LaSalle County Station, Units 1 and 2
Facility Operating License Nos. NPF-11 and NPF-18
NRC Docket Nos. 50-373 and 50-374

Subject: Additional Information Supporting the Request for a License Amendment
to Revise Local Power Range Monitor Calibration Frequency

- References:
1. Letter from Mr. P. R. Simpson (Exelon Generation Company, LLC) to U. S. NRC, "Request for a License Amendment to Revise Local Power Range Monitor Calibration Frequency," dated July 25, 2008
 2. Letter from U. S. NRC to Mr. C. G. Pardee (Exelon Generation Company, LLC), "LaSalle County Station, Units 1 and 2 – Request for Additional Information Related to License Amendment Request to Revise Local Power Range Monitor Calibration Frequency (TAC Nos. MD9414 and MD9415)," dated October 1, 2008
 3. Letter from Mr. P. R. Simpson (Exelon Generation Company, LLC) to U. S. NRC, "Additional Information Supporting the Request for a License Amendment to Revise Local Power Range Monitor Calibration Frequency," dated October 31, 2008
 4. Letter from Mr. P. R. Simpson (Exelon Generation Company, LLC) to U. S. NRC, "Additional Information Supporting the Request for a License Amendment to Revise Local Power Range Monitor Calibration Frequency," dated February 17, 2009

In Reference 1, Exelon Generation Company, LLC (EGC) requested an amendment to the facility operating license for LaSalle County Station (LSCS), Units 1 and 2. Specifically, the proposed changes will revise Technical Specification (TS) 3.3.1.1, "Reactor Protection System (RPS) Instrumentation," Surveillance Requirement (SR) 3.3.1.1.8 and TS 3.3.1.3, "Oscillation Power Range Monitor (OPRM) Instrumentation,"

May 8, 2009
U. S. Nuclear Regulatory Commission
Page 2

SR 3.3.1.3.2 to increase the frequency interval between Local Power Range Monitor (LPRM) calibrations from 1000 effective full power hours (EFPH) to 2000 EFPH.

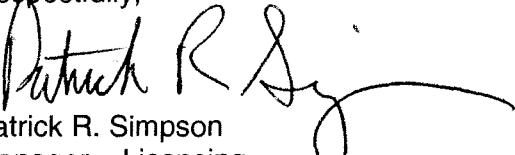

In Reference 2, the NRC requested that EGC provide additional information in support of their review of Reference 1. The response to this NRC request was provided in Reference 3. Following their review of the responses provided in Reference 3, the NRC requested by email that EGC provide additional information to support their review of Reference 1. The response to this request was provided in Reference 4. Based on their review of the responses to these requests, the NRC requested by email, additional clarification of the responses provided in Reference 4. The additional clarification is provided in the attachment to this letter.

EGC has reviewed the information supporting a finding of no significant hazards consideration that was previously provided to the NRC in Reference 1. The additional information provided in this submittal does not affect the bases for concluding that the proposed license amendment does not involve a significant hazards consideration. No new regulatory commitments are established by this submittal.

If you have any questions concerning this letter, please contact Mr. Timothy A. Byam at (630) 657-2804.

I declare under penalty of perjury that the foregoing is true and correct. Executed on the 8th day of May 2009.

Respectfully,

Patrick R. Simpson
Manager – Licensing
Exelon Generation Company, LLC

Attachment: Additional Information Supporting the Request for a License Amendment to Revise Local Power Range Monitor Calibration Frequency

ATTACHMENT

Additional Information Supporting the Request for a License Amendment to Revise Local Power Range Monitor Calibration Frequency

SRXB-1

RAI-1 requested the licensee to provide an uncertainty analysis using decay constants specific to the LPRM detectors at the LSCS. The results should demonstrate that the uncertainties based on a fixed decay factor bound that based on the LPRM specific decay factors for the LSCS. In the response, the licensee did not provide the requested analysis. Instead, it summarized the results of its analysis and indicated that: (1) the analysis used in support of the LAR was based on a fixed decay factor of -0.092, which is based on manufacturer's data; and (2) the decay constant used in the CMS will be adjusted to -0.100 to assure that the evaluated LPRM uncertainty is within the bounds of SLMCPR analysis.

With the results of the analysis with the fixed decay constants of either -0.092 or -0.100, the NRC staff is not sure whether the results are adequate to represent the actual data with values of the decay constants specific to various LPRM detectors at the LSCS. To resolve this RAI satisfactorily, the licensee should provide a discussion or an analysis (such as the requested detector specific decay constant analysis) to show that the assumption used in the analysis in support of the LAR is valid, i.e., the uncertainties based on a fixed decay factor bound that based on the LPRM specific decay factors for the LSCS. If the licensee uses an existing analysis to support the RAI response, it should address applicability of the existing analysis to the LAR. The RAI response should identify the effects of any plant specific deviations, such as the LPRM exposure data that may be collected from different models of LPRM detectors, or methods for the uncertainty analysis that may be based on different ranges of the LPRM exposures to represent a nominal exposure value.

