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Leckman series consists of very deep, well drained soils formed in alluvium. Leckman soils are on alluvial fans and toeslopes and have slopes of 0 to 10 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-4 inches. Light grayish brown (10YR 6/2) clay loam - loam, moist; weak medium platy structure breaks to weak fine crumbs; soft, very friable, nonsticky, nonplastic; neutral (pH 7.0), noneffervescent.

AC – 4-13 inches. Light grayish brown (10YR 6/2) clay loam, moist; weak coarse and medium prismatic structure that parts to weak medium subangular blocks; soft, very friable, nonsticky, nonplastic; neutral (pH 7.3), noneffervescent.

C1 – 13-24 inches. Light grayish brown (10YR 6/2) loamy sand, moist; massive, soft very friable nonsticky, nonplastic, slightly alkaline (pH 7.6), noneffervescent.

C2 – 24-42 inches. Light grayish brown (10YR 6/2) loamy sand, moist; massive, soft very friable nonsticky, nonplastic, slightly alkaline (pH 7.6), noneffervescent.

C3 – 42-60 inches. Light grayish brown (10YR 6/2) loamy sand, moist; massive, soft very friable nonsticky, nonplastic, slightly alkaline (pH 7.6), noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 39 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - The mean annual soil temperature is about 43 to 47 degrees F. The mean summer soil temperature is 64 to 67 degrees F. Textures throughout the profile are fine sandy loam or sandy loam. Gravel content is generally less than 5 percent but can range from 0 to 15 percent.

The A horizons have hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4.

The C horizon has hues of 10YR or 2.5Y, values of 6 or 7 dry and 4 or 5 moist, and chromas of 2 through 4. Reaction is moderately or strongly alkaline. Effervescence may be slight to violent.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is slightly to strongly calcareous in the A horizon and strongly calcareous in the C horizon.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Typic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal coarse fragments was found at depths of 24-42 and 42-60 inches. An estimated stripping depth is 24 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Leckman soils are on alluvial fans and toe slopes of escarpments. Slopes are 0 to 10 percent. The soils formed in alluvium. Elevation is 6,000 to 7,000 feet. The mean annual precipitation is 7 to 9 inches. The mean annual air temperature is 37 to 44 degrees F. The frost-free season is 80 to 110 days.

ONASON SERIES
GRAVELLY SANDY LOAM

Soil Mapping Unit "O"
Lab/BKS Sample ID: G07120056_40
Typical Pedon: Onason sandy loam - rangeland. (Colors are for dry soil unless otherwise stated.)

The Onason series consists of well drained soils that are shallow and very shallow to soft sandstone. These soils formed in residuum and slopewash alluvium weathered from the underlying bedrock. Onason soils are on footslopes, backslopes, and shoulders of hills and ridges. Slopes range from 5 to 45 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0-4 inches. Brown (10YR 5/3) sandy loam, moist; weak very fine granular structure; slightly hard, very friable, nonsticky and nonplastic; many fine and few medium roots; 15 percent semirounded pebbles; neutral (pH 7.1), noneffervescent; clear smooth boundary.

C – 4-16 inches. Yellowish brown (10YR 5/4) loamy sand, moist; weak medium and coarse granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many fine and few medium roots; 15 percent semirounded pebbles; slightly alkaline (pH 7.6), noneffervescent; gradual wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 40 on map included in this report.

Range in Soil Characteristics(According to official series description) - Depth to the paralithic contact and bedrock ranges from 4 to 20 inches. These soils are noncalcareous throughout. The mean annual soil temperature is 36 to 45 degrees F., and the mean summer soil temperature is 59 to 62 degrees F. The particle size control section averages gravelly sandy loam or sandy loam throughout. Clay ranges from 8 to 18 percent and rock fragments of fine or very fine semirounded pebbles range from 0 to 35 percent. EC is less than 2 mmhos throughout.

The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Lag gravel covering up to 75 percent of the surface is common in some pedons. Reaction is neutral or mildly alkaline.

The C horizon has hue of 2.5Y or 10YR, value of 5 or 6 dry, 4 through 6 moist, and chroma of 2 through 4. A thin Bw horizon is present in some pedons. Reaction is neutral or mildly alkaline.

The Cr horizon consists of soft, noncalcareous, coarse- and medium-grained sandstone interbedded with thin lenses of shale and siltstone. The yellowish brown or brown sandstone may have discontinuous lenses of hard sandstone or shale in some pedons. The soil-bedrock interface is considered a paralithic contact and roots plane out at the contact.

Range in Characteristics (according to field observations, lab analysis): Lab texture for the A horizon is coarser than typical for the map unit.

Taxonomic Class (According to official series description): Loamy, mixed, superactive, nonacid, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1): Marginal coarse fragments were found at a depth of 0-4 inches and unsuitable coarse fragments were found at a depth of 4-16 inches. An estimated stripping depth is 0 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Onason soils are on footslopes, backslopes, and shoulders of rolling and steep hills and ridges. These soils formed in residuum and slopewash alluvium weathered from the underlying noncalcareous sandstone. Slopes range from 5 to 45 percent. Elevations are 6,000 to 7,600 feet. The climate is cool, semiarid with moist springs and dry summers. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 34 to 44 degrees F. The estimated frost-free season is about 80 to 110 days, but frost may occur in any month.

CRAGOSEN SERIES
GRAVELLY SANDY LOAM

Soil Mapping Unit "Cr"
Lab/BKS Sample ID: G07120056_41
Typical Pedon: Cragosen sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Cragosen series consists of shallow, well drained soils that have bedrock at less than 20 inches. The soils formed in slopewash alluvium on fan aprons, footslopes, and shoulder, ridge, and hill crests. Slopes are from 0 to 60 percent and are both simple and complex. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 2 inches. Pale brown (10YR 6/3) sandy loam, moist; moderate fine granular structure; soft, very friable, slightly sticky and slightly plastic; lime disseminated and as coatings on undersides of rock fragments; 25 percent pebbles and 10 percent cobbles; slightly acid (pH 6.3); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

C - 2 to 14 inches; brown (10YR 5/3) loam, moist; slightly hard, very friable, slightly sticky and slightly plastic; lime disseminated and as thin coatings on all surfaces of rock fragments; 35 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.8); strongly effervescent; clear wavy boundary. (4 to 14 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 41 on map included in this report.

Range in Characteristics (According to Official Series Description) - Depth to bedrock ranges from 6 to 20 inches. Depth to uniformly calcareous material ranges from 0 to 6 inches. The mean annual soil temperature is about 44 degrees F. and ranges from 40 to 46 degrees F. The mean annual summer soil temperature ranges from 59 to 63 degrees F. EC ranges from 0 to 4 mmhos throughout the soil. Exchangeable sodium is estimated to be between 0 and 12 percent. The particle size control section matrix is loam, sandy loam, or sandy clay loam with 15 to 25 percent clay and 30 to 60 percent sand with 15 percent or more fine sand or coarser. Rock fragment content of the control section ranges from 25 to 45 percent pebbles and 5 to 15 percent cobble and averages over 35 percent.
The A horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction is neutral through strongly alkaline. Neutral and mildly alkaline reactions occur in the presence of gypsum that acts as a buffering agent.
The C or Bk horizon has hue of 5Y through 7.5YR, value of 4 through 7 dry, 3 through 6 moist, and chroma of 2 through 4. Reaction ranges from mildly through strongly alkaline.

The mildly alkaline reaction occurs in the presence of gypsum. A Bw or Bk horizon may replace part or all of the C horizon but is not diagnostic of either a cambic or calcic horizon. The carbonate movement, while common in some pedons, is not consistent and, though pedogenic, does not meet the requirement for a diagnostic horizon.
The 2Cr horizon consists of varicolored shales interbedded with semiconsolidated siltstone and sandstone. The material is soft with thin, discontinuous lenses of consolidated rock.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A horizon. According to the NRCS soil series description, the soil profile is strongly calcareous in the A horizon. Lab texture for the A horizon is coarser than typical for the map unit.

Taxonomic Class - Loamy-skeletal, mixed, superactive, calcareous, frigid, shallow Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal coarse fragments was found at depths of 0-2 and 2-14 inches. An estimated stripping depth is 0 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - The Cragosen soils are on fan aprons, footslopes, shoulders, and crests of ridges and hills. These soils formed in slopewash alluvium over sandstone controlled uplands. Slopes range from 0 to 60 percent and are both simple and complex. Elevations range from 6,000 to 7,800 feet. The mean annual precipitation is about 12 inches but ranges from 9 to 14 inches with about half falling as snow and rain during April, May, and June. The mean annual temperature is about 40 degrees F. but ranges from 39 to 44 degrees F. The frost-free season is estimated to range from 60 to 100 days depending upon elevation, aspect, and air drainage.

FORELLE SERIES
SANDY LOAM

Soil Mapping Unit "F"
Lab/BKS Sample ID: G07120056_42
Typical Pedon: Forelle fine sandy loam – sandy clay loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Forelle series consists of very deep, well drained soils on fan aprons, fan piedmonts, hillslopes, and hill toeslope positions. These soils formed in alluvium and slope alluvium derived from sedimentary rocks, primarily shale. Slopes are typically simple and range from 0 to 30 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 5 inches. Light brownish gray (10YR 6/2) sandy loam – sandy clay loam, moist; strong fine granular structure; soft, very friable, nonsticky and nonplastic; 5 percent fine, semirounded pebbles; slightly alkaline (pH 7.5); noneffervescent; clear smooth boundary. (1 to 5 inches thick)

Bt - 5 to 14 inches. Brown (10YR 5/3) clay loam, moist; weak medium prismatic structure parting to moderate medium subangular blocky; hard, very friable, slightly sticky and slightly plastic; few, thin clay films on faces of some peds; 5 percent fine semirounded pebbles; slightly alkaline (pH 7.6); noneffervescent; clear smooth boundary. (2 to 5 inches thick)

Btk - 14 to 32 inches. Brown (10YR 5/3) clay loam, moist; moderate medium prismatic structure parting to moderate medium subangular blocky; very hard, friable, slightly sticky and slightly plastic; continuous thin clay films on faces of peds and lining pores and root channels; 5 percent fine semirounded pebbles; slightly alkaline (pH 7.7); strongly effervescent; clear wavy boundary. (7 to 15 inches thick)

C1k - 32 to 42 inches. Pale brown (10YR 6/3) clay loam, moist; weak medium prismatic structure parting to weak medium subangular blocky; hard, friable, slightly sticky and slightly plastic; few thin clay films on faces of some peds and in some root channels; common soft masses of lime; 5 percent fine, semirounded pebbles; slightly alkaline (pH 7.7); violently effervescent; gradual smooth boundary. (3 to 6 inches thick)

C2k - 42 to 60 inches. Light yellowish brown (2.5Y 6/4) clay loam, moist; massive; hard, friable, slightly sticky and slightly plastic; lime is disseminated and as common soft, rounded masses; 10 percent fine, semirounded pebbles; moderately alkaline (pH 7.9); violently effervescent; gradual smooth boundary. (15 to 30 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 42 on map included in this report.

Range in Characteristics (According to Official Series Description) – Mean annual soil temperature is 41 to 45 degrees F. Mean annual summer soil temperature is 59 to 63 degrees F. Depth to base of argillic horizon is 12 to 25 inches. Depth to secondary calcium carbonate is 12 to 25 inches. Rock fragment content of the entire soil to 60 inches is 15 percent or less when averaged with pebbles ranging from 0 to 15 percent and cobble from 0 to 5 percent. EC is less than 2 mmhos throughout.

Regarding the A horizon, the hue is 7.5YR through 5Y. The value is 5 through 7 dry, 3 through 6 moist. The chroma is 2 through 4 dry or moist. The texture is fine sandy loam or loam. The reaction is neutral through moderately alkaline.

Regarding the Bt horizon, the hue is 7.5YR through 5Y. The value is 4 through 7 dry, 3 through 6 moist. Chroma is 2 through 6 dry or moist. Texture is loam, clay loam, or sandy clay loam with 18 to 35 percent clay and more than 15 but less than 35 percent fine sand or coarser. Reaction is neutral through moderately alkaline.

Regarding the Btk and Bk horizon, the hue is 7.5YR through 5Y, and value is 6 through 8 dry, 4 through 7 moist. Chroma is 1 through 6 dry or moist. Texture is loam, clay loam, sandy clay loam, and less commonly sandy loam with 18 to 30 percent clay; clay size carbonates may make up to 5 percent of the clay fraction. Calcium carbonate equivalent: is 4 to 15 percent. Reaction is moderately or strongly alkaline.

Regarding the C horizon, the hue is 7.5YR through 5Y. The value is 5 through 7 dry, 4 through 6 moist. The chroma is 2 through 6 dry or moist. The texture is loam, clay loam, sandy clay loam, or sandy loam with 18 to 30 percent clay. Reaction is slightly through strongly alkaline. Calcium carbonate equivalent is 1 to 6 percent.

Range in Characteristics (according to field observations, lab analysis): This soil profile is violently calcareous in the C horizon. According to the NRCS soil series description, the soil profile is slightly calcareous in the C horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) – No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 14 inches due to the change in effervescent in the B horizon.

Geographic Setting (According to Official Series Description) - Parent material is alluvium and slope alluvium derived from shale interbedded with sandstone and siltstone. Landform is fan aprons, fan piedmonts, hillslopes, and hill toeslopes. Slopes are 0 to 30 percent. Elevation is 5,300 to 7,800 feet. Mean annual precipitation is 12 inches but ranges from 9 to 14 inches of which about half falls as rain or snow in April, May and early June. Mean annual temperature is 39 to 45 degrees F. Frost-free period is 75 to 110 days depending upon elevation, aspect, and air drainage.

GRIEVES SERIES
SANDY LOAM

Soil Mapping Unit "Gr"
Lab/BKS Sample ID: G07120056_43
Typical Pedon: Grieves clay – rangeland. (Colors are for dry soil unless otherwise stated.)

The Grieves series consists of very deep, well drained and somewhat excessively drained soils that formed in locally transported calcareous materials weathered from sandstone. Grieves soils are on fans, footslopes and toeslopes. Slopes range from 0 to 40 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Grayish brown (10YR 5/2) clay, moist; moderate very fine granular structure; soft, very friable, slightly sticky, slightly plastic; many very fine, fine, and medium roots; moderately alkaline (pH 7.9); noneffervescent; clear wavy boundary. (2 to 5 inches thick)

AC - 3 to 11 inches. Pale brown (10YR 6/3) clay, moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine, fine and medium roots to 12 inches; moderately alkaline (pH 7.9); noneffervescent; gradual wavy boundary. (0 to 8 inches thick)

C1k - 11 to 22 inches. Pale brown (10YR 6/3) clay, moist; massive; soft, very friable, slightly sticky, slightly plastic; common very fine, fine, and medium roots to 35 inches; few very fine, fine, and medium roots to 60 inches; slightly alkaline (pH 7.8); strongly effervescent.

C2k - 22 to 31 inches. Pale brown (10YR 6/3) clay, moist; massive; soft, very friable, slightly sticky, slightly plastic; common very fine, fine, and medium roots to 35 inches; few very fine, fine, and medium roots to 60 inches; slightly alkaline (pH 7.7); strongly effervescent.

C3k - 31 to 40 inches. Pale brown (10YR 6/3) clay, moist; massive; soft, very friable, slightly sticky, slightly plastic; common very fine, fine, and medium roots to 35 inches; few very fine, fine, and medium roots to 60 inches; slightly alkaline (pH 7.6); strongly effervescent.

C4k - 40 to 60 inches. Pale brown (10YR 6/3) clay, moist; massive; soft, very friable, slightly sticky, slightly plastic; common very fine, fine, and medium roots to 35 inches;

few very fine, fine, and medium roots to 60 inches; slightly alkaline (pH 7.7); strongly effervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 43 on map included in this report.

Range in Characteristics (According to Official Series Description) –
The mean annual soil temperature is about 43 degrees to 46 degrees F. The mean summer soil temperature is about 59 degrees to 62 degrees F. The control section is sandy loam or fine sandy loam averaging between 10 to 18 percent clay. Gravel ranges from 0 to 15 percent; up to 10 percent cobblestones are found in the very lower part of the control section.

The A horizon has hue of 2.5Y or 10YR; value of 5 or 6 dry, 3 through 5 moist; and chroma of 2 through 4. It is mildly or moderately alkaline. A Bw horizon is lacking in some pedons.
The C horizon has hue of 2.5Y or 10YR, value of 6 through 8, 4 or 5 moist, and chroma of 2 through 4. It is moderately or strongly alkaline.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A horizon. According to the NRCS soil series description, the soil profile is strongly calcareous in the A horizon.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) – Marginal texture was found at depths of 0-3, 3-11, 11-22, 22-31, 31-40, and 40-60 inches. An estimated stripping depth is 0 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - Grieves soils are on nearly level to sloping alluvial fans, footslopes or toeslopes. Slopes are 0 to 40 percent. They formed in locally transported calcareous materials weathered from sandstone or sandstone interbedded with shale. Elevation is 5800 to 7,200 feet. The mean annual precipitation is 9 to 14 inches, which occurs mainly in the winter and spring. The mean annual air temperature is 39 degrees to 45 degrees F. The mean summer temperature is 58 degrees to 65 degrees F. The frost-free season is 60 to 100 days.

