Subject:

IOEB Clearinghouse Screening Summary for Monday, April 20, 2009

Outside of Scope

Outside of Scope

3. Oyster Creek – Water Pumped from Cable Vault Contains Tritium UPDATE

Based on Guided Wave testing the licensee is focusing on 6" underground pipe that serves as the condensate transfer supply as a possible source of the tritium, though they have not ruled out the CST at this time. Water seeping into the cable vault shows elevated tritium levels indicative of condensate water, as do samples from a monitoring well near the condensate transfer building. Two additional monitoring wells are being dug to further assess the potential source of the leak and the licensee is making plans to replace the piping tomorrow. The CST at Oyster Creek is not a safety-related component, however the region is verifying that the licensee's actions to isolate the affected piping do not impact the ability to provide makeup to the isolation condenser or impact condenser operations. Pass to Tritium Groundwater Staff (Richard Conatser and Steve Garry).
Assigned to Rebecca Sigmon.
