Docket No. 50-312 Rancho Seco Nuclear Generating Station License No. DPR-54

RANCHO SECO FINAL STATUS SURVEY REPORT, REVISION 1

Attention: John Hickman

Attached is Revision 1 to Final Status Survey (FSS) Report # 5 for the survey units associated with survey areas F5010000, F8000000, F8080000, F8100000, F8110000, F8120000, F8130000, F8140000, F8260000, F8340000, F8370000, F8510000, and F8990000. The original submittal was made via SMUD letter DPG 09-097, dated March 5, 2009. Revision 1 updates the dose calculations for the survey unit that includes the Reactor Building floor and makes additional corrections and editorial changes. The corrections made do not change the status of the survey units included in this report meeting the radiological criteria for unrestricted use.

Members of your staff with questions requiring additional information or clarification may contact me at (916) 732-4817.

Sincerely,

Einar Ronningen

Superintendent, Rancho Seco Assets

NRC Region IV

RANCHO SECO FSS FINAL REPORT

Final Status Survey Report 5 Rev. 1

September 1, 2009

FSS FINAL REPORT

Final Status Survey Report 5

1.0 Overview

As discussed in Section 1.4 of the Rancho Seco License Termination Plan (LTP), SMUD intends to release the Rancho Seco site for unrestricted use in two phases, with the license being terminated after completion of the second phase. The first phase includes the release of the majority of the site, including impacted and non-impacted areas, except for the Interim Onsite Storage Building (IOSB) and the area immediately surrounding it. All radioactive material is now stored within the boundaries of the IOSB facility. All areas included in the first phase have been verified as ready for release and no additional surveys of these areas will be required.

SMUD will continue to store Class B & C radioactive waste in the IOSB until an acceptable disposal facility becomes available. After disposing of the Class B & C radioactive waste, SMUD will complete the final status survey for the remainder of the site (i.e., the IOSB and area immediately surrounding it) and will submit a license amendment request to terminate the 10 CFR Part 50 license and release the remainder of the site for unrestricted use. The spent nuclear fuel and the Greater than Class C (GTCC) waste are stored at the Rancho Seco Independent Spent Fuel Storage Installation (ISFSI), which is licensed under 10 CFR Part 72, independent of the 10 CFR Part 50 licensed site.

Section 1.4 of the LTP discusses the information to be provided to support release of land from the Rancho Seco 10 CFR Part 50 license. The information provided in this report includes a discussion of dismantlement activities performed, final status survey results, and an evaluation of the potential for re-contamination and controls applied to prevent this for each survey unit completed.

The information contained in this submittal will be sufficient for the NRC to conclude that, for the land and structures associated with the release, dismantlement has been performed in accordance with the approved license termination plan, and the terminal radiation survey and associated documentation demonstrates that the facility and site are suitable for release in accordance with the criteria for decommissioning in 10 CFR Part 20, Subpart E by meeting a site release criterion of 25 millirem TEDE per year over background.

Once these lands and structures are released, no additional surveys or decontamination of these areas will be required unless the NRC determines that the criteria of 10 CFR Part 20, Subpart E were not met.

2.0 Site Information and Physical Description

- 2.1 Physical Description of Land or Structures to be Released

 The land and structures to be released will be described in the application for license amendment and is unchanged by this submittal.
 - As discussed in section 1.0 above, this submittal provides detailed discussion on demolition activities completed and final status survey results for 97 survey units located on the site to be released. Details are provided for each survey unit on survey methods, results, data analysis, and conclusions. In all cases, Rancho Seco is providing a complete package of information relating to each survey unit so that the NRC staff can verify that the License Termination Plan has been fully implemented for each survey unit and that the final status survey results support unrestricted release of the land from License DPR-54 in accordance with the proposed license amendment.

This submittal addresses dismantlement and FSS information for survey units associated with the 5010051, 800007, 800009, 800010, 810000, 811000, 812000, 813000, 814000, 826000, 834000, 837000, 851000, and 899000 areas. Table 1 provides a description of the survey units addressed in this submittal.

