Initial Scientific Notebook Entry for Corrosion Resistant Material Potentiostatic and Potentiodynamic Tests.

Title: Potentiaostatic tests, polarization tests, crevice repassivation tests, passive current density tests, critical pitting temperature tests, critical repassivation temperature tests.

Test Performed by: Kuang-Tsan Kenneth Chiang , Darrell Dunn , Brian k. Derby

Objective: Study the effect of Nitrate [NO_3^-] to Chloride [Cl^-] concentration ratio on corrosion resistance of candidate materials.

Equipment: EG&G Versastat Serial Number 20104. EG&G Model 352 corrosion software. NEC 586 computer. Keithley Electrometer Model 614 SN 55538 or equivalent. ASTM G-5 Polarization Cell. Large 2 L glass cells with Teflon tops. Electrochemical Impedance Spectroscopy system including Solaritron 1260 FRA and Solaritron 1287 Potentiostat. ESC 440 multichannel potentiostats with National Instruments Labview data acquisition software or Strawberry Tree data acqusition software.

Materials: Alloy C-22

Specimen Specifications: Cylindrical CPP specimens 1.195"x.250" and Crevice repassivation specimens with Teflon crevice washers attached to surface.

Measurement Parameters: Current and Potential as described in TOP-008. Temperature of solution ±2°C.

Required Level of Accuracy: Potentials ±5mV. Current less than 0.1 microamp.

Uncertainty and Source of Error: Current density calculated as current divided by sample area. Actual current density of corroding areas is not determined. Resolution limit of data acquisition systems may limit accuracy of passive current density measurements.

Formulation and Make-Up of Simulated Concentrated Water, High Ionic Content Aqueous Solution

Greg Gdowski, April 4, 1997

K.T. Chiang
11-2-03

1.0 PURPOSE

This procedure describes the formulation and make-up of Simulated Concentrated Water (SCW), a high-ionic-content water to be used for Activity E-20-50 "Long-Term Corrosion Studies." This water has an ionic content which is nominally a factor of a thousand higher than that of "representative" waters at or near Yucca Mountain. "Representative" waters were chosen as J-13 well water [Harrar, 1990] and "perched" water at Yucca Mountain [Glassley, 1996] (see Table 1). J-13 well water is obtained from ground water that is in contact with the Topopah Spring tuff, which is the repository horizon rock. The "perched" water is located in the Topopah Spring tuff, but below the repository horizon and above the water table. A nominal thousand times higher ionic content was chosen to simulate the water that would result from the wetting of salts which have been previously deposited on a container surface.

The expected composition of the SCW is given in Table 1. It is anticipated that the actual composition of test solutions will be within ± 20% of these values. The changes in the corrosive properties of the test solutions will be acceptable within these values. In addition similar type materials are tested in the same test vessel, so minor vessel to vessel variation of solution composition is of limited significance.

Both of the "representative" waters have similar corrosive characteristics. The solution pH's and the concentrations of the aggressive anions (Cl^-, F^-, and SO_4^{2-}) are essentially equivalent from a corrosion stand point.

This aqueous solution is one of the four aqueous test solutions to be used in the activity. The other aqueous solutions included a Simulated Dilute Water (SDW), a simulated acidic concentrated water (SAW), and a simulated basic concentrated water (SBW).

This TIP documents the chemical reagents, reactant air, and the procedures used to make-up the aqueous solution for Activity E-20-50. More than 12,000 liters (3,170 gallons) of Simulated Concentrated Water solution are required for the test vessels for implementation of the full test matrix of the activity plan.

2.0 SCOPE

This procedure applies to the Simulated Concentrated Water solution, one of the aqueous solutions that are to be used in the test vessels for Activity E-20-50 "Long-Term Corrosion Studies."

3.0 RESPONSIBILITIES

The Principal Investigator (PI) or designee is responsible for:

- the conduct of the activities and methods described in this procedure, and
- maintaining laboratory scientific notebooks.

The Task Area Leader (TAL) is responsible for:

- ensuring that the requirements of this procedure are implemented,
- ensuring that personnel conducting the work are qualified and are trained to this procedure,
- verifying that this procedure meets the objectives of the Scientific Investigation Plan (SIP) "Metal Barrier Selection and Testing" (SIP-CM-01, Rev.3, WBS # 1.2.2.5.1) and Activity E-20-50 "Long-Term Corrosion Studies", and
- ensuring approval of this procedure.

