

EPRI/NRC-RES FIRE PRA METHODOLOGY

Integration, Lessons Learned and Insights

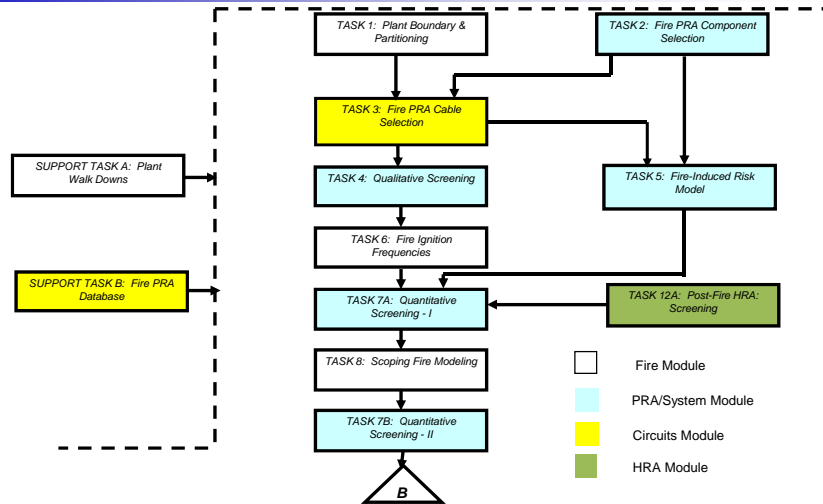

Bijan Najafi, SAIC
Steve Nowlen, SNL
Joint EPRI/RES Fire PRA Course
September 27 – October 1, 2010, Washington DC
October 25 - 29, 2010, Washington DC

A Collaboration of U.S. NRC Office of Nuclear Regulatory Research (RES) & Electric Power Research Institute (EPRI)

PART I

Integration

Remember the Fire PRA Process and Module Structure flow chart we showed the first day...

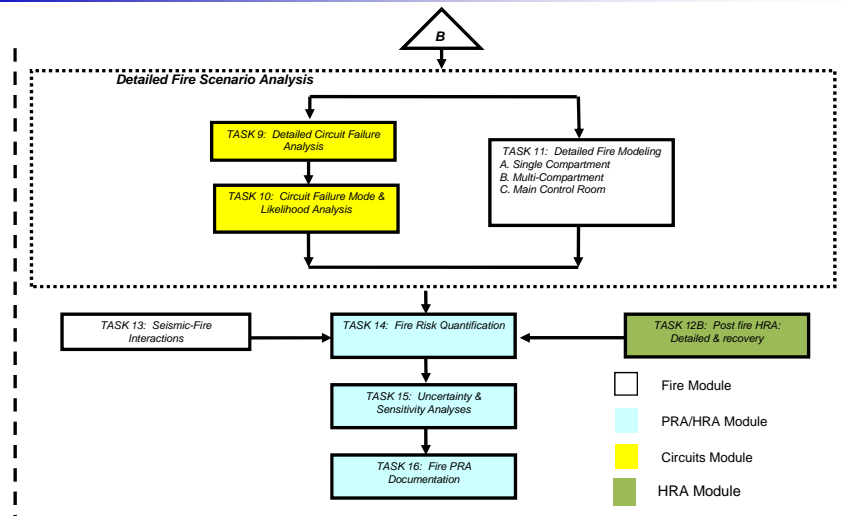

Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights

Slide 3

A Collaboration of U.S. NRC Office of Nuclear Regulatory Research (RES) & Electric Power Research Institute (EPRI)

Fire PRA Process and Module Structure (2)

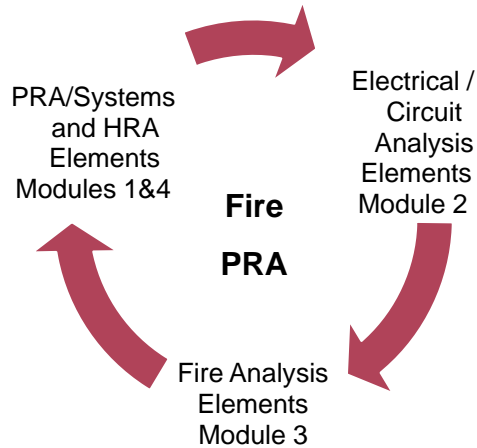

Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights

Slide 4

A Collaboration of U.S. NRC Office of Nuclear Regulatory Research (RES) & Electric Power Research Institute (EPRI)

