## Sampling Event Summary

Site: Monument Valley, Arizona, Processing Site

Sampling Period: June 8-10, 2009

Thirty-five groundwater samples and one surface water sample were collected at the Monument Valley, Arizona, Processing Site to monitor groundwater contaminants as specified in the 1999 *Final Site Observational Work Plan for the UMTRA Project Site at Monument Valley, Arizona.* Sampling and analysis was conducted as specified in the *Sampling and Analysis Plan for U.S. Department of Energy Office of Legacy Management Sites* (LMS/PLN/S04351, continually updated). Water levels were measured at each sampled well. Duplicate samples were collected from locations 0655 and 0669.

Time-concentration plots for ammonia as nitrogen, chloride, nitrate + nitrite as nitrogen, sulfate, uranium, and vanadium are included with the results data. The data from this sampling event are consistent with values previously obtained. Widely fluctuating uranium concentrations in wells 0657 and 0662 have been previously noted and this trend continues with the data from this sampling event. Ongoing erosion of a former uranium mine located upgradient from the site may be affecting the uranium concentrations at these locations. Nitrate + nitrite as nitrogen concentrations in wells 0655, 0662, 0761, 0762, 0764, and 0771 have been increasing, which is consistent with downgradient movement of the contaminant plume.

Wells with analyte concentrations that exceeded U.S. Environmental Protection Agency (EPA) groundwater standards are listed in Table 1.

Analyte	Standard <sup>a</sup> (mg/L)	Site Code	Location	Concentration (mg/L)
Nitrate + Nitrite as	. 10	MON01	0606	230

	· · ·	ŀ	0662	0.085

Table 1. Monument Valley Locations That Exceed Standards

<sup>a</sup>Standards are listed in 40 CFR 192.02 Table 1 to Subpart A.

The Navajo Nation's proposed cleanup standard for sulfate is 250 milligrams per liter (mg/L). The ratios of sulfate:chloride concentrations vary depending on whether the source is related to past millsite activities or if it occurs naturally. Tailings fluids were enriched in nitrate and sulfate but had relatively low chloride concentrations. A sulfate:chloride ratio greater than 10 is a good indication of groundwater contamination resulting from milling activities. The proposed sulfate treatment goal for Monument Valley will incorporate both criteria. The treatment goal will be achieved when the sulfate concentration is less than 250 mg/L or the sulfate:chloride ratio is less than 10. Table 2 lists sulfate concentrations and sulfate:chloride ratios.

Location	Sulfate Concentration (mg/L)	Sulfate : Chloride	<b>Treatment Goal Achieved ?</b>
0402	21	. 2	Yes

### Water Sampling Field Activities Verification Checklist

F	Project	Monument Valley, Arizona	Date(s) of Wate	r Sampling	June 8-10, 2009			
۵	Date(s) of Verification	July 30, 2009	Name of Verifie	r	Gretchen Baer			
			Response (Yes, No, NA)		Comments			
1.	Is the SAP the primary document	directing field procedures?	Yes					
	List other documents, SOPs, instr	uctions.			r dated May 12, 2009.			
2.	Were the sampling locations spec	ified in the planning documents sampled?	No No		0617 and monitor well 0777 were deleted from at the direction of the site lead.			
3.	Was a pre-trip calibration conduct documents?	ed as specified in the above-named	Yes					
4.	Was an operational check of the f	ield equipment conducted daily?	Yes					
	Did the operational checks meet of	riteria?	Yes		· · · · · · · · · · · · · · · · · · ·			
5.	Were the number and types (alkal pH, turbidity, DO, ORP) of field me	inity, temperature, specific conductance, easurements taken as specified?	Yes					
6.	Was the category of the well docu	mented?	Yes					
7.	Were the following conditions met	when purging a Category I well:						
	Was one pump/tubing volume pur	ged prior to sampling?	Yes					
	Did the water level stabilize prior t	o sampling?	Yes					
	Did pH, specific conductance, and sampling?	turbidity measurements stabilize prior to	No	Turbidity was >1 "Q."	0 NTU @ location 0760. Data are qualified as			
	Was the flow rate less than 500 m	L/min?	Yes	•				
	If a portable pump was used, was installation and sampling? .	there a 4-hour delay between pump	NA		· · · · · · · · · · · · · · · · · · ·			