CUSHOOL SERIES
SHALLOW VARIANT

Soil Mapping Unit "Cu-SH"
Lab/BKS Sample ID: G07120056_47
Typical Pedon: Cushool shallow variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Cushool shallow variant series consists of well drained soils that are moderately deep to soft sandstone. They formed in slope alluvium and colluvium over residuum weathered from sandy shale and sandstone. Cushool soils are on rock-controlled hills, pediments, structural benches, ridges, and short fan aprons. Slopes are 0 to 50 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 2 inches. Grayish brown (10YR 5/2) sandy loam, moist; moderate fine granular structure; soft, very friable, nonsticky and nonplastic; common fine and very fine roots; moderately acid (pH 5.9); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

Bt - 2 to 11 inches. Brown (10YR 5/3) sandy loam - sandy clay loam, moist; moderate medium subangular blocky structure parting to moderate medium granular; slightly hard, very friable, slightly sticky and slightly plastic; common fine and medium roots; few distinct clay films on faces of peds and inside root channels; slightly alkaline (pH 7.5); noneffervescent; clear smooth boundary.

Ck - 11 to 16 inches. Yellowish brown (10YR 5/4) sandy loam, moist; moderate medium prismatic structure parting to moderate medium subangular blocky; slightly hard, very friable, slightly sticky and slightly plastic; common fine and medium roots; many clay films on faces of peds and in root channels; slightly alkaline (pH 7.5); strongly effervescent (Combined thickness of the Bt horizons is 9 to 23 inches.)

Type Location - Sweetwater County, Wyoming; refer to waypoint 47 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) – The mean annual soil temperature ranges are from 41 to 47 degrees F. The mean summer temperature is 59 to 63 degrees F. The depth to calcic horizon is 11 to 34 inches. The depth to paralithic contact is 20 to 40 inches shale interbedded with sandstone. These soils are typically free of carbonates through the upper part of the Bt horizon. The rock fragments range from 0 to 30 percent throughout the whole soil and are pebbles or

channers. The exchangeable sodium ranges from 0 to 15 percent throughout the argillic horizon and Bk horizons. EC ranges from 0 to 4 mmhos throughout.

Regarding the A horizon, the hue is 7.5YR to 5Y. The value is 4 through 7 dry, 3 through 5 moist. The chroma is 2 through 6 dry or moist. The calcium carbonate equivalent is 0 to 5 percent. The reaction is neutral through moderately alkaline.

Regarding the Bt horizon, the hue 7.5YR to 5Y. The value is 4 through 6 dry, 3 or 4 moist. The chroma is 2 through 6 dry or moist. The texture is sandy clay loam, fine sandy loam, or sandy loam with 18 to 35 percent clay, 0 to 28 percent silt, and 45 to 80 percent sand with more than 35 percent being fine sand or coarser. The calcium carbonate equivalent is 0 to 5 percent. The reaction is neutral through moderately alkaline.

The Btk horizon when present is moderately or strongly alkaline. Regarding the Bk horizon, the hue is 7.5YR to 5Y. The value is 5 through 7 dry, 4 through 7 moist. The chroma is 2 through 6 dry or moist. The texture is loamy fine sand, sandy loam, and fine sandy loam. The calcium carbonate equivalent is 5 to 15 percent. The reaction is moderately or strongly alkaline. A thin C horizon is present in some pedons.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the B horizon. According to the NRCS soil series description, the soil profile is strongly calcareous in the B horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 11 inches due to the change in effervescent in the C horizon.

Geographic Setting (According to official series description) – The parent material is slope alluvium and colluvium over residuum weathered from sandy shale and sandstone. The landform is rock-controlled hill and ridge slopes, fan aprons, pediments, and structural benches. The slopes are 0 to 50 percent. The elevations are 5,300 to 7,800 feet. The mean annual precipitation is about 12 inches but ranges from 9 to 14 inches of which about half falls as snow and rain in April, May, and early June. The mean annual temperature is about 41 degrees F. and ranges from 39 to 45 degrees F. The frost-free season is 75 to 110 days depending upon elevation, aspect, and air drainage.

CARMODY SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "Ca-NC"
Lab/BKS Sample ID: G07120056_48
Typical Pedon: Carmody noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Carmody noncalcareous variant series consists of well to somewhat excessively drained soils that are moderately deep to siltstone. These soils formed in material weathered from calcareous siltstone or fine grained sandstone. Carmody soils are on uplands of the cold intermountain basins. Slopes are 2 to 45 percent. The mean annual precipitation is about 8 to 10 inches and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 2 inches. Light brownish gray (10YR 6/2) sandy loam, moist; weak fine and very fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; lime disseminated; slightly acid (pH 6.1); noneffervescent, gradual wavy boundary. (4 to 10 inches thick)

C1 - 2 to 14 inches. Light brownish gray (10YR 6/2) sandy loam, moist; moderate medium and coarse prismatic structure; slightly hard, friable, slightly sticky; few fine and many medium roots; lime disseminated; neutral (pH 7.1); noneffervescent, abrupt wavy boundary. (16 to 30 inches thick)

C2 - 14 to 18 inches. Light brownish gray to white, calcareous siltstone containing sandy clay loam, slightly alkaline (pH 7.6); noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 48 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) - Depth to a paralithic contact is 20 to 40 inches. Depth to uniformly calcareous material is 0 to 10 inches. The mean annual soil temperature ranges from about 40 to 47 degrees F., and the mean summer soil temperature ranges from about 59 to 63 degrees F. The control section is very fine sandy loam or fine sandy loam, averaging 10 to 18 percent clay and more than 15 percent fine sand or coarser. Flat fragments or fine pebbles range from 0 to 15 percent. Thin, discontinuous horizons of carbonate accumulation occur immediately above the paralithic contact in some pedons.
The A horizon has hue of 2.5Y or 10YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. EC is less than 2 mmhos. Reaction is mildly or moderately alkaline.

The C horizon has hue of 2.5Y or 10YR, value of 4 through 7 dry, 3 through 5 moist, and chroma of 2 through 6. EC is less than 2 mmhos. Reaction is moderately or strongly alkaline.
Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly calcareous in the A and C horizons. Lab texture for the A horizon is coarser than typical for the map unit. Textures throughout the profile are finer than a typical Carmody.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Ustic Torriorthents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 2 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description) - Carmody soils are on plateaus and hillslopes in intermountain basins. Slopes are 2 to 45 percent. The soils formed in calcareous material weathered from semiconsolidated fine grained sandstone or siltstone. The mean annual precipitation ranges from 10 to 17 inches of which about half falls as snow or rain in April, May, and early June. Elevation is 5,300 to 7,500 feet. The mean annual temperature is 39 to 45 degrees F., and the mean summer temperature is 58 to 65 degrees F. The frost-free season is 75 to 120 days depending upon aspect, elevation, and local air drainage.

CUSHOOL SERIES
SANDY LOAM

Soil Mapping Unit "Cu"
Lab/BKS Sample ID: G07120056_49
Typical Pedon: Cushool sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Cushool series consists of well drained soils that are moderately deep to soft sandstone. They formed in slope alluvium and colluvium over residuum weathered from sandy shale and sandstone. Cushool soils are on rock-controlled hills, pediments, structural benches, ridges, and short fan aprons. Slopes are 0 to 50 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 4 inches. Grayish brown (10YR 5/2) sandy loam, moist; moderate fine granular structure; soft, very friable, nonsticky and nonplastic; common fine and very fine roots; moderately alkaline (pH 5.8); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

Bt - 4 to 22 inches. Brown (10YR 5/3) sandy clay loam, moist; moderate medium subangular blocky structure parting to moderate medium granular; slightly hard, very friable, slightly sticky and slightly plastic; common fine and medium roots; few distinct clay films on faces of peds and inside root channels; neutral (pH 7.3); noneffervescent; clear smooth boundary.

Ck- 22 to 36 inches. Yellowish brown (10YR 5/4) sandy clay loam, moist; moderate medium prismatic structure parting to moderate medium subangular blocky; slightly hard, very friable, slightly sticky and slightly plastic; common fine and medium roots; many clay films on faces of peds and in root channels; moderately alkaline (pH 7.9); strongly effervescent (Combined thickness of the Bt horizons is 9 to 23 inches.)

Type Location - Sweetwater County, Wyoming; refer to waypoint 49 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) – The mean annual soil temperature ranges from 41 to 47 degrees F. The mean summer temperature is 59 to 63 degrees F. The depth to calcic horizon is 11 to 34 inches. The depth to paralithic contact is 20 to 40 inches shale interbedded with sandstone. These soils are typically free of carbonates through the upper part of the Bt horizon. The rock fragments range from 0 to 30 percent throughout the whole soil and are pebbles or channers. Exchangeable

sodium ranges from 0 to 15 percent throughout the argillic horizon and Bk horizons. EC ranges from 0 to 4 mmhos throughout.

Regarding the A horizon, the hue is 7.5YR to 5Y. The value is 4 through 7 dry, 3 through 5 moist. The chroma is 2 through 6 dry or moist. The calcium carbonate equivalent is 0 to 5 percent. The reaction is neutral through moderately alkaline.

Regarding the Bt horizon, the hue is 7.5YR to 5Y. The value is 4 through 6 dry, 3 or 4 moist. The chroma is 2 through 6 dry or moist. The texture is sandy clay loam, fine sandy loam, or sandy loam with 18 to 35 percent clay, 0 to 28 percent silt, and 45 to 80 percent sand with more than 35 percent being fine sand or coarser. The calcium carbonate equivalent: 0 to 5 percent. The reaction is neutral through moderately alkaline.

The Btk horizon when present is moderately or strongly alkaline. Regarding the Bk horizon, the hue is 7.5YR to 5Y. The value is 5 through 7 dry, 4 through 7 moist. The chroma is 2 through 6 dry or moist. The texture is loamy fine sand, sandy loam, and fine sandy loam. The calcium carbonate equivalent is 5 to 15 percent. The reaction is moderately or strongly alkaline. A thin C horizon is present in some pedons.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A and B horizons. According to the NRCS soil series description, the soil profile is strongly calcareous in the B horizons.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 22 inches due to the change in effervescent in the C horizon.

Geographic Setting (According to official series description) – The parent material is slope alluvium and colluvium over residuum weathered from sandy shale and sandstone. The landform is rock-controlled hill and ridge slopes, fan aprons, pediments, and structural benches. The slopes are 0 to 50 percent. The elevations are 5,300 to 7,800 feet. The mean annual precipitation is about 12 inches but ranges from 9 to 14 inches of which about half falls as snow and rain in April, May, and early June. The mean annual temperature is about 41 degrees F. and ranges from 39 to 45 degrees F.
The frost-free season is 75 to 110 days depending upon elevation, aspect, and air drainage.

GLENDIVE SERIES
SANDY LOAM

Soil Mapping Unit "Gl"
Lab/BKS Sample ID: G07120056_50
Typical Pedon: Glendive sandy loam, in cropland (colors are for dry soil unless otherwise noted).

The Glendive series consists of very deep, moderately well or well drained soils that formed in stratified loamy calcareous alluvium. These soils are on flood plains and stream terraces. Slopes are 0 to 8 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 5 inches. Grayish brown (10YR 5/2) sandy loam, moist; weak fine granular structure; very hard, friable, slightly sticky and plastic; many very fine roots; moderately acid (pH 5.8); noneffervescent; clear smooth boundary. (3 to 8 inches thick)

C1 - 5 to 15 inches. Grayish brown (10YR 5/2) sandy loam, moist; weak medium subangular blocky structure; very hard, friable, sticky and plastic; many very fine roots; many very fine pores; neutral (pH 7.0); noneffervescent; gradual smooth boundary. (0 to 10 inches thick)

C2 - 15 to 22 inches. Light brownish gray (10YR 6/2) sandy loam, moist; weak coarse prismatic structure; slightly hard, friable, sticky and plastic; common very fine roots; common very fine pores; slightly alkaline (pH 7.8); noneffervescent; gradual smooth boundary.

C3 - 22 to 31 inches. Light brownish gray (10YR 6/2) sandy loam that consists of thin layers of loam, sandy loam and loamy fine sand, moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common fine roots grading to few in lower part; common fine pores; moderately alkaline (pH 8.0); moderately effervescent.

C4k - 31 to 45 inches. Light brownish gray (10YR 6/2) sandy loam that consists of thin layers of loam, sandy loam and loamy fine sand, moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common fine roots grading to few in lower part; common fine pores; strongly alkaline (pH 8.7); strongly effervescent.

C5 - 45 to 60 inches. Light brownish gray (10YR 6/2) loamy sand that consists of thin layers of loam, sandy loam and loamy fine sand, moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common fine roots grading to few in lower part; common fine pores; strongly alkaline (pH 8.6); moderately effervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 50 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) – The soil temperature is 42 to 47 degrees F. Range soil temperature to 40 degrees in MLRA 44. The moisture control section is between 8 and 24 inches; dry in all parts between four-tenths and five-tenths of the cumulative days per year when the soil temperature at a depth of 20 inches is 41 degrees F or higher. The soil phases are channeled, flooded, high elevation, nonflooded, gravelly substratum, sandy surface, warm, and moderately wet, saline. Regarding the Ap horizon, the hue is 10YR, 2.5Y, or 5Y. This horizon with values of 4 or 5 dry, 3 moist and chroma of 2 or 3 may meet the requirements for mollic except for thickness. The value is 4, 5, or 6 dry; 3, 4, or 5 moist. The chroma is 2 or 3. The texture is loam, silt loam, fine sandy loam, sandy loam, loamy fine sand, and silty clay loam. The clay content is 5 to 35 percent clay. The EC is 0 to 8 mmhos/cm; saline phase 4 to 8 mmhos/cm. The effervescence is none to violently. The reaction is pH 6.6 to 9.0. Regarding the C1, C2 horizons, the hue is 10YR, 2.5Y, or 5Y. The value is 5, 6, or 7 dry; 4, 5, or 6 moist. The chroma is 2, 3, or 4. The texture is loam, silt loam, sandy loam, and fine sandy loam. The clay content is 5 to 18 percent. The rock fragments are 0 to 15 percent pebbles. The EC is 0 to 16 mmhos/cm; saline phase 8 to 16 mmhos/cm. The effervescence is slightly to violently. The reaction is pH 6.6 to 9.0.

Regarding the C3 horizon, the hue is 10YR, 2.5Y, or 5Y. The value is 5, 6, or 7 dry; 4, 5, or 6 moist. The chroma is 2, 3, or 4. The texture is sandy loam or fine sandy loam consisting of thin layers of loam, sandy loam, silt loam, loamy sand, loamy fine sand, and occasionally clay loam. The clay content is 5 to 18 percent. The rock fragments are 0 to 15 percent pebbles. The EC is 0 to 25 mmhos/cm; saline phase 8 to 25 mmhos/cm. The effervescence is slightly to violently. The reaction is pH 7.4 to 9.0.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A, C1, and C2 horizons. According to the NRCS soil series description, the soil profile is strongly calcareous throughout

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Aridic Ustifluvents

Suitability for Topsoil (According to WDEQ Guideline 1) - Marginal pH was found at depths of 31-45 and 45-60 inches. An estimated stripping depth is 31 inches based on laboratory analysis.

Geographic Setting (According to official series description) – The landforms are flood plains, stream terraces, and drainageways. The elevation is 1,900 to 5,000 feet. The range elevation is 6000 feet in MLRA 44. The slope is 0 to 8 percent. The parent material is

stratified loamy calcareous alluvium. The climate is long, cold winters; moist springs; and hot, dry summers. The mean annual precipitation is 10 to 16 inches, most of which falls in the spring and early summer. The mean annual air temperature is 39 to 45 degrees F. The range mean annual air temperature is to 38 degrees in MLRA 44. The frost-free period is 90 to 135 days.

ROCK RIVER SERIES
SANDY LOAM

Soil Mapping Unit "RR"
Lab/BKS Sample ID: G07120056_51
Typical Pedon: Rock River sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Rock River series consists of very deep, well drained soils that formed in calcareous alluvium derived mainly from sandstone, eolian deposits, and residuum. Rock River soils are on alluvial fan aprons, relict terraces, benches, hillslopes, and areas of valley fill. Slopes are 0 to 25 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Light brownish gray (10YR 6/2) sandy loam, moist; hard crust that parts to weak fine granular; hard, very friable, slightly sticky and slightly plastic; many fine and medium roots; slightly acid (pH 6.2); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

AC - 3 to 12 inches. Yellowish brown (10YR 5/4) sandy loam, moist; weak medium prismatic structure parting to moderate medium angular blocky; hard, firm sticky and plastic; few fine and many medium roots; continuous thin clay films on faces of peds; neutral (pH 7.2); noneffervescent; clear smooth boundary.

C1 - 12 to 24 inches. Yellowish brown (10YR 5/4) sandy loam, moist; moderate medium prismatic structure parting to moderate fine and medium angular blocky; hard, firm, sticky and plastic; few coarse roots; continuous, thin clay films on faces of peds; mildly alkaline (pH 7.2); noneffervescent; clear smooth boundary. (The C1 horizon is 8 to 20 inches thick.)

C2k - 24 to 36 inches. Yellowish brown (10YR 5/4) sandy loam – sandy clay loam, moist; weak medium angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common thin clay films on faces of peds; lime as many fine and medium soft masses and threads; 10 percent pebbles 1/4 to 3/4 inch in diameter; moderately alkaline (pH 8.1); strongly effervescent; clear smooth boundary. (0 to 8 inches thick)

C3k - 36 to 48 inches. Light brownish gray (10YR 6/2) loamy sand, moist; massive; soft, very friable, nonsticky and nonplastic; lime as many soft masses; many fine soft masses and threads of secondary calcium carbonate; 15 percent lime-coated angular gravel 1/4 to 3/4 inch in diameter; moderately alkaline (pH 8.0); strongly effervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 51 on map included in this report.
Range in Soil Characteristics (According to Official Series Description) - Depth to continuous horizons of calcium carbonate accumulation is 13 to 30 inches. Depth to the base of the argillic horizon is 12 to 34 inches. The mean annual soil temperature ranges from 43 to 46 degrees F., and the mean summer soil temperature ranges from 59 to 65 degrees F. EC is less than 4 mmhos throughout. The rock fragments in the soil are less than 3/4 inch in diameter.