We also look at the fire PRA as comprised of four major parts

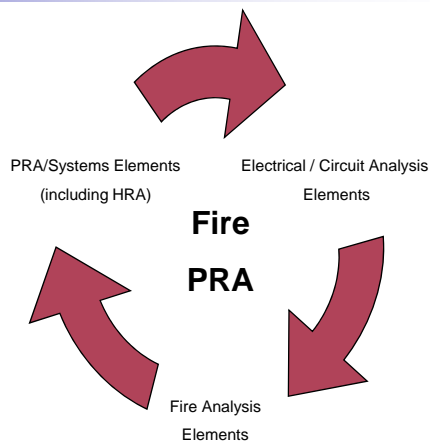

Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights

Slide 5

A Collaboration of U.S. NRC Office of Nuclear Regulatory
Research (RES) & Electric Power Research Institute (EPRI)

Conducting the fire PRA involves an iterative process that progressively refines these elements

- Objective of refinement process is to:
 - Identify (screen) unimportant contributors
 - Obtain more realistic results for important contributors

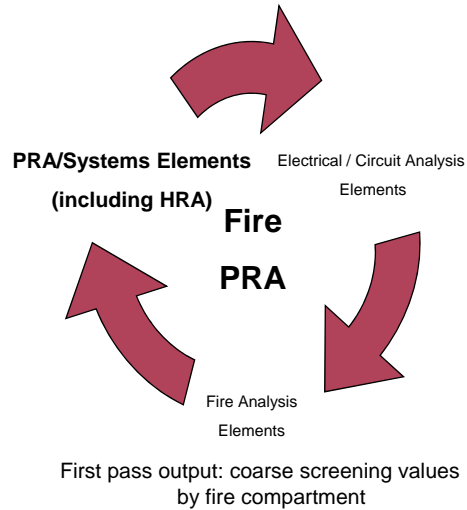

Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights

Slide 6

A Collaboration of U.S. NRC Office of Nuclear Regulatory
Research (RES) & Electric Power Research Institute (EPRI)

The first pass through the analysis generally focuses on the PRA/Systems elements

- Building the plant response model is a major focus of the first pass
- A good, solid plant response model is a necessary element of the fire PRA:
 - System/equipment selection (i.e., what will be credited in the fire PRA)
 - Adoption/modification of internal events PRA models e.g.,
 - Incorporating unique fire-induced equipment failure modes **and sequences**
 - Incorporating fire-specific human actions / human failure events

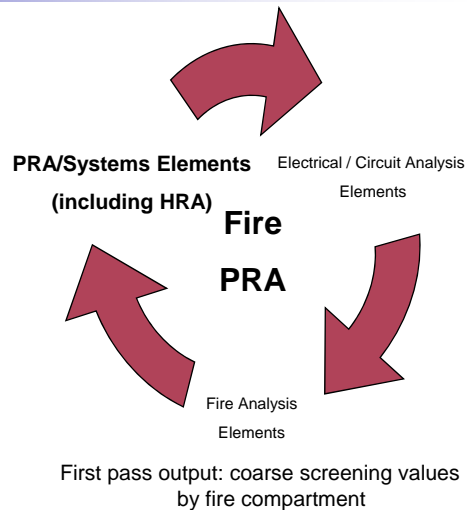

Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights

Slide 7

A Collaboration of U.S. NRC Office of Nuclear Regulatory Research (RES) & Electric Power Research Institute (EPRI)

The first pass through the analysis generally focuses on the PRA/Systems elements (cont.)

