RE: Vogtle Electric Generating Plant – Unit 2
Submittal of Unit-2 ISI Plan, Version 3.0

FROM: John G. Aufdenkampe
Manager, M&IS

A handwritten signature in black ink, appearing to read "John G. Aufdenkampe".

TO: James C. Robinson
Vogtle Technical Services Manager

Materials and Inspection Services (M&IS) is submitting the updated Vogtle-2 ISI Plan (Version 3.0) for site review and approval. This version updates the 2R13 outage results, clarifies the Class 1 and 2 pipe weld examinations to satisfy conventional ISI Code requirements, provides additional details for the augmented examination section, as well as other changes as noted in the Summary of Changes.

A Vogtle Action Item, Priority 5, (#2009203308) has been opened with a proposed due date of November 30, 2009. This approval copy of this document can be accessed from M&IS webpage under Documents Awaiting Approval, Vogtle.

If you require further assistance, please contact James M. Agold at ext. 5778 or Mike Belford at ext. 5783.

Vogtle-2 ISI Plan, Version 3.0

Summary of Changes

Version 3.0 incorporates the results of the 2R13 outage. The tables for the Class 1, 2, and 3 examination tables as well as the component supports have been updated to show the results.

Corporate and site personnel previously decided to implement the new risk-informed/safety-based (RIS_B) ISI methodology for Vogtle-1 Class 1 and 2 piping. A submittal was made to the NRC in April 2009 to request approval to implement the new approach during the third ISI interval at both Vogtle-1 and -2; however, until the NRC approves this submittal, Vogtle will need to meet the conventional ISI requirements for piping. The associated tables have been re-worked to show conventional ISI Code requirements (i.e., the use of Categories B-F, B-J, C-F-1, and C-F-2). The selection of Class 1 and 2 piping welds in the first ISI period of the third ISI interval have taken the (RIS_B) approach into account and many of these examinations can be credited under this new program.

The Introduction has been changed to address the latest information for Class 1 and 2 piping welds related to risk-informing these examinations.

The basis for the augmented examinations for Vogtle-2 has been updated to address the latest information. The examination tables associated with this basis have been updated as well.

The Class 2 basis has been updated to implement the use of ASME Code Case N-624. This Code Case allows Vogtle to implement the decision to focus the Class 2 steam generator examinations during the third ISI interval on steam generator 2 as compared to performing examinations on all four generators during previous ISI intervals. The use of this Code Case has also resulted in changes in the tables for ASME Categories C-B and C-C.

The Class 1, 2, and 3 component support tables and basis have been revised to combine similar supports (e.g., linear restraint, rigid struts) by ASME Class to more closely match the ASME Code criteria.

The following snubbers were deleted during the 2R13 outage and have been deactivated in the database:

- 21204-199-H003 per ABN 2049000107M004
- 21213-005-H005 per ABN 2049000107M002
- 21213-005-H007 per ABN 2049000107M002
- 21302-010-H006 per ABN 2049000107M009

M&IS performed a review of design drawings comparing supports with welded attachments to the corresponding B-K / C-C component. There was also a clean-up of Category D-A welds, where Class 3 supports have been removed. A comparison of the supports vs. the welded attachments has resulted in changes to the ISI Plan tables.

Small diameter AFW piping examinations have been incorporated into the tables based on revised exemption criteria in the 2001 Edition for this system. In addition, new class 2 ISI sketches, plus selected revised Class 2 ISI sketches were incorporated into Volume 8 of the ISI Plan.

Vogle-2 ISI Plan, Version 3.0

Summary of Changes

ISI sketches (Volume 8) and applicable tables have been revised to address Vogle-2 Program Change Requests (PCRs). The applicable PCRs are 2006-005, 2007-001, 2007-002, 2007-003, 2007-006, 2007-007, 2007-008, 2007-009, 2008-004, 2008-005, 2008-007, and 2008-008. In addition, plan tables and text were revised, as appropriate.

Change bars were added to the Augmented text portion as it was given a complete general update.

**Vogtle Electric Generating Plant -- Unit 2
Third 10-Year Interval
Inservice Inspection Plan
VOLUME 4**

INTRODUCTION

Description of the Inservice Inspection Plan

This volume contains the details for Vogtle-2 pertaining to ISI requirements for IWB, IWC, IWD, and IWF except for pressure testing. Pressure testing for Vogtle-2 is covered in Volume 5 of the ISI Plan. This document provides a systematic plan for the performance of ISI-related examinations and tests at Vogtle Electric Generating Plant (VEGP) as required by 10CFR 50.55a and the ASME Boiler and Pressure Vessel Code Section XI.

Code of Record

Except as modified by the NRC caveats in 10CFR 50.55a (see Enclosure 1 of Volume 1), the 2001 Edition of Section XI with Addenda through 2003 is the Code of Record for Vogtle for the ISI interval starting on May 31, 2007 and ending on May 30, 2017.

ISI Periods and Outages

As noted above, the third 10-year ISI interval starts on May 31, 2007. The three ISI periods and the outages where ISI will be conducted are as follows:

<u>Period 1</u>	05-31-2007 through 05-30-2010
2R13	Fall 2008
2R14	Spring 2010
<u>Period 2</u>	05-31-2010 through 05-30-2014
2R14A	Spring 2010
2R15	Fall 2011
2R16	Spring 2013

Period 3 05-31-2014 through 05-30-2017

2R17 Fall 2014

2R18 Spring 2016

Outage 2R14 and 2R14A applies to the spring 2010 outage. Vogtle-2 plans to perform selected Class 2 examinations on the steam generators to minimize craft support. ASME Section XI, Paragraph IWA-2430(d)(3) allows “the ISI inspection period to be extended by as much as one year to enable an inspection to coincide with a plant outage.”

