P-R-O-C-E-E-D-I-N-G-S

(8:29:52 a.m.)

1  
2  
3 JUDGE BOLLWERK: All right. Let's go on  
4 the record, please. Good morning, everyone. We're  
5 here for the third and what will, in all likelihood,  
6 be the concluding day of the mandatory hearing for the  
7 Early Site Permit for the Vogtle 3 and 4, the proposed  
8 Vogtle 3 and 4 units.

9 We're going to hear this morning testimony  
10 relating to a presentation on seismic. Also, we have  
11 scheduled for this morning, or today, additional  
12 presentations on Severe Accident Mitigation Design  
13 Alternatives, and also the AP-1000 Design  
14 Certification revisions.

15 At this point, I think there's one  
16 administrative matter I know of we need to take care  
17 of, which is with respect to Exhibit SNC00001p.

18 MR. BLANTON: Yes, Your Honor, thank you.  
19 I think we need to offer it to be marked for  
20 identification first. And this is Chapter 9 of the  
21 Environmental Report, as we've discussed yesterday.

22 JUDGE BOLLWERK: All right. Then the  
23 record should reflect that Exhibit SNC00001p is marked  
24 for identification.

25 (WHEREUPON, THE DOCUMENT

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 REFERRED TO WAS MARKED AS  
2 EXHIBIT SNC00001p-MA-BD01 FOR  
3 IDENTIFICATION.)

4 MR. BLANTON: We move to admit it.

5 JUDGE BOLLWERK: Any objection? Hearing  
6 none, then Exhibit SNC00001p is admitted into  
7 evidence. I think I got the right number of zeroes in  
8 there, but we'll correct that if we need to.

9 (WHEREUPON, THE DOCUMENT  
10 REFERRED TO, PREVIOUSLY MARKED  
11 EXHIBIT SNC00001p-MA-BD01 FOR  
12 IDENTIFICATION, WAS RECEIVED IN  
13 EVIDENCE.)

14 JUDGE BOLLWERK: All right. And then I  
15 believe that -- anything else the parties have  
16 administratively we need to take care of at this  
17 point?

18 All right. Then let's move on then to our  
19 witnesses on seismic, and we have a considerable panel  
20 here. I guess I did get the right number of chairs.  
21 I guess we did count right. Why don't we go ahead and  
22 have the Applicant introduce their witness. We'll get  
23 him sworn in, and then we'll move -- deal with the  
24 exhibits, and then go to the Staff.

25 MR. BLANTON: Thank you, Your Honor.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Southern Nuclear's witness on the seismic  
2 evaluation issue is Mr. Donald P. Moore.

3 JUDGE BOLLWERK: All right. If you could  
4 raise your right hand, please, and respond orally to  
5 the question I'm going to ask you.

6 Do you swear or affirm that the testimony  
7 you will give in this proceeding will be the truth,  
8 the whole truth, and nothing but the truth?

9 MR. MOORE: I do.

10 JUDGE BOLLWERK: Thank you, sir.

11 MR. BLANTON: Your Honor, Mr. Moore has  
12 three exhibits, I think, that have not yet been  
13 introduced. First is, SNC000091, which is the  
14 Presentation.

15 JUDGE BOLLWERK: All right. Let the  
16 record reflect that Exhibit SNC000091 is marked for  
17 identification.

18 (WHEREUPON, THE DOCUMENT  
19 REFERRED TO WAS MARKED AS  
20 EXHIBIT SNC000091-MA-BD01 FOR  
21 IDENTIFICATION.)

22 MR. BLANTON: SNC000092 is Mr. Moore's CV.

23 JUDGE BOLLWERK: All right. The record  
24 should reflect that SNC000092, as identified by  
25 counsel, is marked for identification.

**NEAL R. GROSS**

24  
25

(WHEREUPON, THE DOCUMENT  
REFERRED TO WAS MARKED AS  
EXHIBIT SNC000092-MA-BD01 FOR  
IDENTIFICATION.)

MR. BLANTON: SNC000093 is Chapter 2.1 of  
the Vogtle Early Site Permit Application Safety  
Analysis Report.

JUDGE BOLLWERK: The record should reflect  
that Exhibit SNC000093, as described by counsel, is  
marked for identification.

(WHEREUPON, THE DOCUMENT  
REFERRED TO WAS MARKED AS  
EXHIBIT SNC000093-MA-BD01 FOR  
IDENTIFICATION.)

MR. BLANTON: And SNC000094 is a site  
layout from Part 2 of the Site Safety Analysis Report.

JUDGE BOLLWERK: All right. Then the  
record should reflect that Exhibit SNC000094, as  
described by counsel, is marked for identification.

MR. BLANTON: And we would move to admit  
those exhibits at this time.

JUDGE BOLLWERK: Any objections? Hearing  
none, then Exhibits SNC000091, 92, 93, and 94 are  
admitted into evidence.

(WHEREUPON, THE DOCUMENTS

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 REFERRED TO, PREVIOUSLY MARKED  
2 EXHIBITS SNC000091-MA-BD01  
3 THROUGH SNC000094-MA-BD01 FOR  
4 IDENTIFICATION, WERE RECEIVED  
5 IN EVIDENCE.)

6 JUDGE BOLLWERK: All right. Then let's  
7 turn to the Staff panel, and we have a host of  
8 thousands here. No, a large panel. Why don't we go  
9 ahead and let you introduce the witnesses so the court  
10 reporter can try to figure out who's who here.

11 MS. PRICE: Good morning, Your Honor.

12 JUDGE BOLLWERK: Make sure you tap and get  
13 close.

14 MS. PRICE: Okay. Good morning, Your  
15 Honor. Starting on the far left, we have Mr. Mark  
16 Notich, who is not currently on the witness list, but  
17 we did want to have him up there, because there are  
18 some environmental slides in the presentation.

19 JUDGE BOLLWERK: All right. Any objection  
20 from the Applicant? All right. Thank you.

21 MS. PRICE: Next to Mr. Notich is Mr.  
22 Christian Araguas, with Mr. Bret Tegeler, Dr. John Ma,  
23 Dr. Weijun Wang, Dr. Carl Costantino, Ms. Sarah  
24 Gonzalez, Ms. Laurel Bauer, and Dr. Gerry Stirewalt.

25 JUDGE BOLLWERK: All right. Thank you.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 All right. I believe that -- let's see.  
2 Mr. Notich, you've already been sworn. Mr. Araguas,  
3 you've already been sworn. I think, are all the rest  
4 of the members of the panel new witnesses?

5 MS. PRICE: Yes, Your Honor.

6 JUDGE BOLLWERK: All right. Very good.  
7 Then I need all of you to raise your right hand, and  
8 respond orally to the question I'm going to ask you.  
9 And when you do respond, let's start at this end, and  
10 just move one after another right down the line.

11 Do you swear or affirm the testimony you  
12 will give in this proceeding will be the truth, the  
13 whole truth, and nothing but the truth? Make sure  
14 you've got it in front of a mic so that the court  
15 reporter can pick it up.

16 MR. TEGELER: Yes, Your Honor.

17 DR. MA: Yes, I do.

18 DR. WANG: I do.

19 DR. COSTANTINO: Yes.

20 MS. GONZALEZ: I do.

21 MS. BAUER: I do.

22 DR. STIREWALT: I do.

23 JUDGE BOLLWERK: All right. Thank you  
24 very much. We're going to have to work out the  
25 logistics of the mics here as we go along, but bear

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

1 with us. We'll kind of pass it around and make sure  
2 everybody gets an opportunity to say what they need  
3 to.

4 All right. Then I think with respect to  
5 the Staff, we have some exhibits to take care of, as  
6 well.

7 MS. PRICE: We do. I'd like to start with  
8 NRC00065, which is Staff Presentation 7, the Seismic  
9 Evaluation.

10 JUDGE BOLLWERK: The record should reflect  
11 that Exhibit NRC00065, as described by counsel, is  
12 marked for identification.

13 (WHEREUPON, THE DOCUMENT  
14 REFERRED TO WAS MARKED AS  
15 EXHIBIT NRC00065-MA-BD01 FOR  
16 IDENTIFICATION.)

17 MS. PRICE: And then NRC000081, which is  
18 the CV for Laurel Bauer.

19 JUDGE BOLLWERK: And the record should  
20 reflect that Exhibit NRC000081, as described by  
21 counsel, is marked for identification.

22 (WHEREUPON, THE DOCUMENT  
23 REFERRED TO WAS MARKED AS  
24 EXHIBIT NRC000081-MA-BD01 FOR  
25 IDENTIFICATION.)

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MS. PRICE: NRC000082, the CV for Sarah  
2 Gonzalez.

3 JUDGE BOLLWERK: The record should reflect  
4 that the Exhibit NRC000082, as identified by counsel,  
5 is marked for identification.

6 (WHEREUPON, THE DOCUMENT  
7 REFERRED TO WAS MARKED AS  
8 EXHIBIT NRC000082-MA-BD01 FOR  
9 IDENTIFICATION.)

10 MS. PRICE: NRC000083, the CV for Gerry  
11 Stirewalt.

12 JUDGE BOLLWERK: The record should reflect  
13 that Exhibit NRC000083, as described by counsel, is  
14 marked for identification.

15 (WHEREUPON, THE DOCUMENT  
16 REFERRED TO WAS MARKED AS  
17 EXHIBIT NRC000083-MA-BD01 FOR  
18 IDENTIFICATION.)

19 MS. PRICE: NRC000084, the CV for Weijun  
20 Wang.

21 JUDGE BOLLWERK: And the record should  
22 reflect that Exhibit NRC000084, as described by  
23 counsel, is marked for identification.

24 (WHEREUPON, THE DOCUMENT  
25 REFERRED TO WAS MARKED AS

1 EXHIBIT NRC000084-MA-BD01 FOR  
2 IDENTIFICATION.)

3 MS. PRICE: NRC000085, the CV for Carl  
4 Costantino.

5 JUDGE BOLLWERK: And the record should  
6 reflect that Exhibit NRC000085, as described by  
7 counsel, is marked for identification.

8 (WHEREUPON, THE DOCUMENT  
9 REFERRED TO WAS MARKED AS  
10 EXHIBIT NRC000085-MA-BD01 FOR  
11 IDENTIFICATION.)

12 MS. PRICE: And NRC000086, the CV for John  
13 Ma.

14 JUDGE BOLLWERK: The record should reflect  
15 that Exhibit NRC000086, as described by counsel, is  
16 marked for identification.

17 (WHEREUPON, THE DOCUMENT  
18 REFERRED TO WAS MARKED AS  
19 EXHIBIT NRC000086-MA-BD01 FOR  
20 IDENTIFICATION.)

21 MS. PRICE: At this time, I'd move to  
22 admit these exhibits into the record.

23 JUDGE BOLLWERK: Is there an 87?

24 MS. PRICE: Oh, yes. Sorry about that.  
25 We also have NRC000087.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 JUDGE BOLLWERK: And that is the?

2 MS. PRICE: That is the CV for Bret  
3 Tegeler.

4 JUDGE BOLLWERK: Thank you. Exhibit  
5 NRC000087, as identified by counsel, is marked for  
6 identification.

7 (WHEREUPON, THE DOCUMENT  
8 REFERRED TO WAS MARKED AS  
9 EXHIBIT NRC000087-MA-BD01 FOR  
10 IDENTIFICATION.)

11 MS. PRICE: Again, at this time, we'd move  
12 to have those exhibits admitted into the record.

13 JUDGE BOLLWERK: All right. Any  
14 objections? Hearing none, then NRC Exhibits  
15 NRC000065, NRC000081, 82, 83, 84, 85, 86, and 87 are  
16 admitted into evidence.

17 (WHEREUPON, THE DOCUMENTS  
18 REFERRED TO, PREVIOUSLY MARKED  
19 EXHIBITS NRC000065-MA-BD01,  
20 NRC000081-87-MA-BD01 FOR  
21 IDENTIFICATION, WERE RECEIVED  
22 IN EVIDENCE.)

23 MS. PRICE: We have just one  
24 administrative matter. Apparently, Mr. Ma is having  
25 difficulty speaking, and I'm concerned that he might

1 lose his voice.

2 JUDGE BOLLWERK: All right.

3 MS. PRICE: I wondered if it would be okay  
4 if Mr. Tegeler read Mr. Ma's slides for him, and then  
5 let Mr. Ma answer any questions that you have.

6 JUDGE BOLLWERK: Okay. Just let us know,  
7 and we'll work around that. Thank you.

8 MS. PRICE: Thank you.

9 JUDGE BOLLWERK: Okay. I believe at this  
10 point we're ready then to turn back to the Applicant's  
11 witness, and begin his presentation. And we're  
12 dealing with Exhibit SNC000091.

13 MR. MOORE: Good morning. It's an honor  
14 to present to you this morning the information on the  
15 geology, seismology, and geotechnical aspects of the  
16 Vogtle ESP LWA application.

17 My name is Don Moore. I'm with Southern  
18 Nuclear Operating Company, and my title is Consulting  
19 Engineer. My responsibilities for the ESP LWA  
20 application is to provide Southern Nuclear overall  
21 technical oversight of Section 2.5, which is geology,  
22 seismology, and geotechnical portions of the  
23 application. As such, I represented Southern Nuclear  
24 in the technical decision making process required of  
25 this multi-disciplined effort.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 I will provide this morning a high-level  
2 overview of Section 2.5, hopefully, addressing the  
3 Board's request in regard to this section, and  
4 focusing on the key areas that form the basis of 2.5.  
5 Could I have Slide Two, please.

6 Please note at the bottom of these slides,  
7 certain slides have an exhibit number, which it means  
8 that information has been submitted for this hearing  
9 that supports the slide information.

10 Briefly, I would like to let the ASLB  
11 panel know something about my professional experience  
12 and qualifications. I have 40 years of experience in  
13 commercial nuclear power plant industry in the area of  
14 civil, structural, seismic analysis and design, solar  
15 dynamic behavior, and seismic qualification of  
16 structures, systems, and components. I'm a registered  
17 Professional Engineer, and I have a Master's degree in  
18 Engineering Science relating mainly to structural  
19 engineering. Again, my position at Southern Nuclear is  
20 Consulting Engineer, which is the highest engineering  
21 technical classification at Southern. Slide Three,  
22 please.

23 I have been a member of various national  
24 standard and code committees on site analysis and  
25 design of nuclear facilities, and seismic

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 qualification of electrical and mechanical equipment,  
2 as shown here. Note that ASCE Standard 43 is listed,  
3 which will be mentioned later, as providing the  
4 methodology for developing the Vogtle Site Pacific  
5 Ground Motion Response. Also, at the bottom, I note  
6 that I'm a member of various nuclear power industry  
7 committees working on resolving generic seismic  
8 issues.

9 I would like to conclude, though, that  
10 even though I have provided technical oversight, and  
11 have an in-depth knowledge of the development of 2.5,  
12 I do not profess to have all the technical expertise  
13 that was required of the many disciplines required to  
14 develop 2.5. Next slide, Slide Four, please.

15 The ESP Solar sections are outlined here  
16 in this slide. As I said earlier, my presentation  
17 will provide a high-level overview. The main focus of  
18 this presentation will be on those sections with a  
19 checkmark to the right. To support the LWA request,  
20 additional information was required in the ESP  
21 application. Those sections that were significantly  
22 modified or added to support the LWA are shown with a  
23 red checkmark. Slide Five, please.

24 I think it's important just to point out  
25 the seismic organization that was put together to

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 develop Section 2.5. This slide provides the program  
2 organization at the top. Of course, Southern Nuclear  
3 has the overall management of this task. My  
4 responsibility, as part of Southern Nuclear, was to  
5 provide overall technical oversight.

6 Bechtel managed and performed the tasks  
7 required of 2.5. Due to the multi-disciplined  
8 expertise required, other organizations were involved.  
9 And, as shown here, we have William Lettis and  
10 Associates. They did the geology and seismic test.  
11 We had Risk Engineering do the site-specific  
12 Probabilistic Seismic Hazard Analysis, PSHA, and  
13 development of the SSE. We also have Bechtel San  
14 Francisco do the slight response, and also worked on  
15 some of the seismological tasks, and also involved in  
16 the development of the site-specific SSE, the GMRS  
17 which is the Ground Motion Response Spectra.

18 Due to the technical complexity of 2.5,  
19 Southern Nuclear formed a Review and Advisory Panel of  
20 outside experts to review the work at key steps, key  
21 stages in the site investigation to provide comments  
22 and recommendations, and I'd like to point out who  
23 these members were. First, we had Dr. Martin Chapman,  
24 Professor at Virginia Tech. He's an expert in  
25 southeast seismology. We have Dr. Robert Kennedy, a

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 renowned seismic structural expert, and was a key  
2 contributor to the performance-based method used to  
3 develop the GMRS, that is ASCE 43-05. We had Dr. Carl  
4 Stepp, who's a former member of the NRC, and later  
5 manager of the EPRI seismic program that developed the  
6 PSHA that was used as a starting point for the Vogtle  
7 site-specific PSHA. And, finally, we had Dr. Robert  
8 Youngs of Geometrics, who's an expert in seismic  
9 hazard and side amplification. Slide Six, please.

10 To help get us oriented, I have a site  
11 plan here showing the location of the two new units,  
12 3 and 4, to the location of the existing Vogtle Units  
13 1 and 2. I have several plans, views shown here. In  
14 all of these, plant north is up, and so that will help  
15 us keep ourselves oriented. I want to note that Unit  
16 3, the union at 3 is only about 1,700 feet west of the  
17 existing Unit 2. The geology and geotechnical soil  
18 conditions are basically the same for all four units.  
19 Therefore, there's basically nothing new in regard to  
20 site soil conditions. We have successfully addressed  
21 soil conditions at the site, and have built two units  
22 that have been operating for about 20 years. Slide  
23 Seven, please.

24 Here we have an aerial view of the Vogtle  
25 site, with the layout of the two new units, 3 and 4,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 overlaid. Here, again, we have Unit 1 and 2, and to  
2 the west we have Unit 3 and 4. In the upper right  
3 corner, we have the Savannah River, which, of course,  
4 is the boundary between Georgia to the left, and South  
5 Carolina to the upper right.

6 On the South Carolina side is the DOE  
7 Savannah River site. The Savannah River site have  
8 similar geological features as the Vogtle site. There  
9 has been a significant amount of geological,  
10 seismological, and geotechnical studies performed at  
11 the Savannah River site, including multiple deep  
12 borings, and fault identification studies.

13 As part of the Vogtle ESP site  
14 investigation, Savannah River site shared much of  
15 their site information that proved to be very useful  
16 in supporting the Vogtle site investigation for the  
17 ESP. For example, this included several site visits  
18 by William Lettis and Associates to investigate site  
19 features, evaluate data, and perform independent  
20 studies, like geomorphic mapping of a river terrace  
21 overlying the Pen Branch Fault to provide additional  
22 data to conclude that the Pen Branch Fault is not a  
23 tectonic source. We'll discuss that a little bit  
24 later in the presentation. Slide Eight, please.

25 I will provide an overview from different

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 sections in 2.5, as previously identified, but the  
2 order that I present it will not, necessarily, be in  
3 numerical order. Instead, I want to follow how the  
4 data was assembled to obtain the final results and  
5 conclusions provided in 2.5.

6 Here, we start off at 2.5-1. This slide  
7 provides the basic geologic and seismic information.  
8 For example, this slide here provides the different  
9 types of studies performed for the Vogtle ESP to  
10 evaluate the tectonic features. Studies, of course,  
11 were also made of non-tectonic features to assess site  
12 acceptability. Slide Nine, please.

13 Now, here's an example, one of the most  
14 significant investigations performed for the Vogtle  
15 ESP. It is the seismic reflection survey performed at  
16 the Vogtle ESP site in order to locate the Pen Branch  
17 Fault. The Pen Branch Fault was identified beneath  
18 the Savannah River site. The Pen Branch Fault is  
19 neither exposed, nor expressed at the surface of the  
20 Savannah River site. Previous studies have determined  
21 that the Pen Branch Fault is not a capable tectonic  
22 source. It's not a source for motion at the site.

23 The ESP site investigations, though,  
24 indicated that the Pen Branch Fault may actually cross  
25 under the Vogtle site. It was decided to perform a

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 seismic reflection survey to determine if, indeed,  
2 this was the case for the following reasons. One, of  
3 course, is the completeness of our site investigation.  
4 And most importantly, we need to identify the  
5 potentially different rock formations directly below  
6 the site. The Pen Branch Fault is associated with the  
7 boundary between the Triassic Dunbarton Basin rock and  
8 the harder crystalline rock.

9 I'm going to describe this figure for you.  
10 On the right is southeast, on the left is northwest,  
11 and there is -- if you can see here, this is a seismic  
12 reflection survey, and you can see a dipping reflector  
13 right here. This actually is the Pen Branch Fault.  
14 And to the southeast is the Triassic basin rock, and  
15 to the northwest is the crystalline basement rock. We  
16 have a horizontal reflector shown here, and this is  
17 the bottom of the coastal plain sediments. And there  
18 is a pull, or uplift shown here, and that is caused by  
19 the reverse fault displacement of the coastal plain  
20 sediments by the Pen Branch Fault.

21 JUDGE BOLLWERK: So what you're referring  
22 to, if you look at the photograph, is that the fault  
23 comes -- basically, there's a horizontal line running  
24 across the center. The fault then comes down from the  
25 center toward the right-hand side of the photograph.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MR. MOORE: Right. Correct.

2 JUDGE BOLLWERK: And then you mentioned a

3

4 MR. MOORE: There is a -- this particular  
5 rock, there's a reverse fault movement up.

6 JUDGE BOLLWERK: That's in the center of  
7 the photograph, that's part of the horizontal line.

8 MR. MOORE: Right.

9 JUDGE BOLLWERK: Right.

10 MR. MOORE: And what is showing here, too,  
11 is these horizontal lines, and there is a warp or  
12 distortion here, which is basically distortion of the  
13 lower sand sediments due to the fault displacement.

14 JUDGE BOLLWERK: All right. Thank you.

15 JUDGE JACKSON: You said that it had been  
16 determined that this fault was not capable, is that  
17 the term of art, which means -

18 MR. MOORE: That's correct.

19 JUDGE JACKSON: -- that it is not  
20 considered a source for earthquake?

21 MR. MOORE: That is correct.

22 JUDGE JACKSON: Is that -

23 MR. MOORE: It is not considered to be  
24 capable source for generating ground motion.

25 JUDGE JACKSON: Is that related primarily

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 to its depth, because it's not expressed on the  
2 surface, or are there other features?

3 MR. MOORE: It is based on studies done to  
4 determine the age when it was last active. And we  
5 will discuss that in just a minute.

6 JUDGE JACKSON: Okay. If you're going to  
7 go over that, that's fine.

8 MR. MOORE: Right.

9 JUDGE BOLLWERK: Let me just mention that  
10 obviously the Staff panel is here. If any of you at  
11 any point have any comments to make on anything that's  
12 being said, you can do so. It would be good to wait  
13 until a break, maybe between the slide. And, also,  
14 please identify yourself for the record before you  
15 speak so the court reporter makes sure we get the  
16 right -- any statement attributed to the right person.  
17 Thank you.

18 MR. MOORE: Here, again, I want to mention  
19 that this was a study mainly to make sure our site  
20 investigation was complete. And as we will see later,  
21 it was important to identify the different type of  
22 rock formations and their location. Slide Ten,  
23 please.

24 Now, this is another plan view, again,  
25 north. Plant north is up. This slide is a plan view

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 of the location of the Pen Branch Fault at our site.  
2 It is shown at a depth of 1,050 feet at the base of  
3 the coastal plain deposits. Where the Pen Branch  
4 Fault separates the Paleozoic crystalline rock to the  
5 northwest, that is to the left, from the Triassic  
6 sedimentary rock to the southeast, that's to the  
7 right. This fault is located -- is a vertical  
8 projection to the surface. That's the black line.  
9 Here, again, that's where the fault intersects the  
10 surface, the bottom surface of the coastal plain  
11 sediment. The fault does not extend, displacements do  
12 not extend, nor are expressed at this surface.

13 I want to notice that here, again, this is  
14 Unit 4, this is Unit 3, this is Unit 2 and 1. And we  
15 will be seeing some additional cross-sections in just  
16 a minute. I want to point out, again, of course, the  
17 black contours, the blue contours shown here represent  
18 the elevation at the top of the Eocene Blue Bluff  
19 Marl. And it illustrates over the Site 3 and 4, and  
20 1 and 2, that the Blue Bluff Marl is very level.  
21 There's very little change in elevation. But right at  
22 the expression of the fault, we see that the Blue  
23 Bluff Marl is warped, or what we call a monocline, or  
24 dipping caused by the reverse displacement of the Pen  
25 Branch Fault.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 JUDGE BOLLWERK: That's reflected, I take  
2 it, in the fact that the lines on the left-hand side,  
3 on the other side of the fault are basically -

4 MR. MOORE: It's warped down, and we'll  
5 show a pictorial sketch of that a little bit later.

6 JUDGE TRIKOUROS: I have a question. The  
7 previous slide that showed the reflection, it seemed  
8 to indicate that the fault was northwest to southeast.  
9 Did I miss something? Is this black line the fault  
10 projection?

11 MR. MOORE: This -- I'll get to that. I'm  
12 going to show -- one of the points I wanted to make,  
13 I think will answer your question. The yellow lines  
14 here are what we call the reflection lines that were  
15 set to do the investigation. The view that I've just  
16 shown in the previous slide, Slide Nine, is this  
17 yellow line in the far lower left corner. This is  
18 line number four. And that view that we were just  
19 looking at in the previous slide is taken from that  
20 line, and it is basically looking northeast. So, in  
21 this way, here again, the plant -- Units 3 and 4 will  
22 be up above the Triassic basin rock, and that -

23 JUDGE BOLLWERK: We're back to Slide Nine  
24 now, right? We're now back to Slide Nine.

25 MR. MOORE: Yes, I'm sorry. We're back to

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Slide Nine. Thank you. And, again, this is a  
2 section, looking, as we said, northeast, and the site  
3 that we're discussing, the ESP site, is located above  
4 the Triassic basin rock. And to the northwest of the  
5 site there is the crystalline basement rock.

6 I think that a couple of slides from now,  
7 I'll have a section that we can go through this, that  
8 will kind of show you the relationship between the Pen  
9 Branch Fault, the site, and the soil layers that will  
10 -- this information should come together.