- Fire **impacts** and **fire-induced** Electrical **faults** tend to be treated at a pretty coarse level during the first pass
 - Fire: focus is generally on fire compartments
 - define fire compartments
 - **develop compartment** fire frequencies
 - map targets to compartments
 - Electrical: utilize existing information as much as possible
 - **select** and trace cables
 - identify potential component failure modes (**fault/function codes**) using conservative approaches

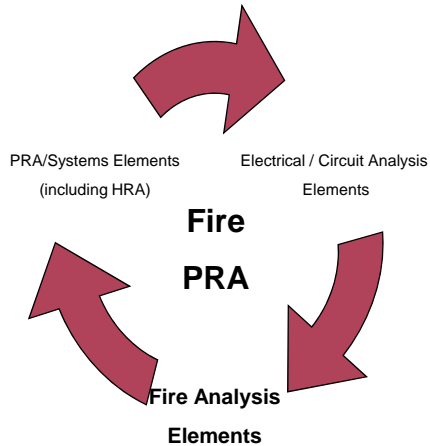

Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights

Slide 8

A Collaboration of U.S. NRC Office of Nuclear Regulatory Research (RES) & Electric Power Research Institute (EPRI)

The second pass will likely focus on first level refinement of the fire analysis elements

- Develop more specific and localized fire scenarios
 - Screen out non-threatening fire sources (no spread or damage potential)
 - Get past the room-wide damage scenarios for important compartments
 - Wide-spread damage scenarios may be plausible, but are generally low-likelihood events
 - Scenario focus shifts towards more representative fire source – target set combinations
 - Localized damage scenarios represent higher-likelihood events for most compartments and will likely dominate final risk estimates

Second pass output: more refined screening estimates tied to specific fire scenarios

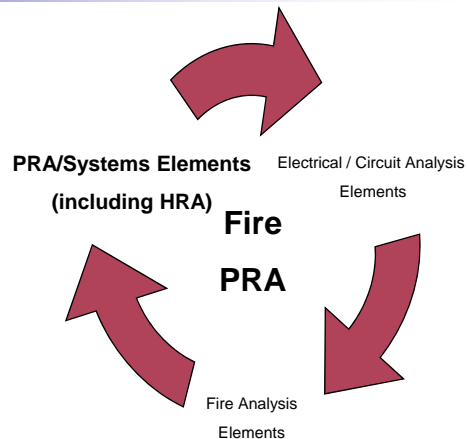

*Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights*

Slide 9

A Collaboration of U.S. NRC Office of Nuclear Regulatory Research (RES) & Electric Power Research Institute (EPRI)

Beyond this point, the analyst must choose where to allocate resources, where to seek further refinement

- One key to success: resource allocation
 - What element should you refine?
 - Where can you get the most “bang for the buck”?
 - Is there something that is easy to do that will improve the answer?
 - “easy” being a relative term here...

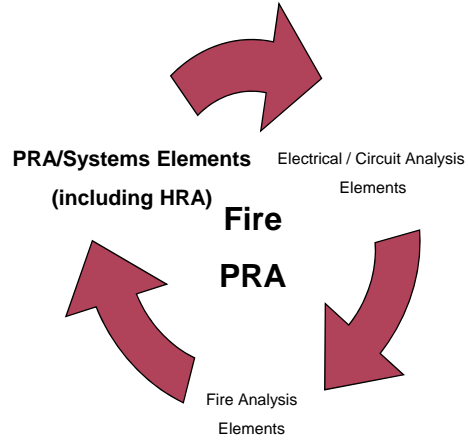

*Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights*

Slide 10

A Collaboration of U.S. NRC Office of Nuclear Regulatory Research (RES) & Electric Power Research Institute (EPRI)

Possible PRA/Systems refinements

- Take credit for additional systems or equipment and add these to the plant response model
- Take credit for additional operator actions
- Refine estimates of existing HEP values
- Refine mitigation/recovery models to reflect changes in your understanding of fire-induced equipment failure modes (requires support from the electrical/circuit element)