ISI Scope Format

A change has been made in the presentation of the ISI Plan tables as compared to the second ISI interval. The detailed examination tables are shown for each applicable Section XI ASME category with a Code Compliance sheet for each ASME Category. In addition, an Augmented Section is enclosed after the ISI requirements to address Augmented and Owner-Elected examinations.

Successive and Deferred Examinations

No successive examinations from the second ISI interval are carried over to the third ISI interval. Some class 1 and 3 examinations were deferred from the second ISI interval and are addressed in the ISI Basis as well as the detailed examination tables.

Implementation of Risk-Informed ISI of Class 1 and 2 Piping

Vogtle implemented risk-informed ISI (RI-ISI) for Class 1 and 2 piping during the second ISI interval for both units. The ISI Plan tables were revised to indicate a new ASME Category R-A and the piping weld numbers were expanded to show both the original welds with the piping categories (B-F, B-J, C-F-1, and C-F-2) and a new weld number to indicate the risk-informed ISI. Since the RI-ISI program was implemented during the ISI interval, the second interval ISI Plan continued to show both sets of ASME Categories and weld numbers.

In the third ISI interval, these weld numbers are only listed as Category R-A since risk-informed ISI will be implemented during the entire ISI interval. Therefore, the ASME Categories B-F, B-J, C-F-1, and C-F-2 are not included in the third ISI interval.

Detailed Schedules for the Third ISI Interval

A detailed schedule of the ISI and associated examinations for the third ISI interval at Vogtle-2 is included. In addition, the ISI Basis for these examinations is included.

VOGTLE-2 THIRD INTERVAL ISI PLAN ISI BASIS DOCUMENT

CLASS 1 COMPONENTS

Category B-A - RPV Item B1.11 and B1.12 Shell Welds

The Vogtle-2 Reactor Pressure Vessel (RPV) has three Item B.11 circumferential welds and nine Item B1.12 welds. Volumetric examination of the twelve welds is required. It is permissible to defer these examinations until the end of the interval; therefore, the requirements of Table IWB-2412-1 are not applicable. All 2nd Interval examinations were completed at the end of the interval during the 3rd period; therefore, 3rd Interval examinations are scheduled for the 3rd period.

Category B-A - RPV Item B1.21 and B1.22 Head Welds

The Vogtle-2 closure head has one circumferential weld and four meridional welds. The Vogtle-2 bottom head has one circumferential welds and four meridional welds. Volumetric examination of these ten head welds is required. It is permissible to defer these examinations until the end of the interval; therefore, the requirements of Table IWB-2412-1 are not applicable. The examination of the circumferential weld on the closure head is scheduled for the first ISI period based on the examination performed during the 2nd ISI interval. The remaining 3rd Interval examinations are also scheduled for the 1st period.

Category B-A - RPV Item B1.30 and B1.40 RPV Flange Welds

The Vogtle-2 RPV has one Item B1.30 shell-to-flange weld and one Item B1.40 head-to-flange weld.

Volumetric examination of the shell-to flange and the head-to-flange welds is required. In addition, a surface examination of the head-to-flange weld is required. Note 5 of Table IWB-2500-1, Examination Category B-A allows deferral of these examinations provided that:

- no welded repair/replacement activities have been performed either on the shell-to-flange weld or head-to-flange weld; and
- neither the shell-to-flange weld nor the head-to-flange weld contains identified flaws or relevant conditions that require successive inspections in accordance with IWB-2420(b).

No welded repair/replacement activities have been performed and there are no identified flaws or relevant conditions that require successive inspections in accordance with IWB-2420(b); therefore, deferral is permissible. The RPV shell-to-flange weld was examined during the 3rd period of the 2nd Interval. These 3rd period examinations were performed automated, using Performance Demonstration Initiative procedures, and included 100% of the length. Examinations were also performed from the top of the flange surface because of limitations with the automated examinations. Therefore, 3rd Interval examinations are scheduled for the 3rd period and the requirements of Table IWB-2412-1 are not applicable.

VOGTLE-2 THIRD INTERVAL ISI PLAN ISI BASIS DOCUMENT

The examination of the Vogtle-2 RPV head-to-flange weld on the closure head is scheduled for the first ISI period based on the examination performed during the 2nd ISI interval; therefore, 3rd Interval examinations are scheduled for the 1st period.

Category B-B - Item B2.11 and B2.12 Pressurizer Welds

There are two B2.11 shell-to-head welds. Volumetric examination of both welds is required. Deferral to the end of the interval is not permitted. Additionally, examination of 1 foot of the longitudinal weld (B2.12) from the intersection of each head circumferential weld is required.

Category B-B - Item B2.40 Steam Generator Welds

There are four steam generators at Vogtle-2. There is one B2.40 tubesheet-to head weld on each of the four steam generators. For inservice examinations, Note 1 of Table IWB-2500-1, Examination Category B-B allows examination of only one of the welds. Volumetric examination of the weld is required. Deferral to the end of the interval is not permitted.

Category B-D - Item B3.90 and B3.100 RPV Full-Penetration Welded Nozzles

The Vogtle-2 Reactor Vessel has four inlet nozzles and four outlet nozzles. During the 1st Interval, a portion of the examinations were performed during the 1st period and the balance was scheduled for the 3rd period. However, all of the nozzles were examined during the 3rd period (some were re-examined). Subsequently, during the 2nd Interval, Code Case N-521 was used to allow deferral of the required examinations to the end of the Interval. For the 3rd Interval, Note 5 of Table IWB-2500-1, Examination Category B-D states, "For PWRs in the second and successive inspection intervals, these examinations may be deferred to the end of the interval, provided no repair/replacement activities have been performed on the examination item, and no flaws or relevant conditions requiring successive inspections in accordance with IWB-2420(b) are contained in the examination item." These conditions have been met; therefore, it is permissible to continue to defer the examinations until the end of the interval and the requirements of Table IWB-2412-1 are not applicable.