The YMP Quality Assurance Manager (QA Manager) is responsible for:

- monitoring the work to assure proper implementation of this procedure, and
- assuring its continued effectiveness.

Simulated Concentrated Water (SCW)

Simulated Dilute Water (SDW)

K. T. Chang
11-2-03

SCW Composition

4.0 COMPOSITION OF SCW AND REACTANT AIR

4.1 Aqueous Solution Composition

The Simulated Concentrated Water (SCW) has a ionic composition that is nominally a factor of a thousand higher than that of "representative" water of Yucca Mountain. "Representative" waters were chosen J-13 well water [Harrar, 1990] and "perched" water at Yucca Mountain [Glassley, 1996]. J-13 well water is obtained from ground water that is in contact with the Topopah Spring tuff, which is the repository horizon rock. The "perched" water is located in the Topopah Spring tuff, but below the repository horizon and above the water table. The thousand times higher ionic content was chosen to simulate the water that may result from wetting of salts and minerals that have been deposited on the container surfaces.

The composition of J-13 well water and the "perched" water are given in Table 1. Only ions with concentration greater than 0.5 ppm are included in this table. Minor constituents have been detected in J-13 well water; these include Li, B, Al, Mn, Fe, Sr, and PO_4^{3-} ions. These constituents have been reported in the 10-100 µg/liter concentration. The most consistently determined minor constituents are Li and B at mean (several studies) concentrations of 48 and 134 µg/liter, respectively. The minor constituents are not explicitly included in the SCW. However, the reagent chemicals have some impurites, which may include the above noted impurities. **The minor constituents at the reported concentrations are not expected to significantly effect the corrosion of the test specimens.**

It is worth noting the differences in the "representative" waters. In terms of the calcium and bicarbonate concentrations, the "perched" water is higher in both of these constituents, and has a higher pH; these both are probably due to contact with calcium carbonate ($CaCO_3$) minerals. The concentrations of Na^+, K^+, F^-, and NO_3^- are slightly higher in J-13 well water.

Table 1. Compositions of "representative" Yucca Mountain waters J-13 well water and "perched" water, and the estimated composition of the simulated concentrated water.

Constituent	J-13 (mg/l) (mg/l)	"Perched" (mg/l)	Simulated Concentrated Water (estimated)
Na	45.80	36	40,900
Si	28.5	37	27 (60C); 49 (90C)
Ca	13.0	25	< 1
K	5.04	1.7	3,400
Mg	2.01	2.2	< 1
F^-	2.18	0.7	1,400
Cl^-	7.14	6.3	6,700
NO_3^-	8.78	4	6,400
SO_4^{2-}	18.4	15	16,700
HCO_3^-	128.9	147	70,000
$CaCO_3$	—	—	47,500 (precipitate)
$MgCO_3$			7,300 (precipitate)
pH	7.41	8.1	

K.J. Chiang
11-02-03

The following paragraphs explain the reasoning used to arrive at the composition and formulation of the SCW. The silica content is based on solubility of α- cristobalite which is believed to be the dominant soluble silica phase of Yucca Mountain rock at 60 and 90°C [Wolery, 1983; Knauss, 1987]. Silica may be added to the solution by dissolution of sodium silicate. The salts, in general, are concentrated by a factor of a thousand over an "average" of the "representative" Yucca Mountain waters. The exceptions are calcium (Ca^{2+}), magnesium (Mg^{2+}), and bicarbonate (HCO_3^-), which are all at lower concentration.

Previous studies have indicated that extensive concentrating of water with relative ionic concentrations like those of the "representative" water (high bicarbonate) results in the precipitation of calcium and magnesium carbonates and silica-base minerals [Drever, 1982]. Calcite ($CaCO_3$) will precipitate first, with some magnesite ($MgCO_3$) co-precipitating in the calcite. The remaining magnesium will precipitate in silica-based minerals.

Simulations of concentrating the "representative" waters were run using the computer program "Geochemist's Workbend, Release 2.2" [Bethke, 1994]. The results generated were in agreement with the qualitative predictions based on the general solution composition. All of the calcium and magnesium was effectively precipitated during concentrating of the solution; a few ppm of each remained in solution.