11 JUDGE BOLLWERK: Would you like to go to  
12 Ten, or to Eleven?

13 MR. MOORE: Let's go back to Slide Ten,  
14 please. Here, again, as I mentioned, the yellow lines  
15 are the seismic reflection lines that were used for  
16 this investigation. The information was very valuable  
17 in defining the distribution of the different rock  
18 types, their properties, and location for development  
19 of the Ground Motion Response Spectra for the site,  
20 which is discussed in Section 2.5-2. Again, this  
21 fault, as other faults in the site vicinity are not  
22 capable tectonic sources. And we'll discuss that  
23 later, as well. Let's go to Slide Eleven.

24 Based on the geologic and seismological  
25 investigations provided in 2.5-1, it was concluded

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 that none of the tectonic features in the site area  
2 are capable tectonic sources. In addition, non-  
3 tectonic deformations in the upper sands, depressions  
4 and minor deformations due to dissolution can be  
5 mitigated by removal. This is provided in detailed  
6 discussions in Section 2.5-3, and 2.5-4. The issue of  
7 the upper sands will be discussed in just a minute.  
8 Could we go to Slide Twelve, please.

9 Now, this jump to Section 2.5-4, which is  
10 stability in sub-surface materials and foundations.  
11 This section provides a description of the surface  
12 profile, the associated soil properties for static and  
13 dynamic analysis. These properties are needed, are  
14 required to develop the GMRS that describes in Section  
15 2.5-2 -

16 JUDGE JACKSON: Excuse me. Can I ask you  
17 a question?

18 MR. MOORE: Sure.

19 JUDGE JACKSON: Are you through discussing  
20 the fault? I was trying to tell if you transitioned  
21 into your next -

22 MR. MOORE: I think that -- if you have  
23 any questions, I'd be glad to answer them.

24 JUDGE JACKSON: Yes, I did. I mean, I'm  
25 familiar with trenching a fault, and looking at the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 slip aging, and dating, when that had occurred, and  
2 get an idea how capable the fault is. I didn't hear  
3 that part. It may be in there. If you could just  
4 briefly tell me how did you evaluate that, that the  
5 fault was -

6 MR. MOORE: The fault had been previously  
7 evaluated by Savannah River for the MOC site and so  
8 forth, and determined that the Pen Branch Fault was  
9 non-capable. Additional studies were done by River  
10 Terrace. Since we now had identified the location of  
11 the Pen Branch Fault on the Vogtle site, we were able  
12 to know exactly where it crossed the river into the  
13 Savannah River site. So, there was a river terrace,  
14 remains of a river terrace that is, I believe, and I  
15 may be wrong on this, but I believe that it's like 1.6  
16 million years old. It was deposited in that time  
17 frame. And a geomorphic study of that was performed  
18 to determine any deformations of that deposit, and it  
19 was determined that that deposit was not affected by  
20 the Pen Branch Fault movement. And, therefore,  
21 because of the age of that river terrace, and there  
22 was no deformations associated with the Pen Branch  
23 Fault; therefore, we knew the Pen Branch Fault has not  
24 moved in that period of time. And, therefore, it was  
25 determined that at that age, that fault can be

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 considered non-capable.

2 JUDGE JACKSON: Okay. Thanks. I had read  
3 that. I just wanted to hear your explanation on it.  
4 Thank you.

5 MR. MOORE: Thank you.

6 In Section 2.5.4, as we mentioned, we're  
7 jumping up to that, because we need to know the  
8 surface profile and the properties. Also, I think the  
9 Board was very much interested in what sections were  
10 affected. This Section 2.5.4 was significantly  
11 affected by adding additional information to support  
12 the LWA. This additional information is referred to  
13 as COL data in the ESP application.

14 The COL data is the ESP soil data  
15 supplemented by a significant amount of data that was  
16 developed for a COL. So, this section, a lot of the  
17 information was added to support the LWA, and support  
18 the responses to RAIs from the NRC.

19 I want to describe now the layers for you.  
20 The upper sands, from the surface down to about 90  
21 feet, we have what we call upper sands, the Barnwell  
22 Group. It is very loose, dense, it's very variable.  
23 As we mentioned yesterday or the day before, the water  
24 table is around elevation 165, which is about 55 feet  
25 below the surface. Also, at the bottom of the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Barnwell Group is what we call the Utley limestone.  
2 It is a very porous, has cavities and dissolution has  
3 occurred. And we'll discuss the upper sands in the  
4 next slide.

5 Right below that, we have the Blue Bluff  
6 Marl. It's a Lisbon Formation. It's very hard,  
7 slightly sandy, cemented, silt clay, has an average  
8 thickness of 70 to 80 feet. It varies in  
9 approximately that range. Below that, we have the  
10 lower sands, the coastal plain deposits, and those are  
11 dense sands about 900 feet thick. And then directly  
12 below that, for the ESP site, we have the Dunbarton  
13 Basin Rock, is a Triassic sandstone. And we have one  
14 boring, Boring B-1003, that was our deep boring that  
15 went down around 1,350 feet, so it went into the  
16 Triassic Basin rock, but it encountered that rock at  
17 1,049 feet. Let's go to Slide Thirteen, please.

18 This discusses, as mentioned earlier,  
19 there is a non-tectonic feature in the upper sands  
20 that indicate stability problems that require  
21 mitigation by removal. This slide here kind of  
22 describes that, the removal of the upper sands, the  
23 Barnwell Group. Here, again, it's highly variable  
24 density along the depth, and it varies from borehole  
25 to borehole. We have a shale rich, very porous

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 material was encountered at the bottom of the Barnwell  
2 Group, right on top of the Blue Bluff Marl, where we  
3 had drilling fluid loses as we were drilling through  
4 that layer.

5 These soils were completely removed, and  
6 replaced with compacted granular fill for the  
7 construction of existing Units 1 and 2. And for these  
8 reasons, these soils will also be removed in a similar  
9 -- removed, as well, for the constructions of Units 3  
10 and 4.

11 I want to also mention that the less dense  
12 portions of the upper sands in the water table will  
13 have a potential to liquify due to an earthquake.  
14 That's another reason they have to be removed.

15 JUDGE TRIKOUROS: What determines how far  
16 in the, I'll say this horizontal direction, do you  
17 have to remove those sands, and what determines -- how  
18 do you determine that?

19 MR. MOORE: I will cover that later, but  
20 let me just answer that we have extensive amount of  
21 excavation where we actually came down to the bottom  
22 of the Blue Bluff Marl. We made sure that that  
23 excavation was extensive enough, such that the  
24 structural and seismic response of the nuclear island  
25 will be totally within the backfill, that the backfill

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 -- the zone of influence that would affect the seismic  
2 response, and the structure response in the nuclear  
3 island will be totally within the backfill. And I  
4 will show you a sketch later.

5 JUDGE JACKSON: Excuse me. On Units 1 and  
6 2, was the excavation clear down to the Blue Bluff  
7 Marl?

8 MR. MOORE: That is correct. It was,  
9 basically, the excavation - and I will discuss that  
10 later, as well - the excavation procedures will be the  
11 same. We will go -- we excavated down to the Blue  
12 Bluff Marl, make sure that we are -- the competent  
13 part of the Blue Bluff Marl that we cut down until  
14 we're satisfied that we were into the Blue Bluff Marl.  
15 And then we will excavate, and we'll have side slopes  
16 that are two -- one vertical to two horizontal,  
17 typically.

18 JUDGE JACKSON: Okay. Thanks. I had read  
19 somewhere that Units 1 and 2, that the excavation may  
20 have been somewhat different than what was planned for  
21 3 and 4.

22 MR. MOORE: I think the footprint, of  
23 course, of the excavation will be different, because  
24 the layout of the units are different. And the  
25 excavation for Units 1 and 2 were done in one large

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 excavation. And, as I think we've seen in the  
2 previous slides, that Unit 1 and 2 were just basically  
3 adjacent to each other, and they have shared  
4 buildings. Whereas, the AP-1000, they're certified as  
5 a single unit, and so they stand alone. And, so, we  
6 basically are building two units that basically are --  
7 each excavation is for a single unit.

8 JUDGE JACKSON: Okay. Thanks.

9 MR. MOORE: Could we go to Slide Fourteen.  
10 I think this is a slide that will help us summarize  
11 what we were just discussing in regard to the sub-  
12 surface profile. This is a real simple pictorial  
13 sketch.

14 I want to note that the sketch is not to  
15 scale, but we have really two cross-sections here.  
16 And to the right -- we have a little white dotted  
17 line, vertical line here. And I just want to point  
18 out that this to the right of that line represents a  
19 cross-section that cuts perpendicular to the Pen  
20 Branch Fault showing the proper inclination of the  
21 fault. The fault here is -- to the right of the fault  
22 is the Triassic Basin Rock. And that, basically, is  
23 -- excuse me, to the left is the crystalline basement  
24 rock. Starting at the bottom we have -- our rock is  
25 Triassic Basin, and it is at a depth of about 1,050

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 feet. And that was determined by Boring B-1003, which  
2 is shown as this dark vertical line. Then we have 900  
3 feet of coastal plain sediment. And then above that,  
4 we have about 70 or 80 feet or so of the Blue Bluff  
5 Marl. And above that we have excavated out the upper  
6 sands, and put in engineered backfill.

7 I should point out here that due to the  
8 way we did this cross-section, it looks like both  
9 units are sitting in the same excavation, but,  
10 actually, these units are skewed because of the angle  
11 that we had to take this cross-section. And I'll show  
12 you -- the next slide will clarify that for you.

13 JUDGE JACKSON: So, basically, this is a  
14 good illustration of why that fault isn't capable,  
15 because that material doesn't show the disturbance  
16 above. You age that, or date that, and that's very  
17 old.

18 MR. MOORE: Right.

19 JUDGE JACKSON: Therefore, that gives you  
20 a lower boundary on the -

21 MR. MOORE: I think the Blue Bluff Marl is  
22 Eocene, which is very, very old. And this is a warp  
23 there, but other deposits from the river on the other  
24 side are providing additional information that the  
25 fault hasn't moved in millions of years.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 JUDGE JACKSON: Okay. I've got it.  
2 Thanks.

3 MR. MOORE: And then, of course, we have  
4 the upper sands here that have been excavated, and  
5 we'll discuss that in just a minute.

6 We have another cross-section here that  
7 kind of added, but it's to the left of the dotted  
8 line. This shows the cross-section at the river. It  
9 shows the river, the Savannah River. We have also  
10 showing the river bluff on the Georgia side, the high  
11 bluff on the Georgia side. And it shows the Blue  
12 Bluff Marl. And you see a slight warp. That is the,  
13 as we mentioned in the other slide, where the -- we  
14 had the contour lines, the blue lines, showing there  
15 was a warp in the Blue Bluff Marl caused by the Pen  
16 Branch Fault movement millions of years ago. So, this  
17 is kind of puts that all together in a single picture  
18 for you.

19 Okay. If we can now go to Slide Fifteen,  
20 please. Now, this here, as we mentioned earlier, we  
21 are going to do excavations for Units 3 and 4 to  
22 remove the upper sands. You've seen this slide  
23 before, but I think before it showed the -- included  
24 access ramps here for simplicity, that's not shown.  
25 The slope to the excavation in the backfill material

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 are similar to that used for existing Units 1 and 2.  
2 So, we basically -- Unit 1 and 2 is shown to the  
3 right, and the same type of excavation that was done  
4 here will be done for -- will be performed for Units  
5 3 and 4. But, as you see here, these two units are  
6 right together, and so there was a large excavation  
7 done for this. And here we'll have two large  
8 excavations.

9 The excavations are very extensive to  
10 assure that the zone of influence of the structures in  
11 regards to static and dynamic response will be totally  
12 within the backfill. And to answer your previous  
13 question, we had, as a minimum, we went out 45 degrees  
14 from the bottom of a foundation, and we intersected  
15 the Blue Bluff Marl. That was the extent of the --  
16 that was the minimum extent of the excavation down to  
17 the Blue Bluff Marl. So there was like a 45 degree  
18 minimum of that.

19 I think this sketch also will point that  
20 out to you. I want to point out that the light yellow  
21 actually will be the exposed Blue Bluff Marl. And,  
22 so, this is the -- so this represents that we have  
23 come down, and whatever is the minimum extent from say  
24 the deepest building, which is the nuclear island,  
25 that is, basically, the -- that defines the limits.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1                   The total excavation for both of these  
2 will be about 3.9 million cubic yards. I want to also  
3 point out that the nuclear island is just one of the  
4 structures, and it's one structure that has the half-  
5 circle. That is the nuclear island. That's the only  
6 safety-related structure. But other structures will  
7 be bounded on the same uniform backfill, so the whole  
8 power block, AP-1000 power block will all be supported  
9 on a uniform engineered backfill, even though they're  
10 not safety-related structures. Next slide, please.  
11 Slide Sixteen.

12                   As part of the LWA, the construction of  
13 the backfill, that's part of the LWA. And this  
14 requires well-defining the backfill design, the  
15 material selection and source locations, borehole  
16 sources, and esthetic and dynamic properties. To  
17 assist in establishing the backfill properties and  
18 verifying that the shear wave velocity of the  
19 backfill, a test pad was constructed. A side of a  
20 hill at the plant was excavated to a 20-foot depth,  
21 and we went into about over 60 feet into the hill, and  
22 then backfilled using the placement procedures used,  
23 and the backfill material used for Units 1 and 2. And  
24 with this, we were able to do static and dynamic fill  
25 tests, and we also did lab tests of this material,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 and, plus, lab tests of other borehole sources at the  
2 site. And this was performed to document the static  
3 and dynamic properties of the backfill.

4 This slide here, this picture shows the  
5 test pad when it was -- when the first five feet of  
6 backfill was placed. In the picture kneeling down is  
7 Dr. Ken Stokoe, Professor, University of Texas at  
8 Austin. He's a renowned expert in soil dynamic  
9 testing. And we had him come in and perform what we  
10 call a spectrum analysis surface wave testing to  
11 determine shear wave velocity. Here, he's sitting  
12 down, I mean, he's kneeling down. This is a line of  
13 geotherms that are used to surface waves to be able to  
14 do a spectrum analysis of that, and determine shear  
15 wave properties with depth. Could I have Slide  
16 Seventeen, please. Yes?

17 JUDGE JACKSON: When was this work done?

18 MR. MOORE: I think it was done in 2007.

19 JUDGE JACKSON: Okay. Presumably,  
20 something like this was probably done in conjunction  
21 with Units 1 and 2?

22 MR. MOORE: No. There was not a test pad  
23 built like this for Unit 1 and 2.

24 JUDGE JACKSON: Okay. I was just  
25 wondering if you had some similar data, or something,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 that had been taken in.

2 MR. MOORE: I think that -- no, this was  
3 not -- shear wave velocity has a different -- the  
4 sophistication of the testing and the importance of  
5 shear wave velocity in our current thinking is  
6 different than what it was back in the construction of  
7 Unit 1 and 2.

8 Anyway, this slide shows Dr. Stokoe  
9 performing the test. Slide Seventeen is actually the  
10 results of the field and lab tests. It's a very  
11 complex slide, but I think it does capture what we  
12 have determined. This slide shows a part of the test  
13 pad shear wave velocity profile, where the vertical  
14 axis is depth, starting at the surface down is zero,  
15 go down to 20 feet. That's the backfill, and then we  
16 actually have measurements into the in situ material  
17 at the bottom of the cut. And the horizontal axis is  
18 shear wave velocity, and here we have 500 feet per  
19 second, 1,000 per second, so forth.

20 Shear wave velocity is an indicator, a  
21 good indicator of adequate soil, and shear wave  
22 velocity is a measure of stiffness, so the higher the  
23 shear wave velocity, the stiffer the material. Shear  
24 wave velocity is very important, and we do seismic  
25 soil structure interaction analysis. This is

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 important to be able to know these values. And, also,  
2 it's needed in site response, developing the GMRS.

3 This slide shows the SASW results, and  
4 overlaid that with what we call a seismic crosshole  
5 test, to confirm that the SASW was providing adequate  
6 results. That's a totally different way of  
7 determining shear wave velocity. Crosshole is where  
8 we put in three borings, one hole is a source, the  
9 other two holes are receivers, and so you actually are  
10 measuring within the soil at depth, where the SASW is  
11 a surface measurement.

12 Also shown here, we have some RCTS. That  
13 is Resonant Column Torsion Shear Test. These are  
14 performed to get lab tests to determine the soil  
15 properties as they change with strain. Soil is a non-  
16 linear material, and its properties are strain-  
17 dependent. But, also, we can from RCTS back out a  
18 shear wave velocity, and calculate a number. And this  
19 was done here by Dr. Stokoe, and we have some  
20 calculated values that fall really close to the  
21 measured values.

22 This results provided a -- the conclusion  
23 is that the backfill design and properties are well-  
24 defined, and sufficient backfill material exists at  
25 the site. We have sufficient borehole sources. We

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 can meet a minimum shear wave velocity of 1,000 feet  
2 per second at foundation depth, was obtained. This is  
3 an AP-1000 parameter. And we have now ITAACs in place  
4 for the backfill in regards to density, as well as  
5 shear wave velocity. And they are provided as part of  
6 ESP LWA application. And these ITAACs will document  
7 that the in-place backfill will meet the design  
8 requirements.

9 JUDGE JACKSON: Just quickly, basically,  
10 this was the engineered material. It was pretty -- it  
11 was uniform down through the range of these  
12 measurements, 25 feet, and so the increased shear wave  
13 velocity with depth, I assume, is just the compaction  
14 that occurs as you become deeper, and increases the -

15 MR. MOORE: Sure. Of course, the backfill  
16 is very uniform material, and it's placed in a  
17 consistent density. And here, a minimum of 95 percent  
18 of modified proctor, and shear wave velocity is a  
19 direction function that's confining pressure. So  
20 that's why at the surface you see that it's much less  
21 than as you go with depth. It's the same material,  
22 but, basically, the confining pressure is key to --  
23 one of the key elements to defining the shear wave  
24 velocity.

25 JUDGE JACKSON: Yes, that's what I would

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 guess. I just was trying to make sure that was  
2 correct. So, it's certainly a function of depth, and  
3 you said at the foundation level the goal was 1,000  
4 feet per second.

5 MR. MOORE: Right. At this particular  
6 test pad, we're reaching 1,000 around 18 or so feet  
7 depth. And so we feel very -- we are confident that  
8 we will have 1,000 foot -- a shear wave velocity of  
9 greater than 1,000 foot per second at a 40-foot depth,  
10 which is the depth of the foundation of the nuclear  
11 island.

12 JUDGE TRIKOUROS: When is the ITAAC going  
13 to be done, basically, at the end of that process  
14 before any construction actually begins of the -

15 MR. MOORE: For density, I mean, for shear  
16 wave velocity, we have an ITAAC that we will -- we  
17 will do some testing when we get the backfill up to  
18 the foundation depth, which is about 50 feet of  
19 backfill. We will do some shear wave velocity  
20 measurements at that point in time, but we have no  
21 confining pressure at that point. At that point, it's  
22 just exposed backfill at the depth of the foundation.  
23 But we will have that shear wave velocity measurements  
24 as useful information, one, to confirm that, yes, we  
25 are getting increasing shear wave velocity with depth.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 It is the shear wave velocity profile that we're  
2 expecting. That when we finally finish the backfill,  
3 we're going to be repeat the measurements again at the  
4 same locations we did before, at least the ones that  
5 are not in the footprint, and then we will use that as  
6 a basis to document an ITAAC, a engineering report  
7 that the shear wave velocity at 40-foot depth is 1,000  
8 foot per second. We will be doing more than one  
9 measurement. We'll be doing three per unit, to  
10 basically provide that information.

11 JUDGE TRIKOUROS: Those tests will not be  
12 done in the footprint.

13 MR. MOORE: There will be some shear wave  
14 velocity measurements in the footprint when we get up  
15 to the foundation elevation, but before the backfill  
16 goes all the way up to the surface. The purpose of  
17 that is to show that those measurements in the  
18 footprint are the same measurements that we get away  
19 from the footprint. And then when we get up to the  
20 40-foot depth, of course, we have no confining  
21 pressure still at the footprint because there's  
22 nothing there, but we will have measurements away from  
23 the footprint where we have an over-burden of 40-feet  
24 of backfill. And that way, we can then determine that  
25 yes, the shear wave velocity at that level is 1,000

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 foot per second. And, of course, when you construct  
2 the building, the building itself will confine the  
3 backfill directly underneath it.

4 JUDGE TRIKOUROS: So that ITAAC is a  
5 prerequisite for beginning construction of the  
6 structure.

7 MR. MOORE: We could not -- we would have  
8 to -- we could not build the AP-1000 at the site. Our  
9 commitment is that it has to be 1,000 foot per second,  
10 and that's an ITAAC. And that's a commitment that we  
11 will provide that kind of backfill.

12 JUDGE TRIKOUROS: Thank you.

13 MR. MOORE: Okay. Let's go to Slide  
14 Eighteen, please.

15 Now that we know the site soil and rock  
16 properties, let's go back now to 2.5.2 to determine  
17 the vibratory ground motion. Per the regulations, 10  
18 CFR Part 100.2-3, the SSE of the GMRS requires  
19 uncertainty be considered in developing the SSE, and  
20 that's through a probabilistic seismic hazard  
21 assessment.

22 This slide here identifies the steps that  
23 were used to obtain the Vogtle site-specific PSHA. Go  
24 up to the stride, the first bullet, the PSHA is  
25 updated following the guidance provided in Reg Guide

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 1.165. As part of that Reg Guide, an acceptable  
2 starting point is to start -- you can start with the  
3 EPRI-SOG PSHA. That was published in 1989. The data  
4 that was used to develop that PSHA was up to around  
5 1984, so our task was to assess the information and  
6 data from that time to the present. So, one, we  
7 assessed the effects of additional seismicity that has  
8 occurred since 1985 to mid-2005. That was, basically,  
9 the extent -- the range where we're doing the PSHA.  
10 We had to look at it and see if there is any seismic  
11 source updates that would -- based on new information.  
12 We'll discuss that in a minute. And, also, as part of  
13 the PSHA, not only looking at seismic source  
14 characterizations, we have to look at ground motion  
15 models. That's taking the ground motion from a  
16 seismic source to your site, and there has been an  
17 update in the ground motion models documented of the  
18 EPRI-SOG, call it EPRI-2004. So, we updated the  
19 ground motion models for the PSHA. I want to point  
20 out, too, the PSHA that we finally did is at hard  
21 rock, so we have -- remember that our site is a deep  
22 soil site. Let's go to Slide Nineteen, please.

23 The most significant and the major update  
24 is shown here, an update of the EPRI-SOG seismic  
25 source was required for Vogtle due to new geoscience

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 information about the Charleston Seismic Source. On  
2 the slide, you can see where the Vogtle site is  
3 identified. And Charleston Seismic Source, where we  
4 had the 1886 Charleston earthquake in this area here,  
5 which is about 100 miles from the site.

6 The new information that has been  
7 developed since 1984 includes geometry, rate in max,  
8 magnitude, parameters for the Charleston Seismic  
9 Source, and these needed to be -- we needed to  
10 consider these and revise our PSHA. The most  
11 significant is the paleoliquefaction data that sand  
12 blows indicates that large Charleston-type events have  
13 reoccurrence intervals in 500 to 1,000 years instead  
14 of the about 2,000 years, as reflected in the original  
15 EPRI-SOG. Therefore, a new seismic source  
16 characterization model was developed for the Vogtle  
17 PSHA, as shown in this slide.

18 The updates include four alternate  
19 sources; A, B, B prime, and C. These alternate  
20 sources are to account for different source  
21 interpretations. And the more confidence you have of  
22 a source characterization, the higher weight you give  
23 it. So we're showing here that we have -- Zone A has  
24 a weight of 70, and the other zones have a weight of -  
25 - of .7, the other ones have a weight of .1.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1                   The update of the Charleston Seismic  
2 Source was incorporated into the EPRI-SOG seismic  
3 source model. The update of Charleston Seismic Source  
4 was peer reviewed by Dr. Martin Chapman, and Dr. Carl  
5 Stepp, two of the members of our review panel. And  
6 both experts in seismic source characterizations.

7                   I want to point out that due to the update  
8 of the Charleston Seismic Source, the Vogtle seismic  
9 hazard did increase from the original EPRI-SOG  
10 results, so this is the update that was performed for  
11 the Vogtle site, so we have a Vogtle site-specific  
12 PSHA updated, and it's at hard rock. If we can go to  
13 Slide Twenty, the next slide, please.

14                  The updated, as I said, EPRI-SOG PSHA  
15 results define seismic hazard at a rock site, but the  
16 Vogtle site is a deep soil site where hard rock is  
17 more than 1,000 feet below the surface. In order to  
18 determine the SSE or GMRS at the ground surface, we  
19 need to determine the site PSHA at the free ground  
20 surface. In order to accomplish this, we need to take  
21 the rock uniform hazard motions and give all those  
22 motions to the surface to obtain site amplification  
23 factors. Next, we take the site amplification factors  
24 and the rock hazard to obtain a soil hazard at the  
25 surface, which is represented by uniform hazard

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 spectra at appropriate mean annual frequencies of  
2 exceedance. And if we can go to the next slide,  
3 Slide Twenty-One.

4 This is a little bit more information on  
5 how that's done. This slide shows the statistical  
6 results of the randomized soil rock profiles that were  
7 actually used to obtain the site amplification factors  
8 that were used to develop the soil hazard at the free  
9 ground surface.

10 Starting at the very top, we have the  
11 backfill material, then we have the Blue Bluff Marl,  
12 then we have the 900 feet of the coastal plain  
13 sediments, and at about 1,050 feet we hit rock. And,  
14 of course, Triassic Basin Rock is not hard rock, and  
15 so we have different interpretations of how that rock  
16 changes with depth. And then we hit about 9,200 foot  
17 per second rock, and that is defined as hard rock for  
18 the PSHA. So, there were 60 randomizations of the  
19 shear wave velocity profile, and there were multiple  
20 time histories used to convolve the motion up, and  
21 that was used to come up with the mean amplification  
22 factors. And that was used to multiply times the  
23 rock, uniform hazard spectra, to get the uniform  
24 hazard spectra at the surface. If we can go to Slide  
25 Twenty-two.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1           The next step is, once we have the uniform  
2 hazard spectra at the surface, we need to develop the  
3 SSE and GMRS. And this is developed following a  
4 performance-based method presented in ASC 43.05, and  
5 later is was adopted in Reg Guide 1.208, entitled, "A  
6 Performance-Based Approach to Define Site-Specific  
7 Earthquake Ground Motions." So, for the Vogtle site,  
8 the SSE GMRS is defined at the free ground surface at  
9 the top of the engineered backfill.

