Indian Point Station Docket No. 50-247 Unit Unit No. 2 Date October 8, 1979 Completed By J. Makepeace Telephone 914-739-8823

Summary of Operating Experience - September, 1979

At the end of the last reporting period, replacement of No. 22 RCP motor was in progress. After this was accomplished, the pump was returned to an operable status on Sunday, 9/2/79. Heatup of the RCS was commenced on the following day. At approximately 0445 hours on Tuesday, 9/4/79, a small amount of oil which had permeated portions of the insulation on No. 24 RCP bowl caught fire. The fire was promptly extinguished and effects were localized in the area of the insulation. To`facilitate replacement of the insulation, the RCS temperature was brought down to approximately 220°F. After replacing the pump bowl insulation, RCS heatup was resumed. In the course of system heatup smoldering-type fires were experienced on the other three pumps. Effects were again confined to the insulation, requiring partial replacement of same.

A 50 psig air pressure test of the main generator was successfully conducted on 9/5/79. The generator was then depressurized, purging with CO₂ and filled with hydrogen.

At 0917 hours on Tuesday, 9/11/79, the reactor was brought critical for the start of Cycle 4 zero power physics test program. This program was completed at approximately 1100 hours on the following day.

The Unit was synchronized to the system at 0055 hours on Saturday, 9/15/79. The load was gradually brought up to approximately 30 percent and held at this level for four days for the steam generator "boron soak" as recommended by Westinghouse.

Following completing of the steam generator "boron soak", the unit was removed from service on Friday, 9/21/79, to check the turbine overspeed trip devices and to perform miscellaneous maintenance work. It was returned to service the following day at 2355 hours and the load gradually escalated to 90% for ex-core/in-core calibration of the nuclear instrumentation system. Data for this calibration was collected on Sunday, 9/30/79.

Other significant items of interest during the report period were as follows:

1.

Line walking of safety related piping as required by IE Bulletin 79-14 was accomplished. A report of the results of this work was submitted to the Commission on 9/28/79.

2. The mechanical seal on No. 21 RHR pump was replaced to correct a slight leakage problem at the seal. Nuclear noise measurements were taken at various power levels to confirm that the apparent loose object at the bottom of the reactor vessel had not lodged between the energy absorbing device and the vessel bottom.

4. On two occasions during low power physics testing, RCC B-6 dropped. In both cases, the rod was retrieved with no difficulty. Subsequent investigation revealed that the problem was caused by a loose connection at top of the oil stack. After repairs, no further problems were encountered.

3.