The estimated composition of the SCW is given in Table 1. It is expected that the actual composition of test solutions will be within ± 20% of these values. The changes in the corrosive properties of the test solutions within these values will not be significant. In addition similar type materials are tested in the same test vessel, so minor vessel-to-vessel variation of solution composition is of limited significance.

4.2 Reactant Air

Reactant air is compressed building air which has been purified to remove hydrocarbons and water. Air will be purified by flowing through a Whatman Zero Air Generator (see Section 6.0). Nominal flow rates through each test vessel will be 200 ml/min. Air will exit through a condenser to remove water; this greatly reduces the amount of water loss from the test vessels.

Reactant air serves two purposes: 1) it keeps the oxygen content of the vessels constant, and 2) the slightly pressurized test vessel will keep the potentially contaminated room air out of the test vessels.

5.0 REAGENTS AND FORMULATION

5.1 Reagent Chemicals

In order to obtain the solution composition given in Table 1, various combinations of chemicals can be used. A spreadsheet has been developed which calculates the composition of a solution based on the added chemicals. **Copies** of typical outputs of the spreadsheets **are** shown in Appendix A **for 60 and 90°C solutions; the amount of silica changes with temperature.** Many of the chemicals listed in the spreadsheet are not used in this particular example. The inclusion of numerous chemicals in the spreadsheet allows the user the freedom to choose the needed chemicals based on availability, cost, and personal preference.

The algorithm to arrive at reagent concentrations was a trial and error method. The quantities of reagents required was estimated, and the spreadsheet calculated the total ionic content of the theoretical solution. Iteration was continued until an acceptable match was achieved.

A few guidelines were used in choosing the reagents. The choices for bicarbonate ions **were** $NaHCO_3$ **or** $KHCO_3$, since **these are** the common commercial source of bicarbonate. The use of potentially hazardous materials such as HF, MgF_2, and CaF_2 was avoided. The more soluble salts (minerals) were chosen, for example, magnesium sulfate was chosen over the less soluble carbonate and nitrate salts.

K.T. Chang
11/02-03

Also solution silica will be obtained by the addition of sodium silicate. (Calculations showed that dissolution of solid silica phases would take extended periods of time (>1000 days) in order for sufficient amounts of silica to dissolve.) Note using sodium silicate will result in slightly elevated sodium concentrations.

Using sodium silicate will result in the formation of hydroxyls equal to the number of moles of sodium atoms added. **In order to neutralize the hydroxyls, an equal number of moles of acid (hydrochloric, nitric, or sulfuric) will be added.**

Since a large percentage of both the calcium and magnesium will form carbonate precipitates, it was not necessary to add soluble salts of these ions to the level of the concentrating. However excess of these ions will be added such that precipitates of calcite and magnesite will form.

A word of caution in using the spreadsheet: the calculations assume that the chemicals dissolve completely and may therefore over estimate the composition of some species. The user must therefore be aware of potential solubility problems. A listing of the solubilities of various chemical is shown in Appendix B.

A typical example of chemicals used to make-up of the aqueous solution are listed in Table 2 along with the quantities required per 1000 l of solution.

Table 2. An example of the reagents and quantites required per 1000 liters of simulated aqueous solution.

Reagent	Quantity @ 60°C (gms / 1000 liters)	**Qualtity @ 90°C (gms / 1000 liters)**
$NaHCO_3$	**128,450.0**	**128,297.0**
NaF	**3,182.6**	**3,182.6**
Na_2SO_4	**12,236.4**	**12,254.5**
$Na_2SiO_3 \cdot 5H_2O$	**204.0**	**370.0**
$MgSO_4 \cdot 7H_2O$	**21,392.0**	**21,392.0**
$CaCl_2 \cdot 2H_2O$	**7,598.0**	**7,598.0**
$Ca(NO_3)_2 \cdot 4H_2O$	**12,168.5**	**12,168.5**
HCl	**3.73**	**70.1**
KCl	**6,417.8**	**6,282.0**
$KHCO_3$	**10.4**	**192.5**
$CaCO_3$	**37,117.3**	**37,117.3**
H_2SO_4	**89.3**	**76.79**

K.T. Chang

11-2-03

The chemicals and the quantities used in making up the test solutions will be listed in the Scientific Notebook or electronic media.

5.2 Purified Water

The make up of the test solutions requires large quantities of low ionic content water is required. The use of LLNL de-ionized water is acceptable. This water has an ionic content typically less than 1 ppm. This is less than 0.001% of the ionic content due to the added chemicals. The source of the water used in testing will be recorded in the scientific notebook.