Table 1

		Table 1
Survey Unit	Class	General Description of Survey Unit
F5010051	3	5010051 – Access Road Area consists of the access road in the Northeast quadrant of the site. The access road provided the route over which radioactive shipments were made. The roadway was also adjacent to areas used for staging outgoing and incoming radioactive material shipments located on the south side of the industrial area of the site. The area is 9,210 m ² .
F8000072,3	3	8000072 – Industrial Area (IA) West of Barrel Farm - This area is located on the west side of the Industrial Area to the north of the retention basins and south of the IOSB. Due to the potential of ~ 700 square meters west of the historic location of the barrel being omitted from survey coverage in survey units 8000071 and 8000121 the survey unit was added. Survey Unit 800073 is located on the west side of the Industrial Area to the north of the spray ponds. Specifically, ~ 250 square meters adjacent to the NW corner of the current IA security fence was potentially omitted from survey coverage in F8000071 and F8000141. The survey unit areas are 696 and 255 m² respectively.

Table 1

C	Class	Consul Description of Courter Unit
Survey Unit	Class	General Description of Survey Unit
F8000091	3	8000091 - South East I A Lands - This area covers a
		majority of the Industrial Area soils exclusive of the
		building footprints and rail line in this area and consist
		primarily of soils and some asphalt. The area was
T0000101.2	2	55,736 m ² .
F8000101,2	3	8000101,2 - IA Central Yard- The IA Yard consisted of
		both paved and unpaved area located adjacent to the
F8000104-6	1 & 2	machine shop and Warehouse "A". The area is 3387 m ² . 8000104 – Pump alley Access Corridor consists of the
F8000104-0	1 & 2	asphalt pavement between the Auxiliary Building and the
		T&R building. 8000105 – IA roadway running north and
		south from the T&R to the intersection with the site exit
		road east of the solidification pad and RB. 8000106-
		Central IA Roadways and paved areas beginning with the
		roadway in front of and north of the maintenance shop,
		west to Warehouse "B" and east to the end of the north
		Laydown area. The survey unit areas are 248, 1,696 and
	·	3,680 m ² .
F8000111	2	8000111- IA Central, East-West Corridor and Fab Shop
		Slab, consist of paved footprint of the Fab Shop and the
		corridor along Warehouse "B". The survey unit area is
		$1,086 \text{ m}^2$.
F8000142	3	8000142- Northern IA Paved Surfaces consists of the
		paved portions of the land area that extends from the
		northern industrial area security fence south to the
		pavement surrounding the cooling towers in the south and
		from the eastern IA security fence at the sally port to
		approximately 100 feet west of the west spray pond. The
F8080031-3	2	survey unit area is 29,138 m ² .
F8080031-3		8080031-3 – Cooling Tower Buffers, South West and East. The cooling towers and basins were part of the
		condenser cooling water system. The paved buffer
		regions consist of survey unit areas of 7,500, 5,547 and
		6,481m ² .
810000	1,2 & 3	810000 consist of the surface and subsurface soil units
	,	and paved areas of the Tank Farm and Steam Sump. It
		also includes the concrete pads remaining for the CST,
		DRCST, DWST and Tritium Evaporator. The total area
		for the survey units in this submittal is 6,350 m ² .
8110000	Interior	8110000 Reactor Containment consist of the interior
	Class 1,	walls and floor of the Reactor Building. The interior
	Class 3 for	concrete walls are covered with 0.25 inch carbon steel
	Containment	liner. The floor consists primarily of concrete (liner plate
	Exterior and	removed). The Building exterior and Tendon Gallery
	Tendon	consists of concrete. The total area for all the survey
E010000	Gallery	units in this submittal is 14,727 m ² .
F812000	Class 1 floor, lower walls,	812000 Fuel Building- The Fuel Building contained the
	Class 2 upper	spent fuel storage pool and the floor area and upper walls
	walls, ceiling,	surrounding the pool. The surveys presented in this submittal are for the following locations: pool floor; N, S,
	Class 3,	E, W pool walls; CR pit; El.40' floor; lower and upper
	Exterior	walls; Styrofoam TM gap; and exterior surfaces. The total
		area for all the survey units in this submittal is $4,256 \text{ m}^2$.
L	L	area for an ine survey amos in this submittan is 4,230 m.