10           Now, the vertical -- this is for the  
11 horizontal. The vertical SSE and GMRS is based on a  
12 frequency-dependent ratio of vertical to horizontal  
13 spectra shapes, which we call V over H. Due to the  
14 limited empirical information on V over H for the  
15 central and eastern U.S. ground motion, alternate  
16 analytical approaches were evaluated and compared to  
17 determine the Vogtle site-specific V over H ratio.

18           JUDGE JACKSON: Let me ask just a  
19 question, make sure I understand this. If you start  
20 at the Charleston source then, you're going to have  
21 some source disturbance, earthquake, or whatever, and  
22 you propagate that then through the rock, through the  
23 hard rock region.

24           MR. MOORE: Right.

25           JUDGE JACKSON: That's how you get from

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Charleston, say to the Vogtle site. And then you're  
2 saying you then work through this to get from that  
3 motion, or that source up to the surface source. And  
4 that becomes the site-specific part where you have to  
5 know what's going on between the hard rock layer and  
6 the surface.

7 MR. MOORE: That is correct. The PSHA at  
8 the rock considers - and it is true that the PSHA at  
9 the Vogtle site, especially at the mean annual  
10 frequencies that we are looking at, are pretty much  
11 controlled by the Charleston source. Of course, there  
12 are other sources, too.

13 JUDGE JACKSON: Right.

14 MR. MOORE: That are considered, of  
15 course.

16 JUDGE JACKSON: Yes, I was just taking the  
17 Charleston as the example.

18 MR. MOORE: Right.

19 JUDGE JACKSON: How you get from the  
20 source to the site.

21 MR. MOORE: And, so, what we have done,  
22 exactly as you said, once we get the PSHA at the rock,  
23 then we have all this information. That's why I went  
24 to 2.5.4 to give you all that kind of soil property  
25 information, because that actually has to be used to

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 get the rock hazard up to the -- to get our soil  
2 hazard at the surface.

3 JUDGE JACKSON: Okay.

4 MR. MOORE: So if we go now to Slide  
5 Twenty-three, this is the final results. Finally, we  
6 have the Vogtle horizontal GMRS shown as a solid black  
7 line, and the vertical GMRS is shown as a dotted blue  
8 line. The vertical axis is -- this is the response  
9 factor of the vertical axis, the spectra acceleration  
10 that is responsible, single degree of freedom. And  
11 for this particular spectra shape, it's for 5 percent  
12 critical damping. The horizontal axis is the  
13 frequency in hertz. That is the natural frequency of  
14 a single degree of freedom system.

15 I want to point out that the PGA, that's  
16 the Peak Ground Acceleration for the Vogtle GMRS at  
17 the ground surface is defined at 100 hertz, but,  
18 basically, it's -- here that value is, for your  
19 information, is about 0.266 Gs. So, basically, if we  
20 have this ground motion, and you put an accelerometer  
21 on the ground surface, and maximum acceleration from  
22 that measured from that accelerometer will be .266 Gs.  
23 So this is the end product of Section 2.5.2.

24 If we go to Slide Twenty-four, this is  
25 another pictorial cross-section of the Vogtle site

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 that kind of summarizes the results presented so far.  
2 If we go to the left, it shows the 90 feet of  
3 backfill, and about 70 or so feet of the Blue Bluff  
4 Marl, and then 900 feet of the coastal plain  
5 sediments. To the right of the figure, it shows the  
6 location of the GMRS, that's a free field ground  
7 motion at the surface. But also included in this  
8 sketch is the nuclear island embedded about 40 feet in  
9 the backfill, which is the embedment depth. And I  
10 want to point out, additionally, we did following the  
11 same procedures used to develop the GMRS and  
12 consistent, fully consistent with the GMRS, and  
13 outcrop spectra motion was developed called the  
14 Foundation Input Response Spectra at 40-foot depth.  
15 And it's shown here.

16 This is valuable information to have when  
17 you do the source structure interaction analysis that  
18 will be shown later. But I do want to point out that  
19 the GMRS and FIRS are based on site response  
20 calculations, where the nuclear island, of course, is  
21 not included. And it's the incorporation of the AP-  
22 1000 into the -- is considered site-specific seismic  
23 source structure interaction analysis. But this  
24 picture is kind of putting everything together.

25 JUDGE JACKSON: Why do you have -- I

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 didn't understand why you had to visualize it as an  
2 outcrop? Why wouldn't it just be at a level of the  
3 foundation?

4 MR. MOORE: The outcrop is -- the way it  
5 was done for Vogtle was, we had one single column,  
6 soil column from the rock to the surface.

7 JUDGE JACKSON: Okay.

8 MR. MOORE: And we did a 1-D seismic  
9 analysis through a program called SHAKE. And it will  
10 give you outcrop motions. It represents a motion that  
11 is representative of that horizon, but it does  
12 consider the soil above it. And, so, this gives you  
13 basically a characterization of that motion at that  
14 horizon. And that motion is then used later to do  
15 soil structure interaction analysis. And the  
16 importance of defining at the foundation depth is the  
17 engineering opinion that the foundation input is the  
18 more correct location to do -- more important motion  
19 to define motion for soil structure.

20 JUDGE JACKSON: Okay. That outcrop then  
21 is to decouple that when the calculation from what's  
22 above it becomes like a free surface. Is that why you  
23 think of it as an outcrop?

24 MR. MOORE: Well, it's an outcrop -- there  
25 is different ways of -- there's different ways of

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 defining outcrop. This is defined as an outcrop that  
2 is defined using the SHAKE program. I believe the NRC  
3 would consider an outcrop motion where there is -- you  
4 do not have any downcoming waves. But this was done  
5 in a consistent manner, and we have discussed this  
6 with the NRC, and there's different ways of  
7 calculating outcrop motion. But this was done, and  
8 we'll discuss it a little bit later. I will show you  
9 some of the results.

10 JUDGE JACKSON: One other quick question,  
11 and then I'll try to stop interrupting you. You said  
12 at the surface if you put an accelerometer, you would  
13 expect to measure what you had at the 100 hertz. I  
14 just wasn't clear -- it wasn't clear to me why you  
15 chose the 100 hertz. Why wouldn't it be at 10 hertz?

16 MR. MOORE: Well, for one, is our  
17 calculations go out to 100 hertz, and 100 hertz is  
18 considered basically the ZPA, or Peak Ground  
19 Acceleration.

20 JUDGE JACKSON: Okay.

21 MR. MOORE: And for the eastern U.S. we  
22 get, due to the characterization of our hard rock in  
23 the eastern U.S., and the seismic source  
24 characterizations that we have, that we don't have --  
25 our ZPA is at a higher -- PGA is at a higher

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 frequency. I was using the -- to try to define what  
2 a PGA was, I was just using the visual concept of  
3 putting an accelerometer from the soil. And based on  
4 that ground motion, the GMRS, we had that ground  
5 motion, the PGA that would be picked up, the maximum  
6 acceleration from that accelerometer would be .266 Gs.

7 JUDGE JACKSON: Okay. Thank you.

8 JUDGE TRIKOUROS: Just a question  
9 regarding methodology. What methods were used to do  
10 these calculations to generate these response factors?  
11 Are these analytical methods that are established  
12 analytical methods?

13 MR. MOORE: Correct. They're based on the  
14 -- the ground motion is -- the site amplification  
15 factors were based on a 1-D soil column analysis. It  
16 accounts for non-linear, as I said earlier, the soil  
17 behaves non-linearly, depending on the strain, and the  
18 ground motion that you put in will affect the strain,  
19 you iterate until you get the correct strain levels.  
20 And to do this, you have curves -- you have properties  
21 that define in a given soil layer the shear modulus.  
22 Shear modulus reduces with strain. The damping of the  
23 soil layer increases with strain, and this is all  
24 incorporated into the 1-D SHAKE analysis, so that you  
25 get an appropriate soil column response that's

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 consistent with the properties. Shear wave velocity  
2 and the, what we call soil non-linear behavior curves,  
3 which is G over G Max, and damping.

4 JUDGE TRIKOUROS: Is there a name for that  
5 tool?

6 MR. MOORE: It's a 1-D soil analysis. The  
7 program is called SHAKE. It's a very common program  
8 used by everybody in the industry.

9 JUDGE TRIKOUROS: That's what I was  
10 getting to. So, it's an established method that  
11 everybody uses.

12 MR. MOORE: It's a very common method,  
13 yes. It's a 1-D soil column analysis. It's been used  
14 and accepted for years.

15 DR. COSTANTINO: Can I add something to  
16 Don's comment? There are studies which have compared  
17 the results of these analyses with empirical data to  
18 show that the predictions tend to be conservative,  
19 compared to measured empirical data from earthquakes.  
20 That's really the most important part of that whole  
21 aspect.

22 JUDGE TRIKOUROS: We certainly want to  
23 follow-up with the analytical methods with respect to  
24 the Staff side of this.

25 MR. MOORE: All right. Let's go to Slide

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Twenty-five, please.

2 Now, let's focus on the LWA activities,  
3 and how -

4 JUDGE BOLLWERK: You may need to tap on  
5 the mic just to make sure you're getting -- you need  
6 to tap on the mic to make sure we hear you.

7 MR. MOORE: I'm sorry. This is Slide  
8 Twenty-five, and we want to focus on the LWA  
9 activities, and how additional information is required  
10 to support it. You have seen in this slide before, I  
11 want to point that up to the upper light, under the  
12 LWA, backfill will be placed from the top of the Blue  
13 Bluff Marl up to the ground surface, about 90 feet.  
14 Of course, the LWA also includes the EC wall, mudmat,  
15 and waterproof membrane.

16 The lower graph is a picture that shows  
17 the results of the LWA when it's completed, which is  
18 basically backfill to the surface for the EC wall,  
19 forming an opening configured to the footprint of the  
20 nuclear island. Can we go to the next slide, Twenty-  
21 six, please.

22 JUDGE JACKSON: Excuse me. Before you  
23 leave that slide, we were trying to look at that  
24 slide, and make sure we understood the mudmat, and the  
25 membrane. That was a little bit hard to see. Can you

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 just go through where the mudmat is -

2 MR. MOORE: It's shown in a circle detail  
3 in the far right.

4 JUDGE JACKSON: Okay.

5 JUDGE TRIKOUROS: It looked like there was  
6 mudmat below and above the membrane.

7 MR. MOORE: What's going to be done is  
8 that -- once the backfill -- we'll put a mudmat on  
9 top of the backfill, about six inches of concrete.  
10 We'll put a spray on waterproof membrane, and then  
11 we'll put another mudmat, small layer to protect that,  
12 another six inches of concrete on top of that. And  
13 that will perform a working surface for them to put  
14 the reinforcing chair, so they can start laying  
15 reinforcing when that is done later.

16 JUDGE JACKSON: Yes. Thanks. We just had  
17 -- we weren't sure we could see where those arrows  
18 ended, and wanted to make sure that the mudmat was on  
19 both sides of that.

20 MR. MOORE: That's correct. Basically,  
21 it's -- we're required to put in a waterproof  
22 membrane, and we definitely wanted to protect it with  
23 laying in the reinforcing for the basemat, so that  
24 it's protected when they pour the basemat concrete.  
25 And it is a -- the configuration is a mudmat with the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 waterproof membrane, with another concrete cover to  
2 protect it.

3           Going back to Slide Twenty-six, one of the  
4 LWA seismic issues, the backfill directly supports the  
5 nuclear island, and construction of the backfill is  
6 part of the LWA. Therefore, site-specific analysis,  
7 seismic analysis are required to verify that the  
8 backfill properties, which we call C, exceed the site-  
9 specific demand, which we call D, by an adequate  
10 design margin, or C over D has to be greater than a  
11 required factor of safety. The Vogtle site parameters  
12 require site-specific analysis in order to define  
13 capacity, as well as the design. The next couple of  
14 slides will provide the basis for the need for site-  
15 specific analysis.

16           JUDGE JACKSON: Where do you get the  
17 guidelines for what is an appropriate factor of  
18 safety? Is that just -

19           MR. MOORE: I will present that later,  
20 but, basically, the -- for stability, that comes from  
21 the AP-1000 criteria. And for seismic demand -  
22 excuse me - for bearing, we provide those factors in  
23 our 2.5.4, and we use standard safety factors. And  
24 they were safety factors as a measure, and that comes  
25 from an ASCE design guide for foundations.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 JUDGE JACKSON: Okay. So, basically, it's  
2 standard -- a professional standard.

3 MR. MOORE: Correct.

4 JUDGE JACKSON: Okay.

5 MR. MOORE: All right. And I'll show you  
6 the actual results in just a minute.

7 Now, if we go to Slide Twenty-seven,  
8 please. This slide is from Appendix 2.5A, which is  
9 entitled, "Vogtle Site-Specific Seismic Evaluation  
10 Report." It was developed to address the  
11 acceptability of the AP-1000 at the Vogtle site. It  
12 was added to the ESP to support the LWA request. It  
13 provides the seismic stability of the nuclear island,  
14 and the seismic bearing loads on the backfill.

15 This particular slide shows the comparison  
16 of the Vogtle GMRS, which is the blue line, to the AP-  
17 1000 certified design motion, which is shown as red.  
18 As you note, there are exceedances. We have GMRS does  
19 exceed the certified design spectra at around .4 to .7  
20 hertz, and from about 7 to 60 hertz. These  
21 exceedances by themselves would require a site-  
22 specific analysis. If we can go to Slide Twenty-  
23 eight, please.

24 This slide is the comparison of the  
25 vertical GMRS, shown in blue line, to the AP-1000

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 certified design, shown in red. The exceedances are  
2 less in the vertical direction. Also, I want to note  
3 that as part of the 2.5.4, we provided a coefficient  
4 of friction between the foundation and the backfill,  
5 and that coefficient of friction is specified as 0.45.  
6 And that would require also a site-specific evaluation  
7 to determine the acceptability in regards to sliding.

8 Now, if we go to Slide Twenty-nine,  
9 please. As mentioned earlier, the Vogtle site-  
10 specific evaluation was performed and provided in SAR  
11 Appendix 2.5A, pursuant to demonstrate site  
12 acceptability. Also, the ESP Section 2.5.4 also was  
13 expanded to include bearing capacity to the man  
14 information to support the LWA. The site-specific  
15 analysis is required for the following reasons.

16 JUDGE JACKSON: Excuse me. Let me try a  
17 quick question, and I don't know if it's fair to ask  
18 you a question or not. I just wondered, would this be  
19 considered a particularly high seismic hazard area  
20 where we are right now? I mean, this part of the  
21 southeast? Here's my question. I'm just a little --

22 I was just wondering why the standard design wouldn't  
23 have been sufficiently robust that it would have  
24 encompassed what you might encounter in a region like  
25 this.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MR. MOORE: The criteria was developed in  
2 the '90s. At the time, there was a standard spectra  
3 from Reg Guide 1.160 that has standard spectra shape,  
4 and it -- the zero period acceleration, or the PGA was  
5 specified around 33 hertz. The LWAs were based on  
6 that, and what they did was they increased -- they  
7 came up to about a .3 G spectra shape. The spectra  
8 would be -- they just raised that spectra to .3 G, and  
9 at that time it was thought that would be robust  
10 enough for the central and eastern U.S. You do notice  
11 on that particular Westinghouse AP-1000, they have a  
12 slight bump around 25 hertz that was added to account  
13 for the central and eastern U.S. high-frequency ground  
14 motion that was occurring based on these PSHAs. But  
15 when we actually get to doing the site response  
16 analysis, they -- we're showing in some cases that  
17 these spectras are not -- do not cover, especially in  
18 the high-frequency range.

19 I will show you something later that when  
20 we do a site-specific analysis for the site, that  
21 these issues will dissipate, due to the fact of the  
22 soil structure interaction effects.

23 JUDGE JACKSON: Okay. Thanks. I was just  
24 curious. It sounds like maybe some of the standards  
25 or understanding shifted, has been shifting a little

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 bit, and it may have shifted beyond the target.

2 MR. MOORE: EPRI had a project where they  
3 developed some criteria working with the industry on  
4 how -- what are the criteria that would be used to  
5 define a standard plan. And that was part of it.  
6 And, at that time, that was the standard design  
7 procedures. It was deterministic. We came up with  
8 the maximum P ground acceleration and attached a  
9 standard ground response spectra that was really, more  
10 or less, based on information developed from western  
11 U.S. earthquakes.

12 JUDGE JACKSON: Thanks.

13 JUDGE TRIKOUROS: Excuse me. Was there a  
14 generic soil structure interaction analysis done for  
15 the AP-1000 DCD?

16 MR. MOORE: The AP-1000 originally  
17 certified for hard rock, and it had a shear wave  
18 velocity of 8,000 feet per second. Recently, of  
19 course, they going in the process of extending that to  
20 soil sites, and they are looking at multiple generic  
21 soil profiles.

22 JUDGE TRIKOUROS: As part of the revisions  
23 to the DCD?

24 MR. MOORE: That is correct.

25 I will say that what we're doing here is

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 basically, for Vogtle, we're just doing the site-  
2 specific analysis to assure ourselves that our seismic  
3 demand doesn't exceed the AP-1000 design, whatever  
4 that design is. Our effort here is to show that our  
5 site parameters, are enveloped by the certified  
6 design.

7 JUDGE TRIKOUROS: If I might, could you  
8 also tell me what methodology you used to do the SSI?

9 MR. MOORE: Yes. The SSI was done -- I'm  
10 discussing it right here. For the purposes of the  
11 LWA, and just overall nuclear island stability on the  
12 backfill, and sliding and overturning, we did a 2-D  
13 soil structure interaction analysis using SASI. It's  
14 a standard fine element program for doing SSI. And  
15 I'll present some results here on that.

16 The first bullet here relates, as I've  
17 just mentioned, we needed to do a site-specific  
18 analysis. The GMRS exceeded the AP-1000. Also, our  
19 soil profile is unique and different than any others.  
20 Every site is unique, but we have -- if you remember,  
21 we have 90 feet of backfill. Then we have a fairly  
22 hard layer, and then we have kind of an inverse -- the  
23 hard layer, then we have dense sands that are  
24 competent, but they have a lower shear wave velocity  
25 than the Blue Bluff Marl, so these are all unique

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 features. Also, I mentioned the coefficient of  
2 friction is .45 that we need to consider in site  
3 nuclear island stability evaluations.

4 The second bullet is a 2-D seismic  
5 analysis, soil structure interaction models were used  
6 to account for seismic stability. Stability is  
7 related to overall building response. It's the overall  
8 building, how it responds on the soil that's  
9 supporting it and the amount of soil that's embedded  
10 in it, that the building is embedded. And we  
11 determined that the 2-D analysis is totally  
12 sufficient, especially if we show large factors of  
13 safety, which we do for the Vogtle site. And,  
14 therefore, this SSI modeling is used to demonstrate  
15 the adequacy of the backfill for the LWA request. And  
16 that's what it was done -- that's the purpose that  
17 we're providing it for here.

18 Now, the third bullet is basically what is  
19 the model. It's the standard for the Vogtle SSI  
20 model, the model, itself, the structural model is the  
21 standard AP-1000 2-D seismic model, you have one  
22 north-south, and you have one east-west. The north-  
23 south model includes the annex building, the east-west  
24 model includes the turbine building. Sort of a  
25 structure-to-structure interaction that's directly

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 considered. But the difference here, of course, when  
2 you use the Vogtle ground motion input, not the  
3 certified design ground motion, and we used the Vogtle  
4 site profiles.

5 For SSI analysis, that's deterministic  
6 analysis, and so we -- and per the SRP, NUREG 0800  
7 requires that soil profiles need to be -- the three  
8 profiles need to be considered to account for  
9 variability in soil properties. So, what was done for  
10 the Vogtle site was, we came up with a best estimate,  
11 basically is the mean shear wave velocity profile.  
12 Then we had an upper bound, which is basically the  
13 mean plus one standard deviation, and then the lower  
14 bound was the -- excuse me, the median plus -- minus  
15 one standard deviation. And that goes back to Slide  
16 Twenty-one where I showed you the soil profile. So,  
17 this was the basic -- how the analysis was done. If  
18 we could go to the next slide, Slide Twenty.

19 I provided this as just an example of the  
20 seismic response that is actually provided in Appendix  
21 2.5E. This is the response of Vogtle 2-D SSI  
22 analysis. And I only want to provide this to point  
23 out some key points for the panel. This location is  
24 the horizontal north-south at the top of the nuclear  
25 island, the highest point that the responses were

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 calculated. We have three Vogtle in-structure  
2 response spectras, because we have three different  
3 soil profiles. The green is the upper bound soil  
4 case. The blue is the best estimate soil case, and  
5 the dotted red is the lower bound soil case. And, also  
6 shown here just for information purposes is what  
7 Westinghouse provided as their 2-D envelope, AP-1000  
8 envelope, that they have been using when they do kind  
9 of an envelope for the 2-D analysis for comparison  
10 purposes only.

11 The overall building response in regards  
12 to building stability and foundation bearing pressure  
13 is related to the maximum accelerations of the  
14 building along its height. The maximum building  
15 accelerations at a given location and direction is  
16 actually the zero period acceleration of the in-  
17 structure response spectrum. That's the acceleration  
18 value at the flat portion of the in-structure response  
19 spectra at the high-frequency range. As seen here,  
20 that's around 30 to 100 hertz.

21 The two points I want to point out on this  
22 is that the maximum building acceleration highest  
23 location in the nuclear island for the Vogtle specific  
24 analysis is about .7 Gs. So, basically, that same  
25 accelerometer on the roof of the shield building, and

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 we did this Vogtle site-specific analysis, that  
2 accelerometer would show a maximum acceleration at  
3 that point of the structure of .7 Gs. Whereas, the  
4 Vogtle - I mean, the AP-1000 certified design kind of  
5 envelope shows about 1.6 Gs. Therefore, the Vogtle  
6 results for this particular evaluation is about half  
7 of what they had calculated for the AP-1000.

8 The other point I want to point out is,  
9 this illustrates that even though the Vogtle GMRS  
10 exceeds portions of the AP-1000 certified design,  
11 site-specific SSI analysis provides the necessary  
12 information to properly evaluate the site  
13 acceptability. Note that the AP-1000 seismic demand  
14 is based on an envelope for maximum seismic responses  
15 in the red curve in their SSI analysis.

16 I want to also point out that the Vogtle  
17 site-specific results, as seen here, are not unique.  
18 They are very typical of embedded nuclear power plant  
19 type structures on deep soil sites.

20 JUDGE TRIKOUROS: What determined the  
21 requirement for the friction coefficient?

22 MR. MOORE: We had to provide as part of  
23 our submittal what is the coefficient of friction that  
24 we have for the nuclear island, and the interface with  
25 the foundation. That was provided as a site-specific

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 parameter. At the time we were putting the submittal  
2 together, there was a requirement of being --  
3 coefficient of friction being .7. And, of course,  
4 that was, more or less, a consideration of a  
5 foundation of a nuclear island sitting on hard rock,  
6 which is what the basic DCD, I think Rev.15,  
7 addresses. But here we have a soil site, and .7 is  
8 not a realistic coefficient of friction, but this  
9 coefficient of friction is based on the properties of  
10 the backfill, and is related to the angle of internal  
11 friction. It's basically taking that information, and  
12 we use that in a procedure to come up with this  
13 coefficient of friction.

14 JUDGE JACKSON: Let me make sure I  
15 understand it. It is the coefficient of friction then  
16 between, basically, the bottom of the mudmat and the  
17 compacted material that it's resting on.

18 MR. MOORE: Correct.

19 JUDGE JACKSON: And, physically, what  
20 you're concerned with is you're looking at the  
21 horizontal motion, and you want to know the coupling  
22 then between what's going on in the compacted  
23 material, the engineered material, and the foundation.

24 MR. MOORE: Correct.

25 JUDGE JACKSON: And the limit was .7,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 somebody determined.

2 MR. MOORE: That was the specified limit  
3 that they have for their -- yes, that was provided to  
4 us at that point in time. Correct. I mean, the .7  
5 was provided to us at that time, because that was what  
6 the coefficient of friction that was used -- here,  
7 again, I'm providing information based on  
8 conversations I had with Westinghouse engineering  
9 staff, and they said the .7 was based on an analysis  
10 for the hard rock, where the nuclear island sits on  
11 the hard rock, and there is no site soil. It's just  
12 a nuclear island sitting on hard rock.

13 JUDGE JACKSON: Okay.

14 MR. MOORE: But we -- as a part of our  
15 submittal, we provided this information. And all I'm  
16 pointing out here is that that is something that is  
17 explicitly considered in our site-specific seismic  
18 evaluation. As I mentioned earlier, this whole  
19 evaluation is site-specific, so all the different  
20 parameters that could affect stability response and  
21 everything, like soil profile, input motion are all  
22 explicitly considered. And the bottom line is that we  
23 show, after we do all these analyses, that the site  
24 demand is below the capacity of the AP-1000 design.

25 JUDGE JACKSON: And you're going to

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 measure -- there's some measurements involved, was  
2 there not, in the coefficient of friction?

3 MR. MOORE: There is a calculation that  
4 has been submitted. The coefficient of friction, .45  
5 has been based on some calculations that have been  
6 incorporated into the ESP. There is no ITAAC  
7 associated with that.

8 JUDGE JACKSON: You're saying there was no  
9 measurement -

10 MR. MOORE: There's no measurement made  
11 between -- on the backfill. And I think when we see  
12 later in the next slide that we have plenty of margin.  
13 But this is not a -- here, again, we're doing a site-  
14 specific criteria, and this value, we believe, is  
15 conservative.

16 JUDGE TRIKOUROS: So is this a calculated  
17 -- if you can't measure it, do you calculate -- do you  
18 analyze that?

19 MR. MOORE: There's a calculation, yes.  
20 It's based on the angle of internal friction of the  
21 backfill, and that's been done by lab tests, and the  
22 value specified for the combined COL is 36 degrees.  
23 And there is a -- and then we -- basically, that  
24 information -- we then would use a document called the  
25 NavDoc, which is a Navy soil document, standard used

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 by soils engineers to define an appropriate  
2 coefficient of friction between the concrete  
3 foundation and the top of soil.

4 JUDGE TRIKOUROS: So, would it be a true  
5 statement to say that even if the response spectra  
6 were within the AP-1000, you would still be required  
7 to do a site-specific analysis with respect to the  
8 coefficient of friction problem?

9 MR. MOORE: At the time that we made a  
10 submittal, that would be the case, yes. Because they  
11 had specified a higher coefficient of friction, they  
12 provided us at that time.

13 JUDGE TRIKOUROS: So you had no choice but  
14 to do a site-specific soil structure interaction  
15 either way. You had no choice but to do that site-  
16 specific analysis.

17 MR. MOORE: Correct. And, as I said  
18 earlier, the whole -- our analysis -- our acceptance  
19 of our site is based on the site-specific analysis.