The A horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Reaction is neutral through moderately alkaline.

The Bt horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 2 through 6. Texture is sandy clay loam or gravelly sandy clay loam, averaging 20 to 35 percent clay and has more than 35 percent fine or coarser sand. Rock fragments range from 0 to 25 percent pebbles. Reaction is neutral through moderately alkaline.

The Bk horizon has hue of 2.5Y through 7.5YR, value of 5 through 8 dry, 4 through 7 moist, and chroma of 2 through 6. Texture is sandy clay loam, sandy loam, or fine sandy loam modified with from 0 to 30 percent pebbles. Some pedons have textures of loamy sand or coarser below 40 inches. It has accumulation of secondary calcium carbonate that ranges from 1 through 14 percent. Reaction is moderately or strongly alkaline. Some pedons have a C horizon.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A and C1 horizons. According to the NRCS soil series description, the soil profile is strongly calcareous in the B horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 12 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description): Rock River soils are on alluvial fans, fan aprons, benches, hillslopes, and toeslopes. The soils formed in material weathered from calcareous sandstone, eolian deposits, and residuum. Slopes are 0 to 25 percent. Elevation is 5,900 to 7,800 feet. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 41 to 45 degrees F., and the mean summer temperature

is 59 to 63 degrees F. The frost-free season is about 75 to 110 days but varies according to aspect, elevation, and air drainage.

GLENDIVE SERIES
SANDY LOAM

Soil Mapping Unit "Gl"
Lab/BKS Sample ID: G07120056_52
Typical Pedon: Glendive sandy loam, in cropland (colors are for dry soil unless otherwise noted).

The Glendive series consists of very deep, moderately well or well drained soils that formed in stratified loamy calcareous alluvium. These soils are on flood plains and stream terraces. Slopes are 0 to 8 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 5 inches. Grayish brown (10YR 5/2) sandy loam, moist; weak fine granular structure; very hard, friable, slightly sticky and plastic; many very fine roots; slightly acid (pH 6.5); noneffervescent; clear smooth boundary. (3 to 8 inches thick)

C1 - 5 to 23 inches. Grayish brown (10YR 5/2) sandy loam, moist; weak medium subangular blocky structure; very hard, friable, sticky and plastic; many very fine roots; many very fine pores; slightly alkaline (pH 7.4); noneffervescent; gradual smooth boundary. (0 to 10 inches thick)

C2 - 23 to 34 inches. Light brownish gray (10YR 6/2) sandy loam, moist; weak coarse prismatic structure; slightly hard, friable, sticky and plastic; common very fine roots; common very fine pores; slightly alkaline (pH 7.7); noneffervescent; gradual smooth boundary.

C3 - 34 to 42 inches. Light brownish gray (10YR 6/2) loam that consists of thin layers of loam, sandy loam and loamy fine sand, moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common fine roots grading to few in lower part; common fine pores; moderately alkaline (pH 8.1); noneffervescent.

C4 - 42 to 54 inches. Light brownish gray (10YR 6/2) sandy loam that consists of thin layers of loam, sandy loam and loamy fine sand, moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common fine roots grading to few in lower part; common fine pores; moderately alkaline (pH 8.4); noneffervescent.

C5 - 54 to 60 inches. Light brownish gray (10YR 6/2) clay loam that consists of thin layers of loam, sandy loam and loamy fine sand, moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common fine roots grading to few in lower part; common fine pores; moderately alkaline (pH 8.2); strongly effervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 52 on map included in this report.
Range in Soil Characteristics (According to Official Series Description) – The soil temperature is 42 to 47 degrees F. The range soil temperature is to 40 degrees in MLRA 44. The moisture control section is between 8 and 24 inches; dry in all parts between four-tenths and five-tenths of the cumulative days per year when the soil temperature at a depth of 20 inches is 41 degrees F or higher. The soil phases are channeled, flooded, high elevation, nonflooded, gravelly substratum, sandy surface, warm, and moderately wet, saline. Regarding the Ap horizon, the hue is 10YR, 2.5Y, or 5Y. This horizon with values of 4 or 5 dry, 3 moist and chroma of 2 or 3 may meet the requirements for mollic except for thickness. The value is 4, 5, or 6 dry; 3, 4, or 5 moist. The chroma is 2 or 3. The texture is loam, silt loam, fine sandy loam, sandy loam, loamy fine sand, and silty clay loam. The clay content is 5 to 35 percent clay. The EC is 0 to 8 mmhos/cm and saline phase 4 to 8 mmhos/cm. The effervescence is none to violently. The reaction is pH 6.6 to 9.0. Regarding the C1, C2 horizons, the hue is 10YR, 2.5Y, or 5Y. The value is 5, 6, or 7 dry; 4, 5, or 6 moist. The chroma is 2, 3, or 4. The texture is loam, silt loam, sandy loam, and fine sandy loam. The clay content is 5 to 18 percent. The rock fragments are 0 to 15 percent pebbles. The EC is 0 to 16 mmhos/cm and saline phase 8 to 16 mmhos/cm. The effervescence is slightly to violently. The reaction is pH 6.6 to 9.0. Regarding the C3 horizon, the hue is 10YR, 2.5Y, or 5Y. The value is 5, 6, or 7 dry; 4, 5, or 6 moist. The chroma is 2, 3, or 4. The texture is sandy loam or fine sandy loam consisting of thin layers of loam, sandy loam, silt loam, loamy sand, loamy fine sand, and occasionally clay loam. The clay content is 5 to 18 percent. The rock fragments are 0 to 15 percent pebbles. The EC is 0 to 25 mmhos/cm and saline phase 8 to 25 mmhos/cm. The effervescence is slightly to violently. The reaction is pH 7.4 to 9.0

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A horizon. According to the NRCS soil series description, the soil profile is strongly calcareous throughout.

Taxonomic Class - Coarse-loamy, mixed, superactive, calcareous, frigid Aridic Ustifluvents

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 5 inches due to the presence of the C horizon.

Geographic Setting (According to official series description) – The landforms are flood plains, stream terraces, and drainageways. The elevation is 1,900 to 5,000 feet. The range elevation is to 6000 feet in MLRA 44. The slope is 0 to 8 percent. The parent material is stratified loamy calcareous alluvium. The climate is long, cold winters; moist springs; and hot, dry summers. The mean annual precipitation is 10 to 16 inches, most of which

falls in the spring and early summer. The mean annual air temperature is 39 to 45 degrees F. The range mean annual air temperature is to 38 degrees in MLRA 44. The frost-free period is 90 to 135 days.

ROCK RIVER SERIES
NONCALCAREOUS VARIANT

Soil Mapping Unit "RR-NC"
Lab/BKS Sample ID: G07120056_53
Typical Pedon: Rock River noncalcareous variant-rangeland. (Colors are for dry soil unless otherwise stated.)

The Rock River noncalcareous variant series consists of very deep, well drained soils that formed in calcareous alluvium derived mainly from sandstone, eolian deposits, and residuum. Rock River soils are on alluvial fan aprons, relict terraces, benches, hillslopes, and areas of valley fill. Slopes are 0 to 25 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Light brownish gray (10YR 6/2) loam, dark moist; hard crust that parts to weak fine granular; hard, very friable, slightly sticky and slightly plastic; many fine and medium roots; slightly acid (pH 6.5); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

Bt1 - 3 to 15 inches. Yellowish brown (10YR 5/4) clay loam, moist; weak medium prismatic structure parting to moderate medium angular blocky; hard, firm sticky and plastic; few fine and many medium roots; continuous thin clay films on faces of peds; neutral (pH 6.9); noneffervescent; clear smooth boundary.

Bt2 - 15 to 28 inches. Yellowish brown (10YR 5/4) loam, moist; moderate medium prismatic structure parting to moderate fine and medium angular blocky; hard, firm, sticky and plastic; few coarse roots; continuous, thin clay films on faces of peds; slightly alkaline (pH 7.5); noneffervescent; clear smooth boundary. (The Bt horizon is 8 to 20 inches thick.)

C1 - 28 to 40 inches. Yellowish brown (10YR 5/4) sandy loam, moist; weak medium angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common thin clay films on faces of peds; lime as many fine and medium soft masses and threads; 10 percent pebbles 1/4 to 3/4 inch in diameter; slightly alkaline (pH 7.6); noneffervescent; clear smooth boundary. (0 to 8 inches thick)

C2 - 40 to 45 inches. Light brownish gray (10YR 6/2) sandy loam, moist; massive; soft, very friable, nonsticky and nonplastic; lime as many soft masses; many fine soft masses and threads of secondary calcium carbonate; 15 percent lime-coated angular gravel 1/4 to 3/4 inch in diameter; moderately alkaline (pH 7.9); noneffervescent.

Type Location - Sweetwater County, Wyoming; refer to waypoint 53 on map included in this report.
Range in Soil Characteristics (According to Official Series Description) - Depth to continuous horizons of calcium carbonate accumulation is 13 to 30 inches. Depth to the base of the argillic horizon is 12 to 34 inches. The mean annual soil temperature ranges from 43 to 46 degrees F., and the mean summer soil temperature ranges from 59 to 65 degrees F. EC is less than 4 mmhos throughout. The rock fragments in the soil are less than 3/4 inch in diameter.

The A horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 3 through 5 moist, and chroma of 2 through 4. Reaction is neutral through moderately alkaline.

The Bt horizon has hue of 2.5Y through 7.5YR, value of 4 through 6 dry, 4 or 5 moist, and chroma of 2 through 6. Texture is sandy clay loam or gravelly sandy clay loam, averaging 20 to 35 percent clay and has more than 35 percent fine or coarser sand. Rock fragments range from 0 to 25 percent pebbles. Reaction is neutral through moderately alkaline.

The Bk horizon has hue of 2.5Y through 7.5YR, value of 5 through 8 dry, 4 through 7 moist, and chroma of 2 through 6. Texture is sandy clay loam, sandy loam, or fine sandy loam modified with from 0 to 30 percent pebbles. Some pedons have textures of loamy sand or coarser below 40 inches. It has accumulation of secondary calcium carbonate that ranges from 1 through 14 percent. Reaction is moderately or strongly alkaline. Some pedons have a C horizon.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous throughout. According to the NRCS soil series description, the soil profile is strongly to violently calcareous in the B horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 28 inches due to the presence of the C horizon.

Geographic Setting (According to Official Series Description): Rock River soils are on alluvial fans, fan aprons, benches, hillslopes, and toeslopes. The soils formed in material weathered from calcareous sandstone, eolian deposits, and residuum. Slopes are 0 to 25 percent. Elevation is 5,900 to 7,800 feet. The mean annual precipitation ranges from 10 to 14 inches of which about half falls as snow or rain in April, May, and early June. The mean annual temperature is about 41 to 45 degrees F., and the mean summer temperature

is 59 to 63 degrees F. The frost-free season is about 75 to 110 days but varies according to aspect, elevation, and air drainage.

FORELLE SERIES
SANDY LOAM

Soil Mapping Unit "F"
Lab/BKS Sample ID: G07120056_54
Typical Pedon: Forelle fine silt loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Forelle series consists of very deep, well drained soils on fan aprons, fan piedmonts, hillslopes, and hill toeslope positions. These soils formed in alluvium and slope alluvium derived from sedimentary rocks, primarily shale. Slopes are typically simple and range from 0 to 30 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 4 inches. Light brownish gray (10YR 6/2) silt loam, moist; strong fine granular structure; soft, very friable, nonsticky and nonplastic; 5 percent fine, semirounded pebbles; neutral (pH 7.0); noneffervescent; clear smooth boundary. (1 to 5 inches thick)

B - 4 to 15 inches. Brown (10YR 5/3) silt loam, moist; weak medium prismatic structure parting to moderate medium subangular blocky; hard, very friable, slightly sticky and slightly plastic; few, thin clay films on faces of some peds; 5 percent fine semirounded pebbles; moderately alkaline (pH 8.0); noneffervescent; clear smooth boundary. (2 to 5 inches thick)

BC - 15 to 21 inches. Brown (10YR 5/3) silty clay loam, moist; moderate medium prismatic structure parting to moderate medium subangular blocky; very hard, friable, slightly sticky and slightly plastic; continuous thin clay films on faces of peds and lining pores and root channels; 5 percent fine semirounded pebbles; moderately alkaline (pH 8.4); moderately effervescent; clear wavy boundary. (7 to 15 inches thick)

C1 - 21 to 42 inches. Pale brown (10YR 6/3) silty clay loam, moist; weak medium prismatic structure parting to weak medium subangular blocky; hard, friable, slightly sticky and slightly plastic; few thin clay films on faces of some peds and in some root channels; common soft masses of lime; 5 percent fine, semirounded pebbles; moderately alkaline (pH 8.4); moderately effervescent; gradual smooth boundary. (3 to 6 inches thick)

C2k - 42 to 49 inches. Light yellowish brown (2.5Y 6/4) clay loam, moist; massive; hard, friable, slightly sticky and slightly plastic; lime is disseminated and as common soft, rounded masses; 10 percent fine, semirounded pebbles; moderately alkaline (pH 8.3); strongly effervescent; gradual smooth boundary. (15 to 30 inches thick)

C3 - 49 to 58 inches. Light yellowish brown (2.5Y 6/4) sandy loam, moist; massive; hard, friable, slightly sticky and slightly plastic; lime is disseminated and as common soft, rounded masses; 10 percent fine, semirounded pebbles; moderately alkaline (pH 8.2); weak effervescent; gradual smooth boundary. (15 to 30 inches thick)

Type Location - Sweetwater County, Wyoming; refer to waypoint 54 on map included in this report.

Range in Characteristics (According to Official Series Description) – The mean annual soil temperature is 41 to 45 degrees F. The mean annual summer soil temperature is 59 to 63 degrees F. The depth to base of argillic horizon is 12 to 25 inches. The depth to secondary calcium carbonate is 12 to 25 inches. The rock fragment content of the entire soil to 60 inches. Note: 15 percent or less when averaged with pebbles ranging from 0 to 15 percent and cobble from 0 to 5 percent. The EC is less than 2 mmhos throughout. Regarding the A horizon, the hue is 7.5YR through 5Y. The value is 5 through 7 dry and 3 through 6 moist. The chroma is 2 through 4 dry or moist. The texture is fine sandy loam or loam. The reaction is neutral through moderately alkaline. Regarding the Bt horizon, the hue is 7.5YR through 5Y. The value is 4 through 7 dry and 3 through 6 moist. The chroma is 2 through 6 dry or moist. The texture is loam, clay loam, or sandy clay loam with 18 to 35 percent clay and more than 15 but less than 35 percent fine sand or coarser. The reaction is neutral through moderately alkaline. Regarding the Btk and Bk horizon, the hue is 7.5YR through 5Y. The value is 6 through 8 dry and 4 through 7 moist. The chroma is 1 through 6 dry or moist. The texture is loam, clay loam, sandy clay loam, and less commonly sandy loam with 18 to 30 percent clay; clay size carbonates may make up to 5 percent of the clay fraction. The calcium carbonate equivalent is 4 to 15 percent. The reaction is moderately or strongly alkaline. Regarding the c horizon, the hue is 7.5YR through 5Y. The value is 5 through 7 dry and 4 through 6 moist. The chroma is 2 through 6 dry or moist. The texture is loam, clay loam, sandy clay loam, or sandy loam with 18 to 30 percent clay. The reaction is slightly through strongly alkaline. The calcium carbonate equivalent is 1 to 6 percent.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A and B horizon, moderately calcareous in the BC and C1 horizons, and strongly in C2k horizon. According to the NRCS soil series description, the soil profile is strongly calcareous in the B horizon and slightly calcareous in the C horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Haplargids

Suitability for Topsoil (According to WDEQ Guideline 1) – Marginal EC (Conductivity) was found at depths of 42-49 and 49-58 inches. Unsuitable SAR parameter was found at

depths of 15-21, 21-42, 42-49, and 49-58. An estimated stripping depth is 15 inches based on laboratory analysis.

Geographic Setting (According to Official Series Description) - The parent material is alluvium and slope alluvium derived from shale interbedded with sandstone and siltstone. The landform is fan aprons, fan piedmonts, hillslopes, and hill toeslopes. The slopes are 0 to 30 percent. The elevation is 5,300 to 7,800 feet. The mean annual precipitation is 12 inches but ranges from 9 to 14 inches of which about half falls as rain or snow in April, May and early June. The mean annual temperature: 39 to 45 degrees F. The frost-free period is 75 to 110 days depending upon elevation, aspect, and air drainage.

CUSHOOL SERIES
SANDY LOAM

Soil Mapping Unit "Cu"
Lab/BKS Sample ID: G07120056_56
Typical Pedon: Cushool sandy loam-rangeland. (Colors are for dry soil unless otherwise stated.)

The Cushool series consists of well drained soils that are moderately deep to soft sandstone. They formed in slope alluvium and colluvium over residuum weathered from sandy shale and sandstone. Cushool soils are on rock-controlled hills, pediments, structural benches, ridges, and short fan aprons. Slopes are 0 to 50 percent. The mean annual precipitation is 10 to 12 inches, and the mean annual temperature is about 38 degrees Fahrenheit.

A - 0 to 3 inches. Grayish brown (10YR 5/2) sandy loam, moist; moderate fine granular structure; soft, very friable, nonsticky and nonplastic; common fine and very fine roots; neutral (pH 6.6); noneffervescent; clear smooth boundary. (2 to 6 inches thick)

Bt - 3 to 22 inches. Brown (10YR 5/3) sandy loam - sandy clay loam, moist; moderate medium subangular blocky structure parting to moderate medium granular; slightly hard, very friable, slightly sticky and slightly plastic; common fine and medium roots; few distinct clay films on faces of peds and inside root channels; neutral (pH 7.2); noneffervescent; clear smooth boundary.