Table 1

Table 1								
Survey Unit	Class	General Description of Survey Unit						
F813000	Class 1 floor, lower walls, Class 2 upper walls, ceiling, Class 3 Exterior Walls	813000 Auxiliary Building- The Auxiliary Building contained the systems used to transport, process and contain radioactive solids, gases and liquids. The surveys presented in this submittal are for the following rooms located on the -47', -20, +20', +40 and grade elevation: 01 02,51e,109,132,208,211,309-317,350, Exterior Steam Support Structure, East and North exterior walls. The total area for all the survey units in this submittal is 4,920 m ² .						
F8140003	3	8140003 – T&R, AB, NSEB +40' Bridge consists of the access corridor between the Training and Records Building, Auxiliary Building, and Nuclear Service Electrical Building at the + 40' elevation. The survey unit area is 431 m ² .						
F826000	1, 2, 3	826000 Turbine Building submittals in this report consist of the below grade surface, grade level, mezzanine, 40' elevation, Interior and exterior walls. The surfaces consist of steel, concrete and asphalt. The survey units are noted in Table 2 of this submittal. The area is 17,820 m ² .						
F834000	1, 2 & 3	8340011 – The IA Railway was used to transport radioactive material from the site to the out of state waste disposal facilities. This Class 1 survey unit is 100 m² and was established based on discovery of a small area (<1 m²) of contaminated asphalt adjacent the Turbine Building. 8340012 – IA Railway consists of the 4,735 m² Class 2 survey unit region extending from the Turbine Building to the IA fence line. 8340021 consist of the rail area external to the IA. This Class 3 survey unit is 5,990 m².						
F8370001,2	1	8370001,2 RHUT, Aux Boiler Pad- 8370001, the RHUT, Aux Boiler Pad encompassed the area where the A and B RHUTs were located and includes the area that contained the foundation pad for the auxiliary boiler. The area consists of the soils, concrete pad, and the surrounding gravel area above the RHUT pipes. The area is 1819 m ² . 8370002 is the subsurface soil in the same region.						
F8510005	3	8510005 consisted of both paved and soil covered land. The area was located on the west side of the IA. The region is south of the switchyard and extends along the north side of the roadway from the switchyard entrance on the east and around the retention basins to the west. The total area is 7,913 m ² .						

Table 1

Survey Unit	Class	General Description of Survey Unit
F8990000	1,2	The following Survey Units are included in this submittal
		piping systems:
		8990074 – Turbine Pedestal Drains originate on the
		Turbine Building +40 El. and the Class 1 survey unit consists of 8 m ² of piping.
		8990098 - Clean Drain System "C" Hold-Up tank Cross-
		Tie consist of the land region where the piping was
		removed. The Class 2 survey unit total area is 100 m ² .
		8990111 – Decay Heat Drain Lines Reactor Building
		originated in the Reactor Building and terminated in the
		Aux. Building The Class 1 survey unit consist of 49 m ² .
		8990401 – Reactor Building Drains provided an alternate
		pathway for delivering feed water to the steam
		generators. The Class 1 survey unit contains 12 m ² of
		piping.
		8990441 - Fuel Pool Piping System transported
		radioactive fuel pool water through the coolers and clean-
		up demineralizers. The associated piping in this Class 1
		survey unit consists of 38 m ² .
		8991093 – RHUT 8" Lines provided an alternate pathway
		for delivering feed water to the steam generators. This
		Class 2 survey unit contains 110 m ² of trenched land area
		resulting from the removal of the system piping.

The locations of the survey areas listed in Table 1 above are shown in Fig. 1.

2.1.2 Survey Unit Information Being Provided in Subsequent Submittals This submittal is the last submittal of survey unit information and no additional submittals are anticipated.

2.2 Dismantlement Activities

The Rancho Seco License Termination Plan describes the dismantlement activities to be performed for each area and applicable structure of the Rancho Seco site consistent with the use of the Building Occupant scenario. In general, the LTP indicates that temporary structures will be demolished and that permanent structures will be left standing following final survey. In addition, the ISFSI and IOSB structures will remain. During the period of time represented by this submittal, all remediation and dismantlement activities were completed.

3.0 Technical Evaluation

3.1 Potential for Cross-Contamination from Subsequent Activities

Since decommissioning activities were conducted onsite in parallel with final status survey and release decisions, measures were taken to protect survey areas from contamination during and subsequent to the final status survey. Rancho

Seco LTP sections 3.3.5 and 5.2.4 describe contamination and access control measures and periodic routine monitoring practices to prevent and/or detect recontamination of survey areas during or following FSS. These requirements are implemented, as appropriate, through established procedures as described in the LTP.