20 I believe we can go now to the last slide,  
21 please, Slide Thirty-one. The final results of the  
22 Vogtle site-specific evaluation with regards to  
23 stability and adequacy of the backfill is summarized  
24 on this slide. Note that capacity, C, denotes the  
25 available resistance to preventing sliding and

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 overturning. R, for bearing is the ultimate bearing  
2 capacity of the supporting substrata. The seismic  
3 demand is the maximum seismic demand determined from  
4 the Vogtle site-specific SSI analysis considering all  
5 three soil cases, lower bound, best estimate, and  
6 upper bound. The calculated C over D provided in the  
7 slide represents the Vogtle site-specific safety  
8 factors, which, in this slide, is compared to the  
9 minimum acceptable safety factors.

10 Now, let's start at the top. The minimum  
11 sliding, C over D, safety factor given in Appendix  
12 2.5E is 1.83, which is greater than the AP-1000  
13 minimum of 1.1. The minimum overturning safety factor  
14 is 2.45, which is greater than the Westinghouse 1.1.  
15 The static bearing ultimate capacity over the demand  
16 is equal to 11.9 for static, which is compared to ASCE  
17 standard for acceptable bearing safety factors is  
18 about 3, so we have plenty of margin in that, as well.  
19 And for dynamic bearing, which includes the static,  
20 plus the dynamic bearing from seismic, that's the  
21 total C, and the - excuse me. The D for this includes  
22 the dynamic bearing loads from seismic, plus the  
23 static. That's the D. And then the capacity, safety  
24 factor we get is 5.6, which is greater than a typical  
25 safety factor for dynamic bearing of 2.25.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           Also, in 2.5.4 we provide information on  
2 calculations and other information that shows that  
3 there is no potential for soil liquefaction of the  
4 backfill, or any of the material below the foundation  
5 of the nuclear island. In addition, in Section 2.5E,  
6 we provide settlement calculations that account for  
7 building construction, and show that those calculated  
8 settlements are within the AP-1000 accepted limits.

9           So, the conclusion is that the backfill is  
10 fully acceptable, and able to support the nuclear  
11 island with a significant margin. And, therefore,  
12 supports the LWA. Of course, at the completion of the  
13 LWA, as I mentioned earlier, there are ITAACs to  
14 document that the backfill design parameters are fully  
15 satisfied.

16           I hope this presentation addresses your  
17 request, and, if not, I'll be glad to answer any  
18 additional questions.

19           JUDGE JACKSON: Thanks for your patience  
20 in answering questions. I just want to understand one  
21 other thing. You get down to the LWA evaluation, and  
22 you were looking at factors, such as tipping, and  
23 being able to bear the weight of the facility, not  
24 settling, et cetera. I see that with respect to the  
25 LWA. Now, help me understand, you also, obviously,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 have to worry about all the structure inside of this  
2 building, and the plumbing, and whatever else has to  
3 be seismically qualified. And that has limits, or  
4 criteria that have to be met for safety of the overall  
5 facility.. How does that relate to this just tipping,  
6 I mean, this LWA evaluation? I'm trying to make sure  
7 I understand the relationship.

8 MR. MOORE: The analysis that we did was  
9 basically to support the LWA request, and the analysis  
10 that relate to items within the structure, piping,  
11 equipment, and what have you, will be covered under  
12 the COL evaluations, and that is being -- that is an  
13 ongoing process right now.

14 JUDGE JACKSON: Okay. Thanks. That's  
15 what I thought. I just wanted to make sure I knew  
16 what was covered when you said it's adequate for LWA.

17 MR. MOORE: The picture I showed of the  
18 finish product for LWA, basically is a backfill to  
19 surface with MSE wall that forms the footprint of the  
20 nuclear island. And that's all this is covering. The  
21 actual adequacy of the nuclear island, I mean, of the  
22 structure, the components inside the nuclear island,  
23 that's all being fully addressed - will be addressed  
24 in the COL process.

25 JUDGE JACKSON: Thanks a lot.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 JUDGE TRIKOUROS: Are the modifications  
2 that are being made to the DCD in this, I guess Rev.  
3 17, will they preclude the need to do site-specific  
4 soil structure interaction for most of the sites in  
5 the eastern part of the United States, at least?

6 MR. MOORE: I do not -- this is -- you  
7 want my opinion? Okay. That we have standard  
8 designs, but there is no standard site. Every site --  
9 I mean, what I'm saying is that we -- that there are  
10 certain parameters that have to be met, of course, in  
11 the standard design. You can check them all, but  
12 there is a -- there are all these features that would  
13 require some sort of site-specific analysis. And as  
14 I was pointing out earlier, the ground motions that  
15 we're calculating for the eastern U.S. sites, in some  
16 cases are having exceedances. And some of these  
17 exceedances can be addressed, and are being addressed,  
18 and my understanding is with maybe studies being done  
19 by the vendors.

20 JUDGE TRIKOUROS: That's fine. Thank you.

21 JUDGE BOLLWERK: Any further questions  
22 from the Board at this point? No. Let me just turn  
23 briefly to the Staff panel. Do you have anything you  
24 want to say about anything we've talked about over the  
25 last hour and 15 minutes, or 45 minutes, I guess, at

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 this point? No? All right.

2 We've actually been at it almost, as I  
3 mentioned, about two hours. Let's go ahead and take  
4 a break until 10:30, and then we'll come back with the  
5 Staff panel. Thank you.

6 (Whereupon, the proceedings went off the  
7 record at 10:17:13 a.m., and went back on the record  
8 at 10:31:55 a.m.)

9 JUDGE BOLLWERK: All right. If we can go  
10 back on the record, please. All right. After our  
11 break, we're back, and we're going to begin now with  
12 the presentation of the NRC Staff relating to seismic  
13 evaluation. The exhibit we're looking at is NRC Staff  
14 000065. And who is going to be making -- starting  
15 off? All right. Okay. And, again, if you can, just  
16 to help the court reporter, if you would let him know  
17 who you are before you start speaking, that would be  
18 useful to him, I think. Thank you.

19 DR. STIREWALT: And I'll remember to tap  
20 the mic, also.

21 JUDGE BOLLWERK: I appreciate that.

22 DR. STIREWALT: I am Gerry Stirewalt. I  
23 am Senior Geologist in the Office of New Reactors. My  
24 degree is in, in fact, structural geology, which is  
25 the specialty that involves looking at faulting and

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 other types of deformation, rather important things  
2 for site locations. I have worked with the NRC  
3 directly since 1990, the last four years as a real  
4 federal employee, but prior to that, as a consultant.  
5 Prior to that, some years teaching, about seven, and  
6 about 25 years experience actually in site  
7 characterization, looking at structures like we're  
8 trying to deal with here.

9 What I'd like to do is address some of the  
10 key points really on 2.5.1, basic geology and  
11 seismology. If I could have the next slide, please,  
12 and the next, and the next. What I'd like to do -  
13 and, again, as Mr. Moore laid out very, very well, the  
14 Pen Branch was of key concern to us, since, in fact,  
15 in 10 CFR Part 100 requires that we look at features  
16 like that, if, in fact, they are known to occur at the  
17 site. If I could actually go to the next slide, but  
18 mostly because geologists like to start with pictures,  
19 and not just words, so I want to show you a geologic  
20 map, actually, to talk about the issues for the Pen  
21 Branch.

22 JUDGE BOLLWERK: We're on Slide Five, now.

23 DR. STIREWALT: Yes, this is Slide Five.  
24 What I'd like to do is just sort of point out the  
25 geometry of the structure that we have called the Pen

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Branch, sort of locate where it is. That's this  
2 feature right here that you can see extends, in fact,  
3 from the site location into the Savannah River  
4 location, crossing the Savannah River. So this is the  
5 Savannah, the SRS, the Savannah River site. This is  
6 the Vogtle site, separated by the Savannah River.

7 I'd like to point out, also, just a couple  
8 of geologic features on this. You've heard a lot  
9 about the Blue Bluff Marl. You've actually seen a  
10 similar map earlier. But, again, just to locate you  
11 where these features are, the Blue Bluff Marl, the  
12 foundation unit is, in fact, exposed along the river,  
13 as you can see. And I would also like to point out  
14 the location of the terraces, and Mr. Moore mentioned  
15 those, Quaternary terraces. I'd like to specifically  
16 point out the location of the one that's labeled as  
17 QTE, which I realize you can't read, so I'll take the  
18 liberty of pointing to it. This particular feature  
19 is, in fact, located on the grounds of the Savannah  
20 River site, but you will note that, in fact, the trace  
21 of the Pen Branch Fault crosses that terrace. That's  
22 going to be an important point that we're going to  
23 discuss in just a moment.

24 So, again, I just wanted to introduce the  
25 geology, particularly point out that terrace, because

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 that's a very important feature, again, as Mr. Moore  
2 qualified, helping really logically conclude that the  
3 fault is not capable. That was a very important bit  
4 of the information. If I may have the next slide, and  
5 sort of back down to a reasonable scale, please.

6 This is number Six, and you may note that,  
7 in fact, this is really a section, a cartoon section,  
8 if you wish, drawn based on that specific seismic  
9 section that Mr. Moore showed. So, you see the trend  
10 of the Pen Branch at depth, you see the offset with  
11 the sedimentary deposits in the Triassic Basin on the  
12 southeast side of that fault, you see the crystalline  
13 basement of the good old solid Piedmont hard rock on  
14 the west side of that, you see the Blue Bluff Marl.  
15 And he mentioned, in fact, that monocline - showed  
16 you a nice topographic map - that there is right at  
17 the -- really right where the trace of that fault  
18 projects to the surface, that monocline occurs. And  
19 it's sort of gently shown here, if you can imagine.  
20 Now, that's important, because the units above that  
21 particular layer, the Blue Bluff, are not deformed.  
22 And we know from radiometric dating that that unit is  
23 about 33.7 million years old, and what this is tells  
24 us then is that deformation movement along this fault,  
25 latest movement based on every indication we have from

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 field geologic data, is that it is not younger than  
2 33.7 million years old; which really helps us a lot  
3 relative to concept of capability that's defined in  
4 Reg Guide 1.208, which qualifies -- basically, if it's  
5 Quarternary in age, and that cutoff is 1.8 million, so  
6 you can see from this, from our relatively good  
7 control in the field, that we have strong evidence  
8 that this deformation along that fault structure,  
9 along that surface, has not occurred younger than 33.7  
10 million, so well into the definition of being a  
11 structure that's non-capable. And may I have the next  
12 slide, please.

13 I mentioned the concept of the  
14 stratigraphic evidence that's shown in that first  
15 bullet. And, again, that is a concept of using  
16 relative ages. We know the age of a unit, we know  
17 what's above it. We know that it's not distorted.  
18 Consequently, the distortion happened prior to that  
19 time frame, 33.7. Now, again, Mr. Moore mentioned  
20 that fluvial terrace study. This is a very, very  
21 important aspect, and it's kind of exciting  
22 geologically, really, because you get a marker that  
23 really is Quarternary age that you can use to  
24 determine whether or not, in fact, there is  
25 Quarternary deformation registered.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1                    Now, the Applicant did a lot of work, a  
2                    lot of good work looking at the surface. QTE, again,  
3                    as I pointed out on the map, so you know the location,  
4                    you know that the trace of the fault crosses, you know  
5                    it's on the Savannah River side, but they surveyed  
6                    about 2,600 elevation points on that surface, so they  
7                    had a really good control of what that surface was  
8                    doing. Now, that's important because that information  
9                    on elevations indicated clearly that there was no  
10                   surface distortion of what really, in fact, is a  
11                   Quarternary age marker. And, again, geologists get  
12                   very excited about that, because it really gives us  
13                   something that we can pin it, and we can be reasonably  
14                   certain that wow, it's the right age, and it is not  
15                   deformed. So, that's a pretty important factor.

16                   Now, if I may have the next slide. And  
17                   geologists, again, are prone to want to show you  
18                   something in the field. I'd like to just illustrate  
19                   that surface. This is, in fact, that particular  
20                   surface, QTE, with two crusty field geologists  
21                   standing atop for scale. But I think you can see that  
22                   looks pretty flat. Well, that isn't good enough. But  
23                   that point is that with the careful surveying of the  
24                   data points for elevations, there is no place on this  
25                   surface - and, again, I think this illustration is

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 convincing - but there's no place where you see any  
2 distortion, any disruption, any uplift. That's really  
3 a nice plainer surface. It's not distorted or  
4 deformed, and this is right about the position where  
5 the trace of the fault occurs. So, this really is  
6 very, very good, again, field evidence that strongly  
7 indicates that the Pen Branch Fault, in fact, is pre-  
8 Quaternary in age, and, in fact, from our relative  
9 ages, older than 33.7 million. Yes, sir?

10 JUDGE JACKSON: Does that fault -- I'm not  
11 sure what your orientation here is. Does it tend to  
12 be perpendicular or parallel to the tracks that we can  
13 see there?

14 DR. STIREWALT: Okay. Thank you for that  
15 question. The trace of the fault, in fact, runs  
16 almost perpendicular to this roadway. And it is  
17 dipping beneath, two geologists that you see there.  
18 It's dipping southeastward.

19 JUDGE JACKSON: You're right on it.

20 DR. STIREWALT: Yes, sir. Okay. Do you  
21 have further questions on anything regarding the Pen  
22 Branch? Okay. Then I would like to pass the baton to  
23 Ms. Sarah Gonzalez, who will speak to 2.5.

24 MS. GONZALEZ: My name is Sarah Gonzalez.  
25 I've been a seismologist with NRC in the Office of New

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Reactors for the past two and a half years. And,  
2 before that, I was a seismology contractor with NRC  
3 for about three years. And my educational background  
4 is, I have a Master's degree in seismology from San  
5 Diego State University.

6 So, the presentation on Section 2.5.2 is  
7 going to focus on the issues that we felt were most  
8 critical to our review of Section 2.5.2. And one of  
9 the main review focus areas was the Applicant's update  
10 of the EPRI seismic source model. The EPRI source  
11 model was developed by six independent earth science  
12 teams during the mid-1980s. Since the model was  
13 developed more than 20 years ago, the Applicant needed  
14 to determine whether any updates were necessary.

15 As Don Moore mentioned in his  
16 presentation, the Applicant updated the Charleston  
17 Seismic Source. Their update involved significant  
18 changes in geometry, maximum magnitude, and recurrence  
19 interval of the Charleston Source Zone. The update  
20 was based, primarily, on liquefaction features from  
21 historic and prehistoric earthquakes that were  
22 discovered since the EPRI study. And, as a result of  
23 this update, the average occurrence interval of large  
24 earthquakes in the Charleston Source Zone decreased  
25 significantly, which resulted in an increase in the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 overall seismic hazard at the Vogtle site. Next  
2 slide, please, Slide Ten.

3 JUDGE JACKSON: Excuse me. These  
4 liquefaction features seem to be very -- pretty  
5 important indicator of past seismic activity. Is this  
6 something that's fairly new looking for these, or is  
7 it just more detailed mapping of the surface that  
8 brings these to light, or what?

9 MS. GONZALEZ: It's fairly new, and a lot  
10 of these features in the Charleston area were  
11 discovered after the EPRI source model was developed.  
12 In the next following slides, Laurel Bauer is going to  
13 discuss these features in more detail, and how they  
14 were reviewed. But this figure shows the Applicant's  
15 updated Charleston Source Zone, and Don Moore already  
16 went through it. And he mentioned the largest weight  
17 was assigned to Source Zone A. And this weighting,  
18 the large weighting of Source Zone A was primarily  
19 based on earthquake liquefaction features. And Laurel  
20 Bauer will now discuss the Staff's review of these  
21 liquefaction features with respect to the Applicant's  
22 update.

23 JUDGE TRIKOUROS: A question, a 20-year  
24 period passed for the EPRI data, the EPRI-SOG  
25 analysis, and the result of that was that the numbers

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 got worse by a very significant amount. Your slide  
2 said from thousands of years to a thousand years.  
3 What about 20 years from now, or 40 years from now?  
4 I mean, this plant is like a 60-year plant without any  
5 -- at a minimum. What makes you think that you've  
6 reached equilibrium with your knowledge on that?

7 MS. GONZALEZ: Well, there's no guarantee  
8 that no new information will ever surface. However,  
9 based on the Staff's review, we concluded that it was  
10 a very thorough investigation of liquefaction features  
11 in the Charleston area.

12 JUDGE TRIKOUROS: Do you think the  
13 likelihood of 20 years from now, 30 years from now,  
14 new data coming forward that shows that this is non-  
15 conservative is not likely?

16 MS. GONZALEZ: Personally, I think the  
17 investigations were adequate in the Charleston area to  
18 come up with an accurate model of the source zone. I  
19 can't say 100 percent whether some new information  
20 will -

21 JUDGE TRIKOUROS: But is that what the  
22 factor of safety is about? The factors of safety, are  
23 they there for that purpose, to cover such things as  
24 that?

25 MS. GONZALEZ: Well, part of the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Applicant's model did have a lot of uncertainty  
2 incorporated into it. As you can see, there's  
3 different source zones, geometries to account for  
4 areas beyond where most of the liquefaction features  
5 occurred, Source Zone B and B prime. And maximum  
6 magnitudes were also part of a distribution, so  
7 there's some uncertainty built into the model to  
8 account for it.

9 MS. BAUER: My name is Laurel Bauer, and  
10 I've been a geologist with the Office of New Reactors  
11 for just over two years, and I have a Master's degree  
12 in Earth Sciences with an emphasis in  
13 paleoseismology.

14 Before we move on from Slide Ten, I just  
15 wanted to point out the blue -- they're a little  
16 difficult to see, but the blue, red, and yellow  
17 diamonds that you see in this area, and the black plus  
18 sign features represent -

19 JUDGE BOLLWERK: Hold on one second here.  
20 Let's get -- we'll get the right slide up. And you  
21 want part of it -- the magnification increased?

22 MS. BAUER: If we could blow up this area  
23 right here, so I could show you -

24 JUDGE BOLLWERK: Right here? The A, B,  
25 and C part?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MS. BAUER: That's correct.

2 JUDGE BOLLWERK: Sort of the different  
3 boxes? Maybe need to be a little higher, or we're  
4 good?

5 MS. BAUER: That's good. I just wanted to  
6 point out that the red, yellow, and blue diamonds, and  
7 the black plus signs on the figure represent  
8 liquefaction features from both the 1886 earthquake,  
9 as well as prehistoric earthquakes. Okay.. Thank you.  
10 Now moving to the next slide, please.

11 On Slide Eleven, as Sarah Gonzalez  
12 mentioned, the Charleston update was based on  
13 liquefaction features, was partially based on  
14 liquefaction features from historic and prehistoric  
15 earthquakes. These features occur in response to  
16 strong ground shaking, where you have saturated sands  
17 at depth that are affected by the shear stresses, or  
18 affected by the cyclic shear waves. And those  
19 sediments tend to compact, if they have a high volume  
20 change, or high saturation limit, causing the pore  
21 pressures to increase to where they exceed the  
22 overburden pressures, and those sediments are forced  
23 to flow upwards through zones of weakness. And what  
24 I have tried to show with the diagrams here on the  
25 left is both a plainer and a vertical view of an

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 example of liquefaction, where you see the sand has  
2 erupted to the surface, in this case, formed a sand  
3 blow at the surface. And then the figure to the right  
4 also shows an example of what one of these features  
5 might look like in the field. Next slide, please,  
6 Slide Twelve.

7 Abundant liquefaction features from both  
8 historic and prehistoric earthquakes are mapped along  
9 the South Carolina coast for about 115 to 130 miles to  
10 the north, and to the south. And then, further inland  
11 from the Charleston area greater than 65 miles. These  
12 features represent five similar magnitude earthquakes  
13 to the 1886 earthquake, and have been assigned dates  
14 that range back for 5,000 years. Next slide, please.

15 One of the Staff's concerns when  
16 evaluating how the Applicant had characterized the  
17 source zone was that possibly they had not provided  
18 sufficient paleoliquefaction evidence to rule out the  
19 occurrence of large inland earthquakes. While there  
20 is evidence of prehistoric liquefaction features  
21 further inland, they're few, and so we wanted -- asked  
22 the Applicant to provide further documentation on  
23 whether or not features had been documented or  
24 examined further inland. And the Applicant provided  
25 additional expert opinion from experts who had

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 actually done liquefaction studies in the late '80s,  
2 on through the '90s. And while they did not,  
3 necessarily, document in their publications that  
4 features were not found, they did look for  
5 liquefaction, and those features were not found for  
6 their inland, in materials that would be considered  
7 moderately liquefiable.

8 JUDGE JACKSON: Do these normally -- do  
9 you examine these from aerial surveys, or something?

10 MS. BAUER: You can examine them from  
11 aerial surveys. Another way is looking at features  
12 along stream banks, and exposures along streams where  
13 sediments tend to be well-preserved, or where they  
14 tend to be easily accessible. It is possible to see  
15 the features on aerial photographs, specific -- more  
16 likely in earlier aerial photographs before there was  
17 much disturbance of the land area. So that is one  
18 method of looking for them in an open field, for  
19 instance. And, so, some of the inland features that  
20 were examined were along stream banks of the Edisto  
21 River.

22 Based on the information and the expert  
23 opinion that was documented and provided by the  
24 Applicant, the Staff determined that that information  
25 was sufficient to close out Open Item 2.5-5, and the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 SER with open items.

2 And, now, Sarah Gonzalez will continue  
3 with the seismic presentation on Slide Fourteen, if  
4 there are no further questions.

5 MS. GONZALEZ: The Staff also reviewed the  
6 other EPRI seismic source zones that were part of the  
7 model, and the Applicant only performed an update of  
8 the Charleston source zone, so we wanted to make sure  
9 that there were no other source zones that needed to  
10 be updated. And these included the regional seismic  
11 source zones that surrounded the Vogtle ESP site.

12 As I mentioned earlier, the EPRI seismic  
13 source model was determined by six different Earth  
14 Science teams during the '80s. And one of the Earth  
15 Science teams, known as the Dames and Moore team,  
16 assigned low weights for large maximum magnitude  
17 values, and low probabilities of activity to two of  
18 their regional source zones. And the Staff was  
19 concerned that the Dames and Moore hazard curves for  
20 the Vogtle ESP site may not adequately characterize  
21 the regional seismic hazard. And this was Open Item  
22 2.5-1.

23 And in the next slide, Slide Fifteen, this  
24 figure shows the Dames and Moore source zones that  
25 were used in the Vogtle ESP hazard calculation. The

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 source zone shown in blue, which encompasses the  
2 Vogtle ESP site, has a probability of activity of .2.  
3 And this means that -- I'm sorry, .26. This means  
4 that there's only a 26 percent probability that this  
5 area is capable of producing earthquakes greater than  
6 a magnitude five. However, the implications of this  
7 are not significant at the Vogtle site.

8 And then the next slide, Slide Sixteen.  
9 The Applicant demonstrated that the contribution to  
10 the total seismic hazard from the Dames and Moore team  
11 was insignificant at the Vogtle site. They removed  
12 the Dames and Moore team to show that the increase in  
13 seismic hazard is less than 5 percent of the Dames and  
14 Moore results, are excluded. So, the Staff concluded  
15 that this was sufficient to close the open item.

16 Slide Number Seventeen, please. The Staff  
17 also had an open item regarding the Applicant's  
18 decision not to update the Eastern Tennessee seismic  
19 zone. This source zone is located just beyond the  
20 northwestern edge of the 200-mile site radius. The  
21 Applicant concluded that no new information has been  
22 developed since 1986 that would require significant  
23 revision to the EPRI source model. However, the Staff  
24 was concerned that more recent studies suggest  
25 revisions to the EPRI source model may be warranted.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 And these more recent studies assigned slightly higher  
2 maximum magnitude values to the Eastern Tennessee  
3 source zone. This was Open Item 2.5-3.

4 However, the Staff performed a sensitivity  
5 study, which showed that increasing maximum magnitude  
6 values for the Eastern Tennessee seismic zone did not  
7 result in a significant increase in the hazard at the  
8 Vogtle site. And the results of the Staff's study can  
9 be seen on the next slide, Slide Eighteen.

10 This figure shows the seismic hard curves  
11 resulting from the Staff's sensitivity study. We  
12 looked at a range of maximum magnitude values for the  
13 Eastern Tennessee source. The second to lowest curve  
14 with the circles on it shows the result for a maximum  
15 magnitude value of 6.5, which is similar to the more  
16 recent PSHA studies. And if you look at the very top  
17 solid curve, that shows the total seismic hazard at  
18 the Vogtle site. And the contribution to the total  
19 seismic hazard from the curve with magnitude 6.5 as a  
20 maximum magnitude is less than 1 percent of the total  
21 seismic hazard. So, based on this result, the Staff  
22 concluded that it's not a significant contribution to  
23 the Eastern Tennessee. Slide Nineteen, please.

24 You saw this slide earlier in Don Moore's  
25 presentation. It shows the red curve, which is the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 AP-1000 certified design response spectrum, or CSDRS.  
2 And it also shows the GMRS, which is the blue curve.  
3 As Don Moore mentioned, there are several frequencies  
4 where the CSDRS is exceeded. However, in the next  
5 slide, Slide Twenty, summarizes the Staff's  
6 conclusions why the GMRS is an acceptable site  
7 characteristic.

8 The Staff concludes that the Vogtle GMRS  
9 is an adequate representation of the regional and  
10 local seismic hazard, and meets the applicable  
11 requirements of 10 CFR Part 52, and Part 100. The  
12 Staff considers the Vogtle GMRS values to be within  
13 the range of values that new reactor designs are  
14 generally engineered to withstand. And the  
15 appropriateness of the reactor design chosen for the  
16 site will be determined at the COL stage. This  
17 concludes the presentation for Section 2.5.2.

18 JUDGE JACKSON: It looks like you looked  
19 pretty hard, then, at the source terms to make sure  
20 that something hadn't been overlooked somewhere. I  
21 mean, that's what those open items seem to be all  
22 about.

23 MS. GONZALEZ: Yes.

24 JUDGE JACKSON: Thanks.

25 JUDGE BOLLWERK: Maybe you can explain to

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 me in terms of how is what you've done up to this  
2 point going to differ from what happens at the COL  
3 stage?

4 MS. GONZALEZ: Well, for the ESP, we're  
5 approving the GMRS as a site characteristic. We're  
6 not approving a design for the ESP site. So, the  
7 actual -- the adequacy of the design will actually be  
8 determined at the COL stage. We didn't look at -- we  
9 didn't do any analyses to support that.

10 JUDGE BOLLWERK: Right. Although, again,  
11 if you go back to Slide Nineteen, that was based on  
12 the AP-1000. Did I hear you correctly?

