NEMS Forecast Evaluation Methodology

Disclaimer: The papers below are working documents prepared as a job of work for the Energy Information Administration (EIA) in order to solicit advice and comment on statistical matters from the American Statistical Association Committee on Energy Statistics. This topic will be discussed at EIA's spring 2007 meeting with the Committee to be held April 19 and 20, 2007.

3/23/07: Click here to see a memo (on-screen) that reports on the derivation of impact measures for NEMS projections. The projections selected were residential sector demand for delivered energy, electricity, and natural gas; and, commercial sector demand for delivered energy and electricity. The projection year evaluated was 2005. The versions of NEMS considered were the AEO1998-AEO2004 versions. Click here to download the memo as a WORD file.

3/12/07: Click here to see a memo (on-screen) that reports on an effort to revise the regression specifications reported on in the 2/25/07 memo below that were not consistent. Eighteen regressions had onsistency problems of which four could be solved by dropping the lagged endogenous variable. In two of these four, the resulting price elasticity seemed high. Click here to download a WORD version of the memo.

2/25/07: Click here to see a version (on-screen) of a preliminary effort to estimate price elasticities of demand for selected fuels for the residential and commercial sectors. Results are presented for the AEO1998-2007 (inclusive) versions of NEMS. Also presented are selected EIA estimates of the same

elasticities. Click here to download the WORD version of the file.

Click here to see a version (on-screen) of the proposed methodology as of 1/22/07 with examples using weather elasticities derived from specialized AEO2007 version NEMS solutions and regression results for the 1998-2000 AEO versions of NEMS, all for residential and commercial sector energy consumption. Click here to get a WORD version of the methodology.

Click here to see a summary (as of 12/19/06) of the status of data reported for 1995-2005 in the AEO2007 NEMS ran files as related to the actual historical values of the variables. Please send additions, corrections, or other comments to George Lady per the email address above.

Click here to see an on-screen version of the proposed methodology current to 11/27/06.

Click here to get the 11/27/06 version of the proposed methodology as a WORD file.

Click here to get a PDF version of a recent journal article on EIA's forecast evaluation methodology.

Below is the copy of the proposed methodology presented to the ASA.

This is a working document prepared as a job of work (DE-AP01-06EI38129.A000) on behalf of the Energy Information Administration (EIA) in order to solicit advice and comment on statistical matters from the American Statistical Association Committee on Energy Statistics. The topics presented here will be discussed at EIA's fall 2006, meeting with the Committee to be held October 5 and 6, 2006.

Click here to see the full report on-screen.

Working Memorandum

Subject: NEMS Price Elasticities of Demand For Residential and Commercial Energy Use

From: George Lady

Date: February 25, 2007

1. **Background.** This memo reports on work in process to assess the differences between NEMS forecast values and the eventual historical values of the projected series. The point of the assessment is to identify the important reasons for the differences found. The underlying method proposed is reported on in *Methodology_1_22_07* available on the website established in support of the project.

http://optima-com.com/NEM_Evaluation/Evaluation_Method.htm

The results presented here are a first effort to estimate the price elasticities of demand for the consumption of electricity, distillate, natural gas, and delivered energy in the residential and commercial sectors. The results presented are initial and in some cases problematical. A considerable portion of the effort reported on here was devoted to assembling the associated data and automating the analysis process. As reported below, although the majority of the results are entirely consistent with the "theoretical" expectations for the estimated demand relationships, there nevertheless remain issues that, presumably, will be successfully addressed through a reconsideration of some of the specifications reported on here.

2. **Sources.** Price elasticities were estimated, based upon the AEO1998-AEO2007 solution series for the base case and high/low world oil price cases. The choice of these cases reflects the issue of "identification" of demand, versus supply, relationships within NEMS. In the tables below, results based upon these solutions are labeled "SIM##," where "##" indicates the AEO year.

In addition, results based upon the AEO1999 and AEO2003 NEMS solutions are also provided based upon "Price Responsiveness in the AEO2003 NEMS Residential and Commercial Buildings Sector Models," by Seven H. Wade (of OIAF). The AEO2003 results included measures for one-year, two-year, and long run elasticities. This format was followed for the SIM## results cited above. Additionally, over seventy especially constructed NEMS solutions were run for the AEO2006 version of NEMS (the runs were provided for project use by Steven Wade). These solutions were designed to identify via comparative statics the effects of isolated price increases for a number of fuels. The strategy for each fuel was to configure the price series, *ceteris paribus*, with increases of

10%, 25%, 50%, and 100%. Results were presented for the first year of price increase (2010), i.e., one-year and the last year (2030), i.e., long run. All of these results are identified in the table below by "AEO##," where "##" indicates the AEO year.

For the three fuels reported on here, the AEO comparative statics runs were pooled with the AEO2006 base case and high/low world oil price cases. These reports are reported on below as "SIM06:pooled."

A small number of the elasticities presented here were also estimated for the Regional Short Term Energy Model as reported in **Reduced Form Energy Model Elasticities from EIA's Regional Energy Model (RSTEM)** , by Dave Costello released by EIA on 5/9/2006. It is hoped that additional values for the short term model will be estimated. Accordingly, in the table below, the rows for "RSTEM" are at present mostly pace-holders for future estimates.