The potential for re-contamination and the contamination controls/monitoring for the specific survey areas included in this release phase are discussed and evaluated below:

3.1.1 5010051 Access Road

This area consists of the access road in the Northeast quadrant of the site. It was successfully surveyed as a Class 3 area. No remediation was required.

- 3.1.2 8000072 Industrial Area West of Barrel Farm

 This area is located on the west side of the Industrial Area (IA) to
 the north of the retention basin and south of the IOSB. Because of
 potential disparities between survey unit maps this survey unit was
 established to insure the region was adequately addressed. It was
 successfully surveyed as a Class 3 area. No remediation was
 required.
- 3.1.3 8000073 Industrial Area West (north end)

 This area is located on the west side of the Industrial Area to the north of the spray ponds. Because of potential disparities between survey unit maps this survey unit was established to insure the region was adequately addressed. It was successfully surveyed as a Class 3 area. No remediation was required.
- 3.1.4 8000091 South East Industrial Area Lands
 This survey unit includes a majority of Industrial Area soil
 exclusive of building footprints and rail line. The Class 3 region
 consists of soil and asphalt. Because of activities associated with
 the removal of concrete from the Reactor Building verification
 surveys were perform in this area. The final survey for this Class 3
 survey unit was successful. No remediation was required. No
 additional activity was observed during routine verification
 surveys.
- 3.1.5 8000101,2 Industrial Area Central Yard
 This Class 3 region consists of paved and unpaved areas located adjacent to the machine shop and Warehouse "A". Due to activities associated with Reactor Building concrete removal periodic surveillance was maintained to detect any potential recontamination. In addition, verification surveys were performed in

these survey units following completion of Reactor Building activities. No additional activity was observed during the verification surveys.

- 3.1.6 8000104 Pump Alley Access Corridor

 The Pump Alley Access Corridor was successfully surveyed as a
 Class 1 area. No remediation was required. No radioactive
 material is allowed in the area.
- 3.1.7 8000105 Industrial Area Roadway
 This roadway runs north and south from the T&R Building to the intersection of the site exit road east of the solidification pad and BWB. Reactor Building concrete removal resulted in transport of radioactive material over this region. Periodic surveillance surveys were performed in this region prior to the final survey and no potential contamination was observed. The final survey for this Class 2 area was successful. No remediation was required.
- 3.1.8 8000106 Central Industrial Area Roadways

 This region begins with the roadway in front of the Maintenance
 Building, west to Warehouse "B" and east to the end of the North
 Laydown area. Reactor Building concrete removal resulted in
 transport of radioactive material over this region. Periodic
 surveillance surveys were performed in this region prior to the
 final survey and no potential contamination was observed. The
 final survey for this Class 2 unit was successful.
- 3.1.9 8000111 Central East-West Corridor and Fab Shop Slab
 This Class 2 region consists of the paved footprint of the Fab Shop
 and the corridor along Warehouse "B". The final survey for this
 survey unit was successful and no remediation was required.
- 3.1.10 8000142 North Industrial Area Paved Surfaces

 This Class 3 survey unit consists of the paved portions of the land area that extends from the northern Industrial Area security fence south to the pavement surrounding the cooling towers in the south and from the eastern IA security fence at the sally port to approximately 100 feet west of the west spray pond. Final survey of this survey unit was successful and no remediation was required. Periodic surveillance was conducted over portions of the south roadway in this area during Reactor Building remediation and concrete removal and no additional activity was observed.
- 3.1.11 8080031-33 Cooling Tower Buffers South, West and East
 These Class 2 survey units consist of the pavements that surround the cooling towers. During Reactor concrete removal transport

containers were located in some of these regions. Periodic surveillance was conducted over portions of the survey unit. The final surveys for these survey units were successfully performed following completion of the Reactor Building work and no remediation was required.