Volumetric examination of the B3.90 nozzle-to-vessel welds is required in the 3rd Interval. However, Code Case N-648-1 (with NRC caveats) is used to perform an enhanced visual examination for the B3.100 inner radius examinations in lieu of the Code-required volumetric examinations.

Category B-D - Item B3.110 and B3.120 Pressurizer Full-Penetration Welded Nozzles

There are six pressurizer nozzles. Volumetric examination each weld and inner radius is required. Although the nozzle inside radius section examination for pressurizer nozzles is not required in the 2001 Edition of ASME Section XI, 10CFR50.55a mandates this examination. Deferral to the end of the interval is not permitted. Examination is limited and a relief request is needed.

VOGTLE-2 THIRD INTERVAL ISI PLAN ISI BASIS DOCUMENT

Category B-D – Item B3.140 Steam Generator Primary Side Full-Penetration Welded Nozzles

The eight steam generator primary side nozzles are integrally cast into the channel heads; therefore, there are no nozzle to vessel welds. Although the nozzle inside radius section examination for steam generator nozzles is not required in the 2001 Edition of ASME Section XI, 10CFR50.55a mandates this examination. In the 2nd ISI interval, a visual examination was performed per RR-32. Based on recent work at EPRI for the ultrasonic examination of nozzle inner radii, Vogtle will perform ultrasonic examination from the OD for steam generator nozzle inner radii. Deferral to the end of the interval is not permitted.

Category B-E – This is not a Code Category in the 2003 Addenda

Category B-F – See Class 1 and 2 Piping Examinations.

Category B-G-1 – Item B6.10, B6.20, B6.40, and B6.50 RPV Bolting Greater than 2”

For the 3rd Interval, it is permissible to defer each of these inspections to the end of the interval.

For Vogtle-2, each of these examinations has been deferred to the end of the 3rd interval. This deferral is possible because all components were examined at the end of the 2nd Interval (some were re-examined) such that there will only be about ten years between the 2nd Interval and 3rd Interval examinations.

For the 1st and 2nd Intervals, each stud, nut, washer, and flange ligament had an individual number assigned to it. For the 3rd Interval, a combined number was used in ScheduleWorks (e.g., B01 thru B054).

Category B-G-1 – Item B6.60, B6.70, and B6.80 Pressurizer Bolting Greater than 2”

The pressurizer does not have pressure retaining bolting greater than 2” in diameter.

Category B-G-1 – Item B6.90, B6.100, and B6.110 Steam Generator Bolting Greater than 2”

The steam generators do not have pressure retaining bolting greater than 2” in diameter.

Category B-G-1 – Item B6.120, B6.130, and B6.140 Heat Exchanger Bolting Greater than 2”

The heat exchangers do not have pressure retaining bolting greater than 2” in diameter.

Category B-G-1 – Item B6.150, B6.160, and B6.170 Piping Bolting Greater than 2”

The piping does not have pressure retaining bolting greater than 2” in diameter.

VOGTLE-2 THIRD INTERVAL ISI PLAN ISI BASIS DOCUMENT

Category B-G-1 - Item B6.180 and B6.190 Pump Bolting Greater than 2"

There is pressure retaining bolting greater than 2" in diameter on the four Reactor Coolant pumps. However, they are studs without nuts, bushings, and washers so Item B6.200 is not applicable.

Per Note 4 of Table IWB-2500-1, Examination Category B-G-1, a VT-1 of the pump flange surface is required only when a pump is disassembled and a Category B-L-2 examination is performed. If a pump is not disassembled during the 3rd Interval this examination is not required. Because the examination is performed only when the component is disassembled, the requirements of Table IWB-2412-1 are not applicable.

In those cases where an examination is only required when a component or a bolted connection is disassembled, the examination tables show "t" for every outage in the ISI interval. This is used as a reminder to ISI and Vogtle site personnel to perform the required examinations when disassembled.

Per Note 3 of Table IWB-2500-1, Examination Category B-G-1, the volumetric examination of the studs may be limited to one of the four pumps.

Category B-G-2 - Item B7.20, B7.30, B7.50, B7.60 and B7.70 Pressure Retaining Bolting Less Than or Equal to 2" in Diameter

Note: There is not any RPV or heat exchanger pressure retaining bolting ≤ 2 "; therefore, Items B7.10 and B7.40 are not applicable.

Per Notes 1, 2, and 3 of Table IWB-2500-1, Examination Category B-G-2 the following examinations are required.

- For the pressurizer (Item B7.20), examination of the B-G-2 bolting is required if it is disassembled during the 3rd Interval. Examination is required only once during the interval. Because the examination is performed only when the component is disassembled, the requirements of Table IWB-2412-1 are not applicable.
- For the steam generators (Item B7.30) only one generator has been selected for examination per Category B-B. Examination of the bolting is required only if the bolting on the steam generator selected for the Category B-B examinations is disassembled during the 3rd Interval. Examination is required only once during the interval. Because the examination is performed only when the component is disassembled, the requirements of Table IWB-2412-1 are not applicable.
- For piping flange bolting (Item B7.50) the examinations may be limited to one bolted connection among a group of bolted connections that are similar in design, size, function, and service. Examination is required only when a flange is disassembled. Examination is required only once during the interval. Because the examination is performed only when the component is disassembled, the requirements of Table IWB-2412-1 are not applicable.

