SUBJECT: Clarification to Proposed Amendment to Technical  
Specifications Regarding Turbine Valve Test  
Frequency and Electrical Overspeed Protection  
System

By letter dated August 9, 1991, Consolidated Edison Company transmitted an application for amendment to the Indian Point Unit No. 2 license, on the above subject matter. This letter clarifies the application of the NRC acceptance criteria for the probability of a turbine missile ejection incident, as noted therein.

Specifically, in the aforementioned amendment application and supporting analyses, the NRC acceptance criteria for the probability of turbine missile generation is stated as  $5 \times 10^{-5}$ /year. This represented the Westinghouse derived criteria, as reflected in WCAP-11525, based on their interpretation of NRC guidance. The criteria should have been stated as  $1 \times 10^{-5}$ /year, and we request that this substitution be made in all instances where reference is made to the former criteria in our amendment application.

This change will have no impact on the supporting evaluations and conclusions provided in our amendment submittal. This is because the worst case annual probability of missile ejection due to overspeed for Indian Point No. 2, presented in WCAP-11525, is still well within the  $1 \times 10^{-5}$ /year criteria.

Should you or your staff have any questions regarding this matter, please contact Mr. Charles W. Jackson, Manager, Nuclear Safety and Licensing.

Very truly yours,