3.1.12 8100000 Tank Farm and Steam Sump Areas

This region consists of the surface and subsurface soil and paved areas of the Tank Farm and Steam Sump. It includes the concrete pads remaining for the CST, DRCST DWST and Tritium Evaporator. Due to remediation and concrete removal activities periodic surveys were conducted in these areas prior to conducting the final surveys. Some of these surveys resulted in the discovery of discrete particles that were principally concrete chips that were suspected to have originated from remediation activities inside the Spent Fuel and the Reactor Buildings. The final surveys for these areas were conducted following completion of the nearby remediation activities and resulted in several local area investigations but resulted in successful final surveys.

3.1.13 8110000 Reactor Containment, Exterior Walls and Tendon Gallery The Reactor Containment interior surfaces were Class 1 survey units. Following remediation of the surfaces, removal of liner plate from the floor, and removal of the normal sump liner and steel support plate for the emergency sump decay heat piping, final surveys and local area investigation were successfully performed. The activated concrete region of the containment was also remediated to a depth of about 30 cm and the final survey for this region was successful. The Class 3 survey units consisted of the Reactor Building exterior and the Tendon Gallery. These regions required no remediation and the final surveys were successful.

3.1.14 812000 Fuel Building

The survey units associated with this submittal consist of the pool floor, north, south, east and west pool walls, CR pit, floor lower and upper walls of the 40' elevation, StyrofoamTM gap and exterior surfaces. The Fuel Building required extensive remediation in the spent fuel pool area. The pool was isolated and extensive contamination controls were applied. Periodic surveillance of regions adjacent to the above areas was conducted during remediation activities. Verification surveys were conducted following final survey activities on the +40 elevation Fuel Building floors. The final surveys for the pool survey units and fuel building proper were successful. Final surveys for the StyrofoamTM gap and exterior building surfaces were successful.

3.1.15 813000 Auxiliary Building

The rooms in zones 1-6 of the Auxiliary Building surveys are some of the most contaminated site areas. The survey units in these zones are all classified at least Class 2 for upper walls/ceilings with floors being at least Class 2 but usually Class 1. Most of the lower walls and floors required some concrete remediation. When remediation was ongoing in adjacent areas, through-wall penetrations were covered, drain pipe openings were plugged, strict access controls were maintained and the areas were subject to periodic surveillance to check for potential re-contamination. Portions of zones 7-12 are Class 2 or 3 with little potential for recontamination and the controls were somewhat less rigorous. Following the successful completion of final surveys, verification surveys were conducted of the penetrations into the Reactor Building, the hallway to the Turbine Building, elevators, grade level areas, +20' elevation hallways, +40' elevation Personnel Equipment Hatch and grade level Steam Support Sump area. All verification surveys were successfully completed and no additional contamination was observed.

3.1.16 8140003 Training and Records, Auxiliary and NESB +40' Bridge This survey unit is the access corridor between the T and R Building, auxiliary Building and Nuclear Service Electrical Building at the +40' elevation. The final survey was successful.

3.1.17 8260000 Turbine Building

The survey units submitted consist of the below grade surfaces of the condenser and lube oil pits, grade level, mezzanine, 40' elevation, interior and exterior walls. The Turbine Building was successfully remediated and surveyed. Verification surveys were performed for the northeast grade level, south grade level, South exit area and north end of the +40' elevation Turbine Deck. All verification surveys were successful. No radioactive material is allowed in the area.. The area was placed under periodic surveillance to detect any potential re-contamination and no additional contamination was observed.

3.1.18 834000 Industrial Area Railway and Railway External to the IA
The survey units for the railway include Class 1, Class 2, and Class
3 survey units. A Class 1 region was designated where
characterization surveys identified a small area of contaminated
asphalt immediately west of the Turbine Building. The survey unit
for the Class 2 region extends from near the edge of the Turbine
Building to the Industrial Area fence line. Due to Reactor Building
concrete remediation activities this region was subjected to
periodic surveillance to detect any potential contamination prior to

conducting the final surveys. The Class 3 survey unit consisted of the region external to the IA. The final surveys in these areas were all successfully performed following completion of the Reactor Building remediation activities.