C1- 22 to 29 inches. Brown (10YR 5/3) sandy loam, moist; weak medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few fine roots; few distinct clay films on faces of peds and in root channels; calcium carbonate as common fine and medium soft masses and filaments; slightly alkaline (pH 7.6); moderately effervescent gradual wavy boundary. (0 to 8 inches thick)

C2k – 29 to 37 inches. Pale brown (10YR 6/3) sandy loam, moist; massive; slightly hard, friable, nonsticky and nonplastic; calcium carbonate as common fine and medium soft masses and thin filaments and threads; slightly alkaline (pH 7.6); strongly effervescent, clear wavy boundary.

Type Location - Sweetwater County, Wyoming; refer to waypoint 56 on map included in this report.

Range in Soil Characteristics (According to Official Series Description) –
The mean annual soil temperature ranges from 41 to 47 degrees F. The mean summer temperature is from 59 to 63 degrees F. Depth to calcic horizon is 11 to 34 inches. Depth

to paralithic contact is 20 to 40 inches (shale interbedded with sandstone). These soils are typically free of carbonates through the upper part of the Bt horizon. Rock fragments range from 0 to 30 percent throughout the whole soil and are pebbles or channers. Exchangeable sodium ranges from 0 to 15 percent throughout the argillic horizon and Bk horizons. EC ranges from 0 to 4 mmhos throughout. Regarding A horizon, the hue is 7.5YR to 5Y. The value is 4 through 7 dry and 3 through 5 moist. The chroma is 2 through 6 dry or moist. The calcium carbonate equivalent is 0 to 5 percent. The reaction is neutral through moderately alkaline. Regarding the Bt horizon, the hue is 7.5YR to 5Y. The value is 4 through 6 dry and 3 or 4 moist. The chroma is 2 through 6 dry or moist. The texture is sandy clay loam, fine sandy loam, or sandy loam with 18 to 35 percent clay, 0 to 28 percent silt, and 45 to 80 percent sand with more than 35 percent being fine sand or coarser. The calcium carbonate equivalent is 0 to 5 percent. The reaction is neutral through moderately alkaline. The Btk horizon when present is moderately or strongly alkaline. Regarding the Bk horizon, the hue is 7.5YR to 5Y. The value is 5 through 7 dry and 4 through 7 moist. The chroma is 2 through 6 dry or moist. The texture is loamy fine sand, sandy loam, and fine sandy loam. The calcium carbonate equivalent is 5 to 15 percent. The reaction is moderately or strongly alkaline. A thin C horizon is present in some pedons.

Range in Characteristics (according to field observations, lab analysis): This soil profile is noncalcareous in the A and B horizon. According to the NRCS soil series description, the soil profile is strongly calcareous in the B horizon.

Taxonomic Class - Fine-loamy, mixed, superactive, frigid Ustic Calciargids

Suitability for Topsoil (According to WDEQ Guideline 1) - No marginal or unsuitable parameters were found according to Guideline 1. The estimated stripping depth is 22 inches due to the change in effervescent in the C horizon.

Geographic Setting (According to official series description) – The parent material is slope alluvium and colluvium over residuum weathered from sandy shale and sandstone. The landform is rock-controlled hill and ridge slopes, fan aprons, pediments, and structural benches. The slopes are 0 to 50 percent, and the elevations are 5,300 to 7,800 feet. The mean annual precipitation is about 12 inches, but it ranges from 9 to 14 inches of which about half falls as snow and rain in April, May, and early June. The mean annual temperature is about 41 degrees F. and ranges from 39 to 45 degrees F. The frost-free season is 75 to 110 days depending upon elevation, aspect, and air drainage.

To Whom It May Concern

Attached is the Prime and other Important Farmland list for Sweetwater County, Wyoming as requested by

BKS Environmental Associates, Inc.
PO Box 3467
Gillette, Wyoming 82717

As the attached report shows, no Prime farmland soil map units exist in Sweetwater county, Wyoming. If you have any questions, give me a call.

Prime and other Important Farmland

(Only the soils considered prime or important farmland are listed. Urban or built-up areas of the soils listed are not considered prime or important farmland. If a soil is prime or important farmland only under certain conditions, the conditions are specified in parentheses after the soil name.)

No selected map units are classified as Prime or other Important Farmland

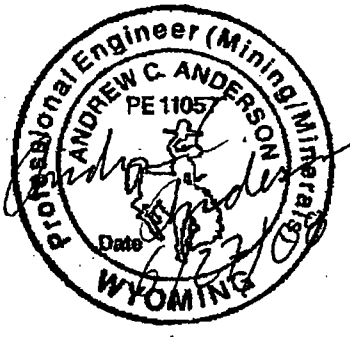
# PROFESSIONAL CERTIFICATIONS

# PROFESSIONAL CERTIFICATION

I hereby certify that the NRC License, Technical Report for Uranium One's, JAB and Antelope Uranium Project, Sweetwater County, Wyoming, Sections 2.6.1 – 2.6.4 & Addendum 2.6-A (geologic figures) was developed by me or under my direction and that I am a Professional Engineer licensed in Wyoming as required by the provisions of W.S. 33-29-105 through W.S. 33-29-113. IN WITNESS WHEREOF, I have hereunder set my hand and affixed my seal.



I further certify that I am a Professional Geologist licensed as required by the provisions of W.S. 33-41-101 through W.S. 33-41-121, and that all geological work performed in relation to this Section was performed by me or under my direction. IN WITNESS WHEREOF, I have hereunder set my hand and affixed my seal.

# 2.7 HYDROLOGY

## 2.7.1 Surface Water

For ease of review all figures associated with this section have been placed at the end of the section.

### 2.7.1.1 Drainage Basins

**Data Sources**

Drainage basin and surface water characteristics were determined by obtaining and analyzing two different publicly available Geographic Information Systems (GIS) datasets. The U.S. Geological Survey (USGS), in conjunction with the United States Environmental Protection Agency (EPA), have created the National Hydrography Dataset (NHD). The NHD is a "comprehensive set of digital spatial data that contains information about surface water features such as lakes, ponds, streams, rivers, springs and wells. Within the NHD, surface water features are combined to form "reaches," which provide the framework for linking water-related data to the NHD surface water drainage network" (USGS and EPA, 2002). Data from the NHD were obtained at a 1:24,000 scale representing the highest resolution dataset that the USGS has to offer.

In addition, The United States Fish and Wildlife Service (FWS) have produced a classification of wetlands and deep water habitat. This information is available as a digital spatial dataset as the National Wetlands Inventory (NWI). The NWI was created to "provide the citizens of the United States and its Trust Territories with current geospatially referenced information on the status, extent, characteristics and functions of wetland, riparian, deepwater and related aquatic habitats in priority areas to promote the understanding and conservation of these resources" (FWS, 2007). Data from the NWI were obtained at a 1:100,000 scale.

**Surface Drainage**

The Antelope and JAB Uranium Project is located in the north central portion of the Great Divide Basin (USGS Hydrologic Unit Code (HUC) 14040200). The Great Divide Basin is a 3,875 square mile ($mi^2$) closed basin in south central Wyoming (Figure 2.7-1).

The Great Divide Basin has approximately 7,800 miles of stream with a mean channel gradient of 0.0001 ft/ft (Table 2.7-1). The maximum elevation in the Great Divide Basin is 9,980 feet above mean sea level (msl) and the bottom of the basin discharges at 6,398 feet msl.

The Antelope and JAB Uranium Project is also completely contained within the Lost Creek Watershed. The Lost Creek Watershed is 415 $mi^2$ in size and located in the north central portion of the Great Divide Basin (Figure 2.7-2). The Lost Creek Watershed has approximately 1,006 miles of stream with a mean channel gradient of 0.0003 (Table 2.7-1). Elevation in the Lost Creek Watershed ranges from 6,520 feet msl to 8,310 feet msl. Streams generally flow from north to south throughout the basin, with the exception of the southern portion of the watershed which flows north, draining to Lost Creek at the outlet of the Lower Lost Creek Watershed. Elevations in the Lost Creek Watershed range from 6,520 feet to 8,310 feet msl.

The Antelope and JAB Uranium Project is contained within four subwatersheds of the Lost Creek Watershed (Figure 2.7-2). The majority of the JAB site lies in the Arapahoe Creek Subwatershed (HUC 140402000102) with smaller portions in the Lower Lost Creek Subwatershed (HUC 140402000103), Upper Lost Creek Subwatershed (HUC 140402000101) and Osborne Draw Subwatershed (HUC 140402000104). The majority of the Antelope site lies in the Osborne Draw Subwatershed with a smaller portion in the Arapahoe Creek Subwatershed.

The Arapahoe Creek Subwatershed is located in the north central portion of the Lost Creek Watershed and has a drainage area of 57.7 $mi^2$ (Figure 2.7-2). The Arapahoe Creek Subwatershed has 198 miles of stream (Table 2.7-1). The average channel gradient is 0.0014 and 5.4% of the channel length is perennial. Elevation in the Arapahoe Creek Subwatershed ranges from 6,800 feet msl to 8,310 feet msl. West Arapahoe Creek, East Arapahoe Creek and Magpie Creek all have their headwaters in the northern portion of the Arapahoe Creek Subwatershed. These three tributaries join to form Arapahoe Creek which runs generally southwest through the watershed. The NWI identified 76 wetland or deep water habitats in the Arapahoe Creek Subwatershed, covering 81.5 acres (USFWS, 2007). One of the surface waters is listed as a freshwater forested or shrub wetland, 37 are listed as freshwater emergent wetlands, 13 as freshwater ponds and 25 as other. The NHD lists names for four of the surface waterbodies in the watershed: the Antelope, Baby Antelope, Cold Spring and Hadsell Reservoirs (Figure 2.7-3, Table 2.7-2).

The Lower Lost Creek Subwatershed is located in the northwestern portion of the Lost Creek Watershed and has a drainage area of 76.2 $mi^2$ (Figure 2.7-2). The Lower Lost Creek Watershed has 138 miles of stream (Table 2.7-1). The average channel gradient is 0.0013 and 23.7% of the stream length is perennial. Elevation in the Lower Lost Creek Subwatershed ranges from 6,520 feet msl to 7,440 feet msl. Lost Creek flows 25.4 miles from north to south through the watershed. The NWI identified 56 wetland or deep water habitats in the Lower Lost Creek Subwatershed, covering 134.8 acres (FWS, 2007). Eleven of the surface waters are listed as freshwater emergent wetlands, eight as freshwater ponds, three as riverine and 34 as other. The largest wetland, by far, is an 81.4 acre riverine wetland along Lost Creek in the lower portion of the watershed. The NHD

named a group of intermittent reservoirs (McKay Reservoirs) totaling two acres in size and located in the headwaters of the watershed (Figure 2.7-4, Table 2.7-2).

The Osborne Draw Subwatershed is located in the northeastern portion of the Lost Creek Watershed and has a drainage area of 72.3 $mi^2$ (Figure 2.7-2). The Osborne Draw Subwatershed has 253 miles of stream (Table 2.7-1). The average channel gradient is 0.0010 and less than 1% of the stream length is perennial. Elevation in the Osborne Draw Watershed ranges from 6,720 feet msl to 8,100 feet msl. The Osborne Draw Subwatershed does not contain any named streams or creeks. The NWI identified nine wetland or deep water habitats in the Osborne Draw Subwatershed, covering 7.5 acres (USFWS, 2007). Four of the surface waters are listed as freshwater emergent wetlands, two as freshwater ponds and three as other. The NHD lists names for two of the surface waters in the watershed: Dry Well Reservoir in the southeast and Osborne Reservoir in the western part of the watershed (Figure 2.7-5, Table 2.7-2).

The Upper Lost Creek Subwatershed is located between the headwaters of the Lower Lost Creek Subwatershed and the Arapahoe Creek Subwatershed, and has a drainage area of 47.5 $mi^2$ (Figure 2.7-2). The Upper Lost Creek Subwatershed has 253 miles of stream (Table 2.7-1). There are no perennial streams in this watershed, and the average stream channel gradient is 0.0005. Elevation in the Upper Lost Creek Subwatershed ranges from 6,800 feet msl to 7,281 feet msl. Lost Creek headwaters are located in the north-central portion of the watershed. The creek then runs east and turns south toward the basin outlet approximately halfway down the watershed. The NWI identified 52 wetland or deep water habitats in the Upper Lost Creek Subwatershed, covering 31.8 acres (USFWS, 2007). Nineteen of the surface waters are listed as freshwater emergent wetlands, six as freshwater ponds and 27 as other. The NHD lists the name for one of the surface waterbodies in the watershed; the Lost Creek Reservoir as an on-channel reservoir located just downstream from where Lost Creek turns from the east to the south (Figure 2.7-6, Table 2.7-2). The reservoir is classified as a combination of freshwater emergent wetland and freshwater pond.

**Table 2.7-1 Drainage Basin Characteristics for the Antelope and JAB Uranium Project**

| Basin | Drainage Area ($mi^2$) | Channel Length (mi) | Elevation Differences (ft) | Channel (ft/mi) | Gradient (ft/ft) |
|---|---|---|---|---|---|
| Great Divide Basin | 3875 | 7800 | 3582 | 0.5 | 0.0001 |
| Lost Creek Watershed | 415 | 1006 | 1790 | 1.8 | 0.0003 |
| Arapahoe Creek Watershed | 57.7 | 198 | 1510 | 7.6 | 0.0014 |
| Lower Lost Creek Watershed | 76.2 | 138 | 920 | 6.7 | 0.0013 |
| Osborne Draw | 72.3 | 253 | 1380 | 5.5 | 0.0010 |
| Upper Lost Creek Watershed | 47.5 | 181 | 480 | 2.7 | 0.0005 |

**Table 2.7.-2 NHD Listed Surface Waterbodies in the Vicinity of the Antelope and JAB Uranium Project**

| Watershed | Waterbody | Size (acres) | Intermittent or Perennial |
|---|---|---|---|
| Arapahoe Creek | Antelope Reservoir | 0.7 | Intermittent |
| | Baby Antelope Reservoir | 2.5 | Intermittent |
| | Cold Spring Reservoir | 2.5 | Perennial |
| | Hadsell Reservoir | 6.5 | Intermittent |
| Lower Lost Creek | McKay Reservoirs | 1.3 | Intermittent |
| Osborne Draw | Dry Well Reservoir | 0.6 | Intermittent |
| | Osborne Reservoir | 3.5 | Intermittent |
| Upper Lost Creek | Lost Creek Reservoir | 8.6 | Intermittent |
| | Lost Creek Reservoir | 1.0 | Perennial |

**The Antelope and JAB Uranium Project Sites**

The JAB site, the smaller of the two Antelope and JAB uranium sites at 6.3 $mi^2$, is the furthest west of the two. JAB contains 13 miles of intermittent streams, no perennial streams and no wetlands or surface waterbodies. The Antelope site is 16.5 $mi^2$ in size, located approximately 3.7 miles east of JAB. Antelope contains 64.7 miles of intermittent streams, no perennial streams and one 0.1 acre freshwater emergent wetland in the northeast portion of the site (Figure 2.7-5).

**Precipitation**

The Antelope and JAB Uranium Project is located entirely within Sweetwater County, Wyoming. The USGS released a publication in 2005 entitled the *Water Resources of Sweetwater County, Wyoming.* This publication presents some of the climate statistics for Sweetwater County. The Antelope and JAB Uranium Project site receives between 7 and 10 inches of precipitation each year (Mason and Miller, 2005). Green River, Wyoming is also located in Sweetwater County approximately 100 miles southwest of the Antelope and JAB Uranium Project at an elevation of 6,109 feet msl. Figure 2.7-7 presents both the average monthly precipitation totals as a percent of the annual for Green River (Mason and Miller, 2005) and the approximate distribution of peak flow events for the Antelope and JAB Uranium Project discussed in greater detail in the Surface Water Runoff section. Figure 2.7-7 indicates that peak flow events are generally the result of convective summer rainstorm events.

The Precipitation-Frequency Atlas of the Western United States, Volume II presents precipitation values for the 6-hour and 24-hour storm events at 2-, 5-, 10-, 25-, 50- and 100-year recurrence intervals (Miller et al., 1973). The precipitation values presented in this atlas for the Antelope and JAB Uranium Project are listed in Table 2.7-3.

**Table 2.7-3 Precipitation Values of Selected Durations and Recurrence Intervals for the Antelope and JAB Uranium Project**

| Duration | 2-year (in) | 5-year (in) | 10-year (in) | 25-year (in) | 50-year (in) | 100-yer (in) |
|---|---|---|---|---|---|---|
| 6-hour | 0.7 | 1 | 1.1 | 1.4 | 1.6 | 1.8 |
| 24-hour | 0.9 | 1.3 | 1.5 | 2 | 2.2 | 2.4 |

**Surface Water Runoff**

Peak flood estimates for all drainage basins pertinent to the Antelope and JAB Uranium Project were estimated following the basin characteristics method outlined in a document entitled *Peak-Flow Characteristics of Wyoming Streams* published by the USGS in 2003. The method presented in this investigation report used regression analysis to relate peak flow events to different basin characteristics for six different hydrologic regions in the state of Wyoming.

The state of Wyoming was divided into six different hydrologic regions based on differences in topography and climate. The Antelope and JAB Uranium Project is located in Hydrologic Region Six, which corresponds to the high desert region where peak flows primarily occur as the result of rainstorms. Table 2.7-4 presents a list of the regression equations and statistics for the determination of peak flow events in Hydrologic Region Six (Miller, 2003). Table 2.7-5 presents peak flow estimates for the 2-, 5-, 10-, 25-, 50- and 100-year events.