21208-045-20 FB	1.5" Flange Bolt Assembly for RC Pump 003
21208-047-18 FB	1.5" Flange Bolt Assembly for RC Pump 004

- For the reactor coolant pumps (Item B7.60), examination of the bolting is required only if a pump is disassembled and examined per Examination Category B-L-2. Examination is required only once during the interval. Because the examination is performed only when the component is disassembled, the requirements of Table IWB-2412-1 are not applicable.
- For the valves (Item B7.70), examination of the bolting is required only if a valve is disassembled and examined per Examination Category B-M-2. Examination is required only once during the interval. Because the examination is performed only when the component is disassembled, the requirements of Table IWB-2412-1 are not applicable.

In those cases where an examination is only required when a component or a bolted connection is disassembled, the examination tables show "t" for every outage in the ISI interval. This is used as a reminder to ISI and Vogtle site personnel to perform the required examinations when disassembled.

Category B-J - See Class 1 and 2 Piping Examinations.

Category B-K - Item B10.10 Class 1 Welded Attachments for Vessels

Note: There are no piping, pumps or valve welded attachments; therefore, Items B10.20, B10.30 and B10.40 are not applicable.

Item B10.10 Pressurizer Skirt Weld - Per Note 7 of Table IWB-2500-1, Examination Category B-K, for the configurations shown in Figs. IWB-2500-13 and IWB-2500-14, a surface examination from an accessible side of the skirt will be performed. In addition, Vogtle will use Code Case N-700; therefore, the remaining pressurizer welded attachments do not require examination.

VOGTLE-2 THIRD INTERVAL ISI PLAN ISI BASIS DOCUMENT

Item B10.10 RPV Head Welded Attachments – There are three integral attachments on the Vogtle-1 RPV closure head. Per Code Case N-700, only one of the three lugs is required to be examined.

Category B-L-1 – Pressure Retaining Welds in Pump Casings – This Code Category is not applicable because there are no Reactor Coolant Pump casing welds.

Category B-M-1 – Pressure Retaining Welds in Valve Bodies – This Code Category is not applicable because there are no valve body welds.

Category B-L-2 – Pump Casings

There are four Reactor Coolant Pumps in this Code Category. Per Notes 1 and 2 of Table IWB-2500-1, Examination Category B-L-2, examination are limited to one Reactor Coolant Pump. Additionally, examination is required only when a pump is disassembled for maintenance, repair, or volumetric examination. Examination of the internal pressure boundary shall include the internal pressure retaining surfaces made accessible for examination by disassembly. If a partial examination is performed and a subsequent disassembly of the pump allows a more extensive examination, an examination shall be performed during the subsequent disassembly. A complete examination is required only once during the interval. Because the examination is performed only when the component is disassembled, the requirements of Table IWB-2412-1 are not applicable.

In those cases where an examination is only required when a component or a bolted connection is disassembled, the examination tables show “t” for every outage in the ISI interval. This is used as a reminder to ISI and Vogtle site personnel to perform the required examinations when disassembled.

Category B-M-2 – Valve Bodies for valves Exceeding 4” NPS

Per Notes 2 and 3 of Table IWB-2500-1, Examination Category B-M-2, examination is required only when a valve is disassembled for maintenance, repair, or volumetric examination. Examination of the internal pressure boundary shall include the internal pressure retaining surfaces made accessible for examination by disassembly. If a partial examination is performed and a subsequent disassembly of that valve allows a more extensive examination, an examination shall be performed during the subsequent disassembly. A complete examination is required only once during the interval. Examinations are limited to one valve within each group of valves that are of the same size, structural design (such as globe, gate, or check valves), and manufacturing method that perform similar functions in the system (such as containment isolation and system overpressure protection). Because the examination is performed only when the component is disassembled, the requirements of Table IWB-2412-1 are not applicable.

**VOGTLE-2 THIRD INTERVAL ISI PLAN
ISI BASIS DOCUMENT**

In those cases where an examination is only required when a component or a bolted connection is disassembled, the examination tables show "t" for every outage in the ISI interval. This is used as a reminder to ISI and Vogtle site personnel to perform the required examinations when disassembled.

The table below groups the valves and can be used to ensure that only one valve of a group of valves needs to be examined.

VOGTLE-2 THIRD INTERVAL ISI PLAN ISI BASIS DOCUMENT

Category B-N-1 – RPV Interior

Item B13.10 - The interior of the RPV is required to be VT-3 examined each inspection period (approximately every 3 years). ASME Code credit is shown for the first ISI period. The tables also show the RPV Closure Head examination per the FSAR 5.3.3.7 requirement although no ASME Code credit is taken for this examination.

Category B-N-2 – Interior Attachments to the RPV

Item B13.50 - There are no interior attachments in the beltline region; therefore, Item B13.50 is not applicable.

Item B13.60 - The accessible interior attachment welds (outside of the beltline region) must be VT-3 examined once per interval. It is permissible to defer these examinations until the end of the interval. Based on EPRI MRP work, Vogtle will perform a VT-1 examination of these six attachment welds.

Category B-N-3 – Removable Core Support Structures

The core support structure shall be removed from the RPV for VT-3 examination once per interval. It is permissible to defer these examinations until the end of the interval.

Category B-O – CRD Housing Pressure Retaining Welds

Vogtle-2 has 20 peripheral CRD housing welds. A 10% sample is required over the 3rd ISI interval. It is permissible to defer these examinations until the end of the interval; therefore, the requirements of Table IWB-2412-1 are not applicable.

Category B-P – Pressure Testing

Pressure testing for Vogtle-2 is addressed in Volume 5 of this plan.

Category B-Q – Steam Generator Tubing

The extent and frequency of the examinations are governed by the Technical Specifications. As requested by Vogtle site personnel, the outages where eddy current testing is performed by steam generator are included in the summary tables.