-	Response (Yes, No, NA)	Comments	
8. Were the following conditions met when purging a Category II well:			
Was the flow rate less than 500 mL/min?	Yes		
Was one pump/tubing volume removed prior to sampling?	Yes	• 	
9. Were duplicates taken at a frequency of one per 20 samples?	Yes	Dups were collected @ 0655 and 0669.	
10. Were equipment blanks taken at a frequency of one per 20 samples that were collected with nondedicated equipment?	NA	·	
11. Were trip blanks prepared and included with each shipment of VOC samples?	NA	~ ~	
12.Were QC samples assigned a fictitious site identification number?	Yes	QC samples are also listed in trip report.	
Was the true identity of the samples recorded on the Quality Assurance Sample Log or in the Field Data Collection System (FDCS) report?	Yes		
13. Were samples collected in the containers specified?	Yes		
14. Were samples filtered and preserved as specified?	Yes	Samples with turbidity >10 were filtered.	
15. Were the number and types of samples collected as specified?	Yes		
16.Were chain of custody records completed and was sample custody maintained?	Yes		
17. Are field data sheets signed and dated by both team members (hardcopies) or are dates present for the "Date Completed" fields (FDCS)?	Yes		
18. Was all other pertinent information documented on the field data sheets?	Yes		
19. Was the presence or absence of ice in the cooler documented at every sample location?	Yes	· · ·	
20. Were water levels measured at the locations specified in the planning documents?	NA		
<ul> <li>maintained?</li> <li>17. Are field data sheets signed and dated by both team members (hardcopies) or are dates present for the "Date Completed" fields (FDCS)?</li> <li>18. ### Water Sampling Field Activities Verification Checklist (continued)

U.S. Department of Energy October 2009

#### • Laboratory Performance Assessment

#### **General Information**

Report Number (RIN):	09052333
Sample Event:	June 8-10, 2009
Site(s):	Monument Valley, Arizona
Laboratory:	ALS Laboratory Group, Fort Collins, Colorado
Work Order No.:	0906150
Analysis:	Metals and Wet Chemistry
Validator:	Gretchen Baer
Review Date:	July 30, 2009

This validation was performed according to the *Environmental Procedures Catalog*, (LMS/PRO/S04325, continually updated) "Standard Practice for Validation of Laboratory Data," GT-9(P). The procedure was applied at Level 3, Data Validation. See attached Data Validation Worksheets for supporting documentation on the data review and validation. All analyses were successfully completed. The samples were prepared and analyzed using accepted procedures based on methods specified by line item code, which are listed in Table 3.

#### Table 3. Analytes and Methods

Analyte	Line Item Code	Prep Method	Analytical Method		
Ammonia as N	WCH-A-005	MCAWW 350.1	MCAWW 350.1		
Chloride	MIS-A-039	SW-856 9056	SW-856 9056		
Nitrite + Nitrate as N	WCH-A-022	MCAWW 353.2	MCAWW 353.2		
Sulfate	MIS-A-044	SW-856 9056	SW-856 9056		
Uranium, Vanadium	LMM-02	SW-846 3005A	SW-846 6020A		

#### **Data Qualifier Summary**

Analytical results were qualified as listed in Table 4. Refer to the sections below for an explanation of the data qualifiers applied.

#### Table 4. Data Qualifier Summary

Sample Number	Location	Analyte	Flag	Reason
0906150-1	0402	Uranium	U	Less than 5 times the calibration blank
0906150-5	0605	Uranium	U	Less than 5 times the calibration blank
0906150-30	0768	Uranium	U	Less than 5 times the calibration blank

#### Sample Shipping/Receiving

ALS Laboratory Group in Fort Collins, Colorado, received 38 water samples on June 16, 2009, accompanied by a Chain of Custody (COC) form. Copies of the two air bills were included in the

receiving documentation. The COC form was checked to confirm that all of the samples were listed with sample collection dates and times, and that signatures and dates were present indicating sample relinquishment and receipt. The COC form was complete with no errors or omissions.