**Table 2.7-4 Basin Characteristic Regression Equations Used to Predict Peak Flows for the Antelope and JAB Uranium Project***

| Equation | $SE_E$ (percent) | $SE_P$ (percent) |

## 2.7.2 Ground Water

This section describes the regional and local ground water hydrology, including hydrostratigraphy, ground water flow patterns, hydraulic gradient and aquifer parameters. The information provided in this section satisfies the data requirements of NUREG 1569 and Regulatory Guide 3.46. The discussion is based on information from reports of investigations performed within the Great Divide Basin, previous investigations of the site, and the geologic information presented in Section 2.6. Additional site specific hydrogeologic data have been collected by Uranium One throughout 2007 and 2008.

Regional and site baseline water quality conditions and local ground water use are discussed in Sections 2.7.3 and 2.7.4, respectively.

### 2.7.2.1 Regional Hydrogeology

The JAB and Antelope sites are located in the north central portion of the Great Divide Basin in south-central Wyoming, south of the Sweetwater River and north of the Washakie Basin. The project site lies within the Upper Colorado River Basin Aquifer System as defined by the USGS (Whitehead, 1996). Within the project area, this aquifer system contains aquifers in the Quaternary, Lower Tertiary and Upper Cretaceous Formations. The Quaternary aquifer includes some discontinuous quaternary gravel deposits overlying the JAB site. The Lower Tertiary aquifers include the Battle Springs Formation and the Fort Union Formation. The Upper Cretaceous aquifers include the Lance/Fox Hills Formation, the Mesa Verde Formation and the Frontier Formation.
Significant historical studies on the aquifers within the Great Divide Basin have been completed by Welder and McGreevy, 1966; Fisk, 1967; and Collentine et al., 1981. The information in the following summaries on ground water flow and recharge as well as the descriptions of the major regional aquifers and aquitards was acquired from these three sources.

Ground Water Flow
Ground water flow is to the south to southwest from the project area towards the synclinal axis of the structurally closed Great Divide Basin. The basin is bordered by the Wind River Range and Granite Mountains to the north, the Rock Springs uplift to the west, the Rawlins uplift to the east, and the Wamsutter Arch to the south. Due to the closed nature of the basin, no precipitation is lost as runoff and little to no ground water is discharged out of the basin. Some ground water is lost from underflow into the Washakie Basin to the south, but since the exchange between the basins is so small they can be considered hydrologically separate. Most ground water loss is through transpiration and some through evaporation.

Recharge
Recharge to the basin is principally from outcrop related infiltration of snowmelt and early spring rains at the basin margins. In 1967, Fisk estimated an average recharge of about 3,000 gpm and that fresh water can be found to depths of 3,500 feet in the Tertiary deposits. This vast amount of water in storage is historic and thought to have accumulated during the Pleistocene. The water in storage is not stagnate but is transmitted at different rates through each water-bearing formation in the Great Divide Basin.

ISR mining is to be isolated within the Eocene Battle Springs Formation with cased and cemented wells. The closed Great Divide Basin will contain all hydrological impact from mining activities to the basin. Downward seepage from the Battle Springs Formation into the deeper Mesa Verde and Frontier Aquifer is not expected to occur due to the impermeable Lewis Shale aquitard which separates them.

Aquifers

Thick sequences of sediments containing several major and minor aquifers underlie the project area. In descending stratigraphic order, the aquifers include: Quaternary gravels, Eocene Battle Springs, Paleocene Fort Union, Upper Cretaceous Lance/Fox Hills, Cretaceous Mesa Verde, and the Cretaceous Frontier. The Battle Springs Formation is the uranium host and aquifer of primary importance within the project area.

*Quaternary Gravels*

Some Quaternary gravel deposits are found in the northern half of T26N R94W near the JAB satellite facility. These are discontinuous aquifers that may locally yield large amounts of water and generally have good water quality.

*Battle Springs*

The Battle Springs Aquifer is a Tertiary stream and deltaic deposit coeval with the Wasatch Formation with which it inter-fingers just to the west of the project area. The Battle Springs Formation consists of semi-consolidated, highly permeable, fine to very coarse-grained, arkosic sandstones, conglomerates and claystones that most likely originated from the granites of the Sweetwater Arch to the northeast. The thickness of this deposit within the Great Divide Basin is estimated to be between 1,000 and 3,300 feet. Welder and McGreevey reported attainable yields greater than 1,000 gpm but Collentine et. al. reported 150 gpm as a likely yield with most yields ranging from 30 to 50 gpm. Historic transmissivities range from 29 to 3,157 gpd/ft and average storage coefficients range from $10^{-3}$ to $10^{-5}$.

*Fort Union*

The Fort Union Formation is a lower Tertiary aquifer which directly underlies the Battle Springs Formation. This formation is made up of fine to coarse grained sandstone,

carbonaceous coal with minor siltstone and claystone in the upper portion. The thickness varies from less than 1,000 feet to about 2,500 feet within the Great Divide Basin. It is generally considered a major aquifer that produces moderate to high yields. Porosities range from 15 to 39 percent, permeabilities are typically less than 1 gpd/ft$^2$ and transmissivities are typically less than 2,500 gpd/ft.

*Lance/Fox Hills*

The Lance/Fox Hills Aquifer is a low to moderate yielding minor aquifer that produces supplies adequate for stock and domestic wells. The Lance is composed of very fine to medium grained sandstones and dark gray to light brown shale, carbonaceous shale, lignite and coal. The Fox Hills is a sandier section underlying the Lance. The thicknesses vary greatly across the basin. For the Fox Hills sandstone, oil field data indicate porosity, permeability and transmissivity values of approximately 20 percent, 0.9 gpd/ft$^2$, and 10 to

20 gpd/ft, respectively. Lance Formation yields from stock wells are estimated to be between 5 and 30 gpm with transmissivities less than 22 gpd/ft.

*Mesa Verde*

The Mesa Verde Aquifer is an alternating sandstone-shale deposit associated with the regressive-transgressive phase of a Late Cretaceous sea. It is confined by the Lewis Shale above and the Cody Shale below. This formation has been exploited within the Great Divide Basin due to its value as a commercial oil and gas resource. Within the Basin, the Mesa Verde thickness ranges from 2,200 to 5,600 feet. Small to moderate yields can be expected and average porosities are about 20 percent.

*Frontier*

The Frontier Formation is a minor aquifer consisting of sandstones and shales with a few bentonite beds and lenses of pebble conglomerate. The thickness is estimated between 190 to 900 feet within the basin. Historic transmissivities are estimated between 100 and 20,000 gpd/ft with yields ranging from 1 to 100 gpm.

Aquitards

Major aquitards which underlie the project area include the Upper Cretaceous Lewis Shale, Cretaceous Cody Shale and the Lower Cretaceous units.

*Lewis Shale*

The Lewis Shale hydrologically separates the Tertiary and Lance/Fox Hills Aquifers from the stratigraphically lower Mesa Verde Aquifer. A thickness of 1,906 feet was measured on the southeast flank of the Great Divide Basin. The aquitard thins towards the west and is likely to be thinner underneath the study area.

*Cody Shale*

The Cody Shale aquitard hydrologically separates the Mesa Verde Aquifer from the underlying Frontier Aquifer and is around 5,000 feet thick underneath the project area.

*Lower Cretaceous Units*

The Lower Cretaceous units which underlie the Frontier Aquifer consist of the Mowry Shale, Thermopolis Shale and Cloverly Formation. The Mowry and Thermopolis Shale are aquitards with a combined thickness ranging from 190 to 760 feet. The Cloverly Formation is often considered a minor aquifer with low to moderate yields with a thickness ranging from 45 to 240 feet. When grouped together, the Lower Cretaceous units are considered a leaky confining unit.

### 2.7.2.2 Site Hydrogeology

Uranium One has conducted an intensive, on-going field investigation since the spring of 2007 to collect site-specific geohydrologic data across the project area. The purposes of the field program have been to collect well hydraulic and water quality data in the vicinity of the known ore zones to establish baseline conditions, and to evaluate potential effects of operations on adjacent ground water quality and quantity. The field program was intended to verify historic aquifer test data collected at the JAB site by Hydro-Engineering (1984) and collect new data to characterize the Battle Springs Aquifer across the Antelope and JAB project areas.

Monitoring Well Locations

Six monitoring well locations were established at the JAB site as part of the Hydro-Engineering (1984) investigation. All of these wells were completed in the Production Sand to collect representative background data for this unit. Aquifer testing was conducted at two locations as part of this investigation, and water quality samples were collected from all of the wells. All of these wells still exist, and Uranium One has collected additional water quality data from them. Two well clusters consisting of a pumping well, and two piezometers completed in the Production Sand, and one in the Underlying Sand were established as part of that investigation. Uranium One installed two additional pumping wells to further investigate the aquifer properties at JAB in the first quarter of 2008. The locations of the JAB wells and surface water sampling locations are included on Figure 2.7-8. Table 2.7-6 presents the well completion information for all of the monitoring wells at the Antelope and JAB Project site.

Twenty two monitoring wells have been established at the Antelope site. The locations of the Antelope wells are shown on Figure 2.7-9. Wells designated as M or MP at Antelope are completed in potential uranium producing sand horizons. Wells designated as MU are completed in sands underlying the producing horizons at that location.
The monitoring wells were completed to Uranium One specifications, approximating operating well specifications. Typical well completion diagrams are included on Figure 2.7-10. After the wells were constructed, they were developed and allowed to stabilize before aquifer testing and water quality sampling were initiated.

Hydrostratigraphic Units

The principal aquifer at the Antelope and JAB Project, and the host of the uranium producing zones is the Battle Springs Aquifer. The Battle Springs Formation was deposited by a large alluvial fan system, consisting of deposits of very fine to very coarse grained arkosic sandstones interbedded with thin shales, mudstones, and localized conglomerates. The lithology of the Battle Springs Formation varies greatly, both laterally and vertically, typical of an alluvial fan deposit. Based upon exploration drilling, and the correlation of geophysical logs, Uranium One has identified the following five hydrostratigraphic units at JAB: the Overlying Sand, the Overlying Confining Unit, the

Production Sand, the Underlying Confining Unit, and the Underlying Sand. Above the Overlying Confining Unit, the overlying sands are unsaturated. Twelve hydrostratigraphic units have been identified at Antelope. From shallowest to deepest, these sands are identified as the 290-250 Sand, the 245 Shale, the 240-200 Sand, the 195 Shale, the 190-150 Sand, the 145 Shale, the 140-100 Sand, the 95 Shale, the 90-50 Sand, the 45 Shale, the 40-10 Sand, and the 05 Shale. Type sections illustrating the relative positions of the identified hydrostratigraphic units are presented as Figures 2.7-11 and 2.7-12.

JAB Hydrostratigraphic Units

*Overlying Sand*

The Overlying Sand Unit is a typical alluvial fan channel deposit consisting of fine to coarse grained arkosic sands. The sand units are separated by thin shale and mudstone layers. This unit ranges from four to 23 feet thick in the permit area with 10 feet being the average. Although there is uranium mineralization present in this sand, it is unsaturated and not viable for ISR mining.

*Overlying Confining Unit*

The Overlying Confining Unit is a thinly interbedded sandstone, shale, and mudstone unit. It is typical of the normal, fining upward sequence of an alluvial fan depositional sequence. The Overlying Confining Unit ranges from three to 33 feet thick in the Permit Area, averaging 10 to 15 feet thick.

*Production Sand*

The Production Sand contains the mineralized zone at JAB, and is a typical alluvial fan channel deposit consisting of fine to very coarse grained arkosic sandstone. The Production Sand ranges from 22 to 54 feet thick in the JAB Permit Area, with an average thickness of 35 to 40 feet. Within the Production Sand, individual sandstone beds are fairly thick, with the thinnest sandstone beds ranging from eight to 10 feet thick. The remaining sands are separated by thin interbedded clay and mudstone units.

*Underlying Confining Unit*

The Underlying Confining Unit is a carbonaceous shale. The carbonaceous shale is a member of the Wasatch Formation that has inter-tongued with the arkosic sands of the Battle Springs Formation. The carbonaceous shale is a lacustrine – paludal deposit, indicating a period of non-erosion from the ancestral Granite Mountains to the north, and a concurrent period of regional subsidence, allowing the expansion of the ancient lakes to the south of the Permit Area. This carbonaceous shale thickens to the south and southwest of the JAB Permit Area. In the Permit Area the carbonaceous shale is between six and 30 feet thick, with 10 to 12 feet thick being the average.

*Underlying Sand*

The Underlying Sand Unit is a fine to coarse grained arkosic sandstone with thin, interbedded shale and mudstone layers. This unit ranges from 2 to 34 feet thick in the JAB Permit Area, averaging approximately 15 feet in thickness. The Underlying Sand Unit is a typical alluvial fan channel deposit. The variations in the sandstone thickness are indicative of channels within the alluvial fan moving laterally and vertically over time. The interbedded shales and mudstones represent lower energy floodplain and sheet flow deposits, distal from the main channel deposits. Isopach maps of the Overlying Sand, Overlying Confining Unit, Production Sand, Underlying Confining Unit, and the

Underlying Sand, are presented as Figures 2.6-3 through 2.6-8 in the Geology Section (Section 2.6) of this technical report.

Antelope Hydrostratigraphic Units

*290-250 Sand*

The 290-250 Sand Unit is present in only the southern portion of the Antelope permit area as these sand beds have been eroded in the northern portion. The 290-250 Sands are arkosic, very fine to very coarse grained sandstones with interbedded shale and siltstones.

*245 Shale*

Underlying the 290-250 Sand is the 245 Shale. It is five to 25 feet thick, averaging 12 feet and consists of gray shale and siltstone. The color can vary from greenish-grey, to pale purple and yellow. The 245 Shale is present in the southern portion of the permit area, but has been removed by erosion in the north (Figure 2.6-25).

*240-200 Sand*

Underlying the 245 Shale is the 240-200 Sand. It is 205-298 feet thick, averaging 254 feet, and consists of very fine to very coarse grained arkosic sandstone with interbedded yellow, purple, and greenish-grey shale. Pebble conglomerate may be present at the base of the individual channel sand units. Minor chert and pyrite can also be observed. A complete section of the 240-200 Sand is present in the southern two-thirds of the permit area, but becomes an erosional surface in the northern third (Figure 2.6-24). This unit contains uranium mineralization, and Well M-9 is completed in this sandstone unit.

*195 Shale*

The 195 Shale underlies the 240-200 Sand, is four to 43 feet thick, averaging 14 feet, and consists of greenish-gray shale. It is exposed on the surface and has been eroded in the northernmost edge of the permit area. Where it has not been removed by erosion it is laterally continuous (Figure 2.6-23).

*190-150 Sand*

The 190-150 Sand underlies the 195 Shale and is 167 to 322 feet thick across the Antelope permit/license area, averaging 252 feet thick. It consists of very fine to very coarse grained arkosic sandstone with interbedded shale and siltstones. It contains minor black chert, and minor to moderate pyrite. Along the northern edge of the permit area, the 190-150 Sand is exposed at the surface and has been partially eroded (Figure 2.6-22). This sand contains uranium mineralization. Wells M-2, M-3, M-4, MU-4, M-11, M-12, M-16, and MP-16 are all completed in this sandstone unit.

*145 Shale*
The 145 Shale underlies the 190-150 Sand, is four to 30 feet thick, averaging 12 feet and consists of greenish-gray shale. It is laterally continuous throughout the permit area (Figure 2.6-21).

*140-100 Sand*
The 145 Shale is underlain by the 140-100 Sand. The 140-100 Sand is 219 to 405 feet thick, averaging 291 feet, and consists of arkosic and quartzose, very fine to very coarse grained sandstone with interbedded shale and siltstones (Figure 2.6-20). The shale can range in color from green-grey to pale purple. Minor black chert and pebble conglomerate layers can also be present and the unit often contains some pyrite. Wells M-1, MU-2, M-6, M-8, M-12, M-14, and MU-16 are completed in this sand unit.

*95 Shale*
Underlying the 140-100 Sand, the 95 Shale is three to 35 feet thick, averaging 14 feet. The 95 Shale consists of greenish grey shale and siltstone. It is laterally continuous throughout the permit area (Figure 2.6-19).

*90-50 Sand*
The 90-50 Sand underlies the 95 Shale, is 233 to 371 feet thick and averages 284 feet. It consists of arkosic, very fine to coarse grained sandstone with interbedded greenish grey shales and siltstones, and can contain abundant pyrite. Figure 2.6-18 shows the isopach map of the 90-50 Sand. Well MU-13 is completed in this sand representing an underlying Sand Unit.

*45 Shale*
The 45 Shale underlies the 90-50 Sand and is five to 25 feet thick, averaging 14 feet. The 45 Shale appears to be continuous throughout the Antelope permit/license area. It is composed of green-grey shale and siltstone (Figure 2.6-17).

*40-10 Sand*
The 45 Shale is underlain by the 40-10 Sand. It is 257 to 314 feet thick, averaging 287 feet and consists of very fine to coarse grained arkosic sandstone with interbedded green-grey shale and siltstones (Figure 2.6-16). It often contains abundant pyrite.

*05 Shale*
The 05 Shale confining unit consists of green-grey shale and minor siltstone. It is eight to 18 feet thick, averaging 14 feet, and is thought to be continuous throughout the Antelope property (Figure 2.6-15).
Figures 2.6-26 through 2.6-35 in Section 2.6 show cross sections through the Antelope Project area.