VOGTLE-2 THIRD INTERVAL ISI PLAN ISI BASIS DOCUMENT

CLASS 2 COMPONENTS

Per IWC-1220, except for high pressure safety injection systems in a pressurized water reactor plant, pressure vessels and their connections in piping having a cumulative inlet and a cumulative outlet pipe cross-sectional area, neither of which exceeds NPS 4", are exempted from volumetric and surface examination requirements. This exemption applies to the:

- Excess Letdown Heat Exchanger V2-1208-E6-002
- Letdown Heat Exchanger V2-1208-E6-003
- Letdown Reheat Heat Exchanger V2-1208-E6-007
- Reactor Coolant Filter V2-1208-F4-001
- Seal Injection Filters V2-1208-F4-004 & -005
- Seal Water Return Filter V2-1208-F4-002
- Seal Water Heat Exchanger V2-1208-E6-004

Per IWC-1220, for systems (or portions of systems) other than RHR, Emergency Core Cooling, or Containment Heat Removal, vessels that operate at a pressure equal to or less than 275 psig and at a temperature equal to or less than 200⁰F may be exempted from volumetric and surface examination requirements. This exemption applies to the:

- Volume Control Tank V2-1208-T6-001
(operates at about 15 to 35 psig and up to 140⁰F)

Per IWC-1220, for systems (or portions of systems) within RHR, Emergency Core Cooling, or Containment Heat Removal, vessels of any size in statically pressurized, passive safety injection systems of pressurized water reactor plants may be exempted from volumetric and surface examination requirements. This exemption applies to the:

- Accumulator Tanks V2-1204-V6-001 through -004

Per Code Case N-706, a VT-2 performed during the system leakage test will be used in lieu of the volumetric examination requirements for the:

- Regenerative Heat Exchanger V2-1208-E6-001
- RHR Heat Exchangers V2-1205-E6-001 & -002

Since only pressure testing will be performed on the components listed above, these components will not show up in the Code Compliance Summary.

VOGTLE-2 THIRD INTERVAL ISI PLAN ISI BASIS DOCUMENT

After applying the exemptions and Code Case N-706-1, the four Steam Generators are the only pressure vessels subject to volumetric and/or surface examinations.

Category C-A – Item C1.10, C1.20 and C1.30 Pressure Retaining Welds in Pressure Vessels

Item C1.10 applies to shell circumferential welds at gross structural discontinuities. Each Steam Generator has three welds that meet this criterion: W03, W04, and W05. Per Note 3 of Table IWC-2500-1, Examination Category C-A, the required examinations may be limited to one steam generator.

To perform the examinations in a manner that optimizes scaffolding one of the welds will be examined during the Spring 2010 outage (at the end of Period 1) and credited to the 2nd Period. This is allowable per paragraph IWA-2430(d)(3) of Section XI which states “That portion of an inspection described as an inspection period may be reduced or extended by as much as one year to enable an inspection to coincide with a plant outage. This adjustment shall not alter the requirements for scheduling inspection intervals.” In ScheduleWorks this one weld is shown as being examined in the 2R14A outage.

There is one C1.20 head circumferential weld and one C1.30 tubesheet-to-shell weld on each of the four Steam Generators. Per Note 3 of Table IWC-2500-1, Examination Category C-A, the required examinations may be limited to one steam generator; therefore, only one C1.20 weld and one C1.30 weld require examination for the steam generators.

Category C-B – Item C2.21 and C2.22 Pressure Retaining Nozzle Welds in Pressure Vessels

Each Steam Generator has a Feedwater Inlet Nozzle, an Auxiliary Feedwater Inlet nozzle, and a Steam Outlet Nozzle.

The Steam Outlet nozzle is on the head and it does not have a true inner radius because it was fabricated from a solid piece with multiple holes drilled through it. Relief was requested per RR-14 during the 2nd Interval to not perform inner radius examinations. A similar relief will be submitted for the 3rd Interval. Both the Feedwater and the Auxiliary Feedwater Inlet nozzles have a nozzle to shell weld. Per Figure IWC-2500-4(b), the inner radius examination for the Auxiliary Feedwater Inlet nozzle is not required per ASME.

There are three C2.21 nozzle-to-shell welds and two C2.22 nozzle inner radius on each of the Steam Generators. Per Note 4 of Table IWC-2500-1, Examination Category C-B the required examinations may be limited to one steam generator; therefore, three C2.21 welds and one C2.22 inner radius require examination.

Similar to Category C-A, to perform the examinations in a manner that optimizes scaffolding two of the welds will be examined during the Spring 2010 outage (at the end of Period 1) and credited to the 2nd Period. These welds will also be identified in ScheduleWorks as being examined in the 2R14A outage.

**VOGTLE-2 THIRD INTERVAL ISI PLAN
ISI BASIS DOCUMENT**

Category C-C – Item C3.10, C3.20, and C3.30 Welded Attachments

Item C3.10 – Each of the Steam Generator has four trunnions. Per Note 4 of Table IWC-2500-1, Category C-C only one of the trunnions on one of the Steam Generators require examination. Item C3.20 - Per Note 5 of Table IWC-2500-1, Examination Category C-C, 10% of the piping welded attachments (associated with component supports) shall be examined. Item C3.30 - Per Note 5 of Table IWC-2500-1, Examination Category C-C, 10% of the pump welded attachments (associated with component supports) shall be examined using surface examination techniques.

Category C-D – Pressure Retaining Bolting Greater Than 2” in Diameter

Item C4.30 – There are 2 sets of pump casing studs. Per Table IWC-2500-1, Category C-D, 100% of the studs on one of the pumps is required to be examined using volumetric examination techniques.

Category C-F-1 - See Class 1 and 2 Piping Examinations

Category C-F-2 - See Class 1 and 2 Piping Examinations

Category C-G – Pressure Retaining Welds in Pumps and Valves

There are no welds in Class 2 pumps and valves; therefore, this category is not applicable.