13 MS. GONZALEZ: Yes.

14 JUDGE BOLLWERK: And, so, you had that  
15 design in mind, but, yet, you didn't use it  
16 specifically. I guess that's the -

17 MS. GONZALEZ: For Section 2.5.2, we were  
18 reviewing the GMRS as a suitable site characteristic.

19 JUDGE BOLLWERK: Okay.

20 MS. GONZALEZ: Some parts of the design  
21 are actually reviewed as part of the LWA. And these  
22 analyses that were used are going to be discussed as  
23 part of the LWA presentation later.

24 JUDGE BOLLWERK: Okay.

25 MS. GONZALEZ: So, hopefully, that will

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 answer some of these questions.

2 JUDGE BOLLWERK: And, so, in terms of the  
3 COL, I mean, are you going to look at, for instance,  
4 there's a lot of piping, there's a lot of particular  
5 components. You look at those specifically in terms  
6 of the AP-1000 in the seismic analysis you've already  
7 done?

8 MR. TEGELER: Your Honor, with your  
9 permission, my name is Bret Tegeler. I'm the Senior  
10 Structural Engineer. Maybe I can follow-up Sarah's  
11 comment.

12 JUDGE BOLLWERK: Surely.

13 MR. TEGELER: For the LWA -

14 JUDGE BOLLWERK: Maybe a good version of  
15 American Idol. How is that?

16 (Laughter.)

17 JUDGE BOLLWERK: All right. Go ahead.  
18 I'm sorry.

19 MR. TEGELER: As part of the LWA  
20 application, we are reviewing certain portions of the  
21 design, of the AP-1000 design; namely, the mudmat with  
22 the embedded waterproofing membrane. And then we also  
23 do a check on the foundation stability, which we'll be  
24 talking about that later. And you also heard that  
25 through Mr. Moore's presentation.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1                   There are other features that will be  
2 covered as part of the SCOL review, and those relate,  
3 in particular, to the components internal to the  
4 structure. But because the request did not involve  
5 installing or constructing those components at this  
6 stage, that review has not been done yet. It's  
7 ongoing.

8                   JUDGE BOLLWERK: So we're talking about  
9 the parameters, the basic parameters of the design, or  
10 the parameters of the site. And we'll look at the  
11 actual design, and how, if you shook it, that would  
12 work at the COL stage. Right?

13                   MR. TEGELER: Right.

14                   MR. ARAGUAS: Let me also add just a  
15 clarification, just trying to separate out the ESP and  
16 the LWA. With respect to the ESP, we're trying to  
17 establish the suitability of the site characteristic,  
18 and so, even though we -- this diagram reflects the  
19 differences between the AP-1000 and the actual site  
20 characteristic for the Vogtle site, that comparison  
21 wouldn't have been done until the COL - or, at this  
22 point, I know as Bret pointed out, some of that's been  
23 looked at at the LWA, but had the LWA not been  
24 submitted, and solely an ESP, that comparison would  
25 not be looked at until the COL.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 JUDGE BOLLWERK: All right. Thank you.  
2 All right. I think we're back to -- we were on Slide  
3 Twenty.

4 MS. GONZALEZ: Dr. Stirewalt will now  
5 discuss Section 2.5.3.

6 JUDGE BOLLWERK: I know it's  
7 counterintuitive, but go ahead and tap it. Yes, make  
8 sure it's on, that's the other -- two-step process.  
9 There you are.

10 DR. STIREWALT: If I would turn it on,  
11 that would be beneficial, sir.

12 Okay. Let me talk a bit about 2.5.3,  
13 surface faulting. Mr. Moore alluded to a concern  
14 about some non-tectonic deformation. And, really,  
15 this came out relative to an open item that the Staff  
16 developed for 2.5.3, surface faulting. There were, in  
17 fact - during some of the early work, they actually  
18 found in the field what they called injected sand  
19 dikes. Now, the stratigraphic relationships that  
20 appeared to exist suggested that those features could,  
21 in fact, be Quarternary in age. And you just heard  
22 Ms. Bauer qualify if, in fact, those sorts of dikes  
23 that have moved upward were, in fact, seismically  
24 generated, that means a tectonic source, so we have  
25 tectonic deformation, and there's a real concern.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1                    So, the issue here, in fact, was that the  
2 Staff felt, or determined, that the Applicant really  
3 didn't initially demonstrate that these particular  
4 features were not associated with seismically-induced  
5 liquefaction.        And, consequently, under that  
6 condition, would have been tectonic in origin.

7                    What the Applicant did, is they did a  
8 really good and a thorough analysis. They determined,  
9 in fact, that these features were very, very local,  
10 that they, in fact, spatially -- and they determined  
11 that spatial association by doing some drilling, and  
12 actually mapping out the top of a particular unit. In  
13 fact, that unit was the Utley limestone, where, guess  
14 what, you could have dissolution. And, again, Mr.  
15 Moore qualified that as being a unit at the base of  
16 the Barnwell Group, that overlies the Blue Bluff Marl.  
17 But the point, again, is that they were locally  
18 developed. And, as it turns out, they were spatially  
19 associated with dissolution depressions that they  
20 really were able to define, and define pretty well,  
21 within the Utley limestone. So, basically, they were  
22 equated spatially exactly where those features  
23 occurred. And the concept was, then, if you had  
24 dissolution of this thin and discontinuous limestone  
25 unit that overlies the Blue Bluff, if you had

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 dissolution of that unit, you, in fact, would produce  
2 these dissolution cavities. You would get collapse  
3 above those. And these were saturated sediments at  
4 the time, so they were water-rich, but you'd get  
5 collapse into those dissolution cavities, if you wish.  
6 And that would be the impetus for producing a  
7 fluidized driving force to move the dikes upward. And  
8 that, in fact, based on, again, every bit of field  
9 evidence that we had, was a very reasonable  
10 interpretation, and the Staff concurred.

11 Now, I might also mention that that is one  
12 unit, again, as Mr. Moore defined. That will be part  
13 of the Barnwell, and that unit will be removed beneath  
14 the nuclear island, so even that aspect of that type  
15 of non-tectonic deformation would not be a  
16 consideration for the nuclear island. They're going  
17 to take that unit out of there. So, the point is,  
18 based on that line of reasoning, again, with every  
19 shred of field evidence that we had, the Staff felt  
20 that the open item 2.5.10 was closed. And, in fact,  
21 that the deformation was well-demonstrated to be non-  
22 tectonic in nature, so not of a concern. Were there  
23 any questions on that, sirs?

24 JUDGE BOLLWERK: So, from a very non-  
25 technical standpoint here, the differences between

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Slide Eleven, where you were concerned about  
2 liquefaction of sand because of earthquake shaking  
3 coming up on to the surface, this, in fact, was  
4 something that had collapsed and filled, rather than  
5 coming up from the bottom. Have I got that correct?  
6 Did you compare what you gave us on Slide Eleven,  
7 versus what you just said?

8 DR. STIREWALT: That's exactly correct,  
9 Your Honor.

10 JUDGE BOLLWERK: All right. Thank you..

11 DR. STIREWALT: That's exactly correct.  
12 If there are no further questions on that, then I will  
13 pass the baton to Dr. Carl Costantino, who will begin  
14 the discussion of 2.5.4.

15 DR. COSTANTINO: I'm Carol Costantino. I'm  
16 a Professor Emeritus from City University of New York.  
17 I received my Ph.D. many years ago in the geosciences.  
18 I've been a consultant to both NRC and Department of  
19 Energy for the last 40 years on seismic issues,  
20 primarily geotechnical, site response and soil  
21 structure interaction issues and have been heavily  
22 involved with the development of criteria standards  
23 for both generic nuclear industry as well as standard  
24 review plan developments for NRC. So I've been active  
25 for the staff for a long timer.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           With this particular review, early on in  
2           the development it was clear that the amount of  
3           information available was problematic to make generic  
4           judgments and the characteristics we sort of knew of  
5           the surface materials, the upper sands. We also knew  
6           they were problematic. That was based not only on  
7           looking at the data we had available but also the data  
8           from Savannah River site across the river which had  
9           extreme amount of data available to look at.

10           Anyway, the issues had to do with knowing  
11           what were the properties, what were steer wave  
12           velocity profiles that we would end up working with  
13           since we know that was going to play a role in the  
14           soil structure interaction and then in the site  
15           response area what were the associated properties that  
16           would be appropriate.

17           The permit condition as I read it said  
18           you either remove it or remediate. We all know that  
19           remediation is a tough issue. So the Applicant  
20           decided to remove.

21           In response to one of the questions, that  
22           came up before during the LWA stage, we asked the  
23           Applicant to look at the extent, the lateral extent,  
24           of the excavation that would be required and actually  
25           computations were made to show that the configuration

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 that was presented to you earlier does not have a  
2 significant impact. The remaining soils to the outset  
3 of that do not have a significant impact on any of the  
4 seismic responses both of the site soils as well as  
5 the surface structure. So the use of the one-  
6 dimensional convolution is appropriate and the  
7 analyses carried over into the structure are still  
8 appropriate even for that configuration. So the 2-D  
9 aspect is not a significant issue. We know that.

10 Based on the additional data that was  
11 taken during the LWA studies, all the open issues that  
12 we had concerns with in the call action items were  
13 closed essentially since we now have enough data  
14 primarily with the back flow that was being brought  
15 in. The criteria that was developed, we reviewed that  
16 and agreed with it. The test bacterial (phonetic)  
17 program was extensive, more extensive than we  
18 typically see at sites and the process that's going to  
19 used to put that 3,000,000 or 4,000,000 cubic yards of  
20 material back in is a process that follows standard  
21 procedures in the heavy construction industry and will  
22 end up with the characteristics in this particular  
23 problem mainly uniformity of placement across the  
24 entire area as well as shear wave velocity  
25 requirements that we have to ensure that you won't end

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 up with any significant large settlements or  
2 discontinuities in the current construction stage and  
3 we won't end up with unusual behavior which impact  
4 both the walls and the base metal of the structure.  
5 Next slide please.

6 Well, I think I just said this. During  
7 the LWA. Next slide please.

8 Just to get a feel for the amount of data  
9 that was added during the LWA you can see the original  
10 borings where a standard sampling was performed there  
11 were only 14 borings and they upped it to 174. Now  
12 many of those were taken through the upper soils that  
13 are going to be removed, but we ended up with an  
14 additional 42 borings across the site which went down  
15 into and through the Blue Bluff Marl into the  
16 remaining soils that will be providing the primary  
17 support to the system in addition to the back fill.

18 The one penetrometers were taken through  
19 the upper soils. So they were not able to penetrate  
20 the Blue Bluff Marl, but they do provide velocity  
21 information for materials that could be used for fill  
22 material. The test pits also were based on -- The  
23 only purpose of the test pit would be to characterize  
24 soils you're going to use for the back fill.

25 The P-S loggers, there are six P-S loggers

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 that were taken through the LWA. The purpose of that  
2 was to get down to the materials that are going to  
3 remain which are the Blue Bluff Marl, the soils below  
4 and then finally the Triassic rocks below that and  
5 then the profile below that deck.

6 The P-S logger generates shear wave  
7 velocity information and the purpose not only of  
8 having six of those is to make sure we have adequately  
9 captured variability in that data across the site. So  
10 we have a pretty tight set of data to define the soil  
11 velocity profile from the Blue Bluff Marl on down and  
12 what we need is information on the backfill.

13 JUDGE BOLLWERK: You're tapping into our -

14 -

15 DR. COSTANTINO: What we need remaining to  
16 complete that picture for site response is the  
17 definition of the properties of the backfill from the  
18 top of the Blue Bluff up to the ground surface. Next  
19 slide please.

20 JUDGE BOLLWERK: Now it's slide 25.

21 DR. COSTANTINO: Yes. Again this says  
22 that during the LWA we took enough additional data to  
23 supplement what we had during ESP and take care of our  
24 questions we had during the ESP. So the combination  
25 of both programs really gives us reasonable assurance

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 that we're not going to have any significant problems  
2 provided the backfill is placed to satisfy the  
3 criteria as stated. Next slide please.

4 This is a picture of the profile that we  
5 used. Don Moore showed something similar to this.  
6 This is really a base case profile which is used to  
7 start the probabilistic site response analysis  
8 calculation. The information we need not only this  
9 base case velocity profile, but the variability of  
10 that layer by layer based on the number of P-S logger  
11 profiles we have available. So we need basically the  
12 best estimate which is this together with the sigma or  
13 the uncertainty on the velocities.

14 In the 1-D response analysis, it's a  
15 probabilistic site response analysis, we generate many  
16 realizations of this calculation of this profile and  
17 for each one we generate a surface motion using the  
18 PSHA down at the top of crystalline rock come up with  
19 the 1-D using the 1-D shape. In this case, they used  
20 shape. There are other codes that could be used, all  
21 of them pretty much doing the same thing.

22 As I mentioned earlier, I think there's  
23 significant number of comparisons of these 1-D  
24 calculations with empirical results to show that the  
25 computation works even for 1,000-foot soil comp. That

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 is we get conservative estimates of our ground motion  
2 at the surface.

3 The issue of vertical ground motion in  
4 this convolution is a separate issue. That's why we  
5 use a lot of the emphasis on V/H ratios which come  
6 from the empirical database. What you end up with at  
7 the surface or at the foundation level is a  
8 probabilistic estimate of the response spectra. The  
9 reason why we use an outcrop with respect to your  
10 question before is you could easily develop a  
11 probabilistic in-column motion, not an outcrop, if  
12 you'd like.

13 Then the issue becomes when you carry it  
14 over into the SSI using this probabilistically  
15 determined in-column motion which is relatively smooth  
16 putting it into a deterministic SSI and that leads to  
17 sort of crazy results. So what we try to ensure is  
18 that when we make this probabilistic 2-D  
19 deterministic switch we're going to do this in a  
20 relatively consistent fashion and that's the reason  
21 why we use outcrops and not in-column motions.

22 There are discrepant, I shouldn't say  
23 discrepant, there are alternate procedures to define  
24 this outcrop. That's in addition to then the process.  
25 The Applicant has done it one way. We do it another

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 way. That's written in the standard review plan.  
2 There are differences. But the basic check at the end  
3 we ask them for the SSI analysis with the building,  
4 take the ground motions you're using for the three  
5 analyses and make sure they envelope to GRMS. So  
6 we're confident that we don't have any holes in  
7 whatever process they are following. We've gone  
8 through that step. The next slide.

9 The issue of soil degradation and damping  
10 ratio is it turns out a very important aspect of the  
11 problem. Soil degradation and damping really are ways  
12 to get information on the soil, nonlinear behavior due  
13 to the seismic results into the problem. And the  
14 issue was the backfill. The stream levels down below  
15 the Blue Bluff Marl and not very large. So there's  
16 not much nonlinear behavior down there due to  
17 confinement issue. But in the backfill, we need site  
18 specific data because that dominates the calculated  
19 GMRS. So we have to have a good handle on the  
20 degradation models.

21 And the soil damping ratio information  
22 site specific testing was done by University of Texas  
23 using samples taken from the backfill that was  
24 proposed for use and those were subjected to the  
25 resident column soil, resident column torsional shear,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 laboratory dynamic test results and then we have  
2 results from that which we use in the latest site  
3 specific calculation. Prior to that there were  
4 estimates of these properties that we used and then  
5 now with the latest set of data from LWA we have the  
6 data available and we know the site response. So we  
7 have confidence in the GMRS computed at the soil  
8 surface. Next slide.

9 Under condition one, we talked about that  
10 or you talked about that yesterday. Since all of the  
11 soils that are going to be subjected potentially to  
12 liquefaction effects are being removed. There really  
13 is no longer an issue. You sort of qualify that. If  
14 you get a big enough earthquake, everything liquefies.  
15 So that movie kind of earthquake is not going to --  
16 It's not part of the design. So liquefaction is not  
17 an issue and all of those soils both under and to the  
18 side which could impact the response of the facility  
19 have been or are going to be removed. Next slide  
20 please.

21 JUDGE TRIKOUROS: I was surprised given  
22 what you've said that the horizontal extent wasn't in  
23 the perma condition. Just specifies general remove  
24 the soil.

25 DR. COSTANTINO: That was why we asked

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 that the amount removed be checked. So one of the  
2 specific calculation that was made was a 2-D dynamic  
3 wave propagation calculation that was performed to  
4 show that if we go as far as they propose to go then  
5 there's no input. So I mean that was a I think  
6 serious issue. If they said they were just going to  
7 excavate under the footprint you would obviously think  
8 of that as being potentially a problem. So the amount  
9 of soil proposed to be removed is adequate and we  
10 don't think there's a serious concern with that. Next  
11 slide.

12 JUDGE BOLLWERK: We're now on slide 29.

13 DR. COSTANTINO: Yes. The issue of  
14 bearing capacity we went around on that quite a bit to  
15 make sure that we were capturing computed bearing  
16 capacity and overturning factors of safety to make --  
17 This is sort of a difficult area since these factors  
18 of safety are relatively -- The analyses conducted to  
19 support factors of safety are relatively crude and we  
20 incorporated both static and relatively new dynamic  
21 loading conditions into these evaluations. So that's  
22 we'd like even though the standard review plan says  
23 you could use factors of safety of 1.1 on the sliding  
24 conditions for dynamic the idea of the 1.1 being  
25 acceptable is the idea that the dynamic load isn't on

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 for very long and you're not going to get much  
2 collapse, potential collapse, of the soils underneath  
3 going dynamic loading. The safety factors actually  
4 computed were very much larger. So we have  
5 essentially no concern with those kind of bearing  
6 capacity issues at the site. Next slide.

7 The call action items that were put in  
8 place were to develop those properties that we just  
9 talked about. Everything that we talked about during  
10 ESP and LWA were satisfied. All that's left to do is  
11 actually build the facility and make sure that the  
12 backfill that's placed is placed in a satisfactory,  
13 consistent and uniform manner and it should be a  
14 straightforward problem. Next slide.

15 As far as stability of slopes, there are  
16 really no safety related slopes that could impact the  
17 facility nearby. So it's not an issue. And I think  
18 that's the end and I'm going to pass it back to Dr.  
19 Stirewalt to summarize.

20 DR. STIREWALT: Thanks, Carl. Now I'm  
21 going to move to slide 32.

22 What we'd like to do now is effectively  
23 unless there are no further detailed questions on what  
24 you've heard, we'd like to just sort of have each  
25 staff member who presented some of the technical

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 information just really do sort of quick overview  
2 summary and I would like to start with 2.5.1. I  
3 believe from what you've heard and what we were able  
4 to qualify that the Applicant in fact really did  
5 provide a thorough and an accurate characterization of  
6 the geologic and the seismic characteristics as  
7 required by various pieces of 10 CFR Part 100 which of  
8 course is the means of helping us draw the conclusion  
9 that there's an adequate basis to conclude that there  
10 are no capable tectonic structures in the plant site  
11 area that might in fact generate surface or near  
12 surface fault deformation, default displacement.

13 MS. GONZALEZ: The staff based on its  
14 review of Section 2.5.2, Vibratory Ground Motion,  
15 concluded that the Applicant provided a thorough  
16 characterization of seismic sources surrounding the  
17 site. The Applicant's GMRS adequately represents the  
18 regional and local seismic hazard and the proposed  
19 Vogtle ESP site is suitable with respect to the  
20 vibratory ground motion criteria for new nuclear power  
21 plants and meets the applicable requirements of 10 CFR  
22 100.23.

23 DR. STIREWALT: And if I may have the next  
24 slide please.

25 Quickly address the summary part of 2.5.3

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 on Surface Faulting. The staff believed that the  
2 Applicant did in fact present an adequate description  
3 of the information leading us to conclude that there  
4 really is no solid evidence, no evidence, to indicate  
5 that either surface or near surface faulting or non  
6 tectonic deformation will present a hazard for the  
7 site.

8 DR. COSTANTINO: Next slide please. With  
9 respect to stability of subsurface materials and  
10 foundations that are going to be used for the site, we  
11 have enough information now to adequately describe the  
12 site, characterize the site and use that data to  
13 generate site inputs into the soil structure  
14 interaction problem, namely the GMRS, and we also have  
15 enough information to judge that the stability of both  
16 static and dynamic and sliding issues are really not  
17 issues for the plant. We have suitable factors of  
18 safety:

19 DR. STIREWALT: Honors, that concludes the  
20 presentation of the information that we had for 2.5.

21 JUDGE JACKSON: It was a good summary.  
22 Thanks.

23 JUDGE TRIKOUROS: Thank you.

24 JUDGE BOLLWERK: Anything further from the  
25 Judges?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 (No verbal response.)

2 All right. I think we're ready to move on  
3 then. Thank you very much. We're going to be  
4 starting with slide 30 -- I think you renumbered them  
5 again going on the next one. Is that correct?

6 (No verbal response.)

7 So we're still in the same presentation.  
8 Haven't moved. It has additional parts to it.  
9 Probably you'll want to go to about 34.

10 (Off the record comment.)

11 Thirty-eight. Okay.

12 (Off the record comment.)

13 Right about there. Okay. All right then.  
14 Who is making this presentation?

15 MR. TEGELER: I am, Your Honor.

16 JUDGE BOLLWERK: Okay.

17 MR. TEGELER: As I mentioned earlier, my  
18 name is Bret Tegeler. I'm a Senior Structural  
19 Engineer in the Office of New Reactors Division of  
20 Engineering. We're going to present to you the  
21 structural engineering evaluation of the Applicant's  
22 LWA application. My co-presenters in this  
23 presentation starting from your right are Dr. Carl  
24 Costantino, Dr. Wesung Wong (phonetic) and Dr. John  
25 Ma. And just as previously mentioned by Sarah, I'm

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 going to be helping John out because his voice is a  
2 little sore today. So I'll essentially read his slide  
3 and he can answer the detailed questions.

4 JUDGE BOLLWERK: All right. Very good.

5 MR. TEGELER: Next slide please. And I  
6 apologize. I don't know that I can see the slide  
7 numbers. So I may have some trouble.

8 JUDGE BOLLWERK: All right. Why don't we  
9 go ahead and move to the next slide. I think we're  
10 onto number three probably.

11 MR. TEGELER: Thank you. The purpose of  
12 these presentations is essentially to present, as I  
13 said, the structural engineering review. In this  
14 presentation, I will describe the scope of the LWA  
15 which was mostly previously covered by Don Moore and  
16 then Carl Costantino will provide the background  
17 summary of what was done as part of the geotechnical  
18 evaluation and then myself and John Ma will provide a  
19 summary of the evaluation and findings of the  
20 structural engineering portion. Slide four please.

21 As the Applicant mentioned previously, the  
22 scope of the LWA involves soil foundation work, the  
23 placement of a concrete mud mat, a waterproofing  
24 membrane, a mechanically stabilized earth wall which  
25 you'll hear me refer to as MSE retaining wall and

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 temporary drains.

2 We discussed earlier what was supporting  
3 these elements. So I won't go into much more detail,  
4 only to say that the supporting media that are shown  
5 on this slide are considered in the detailed soil  
6 structure interaction analysis which I'll go into  
7 shortly.

8 I just want to also add on this slide that  
9 the Applicant referenced the AP1000 DCD Rev 15. Next  
10 slide please.

11 This slide was also shown earlier. My  
12 intent for having this slide was just to provide  
13 really a way to identify two important locations  
14 relative to the Vogtle site or at least the site  
15 specific analysis. That is the location of the GMRS  
16 and the foundation input response spectra. I think  
17 Don covered this fairly well, but I just wanted to add  
18 that it's the foundation input response spectra that  
19 is used as input to the SSI analysis. Next slide  
20 please. Slide 6.

21 Don also presented this slide earlier. I  
22 don't have any other information to add to this slide  
23 the Board has a follow-up question. My intent on  
24 showing this slide was similar in that I just wanted  
25 to point out the location of the waterproofing

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 membrane and the mud mat relative to the foundation  
2 structure.

3 JUDGE BOLLWERK: All right. I think we can  
4 go on.

5 MR. TEGELER: Next slide please. Slide 7.  
6 At this point, I will turn the presentation over to  
7 Dr. Costantino.

8 DR. COSTANTINO: I think that much of this  
9 information was mentioned a short while ago. The  
10 extra data that was generated during the LWA came from  
11 the extra borings together with samples and testing  
12 that were done to satisfy the request from the staff.  
13 It was reviewed and all of that data was used to close  
14 all open issues that were generated previously. Next  
15 slide please.

16 The additional data that was generated I  
17 mentioned for the backfill were really to determine  
18 dynamic properties that were appropriate as well as  
19 compaction data to make sure that when it's placed  
20 compaction criteria could be determined. So not only  
21 were the dynamic properties generated, but also  
22 requirements on the amount of fines that were  
23 incorporated into the soil sample were limited to make  
24 sure that it can be placed without any significant  
25 problem and placed uniformly.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           The dynamic properties which came from the  
2           laboratory test, the resonant column torsional shear  
3           are really used directly in the computation of the  
4           GMRS and the FIRS. The GMRS is as stated equivalent  
5           to the site safe shutdown. Next slide please.

6           Based on the data we have, the amount of  
7           information, the additional P-S logger data that was  
8           taken, the staff considers the site investigations  
9           adequate to generate the information we need which are  
10          basically computation of GMRS and the FIRS using the  
11          SSI and criteria for placing the backfill. One of the  
12          big issues is to make sure that the backfill is placed  
13          uniformly, have a given minimum shear wave velocity at  
14          the depth of the fill and provide enough static  
15          capacity. We have enough information to make those  
16          judgments. Next slide please.

17          As I mentioned before, the 174 borings,  
18          most of those were really through the upper soils  
19          which we used for site characterization of those  
20          soils. Forty-two penetrated the Blue Bluff and below  
21          and those were used in the characterization of the  
22          site soil column below.

23          One of the issues on transportation, of  
24          course, when we take samples, so-called under served  
25          soil samples, the issue is to get the sample out of

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 the hole without too much disturbance and over to the  
2 laboratory. So one of the big issues is how do you  
3 transfer from the site to the laboratory. That's  
4 always been a big issue. On some sites, we actually,  
5 Savannah River for example, we bought first class air  
6 tickets and standard samplers up in the seat. The  
7 issue was getting it through the x-ray machine at the  
8 site. So you don't want to turn the samples  
9 horizontally. So those are all details. At Los  
10 Alamos site, we actually put accelerometers on the box  
11 to make sure the box is not shaken too significantly.  
12 Next slide please.

