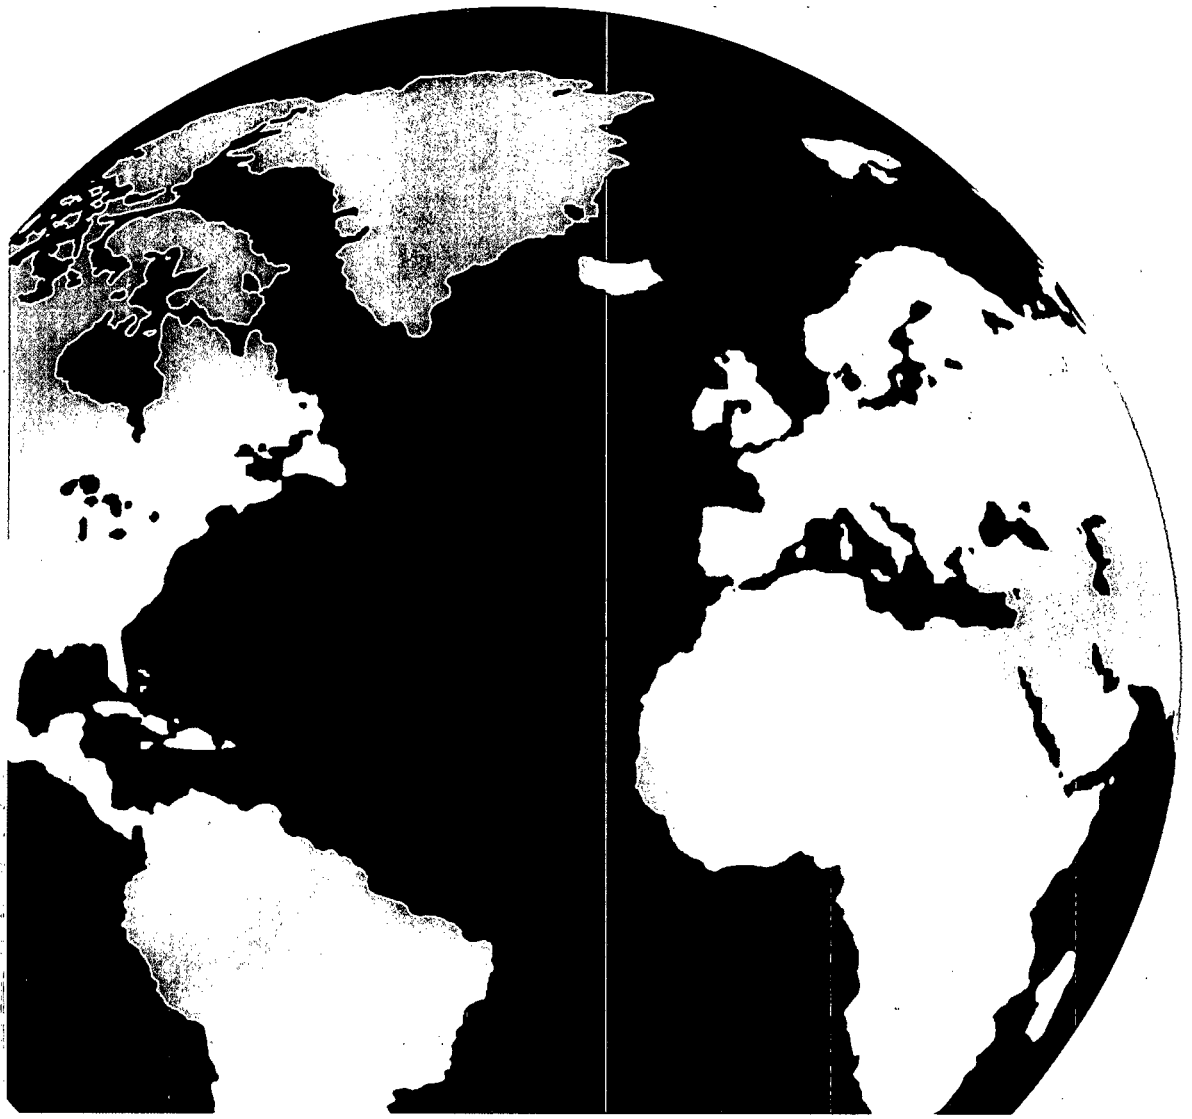
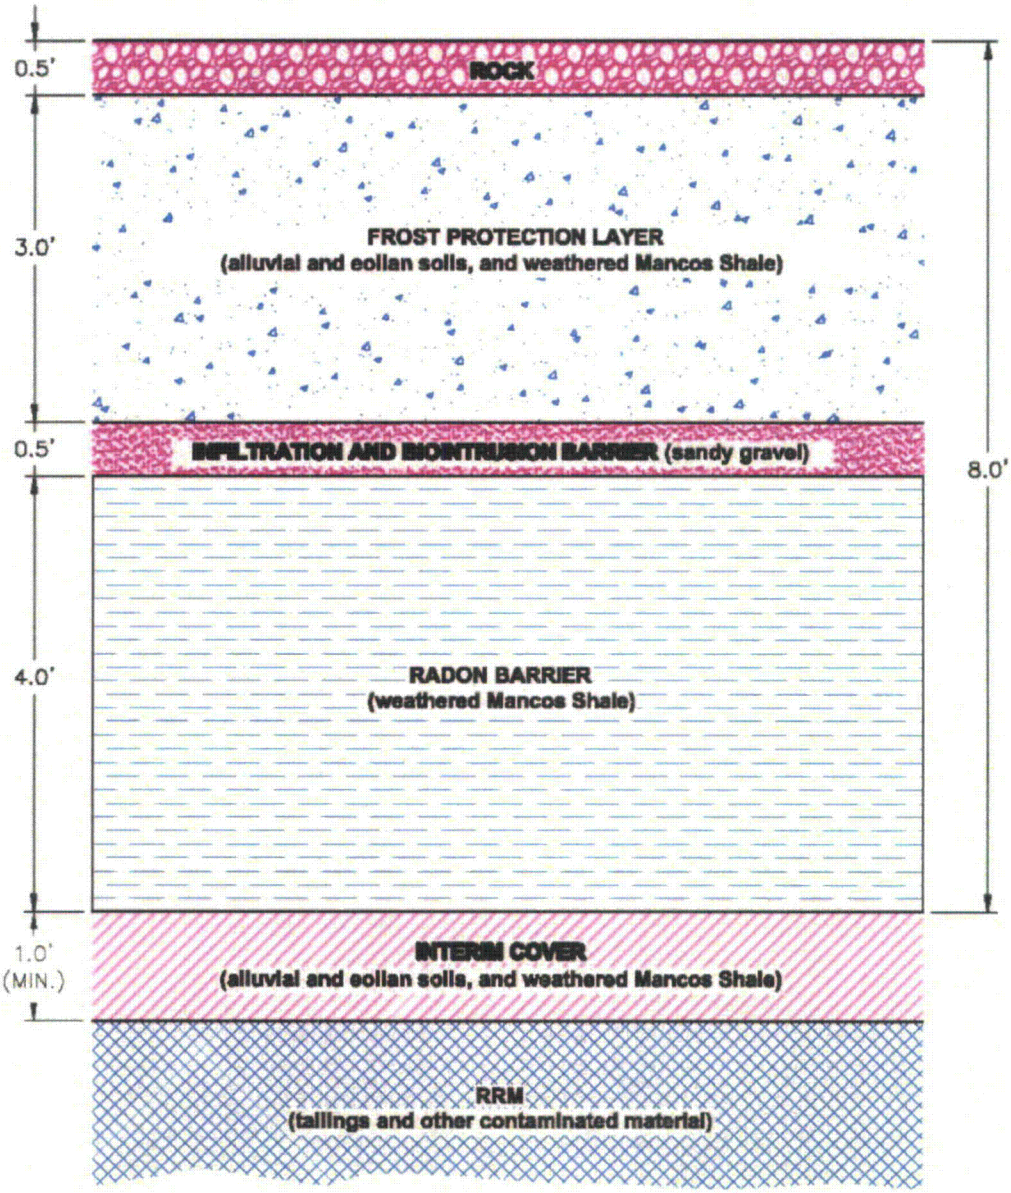
ENERGYSOLUTIONS

