Subject: RE: TMI write up

I only have an accession number for the Preliminary Report. ML093280879. Also here were our key messages: **Key Messages**

- On November 21, 2009, an airborne contamination event occurred inside the containment building (also known as the reactor building) at Three Mile Island (TMI).
- The event had no affect on public health and safety.
- No contamination was found outside the containment building.
- Approximately 150 workers exited the containment building and were processed through the licensee's portal radiation monitors.
- Workers that were not able to clear the portal monitors were decontaminated and proceeded to be whole body counted.
- Some workers received unplanned occupational dose exposures. However, based on information provided by the licensee, the level of dose received was within a small fraction of the NRC's regulatory limit.
- The NRC has dispatched technical experts to independently review and confirm the licensee's technical assessment.
- The licensee continues to investigate the cause of the event.
- The NRC's resident inspector is onsite and is monitoring the licensee's ongoing activities.
- The NRC has been responding to media questions and plans a press briefing today at the TMI training center.
- The NRC will continue follow up of this event under normal event follow up inspections to evaluate licensee activities in evaluating personnel contaminations and root cause for the event.

Subject: TMI write up

Hey do you have a press release or some short description of the TMI issue last week? Im sure that I'll get asked in Orlando
Thanks