Response

The GE Local Power Range Monitor (LPRM) detectors used by Grand Gulf (i.e., NA-250) and used by LaSalle County Station (LSCS) (i.e., NA-300), are regenerative sensors. A regenerative sensor contains U-234 and U-235 in the coated surface. The U-235 absorbs neutrons and produces fission fragments that ionize the gas in the fission chamber. The ionized particles are collected by the sensor electrodes, and produce a detector signal that is proportional to the neutron flux incident on the detector. The fission rate is due primarily to thermal neutron flux, since the product of neutron flux and fission cross section in the thermal region is significantly greater than in the epithermal and fast neutron regions. The U-234 atoms absorb neutrons, become U-235 atoms, and the new U-235 atoms are then available for future fission events. Due to the similarity in the characteristic behavior of the detectors used in Grand Gulf and LSCS, the conclusions presented by Grand Gulf showing the fixed decay constant bounds the specific decay constant is applicable to LSCS.

Previous analysis for Grand Gulf presented results where LPRM calibration currents were based upon LPRM specifically derived calibration curve slopes (Reference 2). This data was presented because this was the method employed in the core monitoring system at Grand Gulf. It was demonstrated that these results were more accurate than the results utilizing a fixed value for the LPRM calibration current slope and therefore provided additional margin (i.e., less uncertainty). LSCS does not utilize LPRM specific

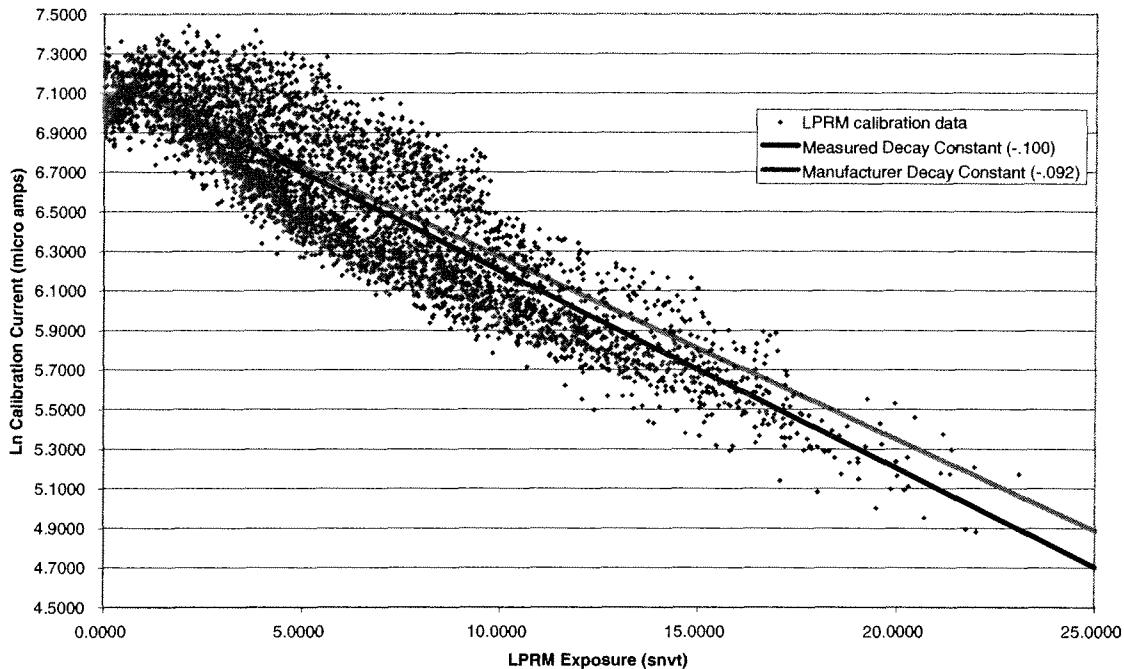

ATTACHMENT

Additional Information Supporting the Request for a License Amendment to Revise Local Power Range Monitor Calibration Frequency

decay constants so an evaluation of the uncertainties based upon individual LPRM decay constants is not applicable to LSCS.

LPRM calibration data for the NA-300 type LPRMs was collected for both LSCS Units 1 and 2 over a period of several years (Enclosure 1). During this time the core monitoring system (CMS) was accumulating LPRM exposure using the MICROBURN-B (1996 – 2004) or the MICROBURN-B2 (2004 – 2006) LPRM flux calculations. The core monitoring system evaluates the LPRM sensitivity between calibrations based upon this same LPRM flux calculation and a single input value for the variation in sensitivity as a function of LPRM fluence (i.e., exposure). In order to evaluate the uncertainty of this core monitoring system it is necessary to evaluate the variance in the actual and expected LPRM sensitivity. This is the analysis that was presented in the original License Amendment Request (LAR) and following Requests for Additional Information (RAIs). In order to project the uncertainty associated with longer calibration intervals, intermediate calibrations were ignored and the projected sensitivity is based upon the calibration one or more calibration steps previous. The projected sensitivity is based upon the single input value for the variation in sensitivity as a function of LPRM fluence. The measured calibration currents, provided in Enclosure 1, are compared to the vendor supplied logarithmic slope (i.e., -0.092) as well as the average slope determined from the measured data (i.e., -0.100) in Figure SRXB-1.1.