3. **Specification.** The specification for the ten versions of the AEO, plus the pooled data for the AEO2006 were very austere. For each regression the specification used was:

$$Q_t = a + b(Price_t) + c(Driver_t) + dQ_{t-1}.$$

The driver for the residential sector is the total number of households and for the commercial sector total commercial floorspace.

For this specification, the one-year elasticity was computed as: $E\_1 = b(P/Q)$, where P and Q were the averages of price and quantity.

The two-year elasticity was computed as $E\_2 = (1 + d)E\_1$ and the long run elasticity as $E\_LR = E\_1/(1-d)$.

The two-year and long run values reflect the feed-forward of the effect of a given year price change through the lagged endogenous variable.

The outcome of the estimation may be termed "consistent" if: $b < 0$, $c > 0$, and $0 < d < 1$. In the eighty-eight regression results, sixty-eight were consistent in this way, sixteen were not, i.e., indicated as "issues: in the table below, and four could not be estimated due to lack of data, e.g., there are no average prices for sectoral delivered energy consumption reported for the AEO2007. For the inconsistent results, the specification used will be reconsidered in an effort to derive a consistent functional expression of the associated energy demand. A summary of the regression outcomes is provided in Table 1 below. Note that there are eleven total

regressions for each sector/fuel combination. The elasticities are reported in Tables 2 and 3 below. The detailed regression results are then presented in an appendix.

Table 1: Consistency of Regression Results

Fuel: / Sector:	Electricity	Distillate Fuel	Natural Gas	Delivered Energy
Residential	Consistent = 11	Consistent = 5 Issues = 6	Consistent = 11	Consistent = 8 Issue = 1 N/A = 2
Commercial	Consistent = 11	Consistent = 6 Issues = 5	Consistent = 7 Issues = 4	Consistent = 9 N/A = 2

In the elasticity tables below, the following explanatory notes are indicated for each value, as appropriate.:

A: Driver elasticity has the wrong sign.
B: Long run elasticity does not converge.
C: Negative lag term.
D: Price elasticity has the wrong sign.
E: Results not reported (for the AEO2006 elasticities the two-year results are provided in the data, but not reported).
F: Average sector price not reported for the AEO2007.

Variable# 1	10.75439	-.041723	-.083212	-8.002029
Variable# 2	134.432	.005164	.12874	5.901539
Variable# 3	5.377107	.528158	.526668	8.842681
Constant		2.306859		

Endogenous Variable	Mean	SER	R-sq	LR-Multiplier
	5.392323	.009361	.992835	2.11935351240458

Data pooled for the years 2010 to 2030 for the solutions given below:

aeo2007.1121a.ran
hp2007.1121a.ran
lp2007.1121a.ran

Endogenous Variable:
Table #2 Energy Consumption by Sector and Source (quadrillion Btu, unless otherwise noted)
  Sector and Source: Residential: Delivered Energy

Exogenous Variables:
1) Table #1 Total Energy Supply and Disposition Summary (quadrillion Btu, unless otherwise noted)
    Supply, Disposition, and Prices: Prices (2005 dollars per unit): Imported Crude Oil Price ($ per

2) Table #4 Residential Sector Key Indicators and Consumption (quadrillion Btu, unless otherwise noted)
    Key Indicators and Consumption: Households (millions):   Total

3) Lagged Table #2 Energy Consumption by Sector and Source (quadrillion Btu, unless otherwise noted)
    Sector and Source: Residential: Delivered Energy

Exogenous Variable	Mean	Coefficient	Elasticity	t-statistic
Variable# 1	52.98807	-.001805	-.007298	-4.105232
Variable# 2	134.432	.01212	.12432	3.163721
Variable# 3	13.02371	.763397	.758613	12.453543
Constant		1.629914		

Endogenous Variable	Mean	SER	R-sq	LR-Multiplier
	13.10585	.026259	.997349	4.22648909777137

Data pooled for the years 2010 to 2030 for the solutions given below:

aeo2007.1121a.ran
hp2007.1121a.ran
lp2007.1121a.ran

Endogenous Variable:
Table #2 Energy Consumption by Sector and Source (quadrillion Btu, unless otherwise noted)
  Sector and Source: Commercial: Electricity

Exogenous Variables:
1) Table #3 Energy Prices by Sector and Source (2005 dollars per million Btu, unless otherwise noted)
    Sector and Source: Distillate Fuel Oil: Electricity

2) Table #5 Commercial Sector Key Indicators and Consumption (quadrillion Btu, unless otherwise noted)
    Key Indicators and Consumption: Total Floorspace (billion squar: Total

3) Lagged Table #2 Energy Consumption by Sector and Source (quadrillion Btu, unless otherwise noted)
    Sector and Source: Commercial: Electricity

Exogenous Variable	Mean	Coefficient	Elasticity	t-statistic
Variable# 1	23.87357	-.010262	-.041997	-4.557163
Variable# 2	93.38322	.020996	.336104	4.14442
Variable# 3	5.721487	.759277	.744692	12.039618
Constant		-.226336		

Endogenous Variable	Mean	SER	R-sq	LR-Multiplier
	5.833541	.006442	.999915	4.15415228291439

Data pooled for the years 2010 to 2030 for the solutions given below:

aeo2007.1121a.ran