Category C-H – Pressure Testing

Pressure testing is addressed in Volume 5 of the Vogtle-2 ISI Plan.

**VOGTLE UNIT 2 THIRD INTERVAL ISI PLAN
ISI BASIS DOCUMENT**

CLASS 3 COMPONENTS

Category D-A – Item D1.10 (Vessel), D1.20 (Piping), and D1.30 (Pump) Welded Attachments

Note: There are no valve welded attachments; therefore, Item D1.40 is not applicable.

The examination requirements apply to the welded attachments on Class 3 pressure-retaining components in support of one or more of the following six functions:

1. reactor shutdown
2. emergency core cooling
3. containment heat removal
4. atmosphere cleanup
5. reactor residual heat removal
6. residual heat removal from spent fuel storage pool

A visual examination will be performed to satisfy ASME Section XI requirements.

Item D1.10 – Pressure Vessel Welded Attachments. A **pressure vessel** is a closed container designed to hold gases or liquids at a pressure different from the ambient pressure; therefore, storage tanks (e.g., CST, etc.) are not pressure vessels. (This position is confirmed by intent inquiry IN 07-01 dated 10/22/07). The ASME Code allows the use of multiple vessels (see Table IWD-2500-1, Note 3). Vogtle will be using ASME Code Case N-700 for this item number.

Component	System	Comments	Period		
			1	2	3
21203-E4-001 21203-E4-002	CCW CCW	4 Total – examine 1 using N-700			1
21203-T4-001 21203-T4-002	CCW CCW	4 Total – examine 1 using N-700			1

21592-T7-001 21592-T7-002	ESF ESF	4 Total – examine 1 using N-700		1	
Total			2	1	3

**VOGTLE UNIT 2 THIRD INTERVAL ISI PLAN
ISI BASIS DOCUMENT**

Item D1.20 – Piping Welded Attachments. Per Note 3 of Table IWD-2500-1, Examination Category D-A, for welded attachments of piping, a 10% sample shall be selected for examination. This percentage sample will be proportional to the total number of nonexempt welded attachments connected to the piping in each system subject to these examinations.

Item D1.30 – Pump Welded Attachments. Per Note 3 of Table IWD-2500-1, Examination Category D-A, for welded attachments of pumps, a 10% sample shall be selected for examination. This percentage sample will be proportional to the total number of nonexempt welded attachments connected to the pumps in each system subject to these examinations.

The ISI scope of the examinations include:

CATEGORY D-A EXAMINATIONS		
ITEM NO.	TOTAL ATTACHMENTS	ATTACHMENTS SCHEDULED for EXAMINATION
D1.10(2)	19	6
D1.20	302	34
D1.30	120	13
TOTALS	441	53

Nuclear Service Cooling Water system pump supports and their integrally welded attachments were examined for second ISI interval Code credit between the Vogtle 2R12 and 2R13 outages. These examinations will be documented in the update to the second ISI interval ISI Plan for Vogtle-2. The examinations for third ISI interval Code credit will be performed in the third ISI period.

ASME Section XI also requires a visual examination whenever component support member deformation, e.g., broken, bent, or pulled out parts, is identified during operation, refueling, maintenance, examination, or testing.

Category D-B – Pressure Testing

Pressure testing is addressed in Volume 5 of this plan.

VOGTLE UNIT 2 THIRD INTERVAL ISI PLAN COMPONENT SUPPORTS

SCOPE

For the 3rd Interval, the determination of the Class 1, 2, and 3 supports to be examined will be performed using Subsection IWF of the 2001 Edition of Section XI through the 2003 Addenda. (The rules in IWF are similar to those used during the 2nd Interval per NRC approved Code Case N-491-1). (Note: IWE supports are not included here).

Per the IWA-9000 Glossary *a component support is defined as a metal support designed to transmit loads from a component to the load-carrying building or foundation structure. Component supports include piping supports and encompass those structural elements relied upon to support the weight or provide structural stability to components.*

Examinations apply to all component supports that are in the scope of the Class 1, 2, and Boundary Diagrams and are not exempt. Supports exempt from examination requirements are those connected to piping or other items exempted from volumetric, surface, VT-1, or VT-3 examinations by IWX-1220. In addition, portions of supports that are inaccessible by being encased in concrete, buried underground, or encapsulated by guard pipe are also exempt from the examination requirements of IWF-2000. Component supports should be selected for examination as follows:

1. Supports should be characterized to identify its support type/function. For VEGP-2, the support type/functions include the following:
 - A Anchor
 - B Constant Spring
 - C Linear Rack 1-D
 - D Linear Rack 2-D
 - E Linear Rack 3-D
 - F Linear Restraint
 - G Rigid Strut
 - H Variable Spring
 - S Snubber
 - U Undersupport
2. 25% of the non-exempt Class 1 piping supports, 15% of the non-exempt Class 2 piping supports, and 10% of the non-exempt Class 3 piping supports shall be examined per Table IWF-2500-1. (Note: These are considered as minimum numbers to examine. As shown in the following tables, additional examinations may be scheduled as applicable).
3. The supports selected for examination shall be prorated such that the individual sample sizes for each system are proportional to the number of non-exempt supports of each type and function in each system. Piping supports were prorated by system and support type/functions as shown in the table, Scheduled Supports By Category.
4. For multiple components other than piping, within a system of similar design, function, and service, the supports of only one of the multiple components are required to be examined.