13 There basically is a seismic -- There used  
14 to be seismic category 1 and seismic category 2 which  
15 had different compaction criteria. But then that was  
16 changed. I mean that's a difficult control issue  
17 during construction. So that was finally changed. So  
18 whatever backfill is going to be placed has a given  
19 grain size distribution characterization, a given  
20 compaction criteria and if we follow that we'll get a  
21 uniformly compacted backfill to satisfy all our  
22 uniformity criteria.

23 If we had both category 1 and category 2  
24 with different compaction criteria that always is a  
25 problem out in the field. And it's the slide points

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 out there. There is some mention of flowable  
2 backfill, but those are going to be relatively minor  
3 around local problems, problem areas, the pipe  
4 connections or whatever. But that's not a major issue  
5 in the compaction problem. Next slide please.

6 JUDGE BOLLWERK: You're now on slide 12.

7 DR. COSTANTINO: Slide 12. The physical  
8 characteristics I think I mentioned before is to limit  
9 the percent of fines. Fines are defined as grain  
10 sizes less than or not less than 200, passed the  
11 number 200 sieve which is 200 openings per inch. If  
12 the fines in the sample are too high, percent fines  
13 are too high, you have trouble in compacting. If any  
14 water gets in, it makes compaction, it makes the  
15 program miserable. So if you have the fines too high  
16 and it rains that day, then there's a problem.

17 The compaction criteria is part of the  
18 ITAAC. There are grain size testing done on soils as  
19 they're brought in and then the soils are placed in  
20 thin lifts, eight to 12 inches in thickness, and  
21 rolled and compacted and density measurements are made  
22 per lift to make sure that no lift is too soft and  
23 that's standard practice that's been used in the  
24 construction industry for many years. Can I have the  
25 next one? That one.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1                   So the ITAAC is -- The first one is the  
2                   ITAAC on the backfill material. That reading requires  
3                   testing as you go to make sure that we're going to  
4                   have a compact backfill and then at the end as Don  
5                   Moore mentioned there's going to be actually at two  
6                   places. When the fill gets up to the bottom of the  
7                   foundation mat there's going to be some shear wave  
8                   velocity testing to make sure we're not seeing  
9                   anything strange and then when it gets up to the top  
10                  we're going to again measure velocities and those  
11                  velocities have to satisfy the criteria that at the 40  
12                  foot depth we at least meet 1,000 feet per second  
13                  shear wave velocity. Next slide please.

14                 We have as you heard Don mention during  
15                 the test pad program there was shear wave velocity  
16                 measurements that were taken to make sure that in that  
17                 program within the 20 foot depth we were able to reach  
18                 1,000 feet per second. Since we're going to be down  
19                 well below 20 feet, we should have no problem in  
20                 meeting the 1,000 foot per second minimum requirement.

21                 There's a phase one, phase two that's  
22                 listed. Phase one is really the program that was done  
23                 for the test pad. Phase two, there are some specific  
24                 details that have to be ironed out. When you start  
25                 now placing large volumes of soil for the actual

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 compaction program, the details on what equipment  
2 you're going to use and how that's going to be placed,  
3 rolled and water content, all of those issues, are  
4 going to have to be worked out and reviewed by the  
5 staff to ensure that there's no potential problem  
6 coming downstream. Next slide.

7 So the general summary I think we made we  
8 think that we know the material properties well enough  
9 to go forward the site. The site is adequate if we  
10 follow all of these, if the actual characteristics  
11 match what we think is going to be there. Then we  
12 have an ITAAC program to confirm that it's placed as  
13 we think it should be placed. Next slide.

14 JUDGE BOLLWERK: I think we're on slide 16  
15 now.

16 MR. TEGELER: This is Bret Tegeler again.

17 JUDGE BOLLWERK: You need to tap the --

18 MR. TEGELER: This is Bret Tegeler again  
19 starting the structural engineering review on slide  
20 16. As I mentioned earlier, the LWA involves the  
21 placement of the concrete mud mat with an embedded  
22 waterproofing membrane. Just to provide a little more  
23 detail on perhaps what we heard earlier with respect  
24 to the MSE wall and mud mat, the mud mat will be  
25 constructed with pre-cast concrete panels with

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 tiebacks that will be approximately 40 feet in height.  
2 which corresponds to approximately the depth of  
3 embedment of the nuclear island.

4 The footprint of the mud mat also  
5 corresponding to the footprint of the nuclear island  
6 is approximately 160 feet by about 260 feet in plan  
7 which is approximately an acre in size just for scale.  
8 The mud mat to be placed will be 12 inches thick in  
9 total. It will be comprised of two six inch layers  
10 with the waterproofing membrane sandwiched between the  
11 two layers and that concrete should have a compressive  
12 strength of about 2,500 psi.

13 The waterproof membrane itself, the  
14 Applicant has stated it will be an elastic spray-on  
15 membrane, approximately 80 to 120 mils in thickness  
16 and as I mentioned will be the sandwich between the  
17 two layers. That membrane will also extend vertically  
18 up the MSE wall. The Applicant also provided a  
19 waterproof membrane ITAAC which states that testing  
20 will be done to confirm that the membrane-mud mat  
21 interface has a coefficient of friction of 0.7 and as  
22 I said earlier the Applicant also referenced AP1000  
23 Rev 15 in this. Next slide please. Slide 17.

24 The LWA does involve foundation elements  
25 construction or preparation for the category 1

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 foundation structure. As such we reviewed those  
2 elements under SRP Sections 3.7.1, 3.7.2 and 3.8.5.  
3 Those mostly relate to the seismic design parameters  
4 and seismic analysis methods and then the foundation  
5 stability.

6 The staff believes that the basis for the  
7 approval of the LWA will not be impacted unless  
8 there's a major change in the footprint of the nuclear  
9 island basement. Additionally, moderate changes in  
10 the structural design will not invalidate the basis  
11 for the LWA approval. Next slide please. Slide 18.

12 I mentioned earlier the various SRP  
13 sections, but I think the main takeaway from my slide  
14 is these three sections involve essentially the review  
15 of the dynamic analysis input parameters such as the  
16 foundation input response spectra, the soil layering  
17 characteristics, structural damping parameters and  
18 then the subsequent review of the actual analysis and  
19 does the SSI model adequately capture the AP1000  
20 structural characteristics and is it embedded properly  
21 in the soil and then the output of that analysis which  
22 would be essentially the demand on a nuclear island or  
23 the loads are then assessed in a foundation stability  
24 analyses concluded on the 3.8.5.

25 JUDGE TRIKOUROS: Could I ask you to go

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 back one slide?

2 MR. TEGELER: This slide?

3 JUDGE TRIKOUROS: Yes. That's the one.  
4 "Moderate changes in structural design will not  
5 invalidate basis for LWA approval." What do moderate  
6 changes? I mean, how does that carry forward?

7 MR. TEGELER: This point addresses the  
8 issue that the LWA is referencing the Rev 15 standard  
9 design. What will be constructed is something other  
10 than that, perhaps 17. The assumption here and I  
11 think the staff has reasonable confidence that changes  
12 that have been identified as part of the amendment  
13 would not likely alter the conclusions reached as part  
14 of this review.

15 What I mean by that is as long as the most  
16 important characteristics remain the same primarily in  
17 this case for foundation stability would be the size  
18 of the footprint, the overall dimensions, which I  
19 mentioned earlier, the overall weight of the nuclear  
20 island. There may be moderate changes to mass or even  
21 internal connections within the structural elements,  
22 but the thought is that those changes would not  
23 significantly impact, for example, again the overall  
24 weight or the inertia or the footprint size.

25 Combine that with the margin that we

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 identified from the Applicant -- I'm sorry. The  
2 margin that the Applicant identified as part of the  
3 site specific evaluation, I think the staff has  
4 convince that this is a true statement.

5 JUDGE TRIKOUROS: So when Rev 17 is  
6 approved, the DCD Rev 17 is approved, then the  
7 Applicant submits its amendment to accommodate that  
8 you basically have already looked at that is what  
9 you're saying.

10 MR. TEGELER: That's correct, Your Honor.

11 JUDGE TRIKOUROS: Okay.

12 MR. ARAGUAS: This is Chris Araguas. I  
13 also wanted to add in respect to your question that  
14 the regulations state that the LWAs perform at the  
15 Applicant's risk and so it's the responsibility of the  
16 Applicant to address any changes that could impact  
17 what was done as part of the LWA at the COL stage and  
18 that could cause some challenges on issuance of the  
19 COL. But again that addresses part of the COL.

20 MR. TEGELER: Okay. Should I proceed?

21 JUDGE BOLLWERK: Yes. Are we on 19 now or  
22 are we still back on 18?

23 MR. TEGELER: Slide 19 please.

24 This slide I'll just quickly summarize the  
25 application of 3.7.1. As it was mentioned earlier,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 the Vogtle site ground motion response spectra, the  
2 GMRS, exceed the AP1000 certified seismic design  
3 response spectra in both the high and low frequency  
4 ranges. As a result of this, the Applicant performed  
5 site specific analysis.

6 The foundation input response spectra is  
7 also defined at the foundation elevation. That is  
8 something that we check in this portion. Next slide  
9 please, 20.

10 This is a slide that was shown earlier.  
11 This is again a comparison of the horizontal GMRS, the  
12 site specific GMRS and FIRS with AP1000 CSDRS and  
13 again this is just to highlight the accedences in that  
14 low frequency range, 0.7, maybe 0.4 to 0.7 range,  
15 below 1 hertz if you will and greater in the range and  
16 then there's an accedence in the higher frequency  
17 range of about 7 to perhaps 60. Next slide please.

18 Similarly, this slide also shows the  
19 accedence in the vertical direction. I won't go  
20 through this because this was already covered. Slide  
21 22 please.

22 As I mentioned earlier, the staff does  
23 perform an evaluation of the input parameters to the  
24 site specific analysis. One of these parameters is  
25 the vibratory ground motion or in this case the FIRS.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 As Dr. Costantino mentioned earlier, an alternative  
2 method was used for developing the FIRS. However our  
3 view indicates that the method did result at least in  
4 this case as a conservative estimate for the  
5 horizontal seismic demand.

6 The staff also evaluated whether or not  
7 the FIR satisfied the 10 CFR Part 50 Appendix S  
8 requirement that the free field motion at the  
9 foundation elevation be a minimum ZPA value of 0.1 Gs.  
10 We also look at critical structural damping values and  
11 we would the values that were used, the analysis, were  
12 consistent with regulatory guidance and we also as I  
13 mentioned earlier evaluated the supporting media below  
14 the nuclear island to make sure that the analysis  
15 assumptions were consistent with the measured values  
16 at the site. Next slide please. Slide 23.

17 In Section 3.72 as I mentioned earlier, we  
18 performed the evaluation of the site specific models.  
19 Again, the Applicant did perform the 2-D site specific  
20 models for evaluating the sliding and overturning  
21 stability. The Applicant used SASSI, essentially 2-D  
22 SASSI stick models for the nuclear island and the  
23 adjacent buildings. The models did account for the 40  
24 foot embedment below the oil surface. The analyses  
25 were performed in three directions and as was

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 mentioned earlier used the upper best estimate and  
2 lower balance soil properties to address  
3 uncertainties. The Applicant then compared the in-  
4 structure responses at six key locations and then also  
5 computed the maximum seismic shear forces for use in  
6 stability and dynamic bearing pressure evaluations.  
7 Next slide please.

8 To summarize our evaluation findings on  
9 the 2-D SSI analysis, the staff finds that the use of  
10 the 2-D SASSI models is acceptable for the evaluation  
11 of the sliding stability and bearing pressure demands.  
12 Further, as a way to in a sense perform a confirmatory  
13 check on the Applicant's analysis, we compared the  
14 analysis results at the nuclear island center of  
15 gravity which you might consider to be a rough  
16 approximation of where you have the average inertial  
17 acceleration.

18 We compared that acceleration level with  
19 the AP1000 soft soil case. That would be Rev 16 and  
20 17 and found them to be similar. Again, it was just  
21 an approximate check.

22 We also performed independent calculations  
23 to essentially check that the seismic shear forces  
24 calculated by the Applicant's 2-D analysis were  
25 reasonable in range and we found that they were

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 realistic values based on our own calculations. Next  
2 slide please. Slide 25.

3 I mentioned earlier that I'm going to  
4 present this for John Ma. The Applicant provided a  
5 waterproofing membrane ITAAC where the design  
6 commitment of the ITAAC states that the friction  
7 coefficient to resist sliding shall be 0.7 or higher  
8 and that testing will be performed to confirm that the  
9 mud mat/waterproofing membrane/mud mat interface  
10 beneath the nuclear island base mat has a minimum  
11 coefficient to resist sliding of 0.7.

12 JUDGE JACKSON: Let me just make sure. I  
13 thought he was talking about the base of the mud mat.  
14 I mean the membrane is embedded, right, and so it's  
15 locked in. There's no issue there.

16 MR. TEGELER: The concern on this  
17 particular ITAAC is you're correct that below the mud  
18 mat we discussed earlier about the friction  
19 coefficient of 0.45. The concern here is that the  
20 membrane itself whether or not that presents a weak  
21 plane, if you will, a shear plane, that could  
22 potentially fail and then slide. So we want to check  
23 to make sure that material, the membrane material  
24 itself, has at least the coefficient of 0.7 which the  
25 DCD requires.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 JUDGE TRIKOUROS: And how is that done?  
2 How would that be done?

3 MR. TEGELER: The Applicant provided some  
4 information from a proposed vendor. I think it was a  
5 bridge. They provided a test report that was done  
6 using a similar application of this particular  
7 material sandwiched between two concrete surfaces and  
8 I believe they did an incline plane test to assess  
9 what the angle of sliding might be and then they can  
10 compute the coefficient of static sliding. That was  
11 based again not -- The intent of that test was I think  
12 to provide staff with confidence that this material  
13 and sandwiched between these two materials, concrete  
14 and concrete, would achieve this friction value and  
15 then these tests were done with that aim.

16 JUDGE TRIKOUROS: This ITAAC reads as if  
17 it's already done. Is that correct?

18 MR. TEGELER: I think

19 DR. MA: This is John Ma. This ITAAC is  
20 not done yet because we are asking them to give us the  
21 information whether this is creditable, has been done  
22 before. So they sent us a report. It's been done  
23 before. You can reach 0.7. But sometimes they did  
24 not reach 0.7. It was 0.4 to 0.8 the data shows.  
25 What they did was they put in like a concrete block

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 over the concrete surface and raised the angle when  
2 the box started sliding.

3 So this ITAAC they would have to do at a  
4 site to do the same kind of test for the material they  
5 used for concrete surface over another concrete  
6 surface which is the mud mat. The six inch mud mat  
7 would be on top of the other six inch mud mat. In  
8 between there's a membrane. So this test would be  
9 done at the site.

10 JUDGE JACKSON: I thought that they were  
11 going to spray this membrane on. Did I have that  
12 right? The membrane you put the first layer down.  
13 You spray the membrane. Then you pour the next.

14 MR. MOORE: That is correct. The actual  
15 test has not been done. The information that was  
16 provided to the NRC was information that we, the  
17 Applicant, were able to get from the vendor as an  
18 example to give them and then give us some assurance  
19 that we would be able to meet the ITAAC. But the test  
20 has not yet been done.

21 JUDGE JACKSON: Yes. I would say I mean  
22 you would have to do it really under those conditions  
23 with those materials. I think that would make a big  
24 difference. It would be different than putting a  
25 couple of slabs around a membrane.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MR. MOORE: That is correct. Here again  
2 we're spraying on -- We're pouring concrete on top of  
3 it and it would have to duplicate. Our commitment is  
4 to duplicate how it is constructed on the site and  
5 we'll do the test. We'll come up with a test plan  
6 that duplicates that construction technique.

7 JUDGE JACKSON: Do you think it would be  
8 a sliding test similar or would it be one where you  
9 mechanically --

10 MR. MOORE: I'm sorry. I'm not able to  
11 answer that. I have not yet seen any of the plans.

12 JUDGE JACKSON: Okay. But it will be some  
13 kind of credible measurement.

14 MR. MOORE: Yes.. An ITAAC we will perform  
15 this and then the NRC can review the test report and  
16 they have the ability to review that and determine if  
17 this is acceptable.

18 JUDGE JACKSON: Okay. Thanks.

19 JUDGE TRIKOUROS: This will be done at the  
20 site.

21 MR. MOORE: I'm not sure. Can I answer  
22 that I'm not sure where it's going to be done? It's  
23 a commitment by the Applicant to perform the test. I'm  
24 not sure exactly where it will be done, but we have a  
25 commitment to duplicate the type of installation so it

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 will be representative. As John Ma has mentioned,  
2 this test that we provide, it will be basically a  
3 block sitting on the material and letting it slide.  
4 We're basically pouring concrete on top of a spray-on  
5 material. So that has to be represented correctly in  
6 the test that's going to be performed as part of the  
7 ITAAC.

8 JUDGE TRIKOUROS: The ITAAC is rather  
9 nebulous. It just is testing. It doesn't say  
10 anything more than that. The acceptance criteria  
11 actually just says that another report exists. I'm  
12 surprised by the acceptance criteria. They don't say  
13 that -- I mean it's implied that it would meet 0.7,  
14 but the acceptance criteria doesn't say that that test  
15 that's performed will meet a 0.7 criterion. It just  
16 says you're going to do a test and the acceptance  
17 criteria is that some report exists somewhere.

18 MR. MOORE: The wording here I understand  
19 your comment. The wording here is very common in the  
20 ITAAC that the design commitment is defined. These  
21 things are very -- The ITAACs are written in very  
22 limited -- I mean they describe the report will exist.  
23 The details on how that's done typically is not put in  
24 the ITAAC wording itself.

25 For example, the wording for the ITAAC for

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 the shear wave velocity, measurements for the backfill  
2 a lot of information has been provided in the SSAR to  
3 describe some of the techniques and so forth.

4 JUDGE TRIKOUROS: I think I'm reading this  
5 incorrectly. This is a report that will exist. This  
6 is a report that will exist in the future.

7 MR. MOORE: Right.

8 JUDGE TRIKOUROS: This is not referring to  
9 the information that was provided, preliminary  
10 information that was provided.

11 MR. MOORE: That preliminary information  
12 was provided to provide some assurance that this type  
13 of material can perform as we expected.

14 JUDGE TRIKOUROS: That's fine. Thank you.

15 MR. TEGELER: Your Honor, if I could just  
16 add. Sorry.

17 JUDGE TRIKOUROS: Go ahead.

18 MR. TEGELER: Perhaps the confusion, I  
19 mentioned that there was a test report done and the  
20 staff has asked an RAI as part of their review of this  
21 portion that for the Applicant to demonstrate that  
22 it's reasonable to conclude that you could actually  
23 achieve this in a real application. So in response to  
24 that RAI, the staff provided a test report done on a -  
25 - I'm sorry. The Applicant provided the test report

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 which was done using the same spray-on material,  
2 perhaps slightly different material, roughness, etc.  
3 But there was enough information to give the staff  
4 confidence that the 0.7 value is achievable.

5 JUDGE TRIKOUROS: Right, but Dr. Ma has  
6 indicated that there wasn't 100 percent. So you need  
7 to do something more.

8 JUDGE BOLLWERK: Does the staff have any  
9 expectations as to how this report will be prepared or  
10 how the test will be done that you --

11 DR. MA: This is John Ma again. My own  
12 personal opinion is the test has to be done at that  
13 job site because the temperature, moisture, the  
14 condition should be simulating the site condition.

15 JUDGE BOLLWERK: I take it other than what  
16 we just heard. Have you expressed this to the  
17 Applicant? Are they aware of that? You are now I  
18 guess. Go ahead.

19 MR. MOORE: We are totally aware of that  
20 and our intent was to provide a test that truly  
21 indicates the site conditions, the unsolved  
22 conditions.

23 JUDGE BOLLWERK: All right. So it seems  
24 everyone is possibly at least at this point on the  
25 same page. All right.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MR. TEGELER: Slide 25. The final bullet,  
2 the soil test data indicated a bearing capacity of 42  
3 ksf. This was mentioned earlier by Dr. Costantino.  
4 Next slide please.

5 This slide summarizes the staff's review  
6 of the Applicant's stability analysis for the nuclear  
7 island. The staff reviewed the maximum horizontal  
8 seismic forces and maximum friction forces below the  
9 basement. This table summarizes those seismic  
10 reactions corresponding to the earlier mentioned lower  
11 bound best estimate and upper bound analyses.

12 Based on this table which indicates that  
13 the maximum friction force results in about 117 kips.  
14 Sorry. I'm checking with John.

15 DR. MA: Yes.

16 MR. TEGELER: Okay. Results in a maximum  
17 friction force of approximately 116-117 kips. The  
18 staff concludes that the nuclear island will not slide  
19 during the SOC because of the friction force is  
20 greater than the inertial force. Next slide please.  
21 Slide 27.

22 The maximum dynamic bearing pressure on  
23 the soil for the nuclear island, the rad waste annex  
24 and turbine buildings, are 18, 1.7, 7.2 and 2.54 ksf,  
25 respectively, during the SOC. The minimum factor of

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 safety with respect to a failure of the dynamic soil  
2 bearing capacity during the SOC is 2.34 which is  
3 equivalent to 42 ksf/the demand of 17.95 ksf. Next  
4 slide please.

5 In summary with respect to the seismic  
6 design parameters, the Applicant adequately developed  
7 the seismic design parameters and has met the  
8 applicable regulatory requirements. With respect to  
9 the seismic systems analysis, the Applicant adequately  
10 performed the site specific, 2-D SSI analysis for the  
11 purpose of determining the maximum seismic demands and  
12 has met the applicable regulatory requirements. The  
13 staff's evaluation of in-structure response which is  
14 as we mentioned earlier will be done as part of the  
15 SCOL review.

16 With respect to the foundation analyses,  
17 the Applicant has demonstrated that the mud mat and  
18 waterproofing membrane are adequate and that the  
19 nuclear island foundation is stable during a safe  
20 shutdown earthquake event. The Applicant's proposed  
21 mud mat and waterproofing membrane design meet the  
22 applicable regulatory requirements.

23 I think this concludes unless you have  
24 further questions.

25 JUDGE BOLLWERK: Any questions from either

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 of the Board members on this?

2 (No verbal response.)

3 All right. Then we can move onto the next  
4 portion of the presentation which is the environmental  
5 review.

6 MR. ARAGUAS: Before we move, I just  
7 wanted to make a clarification.

8 JUDGE BOLLWERK: All right.

9 MR. ARAGUAS: There was a question that  
10 was asked as part of Don's presentation earlier with  
11 respect to demonstrating completion of the ITAAC as  
12 being prerequisites to future construction activities  
13 and I wanted to clarify that the completion of the  
14 ITAACs are not prerequisites of future construction  
15 activities. So to clarify that, they would do the  
16 tests as they do the construction activities, but the  
17 submission of a notification stating to the staff that  
18 the report has been done that documents this would not  
19 need to be done prior to continuing their construction  
20 activities.

21 JUDGE BOLLWERK: Having said that, as you  
22 mentioned before, anything they do relative to the LWA  
23 is at risk, for any construction they do, if it turns  
24 out late or not to be acceptable to the staff.

25 MR. ARAGUAS: That's correct and if the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 staff inspects the ITAAC and determines that they  
2 didn't meet the ITAAC I mean the risk is to the  
3 Applicant.

4 JUDGE BOLLWERK: I take it if the ITAAC,  
5 if the report, is given to you soon after the fill is  
6 put in I take it it's something you're going to review  
7 and indicate to them whether it's acceptable or do you  
8 simply hold it until the end?

9 MR. ARAGUAS: I'll try and answer this to  
10 the best of my ability. I'm not very familiar with the  
11 inspection program that's set forth, but it is my  
12 understanding that the staff is not intending to  
13 inspect every ITAAC closure and look at every single  
14 report. So whether or not we would look at that  
15 specific report for that ITAAC I can't speak to.

16 JUDGE BOLLWERK: I guess, doesn't that put  
17 the Applicant at some risk that they may not want to  
18 be at. If they ask you to review the report and sign  
19 off on the ITAAC before they can continue the  
20 construction wouldn't you want to do that? Maybe not.  
21 Mr. Moore, I don't know if you have anything you want  
22 to say about that.

23 MR. MOORE: I'm not the right person to  
24 answer that question.

25 JUDGE BOLLWERK: All right. Well, maybe

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 that's an interesting procedural question. I have no  
2 idea.

3 JUDGE TRIKOUROS: I'm not sure that I  
4 heard correctly. Staff is saying that if asked to  
5 review and sign off on that ITAAC before construction  
6 they might not. Is that what you're --

7 MR. ARAGUAS: Well, again, I'm not very  
8 familiar with the inspection program that we have  
9 going forward, but I don't think it's necessarily a  
10 submission or a report. I think it's that they submit  
11 a notification to the staff that states that they have  
12 completed the ITAAC and that a report exists such that  
13 when the staff comes and does its inspection  
14 activities they have that opportunity to look at that  
15 report to verify that the ITAAC had been met. Whether  
16 or not that specific report would be looked at, I  
17 can't speak to.

18 JUDGE BOLLWERK: It is what it is I guess.  
19 All right.

20 MR. MOULDING: Let me just a brief  
21 clarification.

22 JUDGE BOLLWERK: Sure.

23 MR. MOULDING: The staff does review every  
24 ITAAC to determine that the ITAAC has been closed.  
25 But as Mr. Araguas said, the inspection of each ITAAC

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 depends on the details of the inspection program and  
2 I'm not sure we know all the details of that at this  
3 point.

4 JUDGE BOLLWERK: So what you're saying is  
5 there's a difference between checking the box that the  
6 report actually exists and then reviewing the report  
7 and seeing that it really is adequate.

8 MR. MOULDING: I believe that is the  
9 distinction, Your Honor.

10 JUDGE BOLLWERK: And the inspection  
11 process is where the report is actually reviewed for  
12 adequacy.

13 MR. MOULDING: Yes sir.

14 JUDGE BOLLWERK: All right. Thank you.

15 Any other question with respect to this  
16 part of it?

17 (No verbal response.)

18 Thank you, sir, for the clarification.

19 Let's then move on to the environmental review.

20 MR. NOTICH: Thank you. This is Mark  
21 Notich and I am again the staff's Environmental  
22 Project Manager for the Environmental Review of the  
23 Plant Vogtle Early Site Permit Application.

24 The Board requested a presentation that  
25 discusses the seismic evaluation performed for the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 plant Vogtle ESP and that the presentation should have  
2 an environmental perspective. Next slide. Thank you.

3 This is slide three. NEPA's reviews focus  
4 on the impact of the proposed action on the  
5 environment. By contrast -- I'm sorry. For the plant  
6 Vogtle ESP, the staff focused on the potential impacts  
7 that construction and operation of two reactors and  
8 associated facilities based on the AP1000 design and  
9 would have on the site and the surrounding  
10 environment. By contrast, seismic analysis is a  
11 safety review focused on the potential impact of the  
12 environment on the proposed facility. Next slide  
13 please.