### 2.7.2.3 Potentiometric Surface, Ground Water Flow Direction and Hydraulic Gradient

The hydrogeologic evaluation of the Antelope and JAB sites included measurement of water levels in monitor wells completed in the production and underlying aquifers to assess the potentiometric surface, ground water flow direction, and hydraulic gradient. Regional ground water flow is generally to the south to southwest. Water level data recorded for the site monitor wells can be found in Addendum 2.7-A. Figure 2.7-13 depicts regional ground water flow after Collentine et. al, 1981.

The JAB site potentiometric surface for the production zone sand is shown on Figure 2.7-14. Water level data used to develop the potentiometric surface map were collected between September 21 and September 29, 2007. Two monitoring wells, MP-2069 and MP-2103, had not yet been drilled at that date so static water level elevations from March 11, 2008 were evaluated for those two sites. Based on the water level data, the direction of ground water flow within the production sand is predominantly to the south with an eastward inclination, generally consistent with the regional flow system. The horizontal hydraulic gradient calculated from this data is approximately 0.002 ft/ft (8 ft/mile). These findings are generally consistent with historic data collected by Hydro Engineering (1984), who reported that ground water in this area generally flows southeasterly with a hydraulic gradient of 0.018 ft/ft. Comparison of current water level data collected during this investigation with those from Hydro Engineering for similar months indicates water levels in these wells have generally fallen anywhere from 0.35 to 3.28 feet since those level measurements were taken in 1980-1982. Despite these differences, the water levels are generally consistent through time. The Historic report (without large figures) is contained in Appendix B of this Technical Report.

Figure 2.7-15 represents the Antelope site potentiometric surface for production sands. Water level data used to develop the potentiometric surface map were collected in March and April, 2008. In general, ground water flow is to the southwest and is generally consistent with the regional flow system. The general hydraulic gradient calculated from the data is 0.02 ft/ft (100 ft/mi). The gradient at Antelope is much steeper than the gradient at JAB. In addition, the gradient steps down from a higher gradient (0.03 ft/ft, 150 ft/mi) in the northeast to a lower gradient (0.01 ft/ft, 40 ft/mi) in the southwest. This suggests that the Antelope site permeability is not homogeneous with respect to the production sands. The flatter gradient areas have a relatively higher permeability while the steeper gradient areas have lower permeability

Differences in hydraulic heads for the JAB and Antelope sites were analyzed by comparing water levels in closely grouped wells completed in different hydrostratigraphic units. These differences were used to assess hydraulic communication between the production sands and the underlying sands. Table 2.7-7 summarizes the water levels of the well groups used for the assessment.

**Table 2.7-7 Head Difference of Underlying Aquifers from Overlying Aquifers – Antelope and JAB Uranium Project**

| Mine Name | Well Group | Date | Well ID | Water Level | Aquifer | Head Difference[1] |
|---|---|---|---|---|---|---|
| JAB | MP-2069 | 3/19/2008 | MP-2069 | 6,790 | Production Sand | + 2 ft. |
| | | | OW-1303 | 6,792 | Underlying Sand | |
| | MP-2103 | 3/24/2008 | MP-2013 | 6,790 | Production Sand | + 0 ft. |
| | | | OW-1307 | 6,790 | Underlying Sand | |
| Antelope | M-13 | 4/3/2008 | M-13 | 7,154 | 140-100 Production Sand | - 40 ft. |
| | | | MU-13 | 7,114 | 90-50 Underlying Sand | |
| | M-16 | 3/27/2008 | M-16 | 7,182 | 190-150 Production Sand | + 4 ft. |
| | | | MU-16 | 7,186 | 140-100 Underlying Sand | |

Notes:
1. A positive difference is shown when the water level in the underlying aquifer is higher than the Production Sand. A negative difference is shown when the water level in the underlying aquifer is lower than the Production Sand.

In general, the difference between the hydraulic heads of the production sands and the underlying sands at the JAB and Antelope sites are minimal. This is consistent with the aquifer test analysis which shows leaky conditions; some water is being contributed to the production zone from the overlying and underlying aquifers. In almost all cases the water levels of the underlying aquifer are slightly above those of the production zone, suggesting the lower sands are recharged at higher topographic elevations and discharge to the overlying sands.

The one exception is well group M-13. The observation well MU-13, drilled into the underlying 90-50 sand, has a water level approximately 40 feet lower than M-13, which is drilled into the 140-100 sand. This difference indicates that these two aquifers are not in hydraulic communication, but that there is potential for ground water from the upper aquifer to drain into the lower aquifer at this location.
The future addition of more monitoring wells in both the underlying and overlying units is expected to constrain the confining properties of the shales between production zone and underlying aquifers. From this preliminary analysis, it appears at Antelope that the 95

Shale between the 90-50 and 140-100 sand is a confining layer while the 145 shale between the 140-100 and 190-150 sands is only semi-confining.

### 2.7.2.4 Site Specific Aquifer Properties

The hydrogeologic properties of the Battle Springs aquifers within the JAB and Antelope Project areas have been estimated from historic and recent aquifer testing. Hydro-Engineering (1984) completed an initial hydrogeologic investigation of the JAB property in 1982 that included aquifer tests on several Production Sand wells. Constant rate tests were conducted on two wells on the JAB property and on three wells on the Antelope property in late 2007 and 2008.

Historic Aquifer Test Results

Hydro-Engineering (1984) completed aquifer tests on six wells at the JAB Project between September 1980 and December 1981 to assess the hydrogeologic characteristics of the Production Sand as well as underlying hydrostratigraphic units. A summary of the Hydro-Engineering tests that were conducted is presented below. Information on the pumping wells and observation wells utilized in the aquifer tests are provided in Table 2.7-6, and the locations of the wells are shown on Figures 2.7-8 and 2.7-9.

- A two day pumping test was completed on Well MW-1292 on October 21, 1980. The well was pumped at a discharge rate of 32 gallons per minute (gpm) while wells OW-1304, OW-1305, and OW-1307 were observed for drawdown. Wells MW-1292, OW-1304, and OW-1305 are completed within the Production Sand, while OW-1307 is completed within the Underlying Sand. Observation wells OW-1304, OW-1305, and OW-1307 are located 60.4, 30.4, and 32.4 feet, respectively, from the pumping well, MW-1292. Drawdown in the observation wells at the end of the test for OW-1304, OW-1305, and OW-1307 were 6.37, 8.85, and 2.79 feet, respectively. The response of OW-1307 during the aquifer test suggests there is hydrologic communication between the Production and Underlying Sands. Hydro-Engineering (1984) speculated that a poor bentonite seal in the well annulus or pinching out of the mudstone in this area could account for the drawdown in OW-1307.

- Well MW-1291 was pumped at an average rate of 3.1 gpm for 405 minutes on December 9, 1981, while monitoring wells OW-1301, OW-1302, and OW-1303 were observed for drawdown. OW-1301, OW-1302, and MW-1291 are completed within the Production Sand, but OW-1303 is completed in the Underlying Sand north of a localized fault. Observation wells OW-1301, OW-1302, and OW-1303 are located 62, 30.5, and 50 feet, respectively from MW-1291. Drawdown in observation wells OW-1301, OW-1302, and OW-1303 were measured to be 1.10, 1.88, and 0.06 feet at the end of the test. Hydro-Engineering (1984) reported that

very little water level change was observed in OW-1303, and that the Underlying Sand north of the fault is not readily connected to the Production Sand.

- On September 17, 1980, Well MW-1298 was pump tested at an average rate of 5.9 gpm for 55 minutes. Drawdown in this well at the end of the test was measured to be 85.61 feet. MW-1298 is completed in the Production Sand. No observation well data were collected during this test.

- Located in the southeast corner of the proposed mining area, Well MW-1299 was pump tested at an average rate of 23.7 gpm for 916 minutes on September 16, 1980. MW-1299 is completed in the Production Sand. At the end of the test, the water level in this well had been drawn down 14.25 feet. No observation well data were collected during this test.

- Well MW-1300, which lies north of all the previously mentioned wells, was pump tested at an average rate of 6.9 gpm. This well is also completed in the Production Sand. At the end of this test, drawdown in the well was measured to be approximately 13.5 feet. No observation well data were collected during the test.

- The JAB #1 well was used for a drilling water supply, and is completed in the Production Sand. This well was tested for 870 minutes on September 16, 1980, at a final discharge rate of 55 gpm. Total drawdown measured in this well at the end of the test was 32.61 feet. No observation well data were collected during this test.

Summarized in Table 2.7-8, transmissivities estimated from previous aquifer tests completed for the JAB Project vary and range from 40 to 4,700 gallons per day per foot (gpd/ft). Hydraulic conductivities estimates vary similarly, and range from 1.3 to 82.3 gallons per day per square foot ($gpd/ft^2$).

**Table 2.7-8 Summary of Horizontal Aquifer Properties of the Production Sand in the JAB Project Area, Historic Aquifer Tests – Antelope and JAB Uranium Project**

| Well | Date Tested | Analysis Method | Transmissivity (gpd/ft) | Storage Coefficient | Aquifer Thickness (ft) | Hydraulic Conductivity ($gpd/ft^2$) |
|---|---|---|---|---|---|---|
| MW-1300 | 10/1/1980 | Jacob, Theis Recovery | 650-670 | -- | 30 | 21.7 |
| MW-1292 | 10/21/1980 | Jacob, Theis Recovery | 2800-2900 | -- | 70 | 40.4 |
| OW-1304 | 10/21/1980 | Theis, Jacob | 4700 | $2.4x10^{-4}$ | 70 | 66.6 |
| OW-1305 | 10/21/1980 | Theis, Jacob | 3900-4200 | $2.4x10^{-4}$ - $1.7 \times 10^{-4}$ | 70 | 59.1 |
| JAB #1 | 9/16/1980 | Theis Recovery | 3400 | -- | 40 | 82.3 |
| MW-1299 | 9/16/1980 | Jacob, Theis Recovery | 1400-1700 | -- | 53 | 29.2 |
| MW-1298 | 9/17/1980 | Jacob, Theis Recovery | 40-50 | -- | 35 | 1.3 |
| MW-1291 | 12/9/1981 | Jacob, Theis Recovery | 100-220 | -- | 45 | 4.6 |
| OW-1301 | 12/9/1981 | Theis, Jacob | 790-880 | $1.9 \times 10^{-4}$ – $5.4 \times 10^{-4}$ | 45 | 18.7 |
| OW-1302 | 12/9/1981 | Theis, Jacob | 510-580 | $1.2 \times 1^{-4}$ – $9.1 \times 10^{-4}$ | 45 | 12.0 |

Source: Hydro-Engineering (1984)
Notes: -- Indicates storage coefficient could not be calculated from these data.

Limited data (e.g., laboratory analyses or detailed pump test data) regarding the vertical hydraulic conductivity of the confining units are available for the JAB Project area. Based on aquifer testing of MW-1292 and observation well OW-1307 which was completed in the Underlying Sand, Hydro-Engineering estimated a vertical permeability of 0.43 ft/day ($1.6 \times 10^{-4}$ cm/sec) for the Underlying Confining Unit below the Production Sand. It was concluded that this value was probably not representative.

2007-2008 Aquifer Tests

In December 2007 and March-April 2008, Uranium One, Pronghorn Pump (Pronghorn), and Lidstone and Associates, Inc. (LA) initiated an aquifer test program for both the JAB and Antelope Projects that was designed to accomplish the following objectives:

1. Demonstrate hydraulic communication between the production sand zone pumping wells and the surrounding monitor wells;
2. Assess the hydrologic characteristics of the production zone aquifer within the tested areas;
3. Evaluate the presence or absence of hydrologic boundaries in the production sand zones within the project areas; and,
4. Demonstrate sufficient confinement between the production sand zones and the overlying and underlying sands for the purposes of ISR mining.

Given the vast expanse of each property plus the distance between the properties, LA and Uranium One decided to complete aquifer tests at several locations on both properties. Two wells, MP-2069 and MP-2103, were tested at the JAB Project area, and three wells, MP-4, M-13, and MP-16, were tested at the Antelope Project area. These aquifer tests were completed between March 19 and April 1, 2008. Table 2.7-6 provides basic well information for the pumping wells and observation wells used in the tests. Details regarding the pump test results and analysis for the JAB and Antelope Project areas are provided in Addendum 2.7-B and 2.7-C, respectively.

Aquifer Testing Procedures

For pump testing purposes, Uranium One contracted Pronghorn to install the test pumps and all necessary appurtenances for each well. The test pumps were typically set in each production well to a depth above the uppermost screened interval. During the tests, ground water was lifted from the pump through a steel column pipe, and once at ground surface, was routed through a PVC discharge manifold consisting of an approximately one inch totalizing Great Plains Industries and a flow control valve. Below the flow control valve, flexible hose was used to discharge the water to ground surface. Discharge rates were monitored with both the in-line flowmeter, and a calibrated five gallon bucket. The flowmeter was used to record both total pumpage and instantaneous flows. During the constant rate tests, water level changes in the production and observation wells were monitored both manually with a water level tape, and electronically with In-Situ LevelTroll 700™ pressure transducers. The locations of each of the wells that were used during the tests were field surveyed with a hand held Garmin GPS unit for initial survey purposes.

LA utilized standard aquifer test procedures included with Schlumberger Water Services' Aquifer Test Pro 4.2™ software package to develop the hydrogeologic parameter estimates presented herein. Curve matching analysis of the drawdown data generated by

the pump testing generally indicated that the saturated sandstones of Battle Springs Aquifer behave as leaky confined aquifers. Typical analytical methods that were used for this analysis included Hantush and Jacob (1955), Cooper & Jacob (1946), and the Theis Recovery (1935) methods.

JAB Aquifer Test Results

LA completed two aquifer tests in the JAB project area. The tests were completed utilizing wells MP-2069 and MP-2103 as the pumping wells. Test results are summarized in Table 2.7-9.

**Table 2.7-9 Summary of Horizontal Aquifer Properties of the Production Sand in the JAB Project Area – March-April 2008 – Antelope and JAB Uranium Project**

| Well | Date Tested | Analysis Method | Transmissivity (gpd/ft) | Storage Coefficient | Aquifer Thickness (ft) | Hydraulic Conductivity ($gpd/ft^2$) |
|---|---|---|---|---|---|---|
| MP-2103 | 3/24/2008 | Hantush, Cooper-Jacob, Theis Recovery | 1360 – 2130 | -- | 35 | 38.9 – 60.7 |
| MW-1292 | 3/24/2008 | Hantush, Cooper-Jacob, Theis Recovery | 1850 – 2420 | $1.9 \times 10^{-5}$ – $3.5 \times 10^{-5}$ | 35 | 52.7 – 69.0 |
| OW-1307 | 3/24/2008 | Hantush, Cooper-Jacob | 1180 – 4180 | $1.2 \times 10^{-4}$ – $1.9 \times 10^{-4}$ | 35 | 33.8 – 120 |
| MP-2069 | 3/19/2008 | Hantush, Cooper-Jacob, Theis Recovery | 850 – 1160 | -- | 40 | 21.3 – 28.9 |
| MW-1291 | 3/19/2008 | Hantush, Theis Recovery | 585 – 923 | $8.8 \times 10^{-5}$ | 40 | 14.6 – 23.1 |
| OW-1301 | 3/19/2008 | Hantush, Cooper-Jacob, Theis Recovery | 790 – 1080 | $6.9 \times 10^{-6}$ – $7.1 \times 10^{-6}$ | 40 | 19.8 – 26.9 |
| OW-1302 | 3/19/2008 | Hantush, Cooper-Jacob, Theis Recovery | 693 - 1100 | $1.1 \times 10^{-5}$ – $1.5 \times 10^{-5}$ | 40 | 17.3 – 27.4 |

Notes: -- Indicates storage coefficient could not be calculated from these data.

MP-2069 Aquifer Testing

Beginning on March 19, 2008, Well MP-2069 was tested for 2,880 minutes at an average rate of 10.25 gpm, while water levels were monitored in four observation wells. Observation wells OW-1301, OW-1302, and MW-1291 were utilized to monitor water levels in the Production Sand at distances of approximately 116, 148, and 170 feet, respectively. Observation well OW-1303 was used to observe any water level changes in the Underlying Sand on the other side of a localized fault in the Battle Springs Formation, at a distance of approximately 234 feet from the pumping well.

As summarized in Addendum 2.7-B, the transmissivity and hydraulic conductivity of the Production Sand in the vicinity of MP-2069 appear to reflect leaky confined aquifer conditions. Transmissivity estimates made from pumping, recovery, and distance drawdown data for the Production Sand range from 585 to 1,160 gpd/ft, with an average of 869 gpd/ft. Based on an average thickness of 40 feet, the hydraulic conductivity of the aquifer ranges from 14.6 to 28.9 gpd/ft$^2$, with an average of 21.7 gpd/ft$^2$. Based on observation well data, the average storage coefficient of the Production Sand was estimated to be $2.4 \times 10^{-5}$. After two days of pumping, the radius of influence of this well extended approximately 0.5 miles based on distance drawdown data. Comparison of these results in Table 2.7-9 with those from Hydro-Engineering (1984) presented in Table 2.7-8 indicate that the current results are similar, but slightly higher than those previously estimated.

As shown in Addendum 2.7-B, the test pumping of MP-2069 drew down water levels in the Production Sand, as expected, and suggests that the Production and Underlying Sands are in limited hydraulic communication. Water levels in OW-1303 declined minimally during the later portion of the test and into the recovery period before rebounding. Maximum water level drawdown associated with this well was measured to be 0.25 feet. The relative similarity of the water level elevations between MP-2069 and OW-1303 (~2 foot difference), in combination with the 0.25 feet of drawdown that observed during this test suggests that the Production Sand may be in limited hydraulic communication with the Underlying Sand in this area. It is also possible that some of this small drawdown could be associated with barometric pressure effects, given the limited background data collected and lack of barometric pressure data for correction. The limited impact on the water level in OW-1303 due to the pumping of MP-2069 appears to indicate that the two sands are separated by an adequate confining unit. Consequently, impacts to the underlying sand from mining are expected to be minimal. The impact of barometric pressure changes in this area will be further evaluated during wellfield specific testing.