VOGTLE UNIT 2 THIRD INTERVAL ISI PLAN COMPONENT SUPPORTS

ISI PLAN TABLES

Beginning in 2005, ISI Plan Tables are generated by the industry standard ScheduleWorks ISI software. The following tables were generated using a standard format provided by ScheduleWorks. It should be noted that the Scope/Method/Procedure field is for *information only*. This information may be changed during an outage by IDDEAL users at the site, but it will not be reflected in the ISI Plan until the plan is issued after the outage. When using these tables the user needs to understand the following symbols:

Scheduled	"s"	To schedule a component, place the identifier "s" in the required period/outage.
Completed	"c"	Upon exam completion for a scheduled component and by uploading the outage scope from IDDEAL back to ScheduleWorks, an "s" will be updated to completed "c".
Re-scheduled	"r"	Once a component has been scheduled, and you wish to reschedule to another outage, replace the scheduled "s" with a rescheduled "r" and enter an "s" in the new outage schedule.
Expanded Scope	"e"	To increase a work scope without taking code credit in the percentage calculations, enter an expanded "e".
Expanded Scope Completed	"E"	Upon exam completion of an expanded scope and by either uploading the outage scope from IDDEAL or manually changing the letter to an upper case "E" the exam scope is completed.
Additional Scheduled	"a"	After an initial expanded work scope has been identified and you wish to add an increased expanded work scope, enter an additional expanded scope "a".
Additional Completed	"A"	Upon exam completion of an additional expanded scope and by either uploading the outage scope from IDDEAL or manually changing the letter to an upper case "A" the exam scope is completed.
Partial	"p"	To track partially completed component examination requirements enter a partial "p".
Deferred	"d"	Once a component has been scheduled, and you wish to defer the inspection to another Outage, or Period, replace the scheduled "s" with a deferred "d" and enter an "s" in the new Outage.
Limited	"l"	To track limited component examinations or limited completions of requirements enter "l".
Multiple Scheduled	"b"	For multiple scheduling of the same component in successive Outages or Periods within an Interval enter "b".
Multiple Completed	"B"	Upon exam completion of a multiple scope in the same Interval and by either uploading the outage scope from IDDEAL or manually changing the letter to an upper case "B" the exam scope is completed. This multiple scheduling scope will not count as completed for code calculations.
Tickler	"t"	To track exam scopes or use as reminder or identifier to confirm scheduling enter "t".
Successive Exams	"h"	Successive examinations.
Successive Exams Com	"H"	Upon exam completion of a successive scope and by either uploading the outage scope from IDDEAL or manually changing the letter to an upper case "H" the exam scope is completed.

VOGTLE UNIT 2 THIRD INTERVAL ISI PLAN COMPONENT SUPPORTS

EXAMINATION OF SNUBBERS

IWF-1220 of the 2001 Edition of Section XI with Addenda through 2003 requires that the inservice inspection requirements for snubbers be in accordance with the requirements of IWF-5000, which states:

- (a) Inservice examinations shall be performed in accordance with ASME/ANSI OM, Part 4, using the VT-3 visual examination method described in IWA-2213.
- (b) Inservice tests shall be performed in accordance with ASME/ANSI OM, Part 4.

10 CFR 50.55a(b)(3)(v) provides an alternative to these two requirements. Licensees may use Subsection ISTD, "Inservice Testing of Dynamic Restraints (Snubbers) in Light-Water Reactor Power Plants," ASME OM Code, 1995 Edition through the 2003 Addenda, in place of the requirements of IWF-5300(a) and (b) by making appropriate changes to their technical specifications or licensee-controlled documents (if required). Inservice examinations must be performed using the VT-3 visual examination method described in IWA-2213.

However, per IWF-5300(c) integral and non-integral attachments for snubbers including bolting, pins, and clamps, shall be examined in accordance with the requirements of this Subsection (IWF). (Attachments to the pressure boundary such as lugs will be examined per Category B-K, C-C, or D-A). IWF allows a percentage of the integral and non-integral attachments for snubbers to be examined as follows:

- Attachment welds will be examined in accordance with IWB, IWC, or IWD.
- The snubber unit including the pins that secure the snubber unit into the support structure will be examined as required by OM requirements.
- The support structure (bolting, pin, and clamps outside of the snubber unit), will be VT-3 examined and reported as required by IWF. Therefore, for Class 1 snubbers, 25% of the support structures will be scheduled and VT-3 examined; 15% of the Class 2 support structures will be scheduled and VT-3 examined, and 10% of the Class 3 support structures will be scheduled and VT-3 examined. For non-piping snubbers, Footnote 3 of Table IWF-2500-1 must be used to determine the scope.

Personnel performing the VT-3 examinations may be qualified and certified per IWA-2310 through IWA-2314 (the standard qualification/certification process) or per IWA-2317. IWA-2317 allows the use of plant personnel with at least 40 hours of plant experience in installation, maintenance, or examination of pumps, valves, and supports to perform the VT-3 examinations. These personnel must have 8 hour of training in the Section XI requirements and procedures for VT-3 visual examinations, meet the vision test requirements of IWA-2321, have an initial exam, and have a follow-up exam every three years. If using these alternate requirements they shall be described in the appropriate written practice.

VOGTLE UNIT 2 THIRD INTERVAL ISI PLAN COMPONENT SUPPORTS

Determination of Class 1 Piping Supports to be Examined

Per IWF-1230 supports exempt from examination are those connected to piping and other items exempted from examination by IWB. These include supports on lines:

- Supports located on components less than or equal to 1" in diameter. (Reference Class 1 portion of this document for IWB-1220 exemptions used at VEGP-2).
- Portions of supports that are inaccessible by being encased in concrete, buried underground, or encapsulated by guard pipe.

Non-exempt piping supports were prorated by system and support type/functions as shown in the table, *Scheduled Supports By Category*.