Figure 1. LaSalle Station LPRM Decay Constant

This collection of raw calibration currents is not representative of LPRM uncertainties since the LPRM is specifically calibrated for first use and the CMS uses this calibration to project the sensitivity during the interval between that calibration and the next

ATTACHMENT

Additional Information Supporting the Request for a License Amendment to Revise Local Power Range Monitor Calibration Frequency

calibration. This projection is based upon a constant calibration current below a user defined breakpoint and a user defined logarithmic slope (i.e., decay constant). LSCS provides a single value for the breakpoint and slope for all NA-300 detectors. The error in the LPRM reading just prior to the next calibration is evaluated by comparing the measured calibration current with the projected calibration current at the time of a calibration.

A detailed discussion of the methodology was provided in Reference 1. The LSCS data described above and provided in Enclosure 1 supports using a fixed decay constant of -0.100. This decay constant was used in the uncertainty analysis and supports the conclusions provided in Reference 1.

SRXB-2

In the RAI-2 response, the licensee indicated that it would modify the decay constant to -0.100 in its CMS so that the evaluated LPRM uncertainty is within the bounds of the SLMCPR analysis.

Discuss adequacy of the use of the LPRM uncertainty in the SLMCPR to bound the evaluated LPRM uncertainty, which is the difference between standard deviations (underlined for emphasis) calculated at two different exposure intervals (i.e., 1000 MWd/MTU and 2675 MWd/MTU). If applicable, clarify that the LPRM uncertainty limit used in the SLMCPR analysis is the maximum value of one standard deviation (which captures 67% of the data points) allowed for the relative LPRM errors. Explain that the LPRM uncertainty limit is appropriately used in the SLMCPR analysis to assure that the determined SLMCPR is the core-wide critical power ratio at which 99.9% (equivalent to more than 3 standard deviations) of the fuel rods would not be expected to experience boiling transition during normal condition.

Response

The Safety Limit Minimum Critical Power Ratio (SLMCPR) uncertainties used to determine LSCS SLMCPR are identified in the methodology provided in AREVA topical report ANF-524(P)(A), Revision 2, (Reference 3) and approved by the NRC in the SER provided on August 8, 1990, (Reference 4). The report includes the MCPR calculational procedure and the system measurement and calculational uncertainties to determine an MCPR safety limit that protects 99.9 percent of the fuel rods from boiling transition. The uncertainties used in AREVA's SLMCPR methodology for LSCS are equivalent to one standard deviation.

The radial bundle power uncertainty being used in the SLMCPR calculations, consistent with the methodology described above, includes the LPRM uncertainty component discussed in the AREVA topical report EMF-2158(P)(A) dated October 1999 (Reference 5). The NRC completed their review of topical report EMF-2158 and documented their approval in the Safety Evaluation dated October 18, 1999 (Reference 6). As documented in Reference 5, Equations 9-12 and 9-13 incorporate the LPRM measurement uncertainty into the radial bundle power measurement uncertainty. The

ATTACHMENT

Additional Information Supporting the Request for a License Amendment to Revise Local Power Range Monitor Calibration Frequency

radial bundle power uncertainty value currently being used in the SLMCPR analysis for LSCS utilizes an LPRM uncertainty of 4.3% (i.e., a conservative value for the 2500 EFPH recalibration interval) in lieu of 3.4% for 1000 EFPH.

SRXB-3

In the RAI-3 response, the licensee indicated that a 3D nodal simulator was used to calculate the accumulated exposure values.

Identify the name of the simulator (or computer code) if it has one, and discuss acceptability of the simulator used for determination of accumulated exposure values. If the simulator was previously approved by the NRC, reference the title and the date of the safety evaluation report that approved the simulator for licensing applications.

Response

Since 1996 EGC has used two different software packages for core monitoring at LSCS. LSCS has used POWERPLEX-II and POWERPLEX-III.

POWERPLEX-II is a software package developed by AREVA for core monitoring tasks in BWR plants. The accumulated exposure values in POWERPLEX-II are performed by the calculation engine (or code) MICROBURN-B in accordance with XN-NF-80-19(P)(A), Volume 1, Supplements 3 and 4, dated November 1990 (Reference 7). This report was reviewed and approved by the NRC in the Safety Evaluation dated August 13, 1990 (Reference 8).

POWERPLEX-III is a software package developed by AREVA for core monitoring tasks in BWR plants. The accumulated exposure values in POWERPLEX-III are performed by the calculation engine (or code) MICROBURN-B2 in accordance with EMF-2158(P)(A), dated October 1999 (Reference 5) as reviewed and approved by the NRC in the Safety Evaluation dated October 18, 1999 (Reference 6).