3.1.19 8370001,2 RHUT, Aux Boiler Pad

The RHUT, Aux Boiler Pad region final survey was successfully completed. Subsequent surveys by ORISE representatives identified a discrete particle (concrete chip) just inside the boundary of this survey unit. This finding resulted in the examination of all potential areas associated with removal of Reactor Building concrete to be examined by scan survey and the institution of more rigorous controls. Because it was highly likely the chip originated from transport of "supersacks" of contaminated concrete along the roadway adjacent to this survey unit, additional measures involving periodic surveys of roadways and storage areas were instituted. The 8370002 survey unit is associated with subsurface soils and the final survey was successful. Following completion of the removal and transport of contaminated concrete from the Reactor Building a verification survey was successfully completed and no additional activity was observed.

3.1.20 8510005 Switchyard South and Retention Basin Buffer Investigations of survey unit boundaries were conducted to confirm all survey units had sufficient overlap and that no regions were missed. Because of potential disparities between survey unit maps this survey unit was established to insure regions of the Switchyard, Helo pad and Retention Basin were adequately addressed. The Class 3 survey unit final survey was successful and no remediation was required.

3.1.21 899000 Buried or Embedded Piping Systems

The pipe remaining on site is surveyed and grit blasted, if necessary, to remove surface contamination. Once final surveys are complete, the pipes are plugged to prevent recontamination or, if necessary, grouted in place. There is little likelihood that piping will become re-contaminated following final survey. In addition, the rooms containing access to the pipes are placed under periodic surveillance to detect any potential re-contamination once FSS is complete. Some of these survey units are trenches resulting form the removal of buried piping systems. All final surveys for these survey units were successful.

4.0 Final Status Survey Report

Rancho Seco LTP section 5.7.3 identifies the contents of the written reports of final status survey results that are to be submitted to the NRC. The contents include the

items described in NUREG-1757, Vol. 2, Section 4.5. The survey unit design details and results are provided below in summary fashion. Specific survey unit design details and results are provided in a copy of each survey unit summary report in Attachment I of this submittal.

4.1 Overview of Results

The survey units included in this report are listed in Table 2 with the exception of five revised reports which are listed is Section 4.6 of this report.

The summary report for each survey unit contains a description of the survey unit; design information, including classification, size, number of measurements, map, scan coverage, and DCGL; survey results; survey unit investigations (anomalous data); data assessment results, including statistical evaluations, if applicable; changes in initial survey unit assumptions on extent of residual activity, an evaluation of LTP changes subsequent to the FSS of the survey unit and survey unit conclusions.

Overall, the attached survey unit summary reports demonstrate that the survey units meet the criteria for release for unrestricted use in accordance with the NRC approved Rancho Seco License Termination Plan.

4.2 Discussion of Changes to FSS Program

The purpose of this section is to discuss changes to the FSS program. There were no changes made to the FSS Program that impacted the final surveys.

4.3 Final Status Survey Methodology

This section summarizes the implementation of the LTP Final Status Survey methodology for the survey units that are included in this first report supporting the release of remaining non-ISFSI and non-IOSB land. Table 2 provided below lists the key FSS design features for each survey unit. These design features include the survey unit classification and size, the standard deviation and Lower Boundary of the Gray Region (LBGR) used for determining the number of direct measurements taken, the percent scan coverage, the design DCGL_{EMC} and the number of measurements required. This report covers only structures for which the DCGL is 43,000 dpm/100 ${\rm cm}^2$ (16,000 dpm/100 ${\rm cm}^2$ for special areas). The buried and embedded pipe DCGL is 100,000 dpm/100 cm² and soil or paved areas have a DCGL of 52.6 pCi/g Cs-137_{surrogate} and 12.6 pCi/g Co-60. The DCGL for activated concrete is a Eu-152_{surrogate} value of 7.7 pCi/g. The standard deviations listed were obtained from site characterization data or survey unit specific measurements. The Type 1 and 2 Errors are the default values of 0.05 and the LBGR is initially based on 50% of the DCGL.

4.4 Final Status Survey Results

The methods used to determine the number of direct measurements to be taken is described in the LTP and the specific survey unit summary reports provided in Attachment I. Key survey results are given in Table 3 below

4.5 Survey Unit Conclusions

Rancho Seco concludes that this information is sufficient for the NRC to make a determination equivalent to 10CFR50.82 (a)(11) regarding the survey units contained in this submittal. The surveys for these survey units and associated documentation demonstrate that these areas of the facility and site are suitable for release in accordance with the criteria for decommissioning in 10CFR20, subpart E by meeting a site release criteria of 25 millirem TEDE per year over background for all dose pathways in accordance with the approved License Termination Plan.

