

MAR 14 1974

DOCKET NO: 50-286

APPLICANT: Consolidated Edison Company of New York, Inc.

FACILITY: Indian Point Unit 3

MEETING OF FEBRUARY 5, 1974 TO DISCUSS IN-SERVICE INSPECTION

A meeting was held in Bethesda, Maryland on February 5, 1974 to discuss the ACRS's comments on the Indian Point 3 in-service inspection program. An attendance list is attached.

Consolidated Edison of New York proposed to augment its in-service inspection program of the steam generator shell by examining five steam generators seams by ultrasonic testing methods. The areas to be examined are the shell and head circumferential welds which are gross discontinuities and are therefore considered the critical welds. This augmented in-service inspection program includes an initial baseline inspection. Consolidated Edison left a draft copy of its proposed Technical Specification for this augmented in-service inspection.

With regard to in-service inspection of the nozzles in the primary head of the steam generator, the applicant has attempted to augment this program also. These nozzles are large castings and do not have external welds. Consolidated Edison investigated the feasibility of performing in-service inspection of these nozzles. Because of the poor surface of this casting, it is not feasible to perform ultrasonic testing. Both the staff and the applicant believe that surface and/or visual inspection of these nozzles would be of no value. The applicant will pursue future development of in-service inspection technology to see if other methods can be used, however no practical in-service inspection of these nozzles seems possible at this time.