14 This is slide four. The staff used NUREG  
15 1555, the Environmental Standard Review Plan, as a  
16 basis to perform the environmental review for the  
17 plant Vogtle ESP. The ESRP does not contain guidance  
18 for environmental review of seismic information.  
19 Instead the ESRP in Section 2.6 guides the  
20 environmental staff to refer seismological analysis  
21 and evaluations to the SER or the SSER. The staff  
22 followed this instruction in preparing the final EIS  
23 for the Vogtle ESP.

24 JUDGE BOLLWERK: All right. Thank you  
25 very much. Appreciate the input. All right. Any

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Board questions for the staff panel in terms of the  
2 seismic evaluation? Anything further?

3 (No verbal response.)

4 Mr. Moore, let me turn to you and see if  
5 you have anything further you wanted to say relative  
6 to what you heard during the presentation by the  
7 staff.

8 MR. MOORE: No, I do not.

9 JUDGE BOLLWERK: All right. Anything  
10 further the staff wants to make the Board aware of  
11 relative to the seismic evaluation? Anyone?

12 (No verbal response.)

13 All right. Then we thank you very much.  
14 This was an important issue. Seismic is always a  
15 question and while we know you spent some time before  
16 the advisory committee on reactor safeguards on this  
17 subject, we thought it was a matter that we ought to  
18 be taking a look at as well. I think the overview  
19 you've given us and the presentation and the detail  
20 you've gone into has given the Board a fairly good  
21 sense of what occurred here, what the issues were and  
22 how they've been resolved in terms of the staff's  
23 analysis as well as the input from the Applicant and  
24 I think we very much appreciate the effort you've put  
25 into this. And thank you for the information and for

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 your service to the Board, all of you. Thank you..

2 All right. At this point, it's about 12:15  
3 p.m. Unless the parties have another approach, what  
4 we would propose to do I think is to proceed on and  
5 try to get in the last two presentations rather than  
6 going and taking a lunch break if that's acceptable to  
7 you all. All right?

8 (No verbal response.)

9 Then let's go ahead and move to the  
10 presentation on severe accident mitigation design  
11 alternatives and this is a staff panel.

12 MR. MOULDING: Would it be okay to take a  
13 brief, maybe a five minute break?

14 JUDGE BOLLWERK: Yes, we can. Absolutely.  
15 Why don't -- Five minutes? Ten?

16 MR. MOULDING: Perhaps ten.

17 JUDGE BOLLWERK: Let's say a ten minute  
18 break then and we'll come back and start with that  
19 presentation. Off the record.

20 (Whereupon, a short recess was taken.)

21 JUDGE BOLLWERK: All right. Let's go  
22 ahead and go on the record then please. We are back  
23 from the break and we're going to start with the -- We  
24 have two presentations left, the first one dealing  
25 with severe accident mitigation design alternatives or

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 SAMDAs as they're often referred to and I believe  
2 we've got the witnesses. Why don't you go ahead and  
3 present the witnesses and I think we have one exhibit  
4 we need to get into evidence.

5 MR. MARTIN: Thank you, Your Honor. I  
6 will introduce the witnesses one more time. I think  
7 we've met them both. On the left is Mark Notich and  
8 next to him is James Ramsdell.

9 JUDGE BOLLWERK: Okay. Thank you,  
10 gentlemen. You both were sworn previously and you  
11 remain under oath.

12 MR. MARTIN: We have one exhibit for this  
13 presentation. It's Exhibit NRC000066, Staff  
14 Presentation 8, Severe Accident Mitigation Design  
15 Alternatives.

16 JUDGE BOLLWERK: All right. And the  
17 record should reflect that Exhibit NRC000066 as  
18 described by counsel is marked for identification.

19 (Whereupon, the document  
20 referred to was marked as  
21 Exhibit NRC000066-MA-BD01 for  
22 identification.)

23 MR. MARTIN: And the staff would like to  
24 move to have this exhibit admitted as evidence.

25 JUDGE BOLLWERK: Any objections?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MS. SUTTON: No objection.

2 JUDGE BOLLWERK: Thank you. Exhibit  
3 NRC000066 is admitted into evidence.

4 (The document referred to  
5 having been previously marked  
6 for identification as Exhibit  
7 NRC000066-MA-BD01, was received  
8 in evidence.)

9 And I believe at this point we're ready  
10 for the panel's presentation on SAMDAs.

11 MR. RAMSDELL: If you can move to slide 3  
12 please. Yes.

13 This slide is here just as an introduction  
14 SAMDAs and as an explanation of why and how SAMDAs got  
15 into the environmental review. I don't think it  
16 requires a lot of more discussion. Environmental  
17 Standard Review Plan 7.3 provides ESP applicants with  
18 an opportunity to address SAMDAs or SAMAs. Southern  
19 in its ESP application for the Vogtle site chose to  
20 include a SAMDA analysis in its environmental report.  
21 Therefore the staff included a SAMDA analysis in EIS.

22 This is the first time that a SAMA or  
23 SAMDA analysis has been included an ESP EIS. The  
24 previous three were based on a plant parameter  
25 envelope that encompassed several reactors and

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 therefore, SAMDA analysis was not appropriate. The  
2 next slide please. It will be slide 4.

3 JUDGE TRIKOUROS: Could I ask you just one  
4 question?

5 MR. RAMSDELL: Yes.

6 JUDGE TRIKOUROS: You referred to both  
7 SAMDAs and SAMAs and there is a distinction. Could  
8 you explain that to us please?

9 MR. RAMSDELL: A SAMDA is a design  
10 alternative. A SAMA is a more generic alternative  
11 that includes procedural and training alternatives  
12 that in general would be most appropriately evaluated  
13 near the time of fuel loading when the plant has been  
14 constructed and the procedures are being developed  
15 rather than some eight or ten years prior to the  
16 development of procedures.

17 JUDGE TRIKOUROS: Okay. Thank you.

18 MR. RAMSDELL: The Vogtle ESP application  
19 cites Revision 15 of the AP1000 design. It's a  
20 certified design. Design certification is  
21 incorporated or part of Appendix D of 10 CFR Part 52.  
22 Paragraph VI(B)(7) of Appendix D states that SAMDA  
23 issues are resolved "for plants referencing this  
24 appendix whose site parameters are within those  
25 specified in a severe accident mitigation design

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 alternative's evaluation." This in essence where  
2 we're going, where the staff is going, in its SAMDA  
3 review.

4 The question is are the site parameters at  
5 the Vogtle site within those considered in the SAMDA  
6 review conducted during design certification. The  
7 next three slides will talk a little bit about what  
8 was done in the design certification review. We'll  
9 talk then about what the staff has done. Next slide.  
10 This is slide 5. All right.

11 The AP1000 SAMDA evaluation was evaluated  
12 by staff in NUREG 1793 Chapter 19. The staff looked  
13 at the probabilistic risk assessment provided by  
14 Westinghouse for the AP1000. It looked at the way in  
15 which Westinghouse went from a list of the order of  
16 100 or more potential design alternatives and narrowed  
17 it down to 16. It looked then -- I guess 14 of the  
18 design alternatives identified by Westinghouse. Two  
19 added by the staff.

20 It then looked at the results of the  
21 uncertainty analysis conducted previously for the AP-  
22 600 and finally it looked at the potential benefits  
23 from reducing or implementing these design  
24 alternatives. The results of the staff review were  
25 documented in an environmental assessment that

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 accompanied the design certification rule. If you go  
2 to the next slide please. It's slide 6.

3 In that environmental assessment, the  
4 staff included the following conclusions. First, that  
5 none of the potential design modifications evaluated  
6 are justified on the basis of cost benefit  
7 considerations. It also concluded that it is unlikely  
8 that any other design changes would be justified in  
9 the future based on the basis of person-rem exposure  
10 because the core damage frequencies are very low based  
11 on an absolute scale.

12 And then finally on the next slide, it's  
13 slide 7, the staff included in its findings that the  
14 evaluation that it had performed provides reasonable  
15 assurance that there are no additional SAMDAs beyond  
16 those currently incorporated into the AP1000 design  
17 which are cost beneficial whether considered at the  
18 time of approval of the AP1000 design certification or  
19 in connection with the licensing of a future facility  
20 referencing the AP1000 design certification where the  
21 plant referencing this appendix is located on a site  
22 whose site parameters are within those specified in  
23 Appendix 1B of the AP1000 design control document.  
24 These issues are considered resolved for the AP1000  
25 design.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 JUDGE BOLLWERK: Just one question. Could  
2 you give us just for the record if you could a couple  
3 of examples of the sort of SAMDAs that were looked at  
4 relative to the AP1000?

5 MR. RAMSDELL: No.

6 JUDGE BOLLWERK: No. All right. Then  
7 we'll --

8 MR. RAMSDELL: I might be able to think of  
9 something but not right off the top of my head.

10 JUDGE BOLLWERK: All right.

11 MR. RAMSDELL: The next slide please.  
12 Slide 8.

13 The staff in preparing the EIS reviewed or  
14 attempted to determine whether the site parameters or  
15 the site was within the bounds of the generic site  
16 considered in the AP1000 design certification review.  
17 It's not easy. It was not easy because the slight  
18 parameters that are involved in the SAMDA analysis  
19 include a year of meteorological data for parameters.  
20 That's about 35,000 numbers. Economic adjustment  
21 values for a variety of locations. Population at 160  
22 sectors, so forth. So the staff decided that the site  
23 specific information that is most appropriate for us  
24 in determining whether the Vogtle site is bounded by  
25 the generic site were the person-rem per reactor year

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 and the offsite economic costs of a cost risk in  
2 dollars per reactor year. These are the values that  
3 are included among the risks that are used to  
4 determine the maximum or the total risk of the severe  
5 accident. Appendix B1 of the AP1000 DCD includes  
6 these numbers for the generic evaluation.

7 Next slide is slide 9. It includes a  
8 comparison of the Vogtle site specific values based on  
9 the severe accident analysis that was discussed  
10 earlier and compares those with the DCD values. In  
11 all cases, the Vogtle site specific numbers are lower  
12 than the generic values included within the design  
13 control document, Appendix B1 table. Therefore, the  
14 staff concludes that the Vogtle site is in fact  
15 bounded by the generic site considered previously and  
16 that therefore the issues related to SAMDA are  
17 resolved for an AP1000 at the Vogtle site Revision 15.

18 JUDGE BOLLWERK: Based on Revision 15 to  
19 the DCD, right?

20 MR. RAMSDELL: Yes.

21 JUDGE BOLLWERK: All right.

22 MR. RAMSDELL: The conclusions are in  
23 slide 10. Yes. Are there any questions?

24 JUDGE TRIKOUROS: This is always  
25 interesting, these types of analyses, because I mean

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 the conclusion is that you shouldn't spend more than  
2 \$30,000. The numbers are on your slide, but I'm just  
3 approximating.

4 MR. RAMSDELL: Right.

5 JUDGE TRIKOUROS: Something like \$30,000.  
6 Any modification that costs more than \$30,000 should  
7 not be done. You know that really has no meaning.  
8 Basically it says that you couldn't possibly come up  
9 with any change to the plant.

10 MR. RAMSDELL: You can't even talk about  
11 it always.

12 JUDGE TRIKOUROS: Right, and that would  
13 include any procedural change for that matter, you  
14 know, be the \$30,000. It would be very difficult to  
15 develop and implement procedures for \$30,000.

16 MR. RAMSDELL: In respect to procedures,  
17 the procedures do not exist. What we are asking  
18 applicants to do at the COL stage is to provide an  
19 assurance that procedures as they are developed will  
20 be based on risk information that is available within  
21 the probabilistic risk assessment and that we ask that  
22 they provide us a time schedule when those procedures  
23 will be developed.

24 JUDGE TRIKOUROS: But the probabilistic  
25 risk assessment assumed procedural actions in

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 determining its results. So I assume there was some  
2 set of guidelines that they had, some procedural  
3 guidelines. Does the staff feel comfortable with  
4 these numbers or is it really in a situation where the  
5 DCD -- Does the staff feel comfortable with these  
6 numbers?

7 MR. RAMSDELL: Yes. If you compare the  
8 numbers for core damage frequency of the AP1000 with  
9 the core damage frequency of current generation plants  
10 you understand why these numbers are down in the  
11 \$30,000 range rather than the \$300,000 or \$3 million  
12 range. If you go to license renewal, you're seeing  
13 numbers in those ranges. This plant was designed  
14 following the probabilistic risk assessments of the  
15 existing the plants and a large number of the design  
16 alternatives that would be considered in a current  
17 generation plant have already been included within  
18 this design.

19 JUDGE BOLLWERK: Judge Jackson, do you  
20 have any questions?

21 (No verbal response.)

22 No. Anything further, Judge Trikouros?

23 JUDGE TRIKOUROS: No.

24 JUDGE BOLLWERK: All right. Then thank  
25 you very much, gentlemen. We appreciate your service

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 to the Board and the information you provided. Thank  
2 you.

3 All right. I think we're down to our last  
4 topic, The AP1000 Design Certification Revisions.

5 MR. MARTIN: The staff would like to  
6 request Mr. Ramsdell staying on for this presentation  
7 as well. He wasn't originally on the witness list,  
8 but if the Applicant has no objection, we think he may  
9 be able to provide extra detail.

10 MS. SUTTON: We have no objection.

11 MR. MARTIN: All right. Thank you.

12 JUDGE BOLLWERK: Then why don't you go  
13 ahead and introduce the panel you're going to have for  
14 this presentation then.

15 MR. MARTIN: I was just notified that they  
16 would also like to have Mr. Tegeler up there to  
17 discuss any differences for the safety aspect of the  
18 revisions if the Applicant has no objection.

19 MS. SUTTON: Again, no objection.

20 MR. MARTIN: Thank you very much.

21 JUDGE BOLLWERK: So let's go ahead and  
22 introduce the panel then for the court reporter's  
23 benefit as well as ours.

24 MR. MARTIN: Okay. Starting from the left  
25 again we have Mr. Mark Notich and then James Van

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Ramsdell and then Christian Araguas and Bret Tegeler.

2 JUDGE BOLLWERK: All right.

3 MR. MARTIN: And then we have one exhibit  
4 for this presentation.

5 JUDGE BOLLWERK: All these gentlemen have  
6 been previously sworn. Gentlemen, you remain under  
7 oath.

8 MR. MARTIN: We have NRC000069 which is  
9 Staff Presentation 11, AP1000 Design Certification  
10 Revisions.

11 JUDGE BOLLWERK: All right. The record  
12 should reflect that Exhibit NRC000069 is marked for  
13 identification.

14 (Whereupon, the document  
15 referred to was marked as  
16 Exhibit NRC000069-MA-BD01 for  
17 identification.)

18 MR. MARTIN: The staff would now like to  
19 move to have this admitted as evidence.

20 JUDGE BOLLWERK: Any objections?

21 (No verbal response.)

22 JUDGE BOLLWERK: Hearing none, then  
23 Exhibit NRC000069 is admitted into evidence.

24 (The document referred to  
25 having been previously marked

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 for identification as Exhibit  
2 NRC000069-MA-BD01, was received  
3 in evidence.)

4 JUDGE BOLLWERK: All right. And then at  
5 this point I believe we are ready for the presentation  
6 then.

7 MR. ARAGUAS: We can move to the next  
8 slide.

9 This slide I just wanted to cover a little  
10 bit of background about what was submitted to the  
11 staff. The Site Safety Analysis Report Rev 0 that  
12 came in August 2006 for the Early Site Permit  
13 Application for the Vogtle site was based on Revision  
14 15 of the AP1000 Design Certification document. All  
15 subsequent revisions to the Site Safety Analysis  
16 Report were based on Revision 15 of the AP1000 DCD.

17 In August of 2007, the Applicant submitted  
18 its Limit of Work Authorization Request and that also  
19 referenced the AP1000 Rev 15 DCD. The Final Safety  
20 Evaluation Report for the ESP and the LWA at the  
21 Vogtle site is based on again Revision 15 of the DCD.  
22 Next slide.

23 I just wanted to provide some context to  
24 the ESP safety review. For the safety review of the  
25 ESP application, the staff does rely on a very limited

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 set of design information. Those values that the  
2 staff used or relied on have been incorporated into or  
3 are proposed to go into the permit. But the  
4 clarification is that issuance of an ESP that  
5 references a certified design does not indicated NRC  
6 approval of the site for that specific design. That  
7 review is done at the COL stage. Next slide.

8 Now let me a little context with respect  
9 to the LWA review which is a little bit different.  
10 With respect to the LWA an applicant must submit a  
11 description of the activities being requested under  
12 the limited work authorization in addition to the  
13 pertinent design and construction information related  
14 to those activities. Since design information is  
15 required in an LWA to support the requested  
16 activities, an applicant must either incorporate by  
17 reference a certified design or furnish design details  
18 for review under an LWA. Granting of the LWA by the  
19 NRC approves the requested activities under the LWA as  
20 well as that specific design information that were  
21 within the scope of those LWA activities and for the  
22 Vogtle LWA request, SMC again has incorporated by  
23 reference the applicable portions of the AP1000 DCD.  
24 Next slide.

25 In summary, just to go and address the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Board's question with respect to impacts regarding any  
2 changes and sort by design, for the ESP the staff is  
3 aware that the accident source term proposed in  
4 Revision 16 of the AP1000 DCD has changed from that  
5 that was looked at with respect to Revision 15 and  
6 this is just one example. Because the Applicant  
7 referenced Revision 15 to the DCD, changes in design  
8 that occur in Revision 16 and Revision 17 and any  
9 subsequent revisions are not considered in the staff's  
10 safety review.

11 Currently, the staff is proposing to  
12 include the AP1000 Revision 15 accident source term as  
13 a set of bounding parameters in the ESP. So at the  
14 COL stages, any differences between those source term  
15 would need to be reviewed and resolved at the COL  
16 stage. Next slide.

17 Now with respect to the LWA as Bret  
18 discussed earlier, the basis for the LWA approval will  
19 not be impacted unless there is a major change in the  
20 footprint of the nuclear island base mat. Any  
21 moderate changes in the structural design will not  
22 invalidate the basis for the LWA approval. Any  
23 incapacibilities between the design information approved  
24 in an LWA and design information submitted in a COL  
25 application would need to be reviewed at the COL stage

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 and as I mentioned earlier any activities undertaken  
2 under an LWA are undertaken entirely at the risk of  
3 the Applicant, namely that the COL or CP may not be  
4 approved where the design ultimately selected is  
5 incapable with the LWA construction.

6 JUDGE BOLLWERK: And I take it just going  
7 back for a second to slide 6 and I believe your last  
8 point that at this point the Applicant when they  
9 actually adopt or Revision 17 for instance we heard  
10 some counsel saying yesterday that, it's sometime in  
11 May, Rev 17. At that point, the staff would begin an  
12 active review of Rev 17 relative to the combined  
13 license application.

14 MR. ARAGUAS: That's my understanding.

15 JUDGE BOLLWERK: Obviously, you're aware  
16 of the revision already.

17 MR. ARAGUAS: Right.

18 JUDGE BOLLWERK: That's public record for  
19 the most part. All right.

20 JUDGE TRIKOUROS: Well, the one thing that  
21 is clear then is that no COL will be issued until all  
22 revisions of the DCD or the latest revisions of the  
23 DCD are incorporated into the COL application reviewed  
24 by the staff.

25 MR. ARAGUAS: That's absolutely correct.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 JUDGE BOLLWERK: Unless the Applicant  
2 chooses not to incorporate the revision. Correct? In  
3 other words if for whatever reason Southern or some  
4 other applicant decided "All right. Things are moving  
5 along. We're going to stop at 17" even though there's  
6 18, 19 and 20 they can do that subject to whatever  
7 concerns the staff might have.

8 MR. ARAGUAS: They could do that. But  
9 again they wouldn't have the level of the finality on  
10 those differences that would be resolved under rule-  
11 making. So, for example, if there was some change  
12 that would certify that didn't coincide with one of  
13 the previous versions that would be treated as I guess  
14 sort of custom design and we would read it separately.

15 JUDGE BOLLWERK: All right. Thank you.  
16 I think we were then about to go to slide 8. I'm  
17 sorry. Slide 9.

18 MR. NOTICH: Okay. Again, I am Mark  
19 Notich. I'm the staff's Environmental Project  
20 Manager. Slide 9. Thank you.

21 Part 3 of Southern's Application for Early  
22 Site Permit at the Plant Vogtle site submitted to the  
23 staff in August of 2006 contained a Rev 0 of the  
24 Environmental Report. Page 1.2 of the ER stated that  
25 Southern has selected the AP1000 and that the NRC has

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 approved the design control document for the AP1000.

2 At the time of submittal of the ER and Rev  
3 0, we approved a DCD for the AP1000 was Rev 15 and  
4 likewise a Revision 1 on November 2006 and Revision 2  
5 submitted in April 2007 of the ER and were both based  
6 on Rev 15 of the AP1000 DCD. Subsequent in revisions  
7 to the Plant Vogtle ESP application did not include  
8 revisions to the ER. So subsequently the Final  
9 Environmental Impact Statement for an Early Site  
10 Permit at the Plant Vogtle Electric Generating Site or  
11 the FEIS is based on Revision 15 of the AP1000 DCD.  
12 Next slide please. Thank you. This is now slide 10.

13 This slide shows the Rev 15 design  
14 parameters that the staff used in determining their  
15 impact characterizations. A detail listing of the  
16 actual parameters is contained in Appendix I of the  
17 Final EIS. Next slide please.

18 Southern submitted commits on the Draft  
19 EIS in closure one entitled "New Information and  
20 Substantive Comments Of a Letter" dated December 26,  
21 2007. In a limited number of subject matter areas,  
22 Southern's comments contained new information that was  
23 based on design parameters proposed in Rev 16 of the  
24 DCD amendments under staff consideration in a separate  
25 DCD review process.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1                   As this information was submitted by the  
2 Applicant, the staff believed that it was important to  
3 assess how it would affect the staff's analysis of the  
4 parameters in Rev 15. Accordingly, the staff  
5 responded to the comments in Appendix E of the Final  
6 EIS and revised portions of the FEIS to provide  
7 additional analyses based on the new information. In  
8 particular, sections of the FEIS that were revised  
9 include 3.2, Plant Description; 5.2, Meteorology and  
10 Air Quality; 5.3 Water Related Impacts; 5.4,  
11 Ecological Impact; 6.2, Transportation Impacts; 7.3,  
12 Water Use and Quality; and 7.5, Aquatic Ecosystem.  
13 Next slide please.

14                   The staff's analysis of the new  
15 information provided in Southern's December 26<sup>th</sup>  
16 letter focused on information that could potentially  
17 affect the analysis of impacts. The staff reviewed  
18 new information on the circulating water, water system  
19 use, final effluent discharge, auxiliary boiler  
20 emissions, additional diesel generators, fuel  
21 irradiation levels and surface water system usage.  
22 Next slide please.

23                   There were values directly dependent on a  
24 design parameter. The staff analyzed how a Rev 16  
25 change would affect the impacts analyzed for Rev 15.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 The staff determined that the new information provided  
2 by Southern would not affect the impact conclusions  
3 stated in the FEIS. Changes in parameter values in  
4 the design ultimately selected for the combined  
5 license application and would be considered as new and  
6 potentially significant information for staff review  
7 at the combined license stage.

8 For instance, with regards to Rev 17, it  
9 is under staff review in a separate AP1000 design  
10 amendment process. Design changes associated with Rev  
11 17 do not need to be considered in the ESP  
12 environmental review because any significant changes  
13 from the parameters evaluated in the ESP and would  
14 have to be considered as part of the COL stage  
15 environmental review.

16 JUDGE BOLLWERK: All right. Let me ask a  
17 procedural question and then we'll see if any of the  
18 Board members have questions. You mentioned it sounds  
19 like with respect to at least Rev 16 that in terms of  
20 the environmental side you actually did look at the  
21 revision and make some analysis based on the revision  
22 given the comments you received.

23 MR. NOTICH: Yes sir.

24 JUDGE BOLLWERK: So I take it at least  
25 from staff's perspective going forward that analysis

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 and those revisions for the COL process assuming that  
2 the ESP were to be granted would be basically cut off.  
3 There is no further analysis that's going to be done  
4 relative to Rev 16.

5 MR. NOTICH: The ESP as I've stated is  
6 based on Rev 15. When the next revision of the DCD is  
7 approved by the staff, that is the data that the staff  
8 would look at to see if there was anything new. If  
9 there is anything new, then the staff would make a  
10 determination if it was significant. Then the staff  
11 would look at their impact characterizations at that  
12 time.

13 JUDGE BOLLWERK: Right. But if you've  
14 already analyzed Rev 16 then obviously I guess it  
15 follows that it's not going to be significant change  
16 since you've already looked at it once.

17 MR. NOTICH: Right. Yes sir.

18 JUDGE BOLLWERK: Okay. Let's move on then  
19 to Rev 17 which was two scenarios. One is let's say  
20 that you look at Rev 17 and decide there are -- And  
21 the Applicant in theory in May or sometime thereafter  
22 is going to adopt that revision. When you look at  
23 that you decide there are no significant informational  
24 changes. What in terms of the process do you do? Do  
25 you issue a letter? Do you issue an environmental

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 assessment? Do you issue or supplement the  
2 environmental impact statement? You don't do anything  
3 because in theory there is no significant information  
4 and you don't have to say boo. Procedurally, how is  
5 that handled?

6 And again the assumption here just so  
7 we're clear on the hypothetical is that you look at it  
8 and you decide there's no new significant information.  
9 What do you need to do?

10 MR. RAMSDELL: At the COL stage, we will  
11 issue an EIS. In that EIS, we will address each issue  
12 that we addressed previously. In the cases where  
13 there is new information, we will make a determination  
14 whether the information is significant or  
15 insignificant. If it's not significant, then we will  
16 adopt the conclusions of the EIS at the ESP stage. If  
17 it's significant, we will go on with a detailed  
18 analysis at that point.

19 JUDGE BOLLWERK: For the COL there is  
20 going to be a document that looks something like this  
21 document which is the Final Environmental Impact  
22 Statement.

23 MR. RAMSDELL: That is correct.

24 JUDGE BOLLWERK: And basically you will go  
25 through the same subcategories that you had and

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 indicate whether there were any significant changes.