As stated in section 4 of the Rancho Seco LTP, as long as the residual activity within a survey unit is less than the DCGL (i.e., the survey unit average activity is less than the DCGL and the EMC criterion has been met), the ALARA criterion has been achieved.

4.6 Summary Report Revisions

Revisions were made to five summary reports from previous submittals. Two revisions were made for submittal 4 (F800011, Helo Pad Area and F8130161, Auxiliary Building Rm 15). Three revisions were made for Submittal 2 (F8130481, Auxiliary Building Rm 37; F8130521, Auxiliary Building Rm 39 and F8130561, Auxiliary Building Rm 41)

F8000011 Helo Pad Area provided an incorrect reference in Table 1 of the Summary Report for the Design Sigma. The correct reference (Table 5-4B) has been included in revision 1 of the report.

F8130161 Auxiliary Building Rm 15 FSS Summary Report, Table 3-1 was difficult to interpret. The Table has been revised with sufficient information and footnotes to provide easier interpretation and the Summary Report has been revised to address changes from Table 3-1.

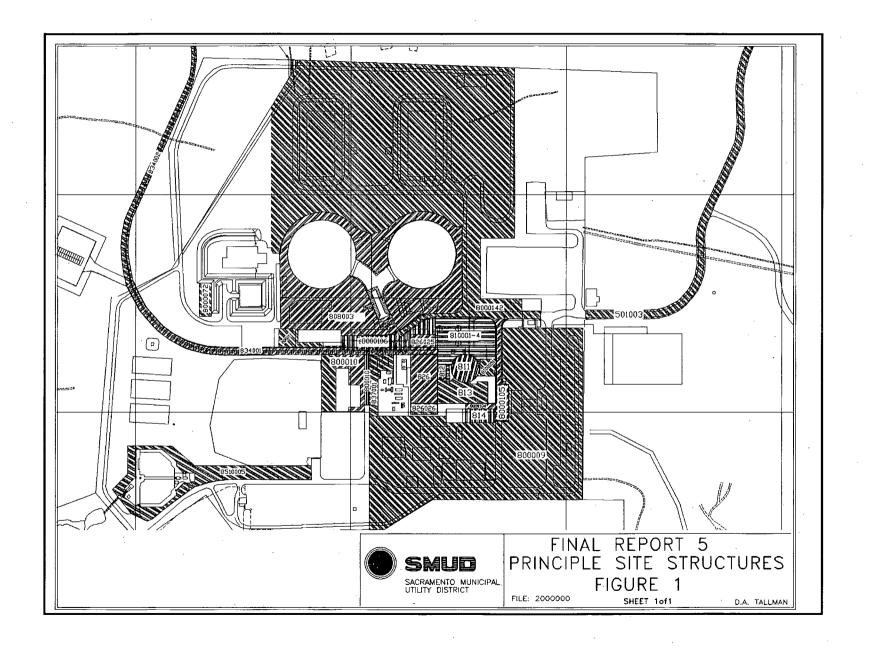

F8130481, F8130521, F8130561 Auxiliary Building Rms 37, 39 and 41 As part of the corrective action for DQ#07-020, gamma surveys were made in rooms 37, 39, and 41 once remediation was complete in the adjacent pump alley. The gamma survey indicated the presence some small elevated areas (less than 0.5 m²). In the interest of completeness, those areas were evaluated and added to Table 3-1 of the Summary Reports for the survey units. Those revised reports are included in Attachment 1 of this Report.

During the teleconference conducted with NRC representatives regarding Submittal 4 items noted in the first paragraph a third finding was noted. This item was associated with survey unit F8990421 where a single measurement was observed to be above the 100,000 dpm/100 cm² DCGL for buried and embedded piping. An examination had been made of this anomalous measurement and the results of the finding placed with the survey package but not with the submitted final summary report. The findings showed that the observed measurement was relative to the existing activity at the op of the drain and the piping but not likely associated with the piping internals. The measurement was taken at the "0" location of the piping which is at the pipe entrance. The area factor for piping (~730 cm²) or the floor region would result in an insignificant level for the recorded 137,654 dpm/100 cm² pipe detector result. Attachment 2 of this report provides the findings associated with F8990421.