As noted previously, there is a local fault is located between MP-2069 and OW-1303. This test appears to demonstrate that the local fault has a limited and potentially insignificant impact on hydraulic communication between the Underlying and Production

Sands. The extent and magnitude of hydraulic communication in this area will be further defined during wellfield specific testing and additional operational controls and monitoring in the underlying area may be proposed based on results of those tests.

MP-2103 Aquifer Testing

MP-2103 was tested for approximately 1,494 minutes at an average rate of 28.7 gpm, starting on March 24, 2008. Water levels in the Production Sand were monitored in Observation Wells MW-1292, OW-1302, and MP-2069 at distances of approximately 336, 2,607, and 2,564 feet, respectively, from the pumping well. Water levels in the Underlying Sand were monitored in OW-1307 at a distance of about 364 feet.

The transmissivity and hydraulic conductivity of the Production Sand in the vicinity of MP-2103 indicate the Production Sand in this area is a leaky confined aquifer. As summarized in Table 2.7-8 and Addendum 2.7-B, transmissivity estimates based on pumping, recovery, and distance drawdown data for both the Production and Underlying Sands range from 1,180 to 4,180 gpd/ft, with an average of 2,110 gpd/ft. Based on a saturated thickness of 35 feet, hydraulic conductivities were estimated to range from 3.8 to 120 gpd/ft$^2$, with an average of 60.4 gpd/ft$^2$. Based on observation well data, the storage coefficient of the aquifer averages 6.4 x $10^{-5}$. After approximately one day of pumping, the radius of influence of this well appeared to extend approximately 0.56 miles from the pumping well. Comparison of these hydrogeologic parameters on Table 2.7-9 with those from Hydro-Engineering (1984) on Table 2.7-8 indicates the transmissivity of the Production Sand is relatively unchanged since the previous testing was completed.

The test pumping of MP-2103 drew water levels in both the Production and Underlying Sands down. The time drawdown data for this test are graphically summarized in Attachment 2.7-B. While failure of the Level Troll 700 in OW-1307 limited the data collection on this well, the equivalent static hydraulic heads associated with these sands as well as the amount of drawdown recorded in OW-1307 (~1.8 feet) during the test indicate these sands are in hydraulic communication. As shown in Figures 2.6-3 through 2.6-8 in the Geology Section (Section 2.6), a continuous carbonaceous shale confining unit is present between the production and underlying sand in this area. Therefore, it is believed that the hydrologic communication in this area is most likely attributable to an improperly sealed historic drill hole or an improper annular seal on well OW-1307. The extent and magnitude of hydraulic communication in this area will be further defined during wellfield specific testing and additional operational controls and monitoring in the underlying area may be proposed based on results of those tests. Also, corrective actions may be taken to eliminate potential communication pathways.

JAB Test Results Summary

Results of the two aquifer tests that were completed at the JAB project area for this project, as well as those recorded previously by Hydro-Engineering (1984) indicate the following:

- The Production Sand has hydraulic continuity across the eastern portion of the project area. Additional (wellfield) scale testing required by the NRC and WDEQ will demonstrate communication throughout the project area between the pumping well(s) and the monitor well ring to be installed.

- The Production and Underlying Sands are in limited hydraulic communication. The degree of hydraulic communication varies across the site, and may be attributable to localized pathways such as an open historic drill hole or improperly sealed historic well since a continuous significant aquitard is present throughout most of the mineralized area.Testing to date has not indicated that local faults act as impermeable boundary conditions. However, as demonstrated by the MP-2069 pump testing located nearest to the known fault north of the mineralized area, the fault does not appear to provide a significant pathway of hydraulic communication.

- Future work including mine unit testing will be conducted to demonstrate that an adequate continuous lower confining layer exists in the project area to minimize impacts on underlying aquifers, and to assess the hydraulic continuity of the Production Sand in the western half of the project area.

Antelope Aquifer Test Results

LA completed three aquifer tests in the Antelope project area. The tests were completed utilizing MP-4, M-13, and MP-16 as pumping wells. Test results are summarized in Table 2.7-10.

MP-4 Aquifer Testing

Starting on March 25, 2008, Well MP-4 was tested for 2,990 minutes at an average discharge rate of 21.5 gpm, while water levels were monitored in three observation wells. Observation wells M-4 and M-5 were utilized to monitor water levels in the 190-150 Sand at distances of approximately 76 and 2,058 feet, respectively. Observation well MU-4 was used to observe any water level changes in the lower portion of the 190-150 Sand, at a distance of approximately 7 feet from the pumping well.

**Table 2.7-10 Summary of Horizontal Aquifer Properties of the Production Sand in the Antelope Project Area – March-April 2008**

| Well | Date Tested | Analysis Method | Transmissivity (gpd/ft) | Storage Coefficient | Aquifer Thickness (ft) | Hydraulic Conductivity ($gpd/ft^2$) |
|---|---|---|---|---|---|---|
| MP-4 | 3/25/2008 | Hantush, Cooper-Jacob, Theis Recovery | 535 – 1350 | -- | 295 | 1.8 – 4.6 |
| M-4 | 3/25/2008 | Hantush, Theis Recovery | 2230 – 2400 | $3.6 \times 10^{-3}$ – | 295 | 7.5 – 8.1 |
| M-13 | 4/1/2008 | Hantush, Cooper-Jacob, Theis Recovery | 169 – 578 | -- | 280 | 0.6 – 2.1 |
| MP-16 | 3/27/2008 | Hantush, Cooper-Jacob, Theis Recovery | 776 – 4830 | -- | 80 | 9.7 – 60.4 |
| M-16 | 3/27/2008 | Hantush, Theis Recovery | 614 - 3840 | $2.7 \times 10^{-4}$ | 80 | 7.6 - 48 |

Notes: -- Indicates storage coefficient could not be calculated from these data.

As summarized in Addendum C and Table 2.7-10, the transmissivity and hydraulic conductivity of the 190-150 Sand in the vicinity of MP-4 reflect confined leaky aquifer conditions. Transmissivity estimates made from pumping, recovery, and distance drawdown data for the 190-150 Sand range from 535 to 5,120 gpd/ft, with an average of 2,030 gpd/ft. Based on an average thickness of 295 feet, the hydraulic conductivity of the aquifer ranges from 1.8 to 17.4 $gpd/ft^2$, with an average of 6.9 $gpd/ft^2$. Based on observation well data, the average storage coefficient of the 190-150 Sand was estimated to be $2.0 \times 10^{-3}$. After approximately two days of pumping, the radius of influence of this well extended about 0.56 miles based on distance drawdown data.

The test pumping of MP-4 drew water levels down in the 190-150 Sand both at distance and at depth within this saturated Battle Springs Aquifer sandstone. Time drawdown data that are graphically presented in Addundum 2.7 C reveal that the water level in M-4 was immediately affected by pumping from the production well. These data also indicate that observation wells M-5 and MU-4 were not affected until late in the test and at roughly the

same time from roughly 3,000 to 3,500 minutes into the test, or during recovery of the pumping well. The maximum drawdown observed at these wells only amounted to 0.11 at MU-4 and 0.24 feet at M-5. While the amount of drawdown at either well is not significant, this impact of pumping MP-4 suggests either that the upper and lower sandstone members of the 190-150 Sand are in some degree of hydraulic communication, that barometric pressure fluctuations affected water levels, or a combination of these. The extent of these impacts will be evaluated further during wellfield scale testing.

M-13 Aquifer Testing

To test the productivity and aquifer characteristics of the 140-100 Sand, well M-13 was tested for 2,881 minutes at an average discharge rate of 19.4 gpm beginning on April 1, 2008. Water levels during this test were monitored at one observation well. Observation well MU-13 was utilized to monitor water levels in the underlying 90-50 Sand at a distance of approximately 135 feet from the pumping well.

The transmissivity and hydraulic conductivity of the 140-100 Sand (production zone) in the vicinity of M-13 reflect leaky confined aquifer conditions. Summarized in Table 2.7-10 and in Addendum 2.7-C, transmissivity estimates made from pumping and recovery data for this sand range from 169 to 578 gpd/ft, with an average of 349 gpd/ft. Based on an average thickness of 280 feet, the hydraulic conductivity of the aquifer ranges from 0.6 to 2.0 gpd/ft$^2$, with an average of 1.2 gpd/ft$^2$. A storage coefficient for the 140-100 Sand in this area could not be estimated because the observation well was not affected by the test.

The test pumping of M-13 drew water levels down in the 140-100 Sand, but did not affect water levels in the underlying 90-50 Sand. Time drawdown data that are graphically presented in Addendum 2.7-C reveal that the water level in MU-13 generally rose throughout the pumping portion of the test, and exhibited diurnal water level fluctuations (of up to ~0.1 feet) apparently in response to barometric pressure fluctuations. Regardless, the well did not appear to be impacted by pumping in the overlying sand. Part of the reason that this well was not affected may be due to the vertical spacing between completion intervals of these wells, which are noted on Table 2.7-6, and/or adequate confining unit between the sands.

MP-16 Aquifer Testing

Starting on March 27, 2008, well MP-16 was tested for 2,906 minutes at an average discharge rate of 13.9 gpm, while water levels were monitored in two observation wells. Observation well M-16 was utilized to monitor water levels in the 190-150 Sand at a distance of approximately 84 feet, while observation well MU-16 was used to monitor

any water level changes in the lower portion of the 140-100 Sand, at a distance of approximately 21 feet from the pumping well.

As summarized in Addendum 2.7-C and Table 2.7-10, the transmissivity and hydraulic conductivity of the 190-150 Sand in the vicinity of MP-16 appear to reflect confined leaky aquifer conditions. The test data, however, are also affected by barometric pressure fluctuations. Transmissivity estimates made from pumping and recovery data for the 190-150 Sand range from 614 to 4,830 gpd/ft, with an average of 2,400 gpd/ft. Based on an average thickness of 80 feet, the hydraulic conductivity of the aquifer ranges from 7.7 to 60.4 gpd/ft$^2$, with an average of 30.0 gpd/ft$^2$. Based on observation well data, the average storage coefficient of the 190-150 Sand was estimated to be 2.7 x $10^{-4}$.

The test pumping of MP-16 drew water levels down in the 190-150 Sand, but did not appear to significantly impact water levels in the underlying 140-100 Sand. Time drawdown data that are graphically presented in Addendum 2.7-C reveal that the water level M-16 was immediately affected by pumping from the production well. The water level in MU-16 appears to be drawn down slightly toward the beginning of the test and rebounds later during the pumping portion and mimics the recovery of M-16 during the pumping portion of the test. Similar water level fluctuations during the later time data were also observed in the pumping well. LA attributes these fluctuations to changes in barometric pressure during and after the pumping portion of the test. Regardless, the MU-16 well did not appear to be impacted by pumping in the overlying sand again due to the vertical spacing between completion intervals of these wells and/or continuous confining unit between the sands.

Antelope Test Results Summary

Conclusions of the three aquifer tests that were completed at the Antelope project area for this project indicate the following:

- The Battle Springs Aquifer in this area is comprised of a relatively thick package of leaky confined sandstone subaquifers that are in both lateral and vertical hydraulic communication at least within each defined sand unit, i.e. the 190-150 Sand at MP-4, on a local basis.
- The extent to which designated overlying and underlying sandstone units are in hydraulic communication needs to be further addressed through additional pump testing with observation wells that better bracket the sandstones immediately above and below the designated shale units. Testing of M-13 and MP-16 suggests that adjoining sandstones may not be in hydraulic communication, but this may be attributable to the vertical spacing between the screened intervals in adjoining sands and/or confining conditions. Furthermore, barometric pressure fluctuations need to be accounted for during the tests.

- Further aquifer testing will be conducted during future wellfield testing to assess the lateral hydraulic continuity of the various hydrostratigraphic sand units. This assessment will require additional monitoring wells completed within the respective sandstones and possibly longer pumping durations.

### 2.7.3 Water Quality

#### 2.7.3.1 Surface Water Quality

Within the Antelope and JAB project areas, surface water samples were collected from seven sampling locations in May, 2007. All locations are existing stock ponds or areas in drainages where ponding occurs. Locations of sample sites are shown on Figure 2.7-6 for JAB and Figure 2.7-9 for Antelope. Photographs of sampling sites JAB SW-1, JAB SW-4, and JAB SW-7 are included as Figures 2.7-16, 2.7-17, and 2.7-18. The parameters included in the surface water baseline water quality monitoring program are listed in Table 2.7-11. Tables showing the sampling results for all locations are included in Addendum 2.7-D. Table 2.7-12 lists the overall average concentrations detected in the surface water samples. One half of detection limit values were used for averaging non-detectable results. Historic surface water samples were collected in 1981 and 1982 from three springs in the JAB area (Appendix B) on Middle Lost Creek (T26N, R95W, S24), Upper Lost Creek (T26N, R94W, S4) and the Hadsell Spring (T26N, R94W, S30).

| Conductivity (field and lab measured) | Vanadium | |
| Temperature (field measured) | Zinc (dissolved) | |

A trilinear diagram was developed to assess baseline water type (Figure 2.7-19). Although the data showed some variability, surface water in the region is predominantly of the sodium bicarbonate type. An assessment was made of the monitoring parameters to determine the general surface water quality. Total dissolved solids (TDS) varied in the seven surface water sampling sites. The maximum concentration was 346 mg/L at SW-2, and a minimum concentration of 14 mg/L was sampled at site 5. The average TDS over the seven sampling sites was 132 mg/L. Iron concentrations also varied within the sampling sites. A maximum concentration of 3.02 mg/L was detected at SW-4, and a minimum of 0.015 mg/L at SW-7, with an average iron concentration of 0.72 mg/L for all seven sites. Radium 226 was also detected at two surface water sampling sites, SW-2 and SW-4. The concentrations at each site were 5.2 pCi/L at SW-2 and 2.2 pCi/L at SW-4. Additionally, an average Gross Alpha value of 7.76 pCi/L for the seven sites suggests the presence of radionuclides in the surface water. TDS concentrations in the historic samples are generally higher than those detected in the 2007 samples. Iron concentrations were similar in the historic samples. Radionuclides were only analyzed in one surface water sample from the Upper Lost Creek site. Radium 226 was measured at 0.14 pCi/L at that time.

Surface water quality was evaluated solely from sampling conducted during the spring. It is expected that samples collected during the spring will have lower values than samples taken during the fall due to dilution from snow melt and precipitation. Additional samples may be collected during the summer, fall and winter if adequate precipitation occurs to generate surface water to determine seasonal variability of surface water quality at the JAB and Antelope sites.

## Table 2.7-12 Surface Water Quality Summary - Antelope and JAB Uranium Project

| Analyte | Test Type[1] | Units | SW-1 | SW-2 | SW-3 | SW-4 | SW-5 | SW-6 | SW-7 |

**1. Test Type Codes: DIS = Dissolution, TOT = Total**

**Highlighted values represent values under detectable limit. For averaging purposes, value presented is 1/2 the limit value (e.g. 0.5 = <1)**

### 2.7.3.2 Ground Water Quality

Regional Ground Water Quality

Water Quality in the Great Divide Basin ranges from poor to excellent. Total dissolved solid (TDS) values in all the aquifers tend to degrade towards the center of the basin, away from the recharge areas and to where the sediments are thickest. Ground water in the shallower, more permeable aquifers has better water quality. The best water quality in the area is found within the Quaternary gravels and the Battle Springs where TDS values are consistently less than 1,000 mg/L. Although the deeper aquifers, such as the Mesa Verde, tend to have poorer water quality, the quality tends to be highly variable and in locations near recharge areas they can provide good quality water.

Sources of ground water quality data for the Great Divide Basin include the National Water Information System, the Wyoming Water Resources Data System and the following authors: Welder and McGreevy, 1966; Fisk, 1967; and Collentine et al., 1981. A short summary of the ground water quality of the major producing aquifers follows.

Quaternary Gravels

Water from the Quaternary gravels generally has less than 1,000 mg/L of TDS. Quaternary waters contain mainly sodium and chloride. The presence of saline alluvial waters is associated with sodium and sulfate enrichment caused by evapotranspiration and seepage upwards along faults from deeper aquifers.

Battle Springs

The Battle Springs Aquifer typically contains less than 500 mg/L TDS. TDS values may be less than 200 mg/L in the northeastern Great Divide Basin where the JAB and Antelope sites are located. The lower TDS waters are primarily of the sodium-bicarbonate type. As the TDS values approach 1,000 mg/L, the water increases in concentrations of calcium-sulfate. Calcium-sulfate enrichment is attributed to the common presence of calcium-magnesium soil horizons and to the dissolution of gypsum and anhydrite.

Fort Union and Lance/Fox Hills

The Fort Union and Lance Aquifers tend to be more saline with higher TDS values, but are highly variable in composition. It is thought that the Lance waters are generally of the sodium-sulfate type although some exceptions show chloride enrichment. TDS values for the Lance can be less than 2,000 mg/L near outcrops to over 35,000 mg/L at deeper depths. TDS values ranging from 800 to over 60,000 mg/L have been recorded for the

Fort Union Aquifer. The high salinity of these waters is most likely due to restricted ground water flow and/or upward migration of saline waters from the Mesa Verde.

Mesa Verde

The Mesa Verde Aquifer has wide variability in TDS concentrations and major ion compositions. TDS values vary from less than 500 to over 50,000 mg/L. The lowest values (<1,000mg/L) are limited to outcrop zones and salinity typically increases away from the outcrops. The high salinities basinward are attributed to fault related restriction of ground water flow and the influx of saline waters from adjacent shales. Water composition varies with the salinity. The lowest TDS waters are of the sodium-bicarbonate type. TDS values between 1,000 and 3,000 mg/L exhibit enrichment in calcium sulfate most likely from the dissolution of gypsum/anhydrite. The most saline water is characterized by dissolved sodium, chloride, and bicarbonate and is relatively free of sulfate.