2 MR. RAMSDELL: That is correct.

3 JUDGE BOLLWERK: For each one of the items  
4 that is in here.

5 MR. RAMSDELL: Yes sir.

6 MR. MOULDING: This is Patrick Moulding  
7 for the staff. Let me briefly clarify part of what  
8 the staff witness had been saying. Part of the  
9 process of the COL stage is that the applicant is  
10 responsible for identifying new and significant  
11 information and that's the information that would be  
12 submitted to the staff.

13 As Mr. Notich and Mr. Ramsdell have  
14 indicated, the staff's intention for a COL referencing  
15 an early site permit is that there would be a  
16 supplement to the Final EIS that would address  
17 significant new information and I believe that's what  
18 Mr. Notich is referring to. It's considered to be a  
19 supplement to the Early Site Permit Final  
20 Environmental Impact Statement. That is the  
21 procedural posture that the staff is using.

22 JUDGE BOLLWERK: So what that will be is  
23 a supplement to this document which deals with the ESP  
24 not necessarily a new EIS for the COL.

25 MR. MOULDING: That's correct, Your Honor.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 It's not considered to be a separate, sole COL  
2 document. But it is an environmental impact statement  
3 that's supplement to the Early Site Permit Final  
4 Environmental Impact Statement and as Mr. Ramsdell it  
5 would address significant new information in any of  
6 the resource areas analyzed for the early site permit.

7 JUDGE BOLLWERK: All right. So then again  
8 anything that comes up that's new or significant  
9 relative to environmental impacts is going to be in a  
10 supplement to this document. It's not in a separate  
11 EIS dealing with the COL.

12 MR. MOULDING: Just to be clear, I wanted  
13 to make sure that was new and significant information.  
14 The supplement to the Final EIS would not discuss all  
15 new information, but information that was determined  
16 to be new and significant.

17 JUDGE BOLLWERK: All right. And would  
18 that supplement be issued in draft with public  
19 comments.

20 MR. NOTICH: Yes sir. Yes, it will be  
21 issued in draft, made available for public comments.  
22 There would be a public comment meeting probably in  
23 this room and then the staff --

24 JUDGE BOLLWERK: Maybe a little bit better  
25 sound system.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 MR. NOTICH: Right. And upon the staff's  
2 assessment of those comments and responses, the staff  
3 will then issue the Final EIS.

4 JUDGE BOLLWERK: All right. And let me go  
5 back to one other question I asked. Let's say that  
6 you looked at whatever the Applicant submitted. You  
7 said first the Applicant will submit an environmental  
8 report or a supplement to their environmental report.

9 MR. NOTICH: Right.

10 JUDGE BOLLWERK: Identifying anything that  
11 they believe is significant and new. Is that right?

12 MR. NOTICH: Correct.

13 (Off the record comments.)

14 JUDGE BOLLWERK: And if you were to  
15 determine there was nothing new and significant, let's  
16 say the Applicant took that position and you agreed  
17 with it, what would you do?

18 MR. NOTICH: We would still issue a Draft  
19 Supplemental EIS which details that the staff looked  
20 for new information in each one of the subject areas  
21 and that if none was found then that issue resolved.

22 JUDGE BOLLWERK: Okay. So there will be  
23 some document called Supplement.

24 MR. NOTICH: Yes sir.

25 JUDGE BOLLWERK: Which identifies and

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 analyzes new and significant information or says,  
2 "We've looked at all these different areas. We've  
3 looked at what the Applicant sent us. We've just  
4 decided there's nothing." I take that would go out  
5 for comment as well.

6 MR. NOTICH: Yes sir.

7 JUDGE BOLLWERK: So if a member of the  
8 public disagreed they could say, "No, we think you  
9 missed this." Then you would have to analyze that in  
10 the Final.

11 MR. NOTICH: Yes sir.

12 JUDGE BOLLWERK: Thank you. That's very  
13 helpful in terms of understanding the process.

14 MR. NOTICH: Sure.

15 JUDGE BOLLWERK: All right. Let me turn  
16 to Judge Trikouros then.

17 JUDGE TRIKOUROS: Okay. Let me go back a  
18 little bit to page six of the presentation. The last  
19 bullet, it's basically saying that the COL applicant  
20 has to demonstrate that the accident doses, "the value  
21 of the ESP are bounded by those of the chosen design."

22 MR. ARAGUAS: That's correct.

23 JUDGE TRIKOUROS: Why is that not a COL  
24 action item or a permit condition?

25 MR. ARAGUAS: Are you saying why don't

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 have a permit condition for it?

2 JUDGE TRIKOUROS: Where is that document?

3 In other words, this is a bullet in a presentation.

4 MR. ARAGUAS: Right.

5 JUDGE TRIKOUROS: Is that a documented  
6 requirement as a COL action item?

7 MR. ARAGUAS: This promulgates at the  
8 permit condition that we talked about yesterday. If  
9 you recall the permit condition that I had on the --

10 JUDGE TRIKOUROS: No, remind me. There is  
11 a permit condition that covers this. That's what I'm  
12 getting at.

13 MR. ARAGUAS: There is a permit condition  
14 that addresses the idea that if an applicant  
15 references a certified design that they don't need to  
16 actually demonstrate that the source term that were  
17 imposed on the permit are bounded by the source term  
18 on the design, but that they only need to demonstrate  
19 that if the design Chi over Qs bound the site Chi over  
20 Qs that would be sufficient enough to demonstrate that  
21 the doses were met. That was the intent of the permit  
22 condition.

23 JUDGE TRIKOUROS: That's the permit  
24 condition.

25 MR. ARAGUAS: That's the permit condition.

1 JUDGE TRIKOUROS: That you're referring  
2 to.

3 MR. ARAGUAS: Correct.

4 JUDGE TRIKOUROS: That's fine. I just  
5 wanted to make sure of that.

6 MR. ARAGUAS: Okay.

7 JUDGE TRIKOUROS: And I have just one  
8 other.

9 MR. ARAGUAS: Absolutely.

10 JUDGE TRIKOUROS: It seems as if the new  
11 information associated with Rev 16 you've taken pains  
12 to make sure that your FEIS covers that information so  
13 when it occurs that the COL is updated to include  
14 these later revisions you'd be able to say fairly  
15 comfortably that there's no need to modify the FEIS  
16 because you've covered that information already.

17 MR. ARAGUAS: Let me just interrupt you if  
18 I may. The analysis that was done as I understand it  
19 and you can chime in after I'm done for the FEIS was  
20 not on the staff's -- Let me start over again. The  
21 staff is supposed to review the application at hand  
22 and the application at hand references Rev 15. That's  
23 for both the safety and the environmental.

24 The reason for the review of those  
25 specific issues associated with Rev 16 that was done

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 on the FEIS was necessitated through the comments that  
2 were submitted by Southern.

3 JUDGE TRIKOUROS: I understand. It's a  
4 very convenient situation in the sense that now the  
5 FEIS is current to Rev 16.

6 JUDGE BOLLWERK: At least in part anyway.

7 JUDGE TRIKOUROS: AT least in part, right.  
8 Correct. So the question that I have is was there any  
9 application of that to the SER. In other words, if I  
10 ask the same questions on the SER that were asked on  
11 the EIS, will there be a separate SER entirely for the  
12 COL rather than a supplement to an ESP SER?

13 MR. ARAGUAS: There would be a separate  
14 SER for the COL. That's correct.

15 JUDGE TRIKOUROS: On the safety side,  
16 there will be an entirely new document and it will --

17 MR. ARAGUAS: An entirely new document on  
18 the safety side.

19 JUDGE TRIKOUROS: And that's why there was  
20 no effort to factor in any of the information on the  
21 safety side.

22 MR. ARAGUAS: Correct.

23 JUDGE BOLLWERK: We still have one -- Yes.

24 MR. MOULDING: Can I add something briefly  
25 to what Mr. Araguas said earlier? Judge Trikouros,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 you asked about a specific scenario about the  
2 demonstration that accident doses evaluated at the ESP  
3 are bounded by those of the chosen design and I just  
4 wanted to point to the overarching regulation that  
5 governs how that comparison is done is in 52.79(b)  
6 which discusses what occurs at the combined license  
7 stage for a combined license application referencing  
8 in the ESP and one of the things it mentions is that  
9 the final safety analysis report, again this is for a  
10 COL application, must either include or incorporate by  
11 reference the early site permit site safety analysis  
12 report and must contain in addition to the information  
13 and analyses otherwise required information sufficient  
14 to demonstrate that the design of the facility falls  
15 within the site characteristics and design parameters  
16 specified in the early site permit. So that's a part  
17 of the general (Inaudible) on that comparison.

18 JUDGE BOLLWERK: I think you faded out  
19 there at the end.

20 JUDGE TRIKOUROS: Okay. For the Final SER  
21 we'll fill in all the sections that weren't in the SER  
22 for the ESP, but the sections that were ESP sections  
23 will be included in that SER. So it would be one  
24 Final SER that's complete.

25 MR. MOULDING: Sorry. What I was reading

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 from there is that site safety analysis report, in  
2 other words, this is the contents of the Applicant's  
3 application. We're not talking about the safety  
4 evaluation report from the staff, rather the contents  
5 of the application, and to what extent that is  
6 supposed to incorporate the material submitted for the  
7 ESP application, in other words, the Applicant's site  
8 safety analysis report.

9 JUDGE TRIKOUROS: All right. Thank you.

10 JUDGE BOLLWERK: Judge Jackson, do you  
11 have any questions?

12 JUDGE JACKSON: No.

13 JUDGE BOLLWERK: All right. Let me make  
14 one comment and then I'll ask then one more question  
15 relative to a matter that the Board raised.

16 I recognize much of this we talked about  
17 is procedural but it is important and useful to us to  
18 understand and I think the other boards that might  
19 come after this one. We've heard for instance there  
20 may be another ESP filed in the near future. Who  
21 knows what will happen. But in any event to  
22 understand how this process works and how the  
23 interrelationship between the different aspects of the  
24 safety side and the environmental side both with  
25 respect to the ESP and the COL operate and we

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 appreciate the information you've provided us.

2 Let me raise one other question that the  
3 Board raised in March 6<sup>th</sup> memorandum and order at page  
4 five. We posed the question, "What impact if any  
5 would the Commission's recent rule change on aircraft  
6 crashes have relative to the early site permit?"

7 MR. ARAGUAS: Let me start off by saying  
8 that I have not personally had a chance to read  
9 through the rule, but it's my understanding that the  
10 Aircraft Impact Rule would not affect the issuance of  
11 the ESP or the LWA. Additionally, it's my  
12 understanding that the rule has not been published  
13 yet.

14 JUDGE BOLLWERK: That's true.  
15 Nonetheless, the Commission has voted it out, but  
16 apparently nobody has seen it.

17 MR. MARTIN: If you would like, I can add  
18 a little bit more detail. As Mr. Araguas has noted,  
19 it hasn't been published yet. We had the staff  
20 requirements memorandum from the Commission and  
21 they've asked the staff to have it published by June  
22 5<sup>th</sup> and there's a 30 day effective date after that.

23 But regardless of when it's actually  
24 published, the text of the rule itself, specifically  
25 Section 50.150 discusses to whom the rule applies and

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 it doesn't apply to applicants for an early site  
2 permit or for an LWA. It specifically applies amongst  
3 others to COL applicants and also applicants for  
4 design certification. So by the terms of the rule, it  
5 does not appear to apply to an ESP applicant.

6 JUDGE BOLLWERK: All right. Anything the  
7 Applicant wants to say about that?

8 MS. SUTTON: Your Honor, we would agree  
9 with that. The text of the rule is clear on its face  
10 that it does not apply to this particular proceeding.  
11 In addition, with respect to the COL, we just would  
12 note that Westinghouse did voluntarily submit  
13 information to the NRC in April of '08 addressing the  
14 rule and that is currently the subject of the ongoing  
15 DCD Rev 17 rule-making and therefore that places it  
16 outside of the scope of the adjudicatory proceedings.

17 JUDGE TRIKOUROS: Is that technical report  
18 I think it's 126? Is that the one you're referring  
19 to?

20 MS. SUTTON: Your Honor, I don't have the  
21 number on it. I have the April 2008 date.

22 JUDGE BOLLWERK: All right. Anything  
23 further that the staff then wants to say on that  
24 subject or the Board? Other Board member?

25 (No verbal response.)

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 JUDGE BOLLWERK: All right. At this  
2 point, gentlemen, we appreciate the evidence that  
3 you've given us, the information you've given us, on  
4 this subject as well as the others you've helped us  
5 with and thank you very much for your service to the  
6 Board being with us these past three days. Thank you  
7 very much. Appreciate it.

8 All right. At this point, I think we have  
9 completed all the presentations that we had scheduled  
10 for the Early Site Permit Mandatory Hearing. I've  
11 checked through briefly. I believe all the exhibits  
12 have been marked and admitted. This record as is the  
13 case with the one in the contested case will not close  
14 until after we do the transcript corrections and that  
15 again would be under the order that we issued I  
16 believe 14 days from today.

17 The transcripts are beginning to show up  
18 or should be showing up in ADAMS soon if you haven't  
19 seen them already. I'm not sure about the status of  
20 the -- Maybe Mr. Cutchin while I'm speaking can check  
21 with our folks back in Washington. Are the videos of  
22 the contested hearing on the DDMS yet? We'll check  
23 that out.

24 Again without the transcript we have  
25 nothing to correct it against, but did you all order

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 a separate set of the transcript? Have you received  
2 it yet? I know I've seen an electronic version  
3 anyway.

4 MR. BLANTON: We have not seen any  
5 transcripts of the contests hearing yet, Your Honor.

6 JUDGE BOLLWERK: We'll be checking on that  
7 back in Washington actually to find out where it is  
8 because I know there is an electronic version that's  
9 floating around. So we need to find out about when  
10 they could get that on. Did you say you put in a  
11 separate order?

12 MR. BLANTON: We did and we've contacted  
13 the court reporting company and they informed us they  
14 had delivered at least some days of the transcript to  
15 NRC, but it has not shown up on ADAMS as of this  
16 morning. I just got an email.

17 JUDGE BOLLWERK: All right. I take it --  
18 Did you order a separate paper copy or were you just  
19 going to wait for the HD?

20 MR. BLANTON: We ordered a paper copy as  
21 well and have not received that.

22 JUDGE BOLLWERK: Okay. That would be  
23 something you need to take up directly with the court  
24 reporting service but in theory they exist. I've seen  
25 the electronic version. So you may want to check on

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 that.

2 I should mention with respect to those and  
3 we'll be probably be putting our an order. There will  
4 be revisions to be made. I know some of the exhibit  
5 numbers because of the number of zeros in them at a  
6 minimum we had on all this are going to need to have  
7 some changes made to them. That may be the case with  
8 this transcript as well, but that's something we can  
9 work through. I don't think that's a big problem.

10 It is also our intent with this transcript  
11 and with the contested case at some point to be able  
12 to marry them with the video and the DDMS and you'll  
13 have that available to you hopefully before your  
14 proposed findings are due. So at least that would be  
15 of some use, although it may be within -- I think  
16 we're going to have to wait until after we do the  
17 transcript provisions which we won't be able to do  
18 until we get the information from you all in terms of  
19 what you want to change.

20 With respect to the mandatory hearing, I  
21 should mention again that there was a separate date  
22 for the proposed findings which I believe is May 22<sup>nd</sup>.  
23 That date was set again with the expectation that you  
24 all then would have some period of time after the  
25 reply findings were due in the contested case to be

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 able to prepare those. So that would be the date  
2 that's applicable here.

3 We only ask for one round of proposed  
4 findings and conclusions. I think that would be  
5 probably adequate. Having said that, if after reading  
6 what you have exchanged, anyone feels the need for  
7 reply findings you can contact the Board. We'll be  
8 certainly willing to consider that request.

9 But at this point, I think based mostly on  
10 my experience with the Louisiana Energy Services  
11 cases, it seemed that one round from each party was  
12 sufficient. If you all disagree and you think there's  
13 something else you want to file let us know and we'll  
14 certainly consider it.

15 In terms of the mandatory hearing process  
16 itself that we've conducted, I think the Judges are  
17 very well satisfied with the information we've gotten  
18 and the way the presentations were made by both  
19 parties. We think the witnesses were very  
20 forthcoming. We thought the slide presentations were  
21 on the whole very good and provided us the information  
22 we needed.

23 So I think this seemed to work for us.  
24 I'm not sure how it worked for you and I'm not sure  
25 how it worked for you. That may be something we need

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 to have in some offline discussion or some other form  
2 a discussion about because although it's not clear  
3 we're going to be doing any more mandatory hearings,  
4 at least, through the Board. Maybe you can take this  
5 experience and pass it along to the Commission. I  
6 have no idea how that's going to play out. But again  
7 we do appreciate the information you gave us. It was  
8 useful to us and will help us in making a well-  
9 reasoned decision relative to the mandatory hearing  
10 side.

11 I do apologize for the audio problem. As  
12 you know, we had a good system I think with the  
13 contested hearing. We had a major component fail on  
14 us that worked Friday afternoon and didn't work when  
15 we got here on Monday and it didn't work on Sunday  
16 afternoon either for the limited appearances and I  
17 apologize for that. But hopefully you will still find  
18 what's in the DDMS in terms of the video if you want  
19 to use it useful notwithstanding all the tapping on  
20 the microphones and again I apologize for that.

21 We aren't happy with it and I know you  
22 aren't and I think one of the lessons we learned from  
23 it is maybe we need to have additional backup.  
24 Although it's always a question of just send money for  
25 the additional backups for some of the major

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 components of the system in case they do fail because  
2 we thought the system worked well in Augusta. But it  
3 didn't hold up here. In fact, I think we're talking  
4 about taking these microphones back because we don't  
5 think they're working properly in any event.

6 In terms of the logistics that were  
7 involved here, I obviously very much appreciate the  
8 help of our IT specialists, Joe Deucher, Mack Cutchin,  
9 the folks in Washington, D.C., Andy Welkie who is  
10 still online. We've been doing a lot of -- We have  
11 actually a chat function through DDMS we can use and  
12 they've been in consistent communication to try to  
13 keep things updated in terms of the exhibits so we  
14 know what's going on back there as well and they are  
15 aware of what's going on here. When we had new  
16 exhibits coming in, they were informed pretty promptly  
17 that was going to happen.

18 Wen Bu, our law clerk, has been an  
19 invaluable assistant to the Board. Ashley Prange who  
20 is actually now in Crow Butte up in -- I believe she's  
21 in Rapid City, South Dakota. She's sort of spent a  
22 little time with us and headed up there. So it's a  
23 busy time for the panel and the boards and we  
24 appreciate the help she was able to give us here.

25 Our court reporter who has been with us

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 the whole time. I think he has a few gray hairs given  
2 the size of the panels we've presented him with, but  
3 we do appreciate his efforts as well.

4 And here at the Augusta Technical College,  
5 the Waynesboro/Burke Campus, Vicki Garrison who has  
6 been of invaluable assistance to us. If you all are  
7 looking to use this facility, Vicki Garrison is your  
8 contact person. She's been wonderful with us and I  
9 hope she would give the same benefit and then Robert  
10 Rutledge who has gotten the building open for us. If  
11 the front doors aren't open and we get here at 7:45  
12 a.m. this doesn't start and he's been great in terms  
13 of both opening them and closing them at night keeping  
14 our equipment safe. So we do appreciate his efforts  
15 as well.

16 I am told that last week is ready on the  
17 DDMS in terms of the video if you want to be in  
18 looking at it and for this week in terms of the  
19 mandatory hearing by Thursday or perhaps Friday the  
20 video should be available as well. And in terms of  
21 the transcripts, we'll certainly check from our end.  
22 If you ordered a separate copy of it though, you  
23 should check with them because you've paid for that  
24 and in theory they should be doing what they need to  
25 do with you and the staff obviously depends on what we

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 are.

2 I know the electronic version is around  
3 for the last week. I just don't know where it is in  
4 terms of ADAMS and the paper copies. They may be  
5 sitting on your desk back in Washington for all I  
6 know.

7 Any of the Board members have anything  
8 they want to say at this point?

9 JUDGE JACKSON: I'd just like to thank  
10 everyone for their patience in answering all our  
11 questions. We appreciate it very much.

12 JUDGE TRIKOUROS: I'd second that and  
13 again I'll reiterate that everything has been very  
14 professional, extremely pleasant, for us to work under  
15 these conditions and we thank you for that.

16 JUDGE BOLLWERK: And it's been a long ten  
17 days here, seven days of hearing, ten days in all when  
18 you look at all the travel time and the weekend in  
19 between. This was not a sprint. It was a marathon,  
20 but I think we've gotten to the end and I would  
21 certainly agree as I expressed in the contested case  
22 last week very professional on the behalf of everyone  
23 that's been involved. We do appreciate it.

24 One other thing I should remind you. I  
25 still do need -- I have the staff's I believe. From

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 the Applicant, I do need your cross examination or  
2 proposed cross examination questions in electronic  
3 version emailed to me at some point and I haven't seen  
4 frankly the ones from the Joint Intervenors either.  
5 I may well issue something on Friday that we have an  
6 exhibit to deal with that we still have to admit and  
7 I may have some time deadlines just to help folks  
8 along to do that.

9 MR. BLANTON: I've got one thing to raise  
10 just out of an abundance of caution.

11 JUDGE BOLLWERK: All right.

12 MR. BLANTON: Your Honor, before we close  
13 here, your question from the first of the week about  
14 which questions the Board is to answer and the 52.24  
15 findings in the notice of hearing started me thinking  
16 about what we've done here this week and I note there  
17 are a couple of -- One is sort of pro forma finding  
18 about all the notifications to agencies, local  
19 governmental agencies, have been made in 52.24.  
20 There's another one about the technical qualification  
21 of the Applicant to engage in activities. In this  
22 case, I would assume that would be the LWA that have  
23 to be made.

24 I don't think there's any controversy or  
25 probably any dispute about either one of those, but I

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 also note that there wasn't a presentation on either  
2 one of those either. So I was hoping we could put on  
3 the record either that the Applicant and the staff are  
4 both satisfied that the answer to those questions that  
5 the application complies with the requirement and see  
6 what the Board wanted to do about that.

7 JUDGE BOLLWERK: Right. We've kind of  
8 gotten caught in between here. I mean we're sort of  
9 in a change between the regulations and the notice of  
10 hearing as we talked about. If you believe it would  
11 be appropriate to provide us with an additional  
12 affidavit either jointly or from separate witnesses  
13 that addresses those particular issues, we can  
14 certainly take that.

15 Again, my intention would be to close the  
16 record fairly soon after we get the transcript  
17 corrections. Having said that, it still leaves a  
18 couple weeks. Would that be your preference if you  
19 feel there's something missing from the record? We're  
20 not trying to play Yahtzee here with anybody.

21 MR. BLANTON: Right. And I think it's  
22 implicit certainly in the SER that the Applicant is  
23 technically qualified. But I wanted to try that  
24 argument out on the Board to let you know that's what  
25 we would be saying if we didn't put anything else in

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 there. But putting some sort of affidavit in that  
2 specifies that we are a licensee of the six nuclear  
3 units and that we've made all the required  
4 notification under Part 2 which is simple.

5 JUDGE BOLLWERK: Anything you want to say  
6 about this, Mr. Moulding?

7 MR. MOULDING: I think we'd be happy to  
8 confer with the Applicant about that and see what.

9 JUDGE BOLLWERK: All right. I think the  
10 Board is certainly not in any way opposed to accepting  
11 additional information whether it's an affidavit from  
12 the parties on that particular subject.

13 MR. BLANTON: I'm just thinking forward to  
14 writing a brief and then having somebody scratching  
15 their head, coming back, asking me where this is in  
16 the transcript.

17 JUDGE BOLLWERK: I agree and where it is  
18 in the record and you're trying to do a proposed  
19 finding that has no basis for support and I would  
20 agree. I appreciate you bringing that to our  
21 attention. I would suggest talk to each other. If  
22 you need to submit another affidavit, we'll certainly  
23 take it for the record. The record isn't going to  
24 close anytime within the next couple weeks.

25 MR. BLANTON: All right.

1 JUDGE BOLLWERK: Do you want me to set  
2 some kind of a deadline for that or do you prefer to  
3 get back to us and tell us what you want to do?

4 MR. BLANTON: I would always prefer to get  
5 back with you and tell you what I want to do.

6 JUDGE BOLLWERK: Okay. Let's do this.  
7 Certainly by the time you file your proposed  
8 transcript corrections if there's going to be  
9 something about it -- That falls outside the  
10 parameters of that, but that would be the point to let  
11 us have that. That still gives you two weeks. Is  
12 that --

13 MR. BLANTON: Certainly, we'll do that.

14 JUDGE BOLLWERK: All right. Let's go  
15 ahead and set that down. All right.

16 Anything else from any of the Board  
17 members?

18 (No verbal response.)

19 Well, again it's been a long haul. Some of  
20 us have been together for the past two weeks. Some of  
21 us have been together this week. But I think we have  
22 -- From the Board's perspective, it's been a very  
23 useful experience and exercise. You've given us a lot  
24 of good information. You're going to give us some  
25 proposed findings of fact and conclusions of law that

1 tell us how you think all this ought to be organized  
2 and what we ought to be determining and we then -- The  
3 ball will be in our court as the saying goes to issue  
4 our decisions. Right now, we're scheduled to do the  
5 contested case in the middle of June and a little bit  
6 closer to the middle of July for the mandatory  
7 hearing. We hope to keep that schedule. That's our  
8 intent.

9 But Judge Trikouros is headed out to Yucca  
10 Mountain next week. So who knows what will happen  
11 with him. Hopefully we will still have his services  
12 from time to time.

13 Again, on behalf of Judge Jackson and  
14 Judge Trikouros as well as other members of the NRC  
15 team that have been here dealing with this, we  
16 appreciate all your efforts. Thank you very much and  
17 we stand adjourned. Off the record.

18 (Whereupon, at 1:28 p.m., the above-  
19 entitled matter was concluded.)

CERTIFICATE

This is to certify that the attached proceedings  
before the United States Nuclear Regulatory Commission  
in the matter of: Southern Nuclear Operating Co

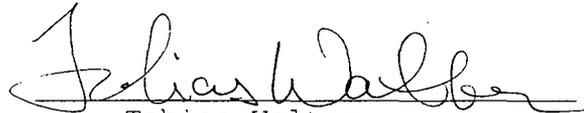

Name of Proceeding: Mandatory Hearing

Docket Number: 52-011-ESP;

ASLB No. 07-850-01-ESP-01

Location: Waynesboro, Georgia

were held as herein appears, and that this is the  
original transcript thereof for the file of the United  
States Nuclear Regulatory Commission taken by me and,  
thereafter reduced to typewriting by me or under the  
direction of the court reporting company, and that the  
transcript is a true and accurate record of the  
foregoing proceedings.