4.7 Attachment 3 of this report presents a Table of the as-left dose for each survey unit and is based on the appropriate DCGL and survey unit listing.

Attachment 1

Survey Unit Summary Reports

Attachment 2

Examination of Elevated Measurement in SU F8990421 Radwaste System Piping Location M1267GI, July 22, 2008

General

Final Status Surveys of the Radwaste System Piping indicated that at one location (M1267GI) the direct measurement result was 137,654 dpm/100 cm². This survey location is at the "0" location (entrance) of a floor cleanout. The 6 inch diameter piping segment is 31.5 feet in length and noted as 3-2-14. This segment of piping surveys consisted of 64 direct measurements.

Findings

- 1. The final survey of segment 3-2-14 was conducted using a 44-159 detector. The detector instrument parameters used for the survey were set for a 44-157 detector.
- 2. With the exception of the dead time constant the instrument configuration used for both detectors (principally, high voltage and threshold) are the same therefore the signal processing and cpm results are essentially the same.
- 3. For these reasons the FSS data was preserved and the cpm results processed using the efficiency for 44-159 detectors.
- 4. Because a Peak-to-Total evaluation had not been conducted for 44-159 detectors in six inch piping the FSS survey results for piping segment 3-2-14 are biased high. Based on other measurements conducted in piping of the same size using both the 44-157 and the 44-159 detector indicate that the their Peak-to-Total response is very similar and the 32 measurements reported for segment 3-2-14 are expectedly biased high by a factor of 6 or more.
- 5. Because the area factor for the single location where the elevated measurement was located (~730 cm²) is large the single elevated measurement is insignificant.
- 6. The location of the elevated measurement is at the "0" location of the floor cleanout and if present, could potentially contribute to the room DCGL. For this concern several measurements were conducted using a 44-10 detector as presented in Figure 1.0 below. [Note that two grid locations (C0)321(BS) and (C0)322(BS) are noted in Figure 1.0.] Four 30.5 cm square grids were examined. One grid is located over the grouted floor cleanout and the other grids are adjacent to the grouted cleanout. Only the cleanout end exhibits any gamma activity significantly above the background.
- 7. Grid C0321GS of SU F8130361 (Ion Exchanger Valve Area, Room 27) resulted in the highest beta scan location for the room (57,103 dpm/100 cm²) and is below the DCGLEMC by a factor of 2.5.

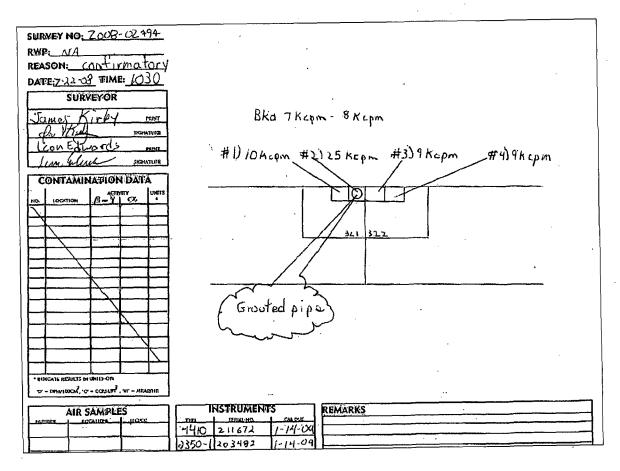

Figure 1.0

Conclusion

Both the anticipated piping area factor based on the piping area of interest (M1267GI) and the beta scan survey results for grid C0321BS relative to the room DCGL $_{\rm EMC}$ values support the insignificance of the 137,654 dpm/100 cm² piping survey observation. The reported 44-159 detector values for piping segment 3-2-14 are not corrected for Peak-to-Compton contribution biasing the reported results high. The resulting direct measurement conducted with the 44-10 detector over the drain reflect the gamma conditions of the elevated surface activity associated with the Room 27 grid C0321BS.

Based on the above conclusions survey unit F899421was properly designed and the number of direct measurements meets the requirements of the RSNGS License Termination Plan. The resulting examination and evaluation provides high confidence that the survey unit satisfies the release criteria.