5.3 Reactant Gas

The reactant air will be purified before entering the test vessels.

6.0 EQUIPMENT

A balance that can measure to 0.1 grams is acceptable for make-up of the test solutions. An acceptable balance is:

Mettler Balance Model # AT200
Serial Number 1114463500

Mettler Balance Model # PC16
Serial Number A51361

An air purifier for cleaning the building compressed air is required. The following unit or equivalent is acceptable:

Whatmann Type 76-818NA Zero Air Generator
Unit Serial Number 768180065B
Tower Module Serial Number 76811-10116B

This air purifier removes hydrocarbon to 0.1 ppm.

7.0 PROCEDURE

The following procedure will be followed in making-up of the Simulated Concentrated Water solutions for the test vessels:

1) Purified water is emplaced in the cleaned vessel; the liquid level is slightly less than the required depth for testing. (Need to account for rise in water level due to the specimens and racks, and the density decrease due to raising the water temperature to the test temperature.)

2) The amount of purified water added to the test vessels is estimated.

3) The required amounts of reagent chemicals is determined and entered in the scientific notebook or electronic media.

4) The purified water is heated to a nominal temperature of 40°C. This will accelerate reactions that occur in solution.

5) The water will be stirred. The stirrer mounted on the vessel is sufficient.

K. J. Chang
11-2-03

6) **Add chemicals to water. No particular order is required for chemical additions except that sulfuric acid will be the last chemical added to the test vessel.**

7) **Concentrated sulfuric acid shall be diluted 500-1000 times the required volume using deionized water and then added to the test vessel.**

8) **The vessel is sealed and brought to testing temperature for at least 24 hours.**

9) **The specimen racks are inserted into test vessel.**

10) **A sample of the test solution is withdrawn for analysis approximately a day after the level of water reaches the normal operation set point.**

Note: The liquid level in the test vessels will self-adjust to the required level. If the liquid level is low, the liquid level control system will add purified water. If the liquid level is high, water removal by the air purge will occur; this may be slow but it will occur. It is preferred to add water rather than to remove water, since the control system shuts down the heaters when the liquid level is above a certain height.

8.0 QA RECORDS

Any data that is pertinent to this TIP shall be entered into the Scientific Notebook or electronic media for Activity E-20-50. This shall include, but is not be limited to the chemical used lot # manufacturer supplied analysis, and actual reagent chemical amounts used for make-up.

11/19/03

New Test Matrix:

Continue with C-22 Cylinders Ht # 2277-3:3266

Solution will be Simulated Concentrated Water
But Instead of Removal of $NaF - Na_2SO_4$
And $NaNO_3$ will Decrease Molarity of Solution
* Note: will Reduce Molarity of Each Reagent $NaF - Na_2SO_4$
And $NaNO_3$ In Simulated Concentrated Water
See Each Individual Test for Concentrations

Temp: will Remain 95°C

All other test parameters will Remain the same

All other Equipment will Remain the Same through out
Testing In Simulated Concentrated Water