#### Preservation and Holding Times

The sample shipments were received intact with the temperature inside the iced cooler at 0.2 °C, which complies with requirements. All samples were received in the correct container types and had been preserved correctly for the requested analyses. All samples were analyzed within the applicable holding times.

#### Laboratory Instrument Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for all analytes. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear curve. Compliance requirements for continuing calibration checks are established to ensure that the instrument continues to be capable of producing acceptable qualitative and quantitative data. All laboratory instrument calibrations were performed correctly in accordance with the cited methods.

#### Method MCAWW 350.1, Ammonia as N

Calibrations were performed using six calibration standards on June 18, 2009. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the method detection limit (MDL). Calibration and laboratory spike standards were prepared from independent sources. Initial and continuing calibration verification checks were made at the required frequency resulting in seven verification checks. All calibration checks met the acceptance criteria.

#### Method MCAWW 353.2, Nitrite + Nitrate as N

Calibrations were performed using seven calibration standards on June 19, 2009. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL. Calibration and laboratory spike standards were prepared from independent sources. Initial and continuing calibration verification checks were made at the required frequency resulting in six verification checks. All calibration checks met the acceptance criteria.

#### Method SW-846 6020A, Uranium and Vanadium

Calibrations were performed for uranium on June 22-23, 2009, using eight standards and for vanadium on June 23, 2009, using seven standards. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL. Calibration and laboratory spike standards were prepared from independent sources. Initial and continuing calibration verification checks were made at the required frequency resulting

in 21 verification checks. All calibration checks met the acceptance criteria. Reporting limit verification checks were made at the required frequency to verify the linearity of the calibration curve near the practical quantitation limit (PQL) and all results were within the acceptance range. Mass calibration and resolution verifications were performed at the beginning of each analytical run in accordance with the analytical procedure. Internal standard recoveries associated with requested analytes were stable and within acceptable ranges.

#### Method SW-846 9056, Chloride and Sulfate

Calibrations were performed using five calibration standards on May 27, 2009. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL. Calibration and laboratory spike standards were prepared from independent sources. Initial and continuing calibration verification checks were made at the required frequency resulting in 11 verification checks. All calibration checks met the acceptance criteria.

#### Method and Calibration Blanks

Method blanks are analyzed to assess any contamination that may have occurred during sample preparation. Calibration blanks are analyzed to assess instrument contamination prior to and during sample analysis. All method blank and calibration blank results were below the PQLs for all analytes. In cases where a blank concentration exceeds the MDL, the associated sample results are qualified with a "U" flag (not detected) when the sample result is greater than the MDL but less than 5 times the blank concentration.

#### Inductively Coupled Plasma (ICP) Interference Check Sample (ICS) Analysis

ICP interference check samples ICSA and ICSAB were analyzed at the required frequency to verify the instrumental interelement and background correction factors. All check sample results met the acceptance criteria.

#### Matrix Spike Analysis

Matrix spike and matrix spike duplicate (MS/MSD) samples are used to measure method performance in the sample matrix. The MS/MSD data are not evaluated when the concentration of the unspiked sample is greater than 4 times the spike concentration. The spikes met the recovery and precision criteria for all analytes evaluated.

#### Laboratory Replicate Analysis

Laboratory replicate sample results demonstrate acceptable laboratory precision. The relative percent difference values for the sample replicates and matrix spike replicates were less than 20 percent for results that are greater than 5 times the PQLs, indicating acceptable precision.

#### Laboratory Control Sample

Laboratory control samples were analyzed at the correct frequency to provide information on the accuracy of the analytical method and the overall laboratory performance, including sample preparation. All control sample results were acceptable.

#### Metals Serial Dilution

Serial dilutions were prepared and analyzed for the metals analyses to monitor chemical or physical interferences in the sample matrix. ICP-MS serial dilution data are evaluated when the concentration of the undiluted sample is greater than 100 times the PQL. All evaluated serial dilution data were acceptable.

