Maybe just use the MD 8.3 SIT events; those that became SIT's as the first cut. Thx  
John

**Subject:** CNRA Input

Mike Cullingford's pulled his usual, and told John yesterday (at the retreat) that he needs a writeup for CNRA on a couple of OpE significant events. Tomorrow. (actually today, but he's obviously not getting that since he told me about it half an hour ago). I'll do the write up and everything tomorrow afternoon, but with the significant topics brief tomorrow morning I don't have the time between now and then to do a thorough review of what's happened since June 1 or so. They're looking for risk/safety significant events, does anyone have a few that stick out from the last few months? Off the top of my head the events that have generated the most followup were the Oconee fuel assembly, Crystal River Containment, and TMI contamination spread, but none of those, with the possible exception of Crystal River, were particularly risk significant.

Otherwise there's the Oyster Creek LOOP with failure of EDG and isolation condenser, and maybe the Diablo Canyon RHR switch issue that's got the SIT going right now? Anything else interesting?

Thanks,