1/2 pore water calculation from Bobby Pabalan

Kuang-Tsan Ken Chiang

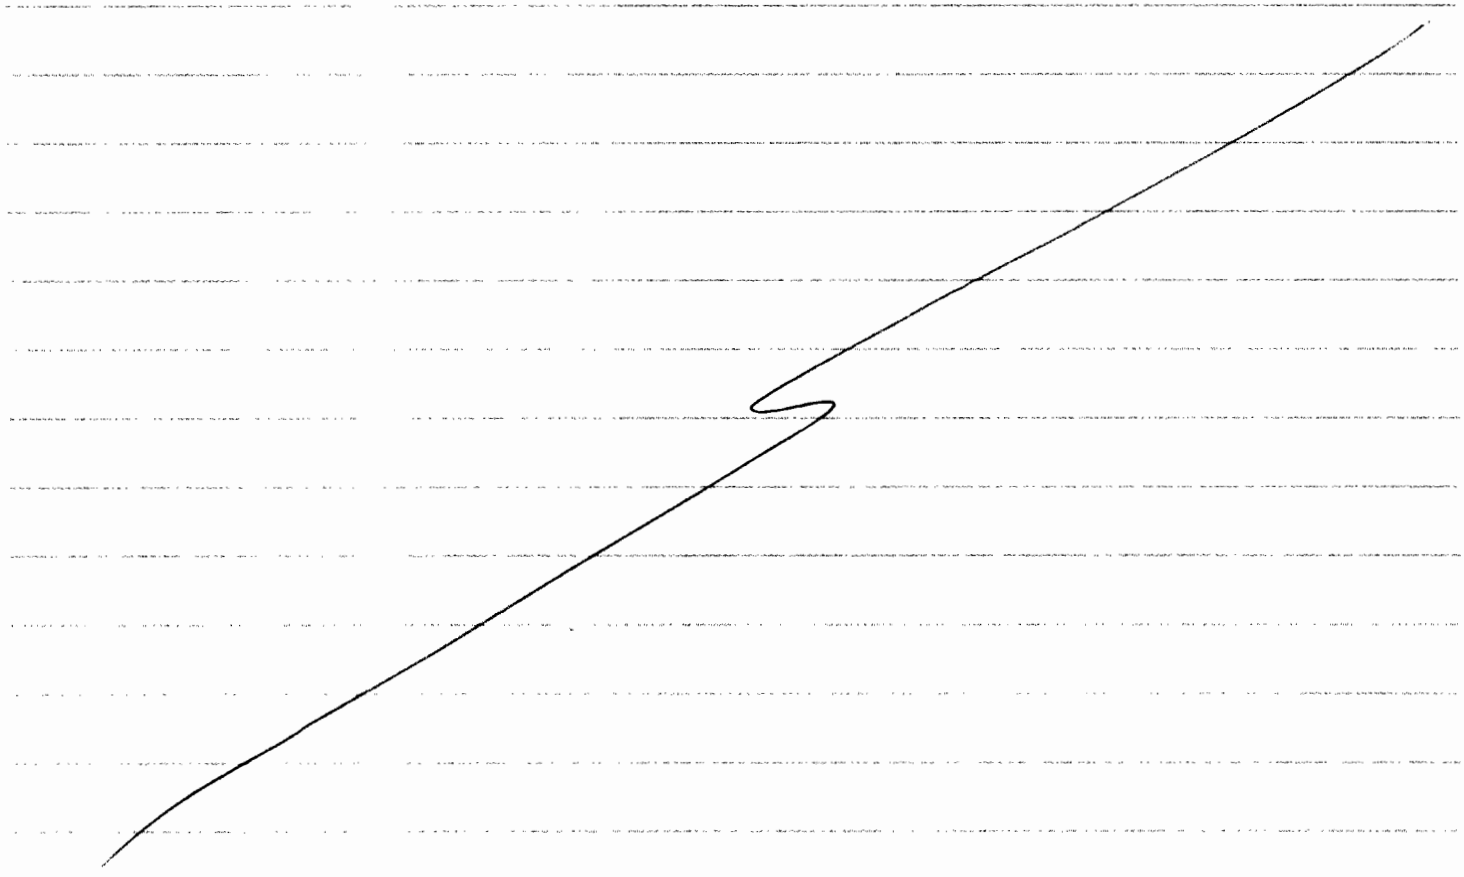
From: R Pabalan [rpabalan@cnwra.swri.edu]
Sent: Wednesday, December 03, 2003 1:33 PM
To: Darrell Dunn; Ken Chiang
Subject: UZ porewater evaporation results

Synth UZ rewater Evap at 95-

Darell, Ken,

Attached is a Word file with plots of pH, ionic strength, and aqueous species concentration as a function of concentration factor and temperature (95, 110, 125, and 140 C) for UZ porewater. The porewater composition was taken from Rosenberg et al. (2001).

