Subject: Crystal River talking points

Marvin,

Some thoughts for talking points:

- In 1976, Crystal River repaired a concrete delamination issue affecting the dome. A Containment Construction Integrity Test was successfully performed after the repair.
- A containment pressure test that simulates accident pressure conditions was last performed in 2005 and was successful.
- The licensee is in the process of discovery to determine the extent of cracking and its impact on the structure.
- The licensee will resolve the issue before startup.
- NRC inspectors are onsite to independently inspect and review the adequacy of licensee actions.

A-S