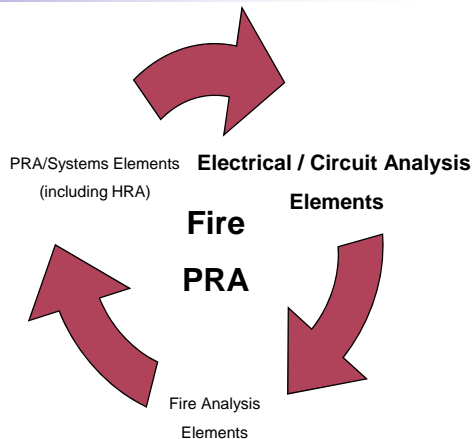

*Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights*

Slide 11

A Collaboration of U.S. NRC Office of Nuclear Regulatory Research (RES) & Electric Power Research Institute (EPRI)

Possible electrical / circuit analysis element refinements

- Refine estimates of the cable/component failure mode likelihoods (e.g., spurious actuation)
- Refine circuit analyses to eliminate cable-to-component failure mode relationships originally assumed but not really plausible (requires input from the PRA/Systems element)
- Refine cable routing/tracing information

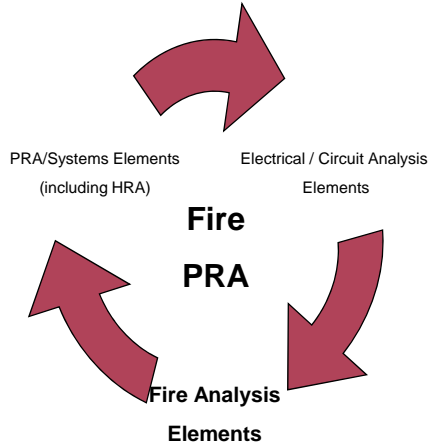

*Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights*

Slide 12

A Collaboration of U.S. NRC Office of Nuclear Regulatory Research (RES) & Electric Power Research Institute (EPRI)

Possible fire analysis element refinements

- Refine fire frequencies
- Refine fire scenarios
 - Break into sub-scenarios to reflect progression of fire damage with time
 - Refine credit given to fire protection systems and features
 - Take credit for fire protection systems and features not previously credited
- Apply fire modeling tools to refine scenario timing (time to target damage)
 - e.g., take advantage of the severity factor approach and distribution on fire peak HRR
- Refine your target sets
 - e.g., incorporate new cable routing/tracing information

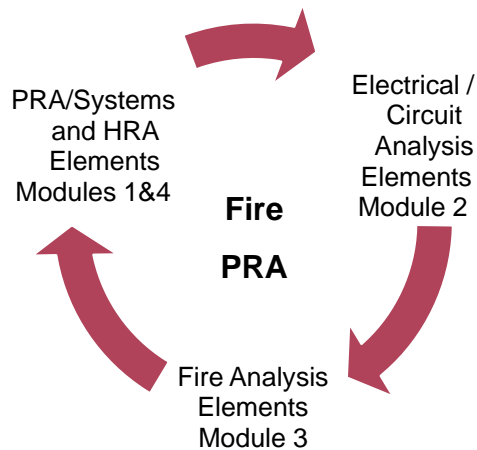

*Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights*

Slide 13

Use of the Fire PRA Method Since its Publication

- Completed
 - First application by the NFPA-805 pilot plants at Harris and Oconee
 - Both PWRs
 - Results from these studies raised questions regarding their potential conservatism
- A number of technical improvements and clarification to the method completed
 - FAQs
- Vast majority of the Fire PRAs are in development and will be submitted as part of transition to 805
 - Due six (6) months after SER issued for the Oconee LAR, although some may submit sooner
 - Peer Review against Section 4 of the ASME/ANS combined PRA standard RA-Sa-2009 and RG 1.200, Rev. 2 has been completed for less than half of these Fire PRAs
 - Early results of these studies have continued the discussion over potential conservatism
- Short and long term improvement projects are in progress and planned

Research (RES) & Electric Power Research Institute (EPRI)*

General

- Planning and schedule
 - Plan for model validation (troubleshooting)
 - Such as cutset review, similar to internal events but with a whole new dimension
 - Plan for model refinements
 - Carefully assess use of conservative assumptions early on
 - Increasing complexity of Fire PRA models are challenging resources and schedule
- Understand the objectives of the Fire PRA and its possible implication on the model
- Automation
 - Plan for an integrated Fire PRA by specifying proper tools and plant data that eventually will communicate with each other
 - Interfaces between different modules; PRA, HRA, electrical and fire analyses
- Fire PRA Standard
 - Self-assessment is easier to do as each task is completed
 - Traceable documentation
- Evolution of methods
 - Stay informed and get involved

*Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights*

Slide 17

*A Collaboration of U.S. NRC Office of Nuclear Regulatory
Research (RES) & Electric Power Research Institute (EPRI)*

Fire Analysis

- Develop a clear consistent process to be followed by the analysis team focused on integrated approach for quantification and simplify documentation process
 - This will be helpful as the method evolves and refinements are implemented
- Consistency between fire modeling and the cable/raceway database
- Walkdowns
 - Keep them targeted: Identify the information needed throughout the Fire PRA and schedule them appropriately
 - Avoid collecting unnecessary information
 - Avoid duplicate walkdown efforts
- Data quality
 - Ignition sources and targets should be identified with the proper ID's
- Tasks 1, 6, 8, and Appendix P will set you up to perform detailed quantification when properly structured
- Main control room analysis method is more robust and tends to yield less conservative results, than single and multi-compartment method
 - This was not the case in the previous, e.g., IPEEE, methods

*Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights*

Slide 18

*A Collaboration of U.S. NRC Office of Nuclear Regulatory
Research (RES) & Electric Power Research Institute (EPRI)*

Electrical Analysis

- Develop a clear consistent process to be followed by the analysis team focused on integrated approach for quantification and simplify documentation process
- Plant specific decisions on where to store/maintain the circuit analysis information
 - Separate database, expanded capability for the cable and raceway database, etc.
- Cable selection and detailed circuit analysis may/should be combined in one task
 - Many cables can be selected and analyzed at the same time
 - Need a well structured database to store and maintain all the information
- Scope and complexity of circuit dependencies may change significantly as the scope of the systems and components are expanded to gain more realistic results
 - Breaker coordination requirements

*Fire PRA Course, 2010, Washington DC
Integration, Lessons Learned and Insights*

Slide 19

*A Collaboration of U.S. NRC Office of Nuclear Regulatory
Research (RES) & Electric Power Research Institute (EPRI)*

PRA/Systems Analysis

- Fire PRA component selection
 - Each component in the list needs a story
 - Where it comes from (Internal events, Appendix R, MSO expert panel, HFE cues/indication review, etc.)
 - How should it be reflected in the model
 - Single most important input to electrical analysis
- Plan for the MSO expert panel
 - Input for the Fire PRA equipment list and the logic model
 - Recognize the application, probabilistic vs. deterministic
- Fire PRA Model
 - There is significant link that begins early on between component selection, fire-risk model and fire HRA.
 - Identification and modeling of operator actions; fire response actions and responses to erroneous alarms/instruments due to spurious actuations
 - Identification and modeling of alarms and instruments
 - Proper reflection of fire procedures in the fire-risk model can become both cumbersome and critical

EPRI/NRC-RES FIRE PRA METHODOLOGY

Module III-2: Perspective

R.P. Kassawara - EPRI

J.S. Hyslop - RES

Joint EPRI/RES Fire PRA Course

September and October 2010

A Collaboration of U.S. NRC Office of Nuclear Regulatory Research (RES) & Electric Power Research Institute (EPRI)

On The Requantification Project

- A consensus methodology for Fire PRA that is facilitating implementation of risk-informed fire protection
- Continues to provide effective tools and approaches for performing fire PRAs
- Refinements to methodology made in many fire PRA areas via NFPA 805 FAQ program.
- Other fire PRA related research planned or underway

*Fire PRA Workshop, 2010, Washington DC
Module III-2: Perspective*

Continued Cooperation

- We established a framework for future research cooperation
- The cooperation under the MOU is continuing
 - Fire Model Application Guide
 - Fire Human Reliability Analysis (HRA)
 - D. C. Circuits Testing
 - Expert Elicitation of Spurious Actuation Probabilities
 - Fire Events Database Improvement
 - Other Projects....