#### **Detection Limits/Dilutions**

Samples were diluted in a consistent and acceptable manner when required. The samples were diluted prior to analysis of uranium and vanadium to reduce interferences. The required detection limits were met for all analytes.

#### **Completeness**

Results were reported in the correct units for all analytes requested using contract-required laboratory qualifiers.

#### Chromatography Peak Integration

The integration of analyte peaks was reviewed for all ion chromatography data. There were no manual integrations performed and all peak integrations were satisfactory.

#### Electronic Data Deliverable (EDD) File

The EDD file arrived on June 27, 2009. The Sample Management System EDD validation module was used to verify that the EDD file was complete and in compliance with requirements. The module compares the contents of the file to the requested analyses to ensure that all and only the requested data are delivered. The contents of the EDD were manually examined to verify that the sample results accurately reflect the data contained in the sample data package.

#### Sampling Quality Control Assessment

The following information summarizes and assesses quality control for this sampling event.

#### Sampling Protocol

Monitor wells were sampled using either a peristaltic pump and dedicated tubing or a dedicated bladder pump. The surface water location was sampled by pumping directly from the pond with dedicated tubing. Sample results for monitor wells were qualified with an "F" flag in the database, indicating the wells were purged and sampled using the low-flow sampling method. Wells 0402 and 0764 were qualified with a "Q" flag, indicating the data are qualitative because these wells were classified as Category II. Well 0760 was qualified with a "Q" flag because the turbidity criterion was not met during purging.

#### Equipment Blank Assessment

No equipment blanks were taken because all samples were collected using dedicated equipment.

#### Field Duplicate Assessment

Field duplicate samples are collected and analyzed as an indication of overall precision of the measurement process. The precision observed includes both field and laboratory precision and has more variability than laboratory duplicates, which measure only laboratory performance. Duplicate samples were collected from locations 0655 and 0669. The duplicate results were acceptable, meeting the EPA recommended laboratory duplicate criteria of less than 20 percent relative difference for results that are greater than 5 times the PQL.

**Potential Outliers Report** 

#### **Potential Outliers Report**

Potential outliers are measurements that are extremely large or small relative to the rest of the data and, therefore, are suspected of misrepresenting the population from which they were collected. Potential outliers may result from transcription errors, data-coding errors, or measurement system problems. However, outliers may also represent true extreme values of a distribution and indicate more variability in the population than was expected.

Statistical outlier tests give probabilistic evidence that an extreme value does not "fit" with the distribution of the remainder of the data and is therefore a statistical outlier. These tests should only be used to identify data points that require further investigation. The tests alone cannot determine whether a statistical outlier should be discarded or corrected within a data set.

There are three steps involved in identifying extreme values or outliers:

- 1. Identify extreme values that may be potential outliers by generating the Outliers Report using the Sample Management System from data in the SEEPro database. The application compares the new data set with historical data and lists the new data that fall outside the historical data range. A determination is also made if the data are normally distributed using the Shapiro-Wilk Test.
- 2. Apply the appropriate statistical test. Dixon's Extreme Value test is used to test for statistical outliers when the sample size is less than or equal to 25. This test considers both extreme values that are much smaller than the rest of the data (case 1) and extreme values that are much larger than the rest of the data (case 2). This test is valid only if the data without the suspected outlier are normally distributed. Rosner's Test is a parametric test that is used to detect outliers for sample sizes of 25 or more. This test also assumes that the data without the suspected outliers are normally distributed.
- 3. Scientifically review statistical outliers and decide on their disposition.

Four results were identified as potentially anomalous. The chloride and sulfate results for well 0602 were identified as potential outliers because of the low variability of the historical data. Chloride and sulfate have not been tested at 0602 since 2001; because the gap between the June 2009 data and the previous data is eight years, high or low points do not necessarily indicate errors in the data. The chloride result for location 0655 had a concentration lower than previously observed. Recent results for chloride indicate downward trending at this location. The uranium result for location 0619 had a concentration lower than previously observed. Examination of historical data shows that uranium results have been fluctuating seasonally but generally trending downward at this location since 2005. The results from this sampling event are acceptable as qualified.

