Washington, DC 20555

SUBJECT: Full Reactor Coolant System Chemical
Decontamination Qualification Program Generic
Topical Report - WCAP 12932 Rev. 1

The subject report has been submitted by Westinghouse for your review and issuance of a Safety Evaluation Report (SER). The Topical Report is the culmination of efforts begun by the Westinghouse Owners Group (WOG) Full System Decontamination (FSD) Subgroup involving ten utilities, Con Edison inclusive, and is applicable to all members within this subgroup. The purpose of this program was to define and complete a systematic evaluation of the major issues that need to be addressed for the successful decontamination of the entire primary system, and affected portions of the auxiliary systems, of a Westinghouse Four Loop Pressurized Water Reactor, with fuel out of the core.

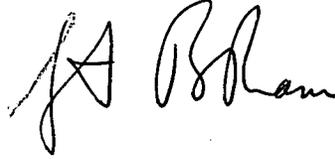

Con Edison currently plans to implement a FSD of the Reactor Coolant System during our scheduled 1995 refueling outage for Indian Point Unit 2, in an effort to reduce source terms and overall personnel radiation exposure for the facility. This effort will involve a considerable amount of engineering, planning and scheduling as well as equipment procurement. We intend to perform this effort consistent with the methodology of the subject Topical Report. Therefore, timely NRC feedback on this report is necessary as we develop our procedures and work with vendors to accomplish this objective.