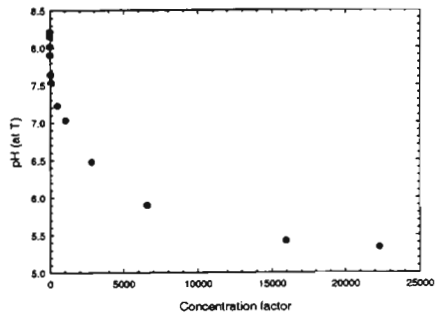
bobby



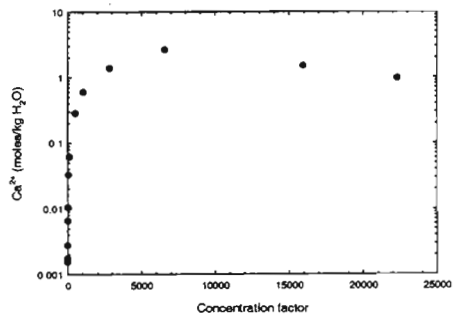
K. J. Chiang 12/4/03

Synthetic UZ porewater evaporation at T=95 °C

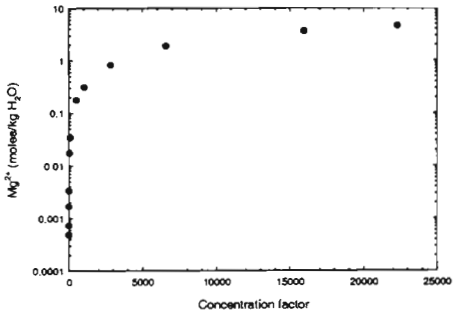
pH vs conc. factor



[Ca^{2+}] vs conc. factor



[Mg^{2+}] vs conc. factor



[Na^{+}] vs conc. factor

Slow Strain Rate Test

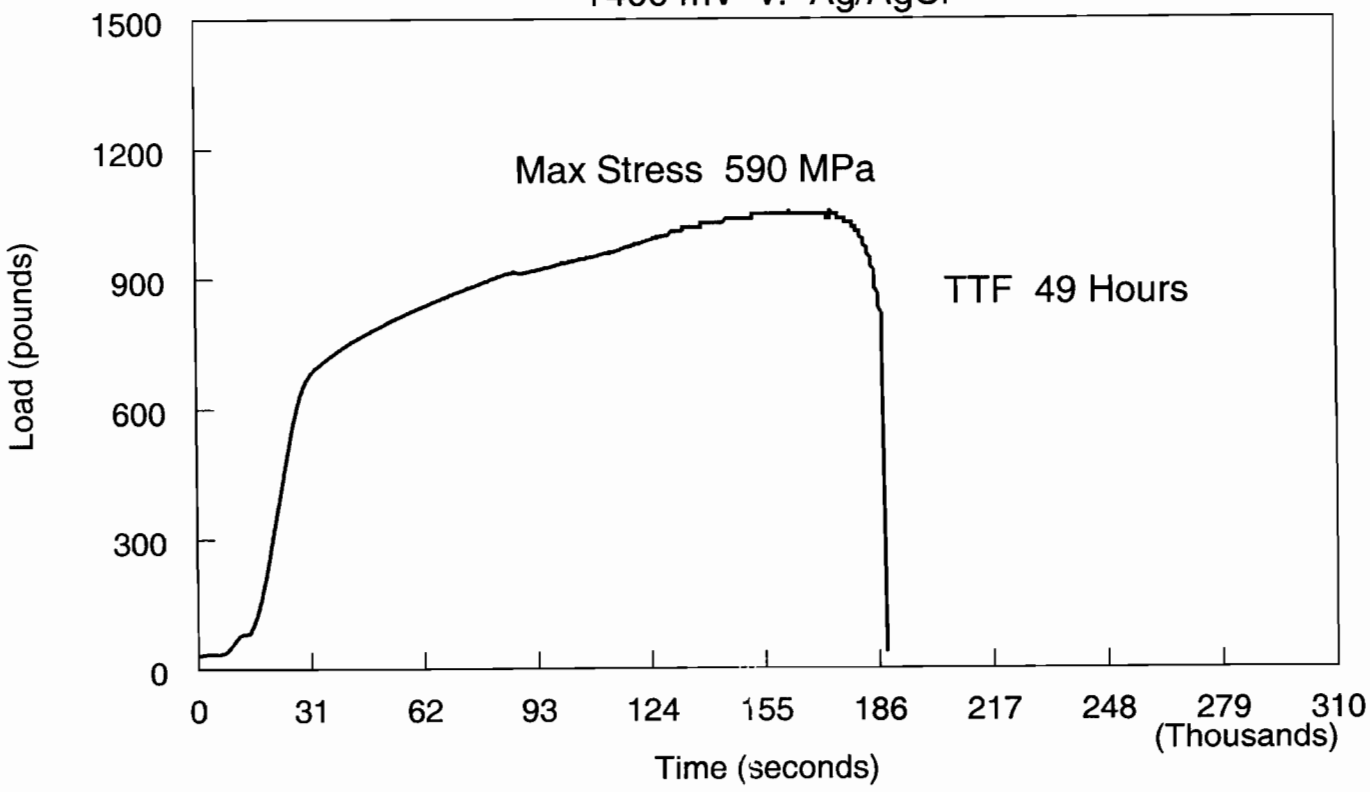
SCW minus F and SO4

SSRMA22_SCW17

+400 mV v. Ag/AgCl



This is a duplicate of SSRMA22_SCW16 which was run due to the failure of the probe in *_SCW16.