Task Order LM00-501 Control Number 09-0748

May 12, 2009

U.S. Department of Energy Office of Legacy Management ATTN: Richard Bush Site Manager 2597 B ¼ Road Grand Junction, CO 81503

SUBJECT:

Contract No. DE-AM01-07LM00060, Stoller June 2009 Environmental Sampling at the Monument Valley, Arizona, Processing Site

REFERENCE: Task Order LM-501-02-114-402, Monument Valley, AZ, Processing Site

Dear Mr. Bush:

The purpose of this letter is to inform you of the upcoming sampling event at Monument Valley, Arizona. Enclosed are the map and tables specifying sample locations and analytes for monitoring at the Monument Valley processing site. Water quality data will be collected from monitor wells at this site as part of the routine environmental sampling currently scheduled to begin the week of June 8, 2009.

The following lists show the monitor wells (with zone of completion) and surface locations scheduled to be sampled during this event.

established 1959

### Memorandum

DATE: June 18, 2009

TO: David Miller

FROM: Gretchen Baer

SUBJECT: Trip Report

Site: Monument Valley, Processing Site.

Dates of Sampling Event: June 8-10, 2009

Team Members: Gretchen Baer and Joe Trevino

**Number of Locations Sampled:** Water samples for metals, anions, nitrate + nitrite as N, and ammonia as N, were collected from 35 monitor wells and one surface location for a total of 36 locations. An additional sample volume was collected for U of A per D. Miller field request.

**Locations Not Sampled/Reason:** Private location 0617 and monitor well 0777 were deleted from the sampling list at the direction of the site lead.

Location IDs	Comments
0765	Additional volume collected for U of A.
0648	Total depth needs to be corrected in SEEPro.
0602	Installed new 3/8" tubing prior to sampling.
0766	Well pad is severely undermined.
0764	Well pad is severely undermined. Well went dry during purge (after ~1L had purged). Measured all field parameters. Collected all sample aliquots after well recovered.
0619, 0776	Bad check valve: water is drawn backwards between pump cycles.
0760	Turbidity requirement could not be met at this Cat I well.
0651	Black specks are visible in the sample. Turbidity was <10 NTUs.

**Location Specific Information:** 

For the U of A sample collected from location 0765, large Nalgene bottles were not available in the field, so a 1-gallon bottle of distilled water was purchased, emptied, and used. The sample was transferred to 1-liter Nalgene bottles before shipment from Grand Junction.

All times are MDT.

[]

Quality Control Sample Cross Reference: The following are the false identifications assigned to the quality control samples.

False ID	Ticket Number	True ID	Sample Type	Associated Matrix
2711	HGZ 960	0655	Duplicate	Groundwater
2712	HGZ 961	0669	Duplicate	Groundwater

**RIN Number Assigned:** All samples were assigned to RIN 09052333.

**Sample Shipment:** Samples were shipped overnight via FedEx to ALS Laboratory Group, Fort. Collins, CO, from Grand Junction, CO, on June 15, 2009.

Water Level Measurements: Water levels were measured at all sampled wells.

**Well Inspection Summary:** Wind has removed sand from beneath the well pads at several locations, most notably at 0764 and 0766.

#### Field Variance: None.

**Equipment:** Wells were sampled with a peristaltic pump and dedicated tubing or a dedicated bladder pump. The surface water location was sampled using a peristaltic pump and dedicated tubing. Because all equipment was dedicated or disposable, equipment blanks were not required. The check valves in wells 0619 and 0776 seem to be malfunctioning; water is drawn backwards between pump cycles.

#### **Institutional Controls**

Fences, Gates, Locks: All were in good condition. Signs: Not applicable Trespassing/Site Disturbances: None observed.

Site Issues:

Disposal Cell/Drainage Structure Integrity: Not applicable. Vegetation/Noxious Weed Concerns: None observed. Maintenance Requirements: Well pads mentioned above. Access Issues: None.

Corrective Action Taken: None.