Determination of Class 2 Piping Supports to be Examined

Per IWF-1230 supports exempt from examination are those connected to piping and other items exempted from examination by IWC. These include:

- Supports located on components less than or equal to 4" in diameter. (Reference Class 2 portion of this document for IWB-1220 exemptions used at VEGP-2).
- Supports located on components in systems (or portions of systems) whose function is not required in support of reactor residual heat removal, containment heat removal, and emergency core cooling and that operate at a pressure equal to or less than 275 psig and at a temperature equal to or less than 200°F. (Reference Class 2 portion of this document for IWB-1220 exemptions used at VEGP-2).
- Supports located on components of any size beyond the last shutoff valve in open ended portions of systems that do not contain water during normal operation. (Reference Class 2 portion of this document for IWB-1220 exemptions used at VEGP-2).
- Portions of supports that are inaccessible by being encased in concrete, buried underground, or encapsulated by guard pipe.

Piping supports were prorated by system and support type/functions as shown in the table, *Scheduled Supports By Category*.

VOGTLE UNIT 2 THIRD INTERVAL ISI PLAN COMPONENT SUPPORTS

Determination of Class 3 Piping Supports to be Examined

Per IWF-1230 supports exempt from examination are those connected to piping and other items exempted from examination by IWC. These include:

- Supports located on components less than or equal to 4" in diameter. (Reference Class 3 portion of this document for IWB-1220 exemptions used at VEGP-2).
- Supports located on components in systems (or portions of systems) whose function is not required in support of reactor residual heat removal, containment heat removal, and emergency core cooling and that operate at a pressure equal to or less than 275 psig and at a temperature equal to or less than 200⁰F. (Reference Class 2 portion of this document for IWB-1220 exemptions used at VEGP-2).
- Portions of supports that are inaccessible by being encased in concrete, buried underground, or encapsulated by guard pipe.

Piping supports were prorated by system and support type/functions as shown in the table, *Scheduled Supports By Category*.

Nuclear Service cooling Water system pump supports and their integrally welded attachments were examined for second ISI interval Code credit between the Vogtle 2R11 and 2R12 outages. These examinations will be documented in the update to the second ISI interval ISI Plan for Vogtle-2. The examinations for third ISI interval Code credit will be performed in the third ISI period.

The Class 3 component supports also show an Owner-Elected scope of 1202 system supports per Letter NOE-01650, dated February 26, 1987.

VOGTLE UNIT 2 THIRD INTERVAL ISI PLAN COMPONENT SUPPORTS

Determination of Supports Other Than Piping to be Examined

Item No. F1.40 applies to Class 1, 2, and 3 components other than piping. Table IWF-2500-1 footnote 1 requires that Item Numbers be categorized to identify support types by component support function. Except for equipment snubbers all equipment support are categorized as F1.40. This reasoning was used because these components are not selected for examination by a pro-ration process. Instead all of the supports on a piece of equipment are required to be examined, except when there are multiple components within a system that have a similar design, function, and service. For this case, Note 3 of Table 2500-1 indicates that only the supports on one of the similar components needs to be examined. For example, each of the two Class 2 RHR pumps has three supports for a total of six supports. Only three of the supports are required to be examined.

The four supports on the bottom of the RPV nozzles are not included for examination based on IWF-1230 which exempts components buried in concrete.

The ISI scope of the examinations include:

ITEM F1.40 EXAMINATIONS		
CLASS	TOTAL SUPPORTS	SUPPORTS SCHEDULED for EXAMINATION
1	58	19
2	19	10
3	164	50
TOTALS	241	79

Therefore, 31.8% of the equipment supports (Non-snubbers) are scheduled for examination.

The Class 2 portion of the four Steam Generators is the only Class 1, 2, or 3 equipment that has snubbers. While the examination of the snubber unit is performed per OM, not Section XI; the remainder of the support is effectively examined the same as any other support. There are two snubbers on each steam generator with only one set of snubbers on one of the steam generators requiring examination (or 25% of the population).

TOTAL CLASS 1, 2, AND 3 PIPING SUPPORTS AND EQUIPMENT SUPPORTS

Code requirements were met as shown in the Code Compliance Scheduling Summary for F-A supports and snubbers.

SCOPE EXPANSION

Component support examinations that reveal flaws or relevant conditions exceeding the acceptance standards of IWF-3400 shall be extended to include the component supports immediately adjacent to those component supports for which corrective action is required. Additional examinations shall be extended to include additional supports within the same

VOGTLE UNIT 2 THIRD INTERVAL ISI PLAN COMPONENT SUPPORTS

system, equal in number and of the same type and function as those scheduled for examination during the period.

Alternately, per IWF-3122.3 the component support with the flaw or relevant condition may be accepted for continued service without corrective actions if an evaluation or test demonstrates that the component support is acceptable for service. Since corrective actions are not required, scope expansion is not required.

SUCCESSIVE EXAMINATIONS

Acceptance of IWF-3410 Conditions by Corrective Measures or Repair Replacement

Per IWF-2220(a), when a component support is accepted for continued service by corrective measures (e.g., adjustment for conditions such as loosened mechanical connections, improper hot/cold settings, etc.) or is accepted through repair/replacement activities the component support shall be re-examined prior to returning the system to service.

Per IWF-2220(b), when a component support is in a system that operates above 200⁰ F and is accepted for continued service by corrective measures (e.g., adjustment for conditions such as loosened mechanical connections, improper hot/cold settings, etc.) or is accepted through repair/replacement activities the component support shall be re-examined during the following heatup and cooldown cycle unless determined unnecessary by evaluation. This examination shall be performed during operation or the next refueling outage.

Per IWF-2420, the component support shall also be re-examined during the next inspection period.

Acceptance of IWF-3410 Conditions by Evaluation or Test

When a component support is accepted for continued service by evaluation or test in accordance with IWF-3122.3 re-examination is not required during the next inspection period. If evaluated or tested and determined acceptable for continued service corrective measures may be used to restore the support to its original design condition re-examination is not required prior to returning the system to service.
