John, Please confirm the numbers:

(b)(5)

Thanks.

Pete, Pete Orphanos (OC Plant Manager is calling me @ 11 am). I believe it is just to touch base and provide an update. Please feel free to join me. Dave

Daily Note, 4/17/09

On April 16, Exelon issued a press release informing that, in the course of a cable replacement activity, it found about 3000 gallons of tritiated water in a concrete cable vault, having a tritium concentration of about 102,000 pCi/l. Exelon had previously informed New Jersey Department of Environmental Protection (NJDEP) and the

NRC of this matter. As part of its investigation to determine the source, Exelon sampled several on-site monitoring wells. A monitoring well in the vicinity of the cable vault and the Condensate Storage Tank (CST) indicated a tritium concentration of about 4,500,000 pCi/l. When last sample about a month ago, the monitoring well indicated less than 200 pCi/l. Accordingly, Exelon is exploring the potential that the leak source is the CST or associated piping, and has so informed the NJDEP