Frontier

TDS values range from 500 to 60,000 mg/L in the Frontier Aquifer. Low TDS values are restricted to outcrop areas along the Sierra Madre Uplift in the Washakie Basin to the south. Near the JAB and Antelope sites, oil field data north of Rawlins suggests TDS values between 1,300 and 3,200 mg/L is likely in the Frontier Aquifer. As TDS increases, the composition of the ground water moves from predominantly sodium-bicarbonate to predominately sodium chloride. At TDS levels above 1,000 mg/L little calcium, magnesium or sulfate are present.

Ground Water Monitoring Network and Parameters

A monitoring well network within the Antelope and JAB Uranium Project area has been installed over the past 30 years for the purpose of regional ground water sampling to establish baseline (pre-mining) ground water conditions. The network consists of eight monitoring wells in the JAB area, all of which are completed in the production zone, and 21 in the Antelope area, of which four are completed in the underlying aquifer (MU-2, MU-4, MU-13, and MU-16). The locations of the monitor wells that were sampled for water quality are shown on Figures 2.7-8 and 2.7-9 and a summary of well construction information can be found in Table 2.7-6 The parameters included in the Antelope and JAB Uranium Project Monitoring Program are listed below in Table 2.7-13

**Table 2.7-13 Ground Water Sampling Parameters – Antelope and JAB Uranium Project**

| Major Ions | Trace Constituents | Radionuclides |
|---|---|---|
| Calcium | Aluminum (dissolved) | Gross Alpha |
| Magnesium | Ammonia (as N) | Gross Beta |
| Potassium (dissolved) | Arsenic (dissolved) | Lead-210 (dissolved and suspended |
| Sodium | Barium (dissolved) | Polonium-210 (dissolved and suspended) |
| Bicarbonate | Boron | Radium-226 (dissolved and suspended) |
| Chloride (dissolved) | Cadmium (dissolved) | Radium-228 (dissolved) |
| Carbonate | Chromium (dissolved) | Thorium-230 (dissolved and suspended) |
| Sulfate | Copper (dissolved) | Uranium (dissolved and suspended) |
| Nitrate + Nitrite (as N) | Fluoride | |
| Silica | Iron (dissolved and total) | |
| Anions | Lead (dissolved) | |
| Cations | Manganese (dissolved and total) | |
| Anion/Cation Balance | Mercury (dissolved) | |
| | Molybdenum (dissolved) | |
| **General Water Chemistry** | | |
| Total Dissolved Solids (@ 180 F) | Nickel (dissolved) | |
| pH (field and laboratory measured) | Selenium (dissolved) | |
| Conductivity (field and lab measured) | Vanadium | |
| Temperature (field measured) | Zinc (dissolved) | |

Seven of the 21 wells in the Antelope area were only sampled once in the last year and 13 were sampled twice. However, six of the eight wells in the JAB area have been sampled at least three times between June 2007 and April 2008, with the remaining two having just been constructed and therefore only sampled once in spring 2008. Uranium One will continue to collect water quality samples on a quarterly basis. The initial monitoring and future monitoring of the entire well network, will provide a comprehensive record of water quality that will better define baseline conditions in the two proposed mining areas.

Water Quality Sampling

Eight wells in the JAB area and 21 wells in the Antelope area were sampled between June 2007 and April 2008 for water quality. The samples were analyzed for the list of constituents described under the current WDEQ/LQD Guideline 8 (March 2005) for uranium mining (Table 2.7-13).

Prior to sampling each well, the static water level was measured from the top of casing with an electronic water level reader and recorded. The total depth of each well was then measured with a weighted tape measure and also recorded. With these two known depths and the diameter of the well, the volume of standing water present (casing volume) was determined. Once pumping commenced, the temperature, pH, and conductivity of the water were measured and recorded on field sampling forms at every half-casing volume evacuated. Ideally, these parameters will reach equilibrium before sampling occurs, which ensures the sampled water is from the aquifer and not water from within the well casing. Typically, a minimum of three casing volumes were evacuated out of the well with a submersible pump before parameter equilibrium was reached and sample collection conducted.

Each bottle was labeled with a permanent marker denoting the project number, the well name, and the date and time of sampling. One bottle was collected and immediately preserved with sulfuric acid, all other bottles were collected unpreserved (raw). Filtering of appropriate samples was conducted at the analytical laboratory. The samples were immediately stored in a cooler to maintain a relatively constant temperature and delivered to Energy Laboratories in Casper, Wyoming to be analyzed for WDEQ/LQD Guideline 8 parameters for uranium mining. Chain of custody documents accompanied the samples to the laboratory

Water Quality Analysis

After the samples were analyzed by Energy Laboratories, copies of the results were sent to Lidstone and Associates. The laboratory data sheets are included in Addendum 2.7-D. The data were then entered into spreadsheets compiling all sampled results for 2007 and 2008 for each well. Of the 29 wells, 7 wells in Antelope and two in JAB were sampled only once, and 14 wells in Antelope were sampled twice. Two JAB wells, MW-1291 and MW-1292, were sampled four times in the last year and four wells (MW-1298, MW1299, MW 1300, JAB #1) were sampled three times. Historic wells in the JAB area were sampled 5 times in the 1980-1982 time period.

To check the accuracy of the data, and to evaluate indicator parameter trends, the average of each parameter for each well was calculated, if there was more than one data set. Single analyses that deviated largely from other samples of the same well were searched

for and noted to identify potential outliers or possible contaminated samples. Questionable data appeared on two samples from wells MW-1298 and MW-1299 in the JAB area that were collected on September 21, 2007. Comparing those analyses to the entire data set, suggested that the results for the two samples had been transposed. An attempt was made to contact Energy Laboratories to resolve this issue, but samples are discarded after six months and were no longer available for reanalysis. The data for that round of sampling has been omitted from the average.

To further evaluate baseline water quality, trilinear diagrams of the average major cations and anions were prepared for the JAB and Antelope areas. The trilinear diagrams are presented as Figures 2.7-20 and 2.7-12. The trilinear diagrams were created using Schlumberger AquaChem version 5.1-151 software. The average concentration of major ions (potassium, sodium, calcium, magnesium, chloride, sulfate, and bicarbonate) was entered for each well sampled.

*Water Quality Results*

From an assessment of the trilinear diagrams, ground water at both JAB and Antelope is predominantly of the calcium sulfate to calcium bicarbonate type with a linear trend from sodium-bicarbonate towards calcium sulfate. JAB water is noticeably more calcium-sulfate rich than the Antelope water, which appears to have much higher levels of carbonate and slightly higher levels of sodium than the JAB water. The observations made from the tri-linear diagrams match what is expected of Battle Springs Aquifer water. Within the Battle Springs Aquifer, the water moves from a sodium-bicarbonate type to a calcium-sulfate type as total dissolved solids increase. At JAB, the higher TDS values are reflected in the higher concentrations of calcium and sulfate. The linear trends on both the JAB and Antelope trilinear diagrams reflect this same pattern; the wells with high concentrations of calcium and sulfate were also measured as having higher TDS values. The calcium sulfate enrichment of the water is attributed to the common presence of calcium-magnesium soils and the dissolution of gypsum and anhydrite.

Table 2.7-14 lists the overall average concentrations of parameters for Antelope and JAB. One half of detection limit values were used for averaging non-detectable results. A majority of the analyte concentrations of sampled water in the JAB and Antelope areas are within WDEQ Guideline 8 parameters for agricultural water (Class II). Results of the baseline monitoring program for each well are summarized in tables in Addendum 2.7-D There are some notable variations of sampled data not included in the tri-linear diagrams that are worth discussing.

First, total dissolved solids (TDS) varies greatly in both proposed mining areas. In the JAB area, concentrations varied from 202 to 2120 mg/L, with an average of 919 mg/L. In the Antelope area, concentrations were notably lower, with an average of 232 mg/L and a

maximum of 639. The WDEQ Class I/II limits on TDS are 500 and 2000 mg/L, respectively. These results generally indicate Class II ground water at JAB and Class I ground water at Antelope with respect to TDS. However, due to high radium levels, groundwater located within uranium mineralized areas is unsuitable for human or livestock consumption. As a result, these waters can be characterized as Class VI water.

**Table 2.7-14 Summary of Water Quality Averages – Antelope and JAB Uranium Project**

| Analyte | Test Type[1] | Units | Surface Water | Ground Water | |
|---|---|---|---|---|---|
| | | | | JAB | Antelope |

Sulfate levels also vary between the Antelope and JAB areas. Similarly to TDS, sulfate concentrations in Antelope were much lower than JAB. The average concentration in JAB was 534 mg/L, with a maximum of 1340 mg/L. These levels put virtually all ground water in JAB well above WDEQ Class I and Class II limits of 250 and 200 mg/L, respectively. The Antelope area, on the other hand, had an average concentration of only 83 mg/L, with a maximum of 337 mg/L. The maximum concentration observed was recorded in only one well (M-15), and is the only concentration in the area that exceeds the Class I and Class II limits.

With a few exceptions, trace elements in the project area met Class I ground water limits, with most being less than applicable detection limits. The exceptions included iron, manganese, and pH. Iron concentrations in monitoring wells M-10 and M-15 in the Antelope area exceeded the Class I limit of 0.3 mg/L. Concentrations were as high as 0.7 mg/L, which is still well below the Class II limit of 5.0 mg/L. Manganese was detected in several samples from both Antelope and JAB areas. One well in the JAB area, MW-1291, had manganese concentrations of 0.28 twice, 0.29, and 0.3 mg/L over four rounds of sampling, which consistently exceeds the Class II limit of 0.2 mg/L. Well MP-2069 was the only other well that had manganese concentrations that exceeded Class I limits in the JAB area. Several wells in the Antelope area had manganese concentrations above the Class I limit of .05 mg/L, with the highest being 0.15 mg/L. Lastly, laboratory pH levels at the Antelope area were slightly higher than at JAB, with an average of 8.2 at Antelope compared with 7.75 at JAB. Two samples from Antelope exceeded the Class III limit of 9.0, with a maximum pH of 9.62 on the sample from well MU-4, which also contained the lowest concentrations of bicarbonate and sulfate in the Antelope area.

Almost every production zone ground water sample analyzed, from both Antelope and JAB, had radium 226 concentrations that exceeded WDEQ's limit of 5 pCi/L. Additionally, two wells in Antelope, which are constructed in the underlying aquifer, MU-2 and MU-13, had radium 226 concentrations above 5 pCi/L. The maximum concentration detected was 1100 pCi/L in well MP-2069, and the averages for the entire areas were 103 pCi/L at JAB and 56 pCi/L at Antelope. The excessive Radium 226 concentrations make the overall ground water in the area Class IV (industrial). The ground water can be classified more specifically as Class IV A, due to the fact that TDS does not exceed 10,000 mg/L.

Four rounds of water quality data were collected from JAB wells JAB No. 1, MW-1291, MW-1292, MW-1298, MW-1299, MW-1300, and OW-1303 from September, 1980 through November, 1982 (Hydro-Engineering, 1984). In general the water quality characteristics in the 2007 and 2008 data from these wells are similar to those observed in the historic sampling (Appendix B).

In summary, ground water within the production zone aquifer is generally of the calcium bicarbonate to calcium sulfate type and can be classified as a type IV A water due to the high Radium 226 and low TDS concentrations. This baseline analysis is intended to evaluate the overall quality of ground water underlying the proposed License/Permit Area under pre-mining conditions. Additional ground water sampling is required before excursion control limits and restoration criteria can be established.

### 2.7.4 Water Rights

#### 2.7.4.1 Surface Water Rights

Existing surface water rights within 0.5 mile of the Antelope and JAB permit boundaries were queried using the Wyoming State Engineers Office (WYSEO) Water Rights Database (WYSEO, 2002). No adjudicated water rights were found. No active surface rights were found within 0.5 mile of the Antelope boundary. Only one active surface right was located within 0.5 mile of the JAB property boundary.

Within 0.5 mile of the JAB permit boundary there are many points of use for permit P29898D (CO2 Pipeline Water Haul), but this permit has been cancelled with the WYSEO. One active, un-adjudicated surface water right for stock use was found just to the south of the JAB permit boundary in the northwest quarter of T26N R94W Section 23. The permit number for this water right is P223S and a summary of this water right is provided in Table 2.7-15. The location of this water right is displayed on Figure 2.7-22. Throughout all phases of the project, Uranium One intends to ensure that this stock reservoir is not impacted in a manner that restricts its intended use.

**Table 2.7-15 Summary of Active Surface Water Rights Within One-Half Mile of the Antelope/JAB Permit Boundary – Antelope and JAB Uranium Project**

| Permit Number | Legal Location | Qtr Qtr | Status | Use | Facility Name | Permit Applicant | Priority Date | Permitted Area | Permit Source |

| P233S | T26N R94W Section 23 | NW SW<br>SW NW<br>SE NW<br>NE SW | UNA | STO | Dry Gulch Stock Reservoir | Bessie A. Mitchell | 6/13/1946 | 1.69 ac ft | McIntosh Gulch |

### 2.7.4.2 Ground Water Rights

Existing active ground water rights within a three mile buffer of the Antelope and JAB permit boundaries were queried using the WYSEO Water Rights Database (WYSEO, 2002). All abandoned or cancelled water rights were discarded from the search. It should be noted that no adjudicated water rights were found within the queried area. Twenty seven permitted wells were identified which are not permitted to Uranium One, and 29 wells were identified which are permitted to Uranium One. A listing of these wells displaying information such as permit numbers, priority, status, use, well depth, yields, static water level, and completion intervals are presented in Addendum 2.7-E. A map showing the location of all permitted wells is presented on Figure 2.7-22.

Of the wells not permitted to Uranium One, there are nine stock wells, four industrial wells, one domestic well, ten miscellaneous wells, two monitoring wells and three test wells. Eighteen of the wells are attributed to some form of mining or exploration by energy resource companies. Eight of the remaining wells are stock wells owned by the Bureau of Land Management (BLM). The last two wells are the Baron Butte #1 well and the Osborne #1 well, which are owned by the State of Wyoming- John McIntosh and the Sun Land/Cattle Co., respectively. Baron Butte #1 is a domestic and stock well and Osborne #1 is a stock well.

The monitoring, test and miscellaneous use wells related to energy resource mining are not permitted for consumptive use. There are four permitted consumptive industrial use wells associated with energy resource mining and exploration. These industrial wells include: LC 129 W, MAPCO Whiskey Peak Unit #1-33, and the Ralph E. Murphy wells #1 and #2. All of these wells are positioned up-gradient of ground water flow. Although not formally filed as abandoned with the WYSEO, it is believed that these wells may no longer be in use since they were all permitted prior to 1980 by oil energy exploration companies that are no longer active in the area.

The BLM stock wells are drilled to depths between 200 and 450 feet and typically yield between 5 and 25 gpm. These wells are likely completed into the same aquifer as the production sand. However, since the production sand dips south and west the majority of these wells are up-dip and thus up-gradient of ground water flow, meaning that impact will be minimal to non-existent. The exceptions are the Osborne Draw Well #123, Eagle Water Well #1, and Powerline well. These wells are located down gradient, but since they are all located more than two miles from the mining boundary, no impact is expected.

The Osborne well #1 is close to the Osborne Draw Well #123 mentioned above. This well is a stock well owned by the Sun Land/Cattle Co. It is 280 feet deep and yields around 10 gpm. The static water level suggests 30 feet of saturation in the well. The

perforated interval is 250 to 280 feet. Due to the proximity and completion similarities the opinion addressed above for the Osborne Draw well applies to this well.
The Baron Butte #1 well is the only domestic well within the three mile buffer. It is located approximately a mile and a half north of the most eastern portion of the Antelope permit boundary. It is 105 feet deep, yields 8 gpm and is perforated between 85 and 105 feet below ground surface. Since the completion interval for this well is stratigraphically higher than the sands targeted for ISR production and is up-gradient of ground water flow, it is not expected to be impacted by mining.

In summary, no impact is expected for wells positioned north to northeast of the mining boundaries since ground water flow is generally to the south to southwest. The wells which are located downgradient include the wells to the west and southwest of the permit boundary, but due to their distance from the boundary no impact is expected. These wells are: Osborne Draw Well #123, Osborne #1, Powerline well, and the Eagle water well. Uranium One intends to correspond with BLM and the Sun Land/Cattle Co. throughout all phases of the project to ensure that these stock reservoirs and wells are not impacted in a manner that restricts their intended use.

Of the wells owned or permitted to Uranium One, 16 are located within the Antelope permit boundary and 14 are located within the JAB permit boundary. The JAB wells were previously owned by UMETCO Minerals Corporation and the Energy Metals Corporation but are now all owned by Uranium One, Inc. Currently, all of the Uranium One wells are permitted by the WSEO as monitor wells. Ten of the 16 monitor wells at Antelope are new wells while six were re-permitted existing wells. Uranium One is using the Bairoil Road Stock well owned by BLM as monitoring well M-15. Uranium One has obtained permission from the BLM to use this well for their purposes. Table 2.7-16 summarizes the re-permitted wells which are being used by Uranium One. Installation of wells for a project of this size is on-going and it is expected that more wells will be permitted in the future.

Currently the project consumes a negligible amount of ground water for well development, monitoring, testing and miscellaneous purposes related to uranium exploration. Besides uranium exploration and mining, stock pond wells will most likely remain the main ground water use in the area.

**Table 2.7-16 Re-permitted Wells Used by Uranium One – Antelope and JAB Uranium Project**