Walter J. Mackerras
6/12/04

It should be noted that in solutions containing HCO3, the amount of OH required to raise the pH is relatively considerable. There is an equilibrium that exist between CO3, HCO3, and OH such that in any solution only two of these can exist in appreciable quantities. The effect here is that the addition of OH reduces the HCO3 concentration by converting it to CO3. Therefore adjusting the pH of these solutions with OH is, in effect, altering the HCO3 concentration of the original SCW solution.

Calculation Summary

SinglePoint_NaOH Calculation for Work1

Automatic Chemistry Model
Databanks:
Public

Unit Set: Default

Isothermal Calculation
Temperatu 25 °C
Pressure 1 atm

Stream Inflows

Water	1000 g
Sodium chl	0 g
Potassium	6.46 g
Sodium nitr	8.758 g
Sodium sul	20.697 g
Sodium bic	96.349 g
Sodium flu	3.096 g
Sodium hyc	9 g

Speciation Summary

Total number of species: 113

SLOW STRAIN RATE TEST

Objective: see page #5 Notebook #695

Specimen: MA Alloy 22 SwRI Drawing # 20-03704-042-001

Heat # ~~2277-8-3266~~ 2277-3-3266 BIO 6/27/06

* **Solution:** α 1/2 L

14,928 g NaCl #041475

264.58 g KCl #006242

Reagents measured with **Model:** OHAUS **SN:** 2883

Cal: ~~15 JUL 04~~ 15 JAN 05 BIO 6/27/06 **Due:** ~~15 JAN 05~~ 14 JUL 05 BIO 6/27/06

Counter Electrode: Pt flag **Reference Electrode:** Ag/AgCl w/ 3M KCl in house

Gas: N_2 (99.999) **Ecorr:** −263 mV

* **Eapplied:** +415 mV **Potentiostat:** EG&G 440-2 **SN:** 920913 8

Specimen Visual: metallic silver-gray ductile fracture

$\dot{\epsilon}^0 = 3.2 \times 10^{-6}\ s^{-1}$

* above saturation * problem w/ probes, Eapp not accurate (see data)

data file: SSRMA22_SCW30

Walter J. Mackowiak

POTENTIODYNAMIC TEST

Objective: see page #5

Specimen: C-22 Cylinder Heat # 2277-3-3266 polishes To A 600 Grit Finish

Initial Weight: 12.70363g
Final Weight: 12.69287g
Model: Sartorius Genius
Cal 11/10/04
SN: 12809099
Due: 5/10/05

SOLUTION: 0.5 m NaCl + 7.1 m KCl
58.45g NaCl Lot # 041475
1058.79g KCl Lot # 035662
+ DI To 2000 mls
* Not Soluable

Reagents measured with
Model: OHAUS
Cal: 7/15/04
SN: 2883
Due: 1/15/05

Initial pH: 7.013
Final pH: 7.647
Model: orion
CAL: 7/21/04
pH Probe: #13-620-296
SN: 2330
DUE: 7/21/05
SN: 4079126

TEST TEMPERATURE: 95°C
Measured with Hg Thermometer SN: 188304
Cal: 1/6/05
Due: 7/6/05

Counter Electrode: Platinum Flag

Reference Electrode: Fisher SCE 13-620-51 **SN:** 9214081

Gas: 99.999% Nitrogen

Ecorr: -322 mv
Ept: -56 mv
Model: Keithley 614
Cal: 6/7/04
SN: 0704936
Due: 6/7/05

Potentiostat: Solartron 1287. **SN#** 00148500

Specimen Examination: No Visual Sign of Corrosion or Pitting Very Mild Surface Staining mainly At Solution Vapor Interface

* Solution Above Saturation - Solid In Bottom of Test Cell
