J. G. Keppler, Chief, Reactor Testing and
Operations Branch, Regulatory Operations, HQ

CONSOLIDATED EDISON COMPANY
INDIAN POINT UNIT 2
RO INSPECTION REPORT 50-247/72-12

The subject report is forwarded for information.

This was a special inspection of the main steam safety/relief valve installation modifications which were necessary to bring the stresses for the combined loading conditions within the allowables of ANSI B31.1.0. The procedure used for the modification along with the welding, nondestructive tests, heat treatment, and dimensional records were all reviewed. No record or work performance deficiencies were identified.

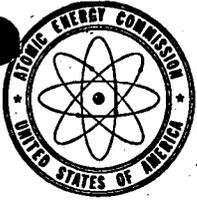

A review of the modification to the ten-inch accumulator check valves in the safety injection system was also performed with no deficiencies identified. The completed pressurizer nozzle reinforcement was inspected and observations of the completed weld reinforcement appear to confirm that the repair and inspection program was followed.