Moab UMTRA Project
Cell Placement





UMTRA COVER DESIGN

- ASTM D 4643 - Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating
- ASTM D 4944 - Field Determination of Water (Moisture) Content of Soil by the Calcium Carbide Gas Pressure Tester
- ASTM D 4959 - Determination of Water (Moisture) Content of Soil by Direct Heating
- During unstable weather, perform tests as dictated by local conditions and approved by the Construction Manager.

6.4 RESIDUAL RADIOACTIVE MATERIAL (RRM)

The objective is to place and compact the RRM in the waste cell to create a stable waste mass. The QC Inspector shall visually inspect the material preparation, ground preparation, and RRM placement operations, and shall perform in-place density tests with companion moisture tests for the CAES to verify that RRM compaction meets the compaction requirements. The QC Inspector shall verify that the RRM placement is performed in accordance with Plans and Specifications, and that the top of the placed waste matches the final grades identified in Section 6.4.5. RRM shall not be placed when frozen or over frozen subgrade. If rain water ponding has occurred, placement of RRM waste shall only be performed after the area is dewatered and approval of Construction Manager, QC Inspector or designee to place is obtained.

6.4.1 Moisture Modification

RRM material should be shipped from Moab at or near optimum moisture for compaction. Some RRM may require minor moisture modification when received at Crescent Junction.

6.4.2 RRM Placement

Scarify the top one inch of subsoil or preceding RRM lift using a footed roller or a dozer prior to placement of subsequent RRM layers. Fill materials shall be placed in continuous and approximately horizontal lifts. The method of dumping and spreading RRM shall result in loose lifts of nearly uniform thickness, not to exceed 12". Compaction equipment shall consist of footed rollers or dozers. Footed rollers shall have a minimum weight of 45,000 pounds and at least one tamping foot shall be provided for each 110 square inches of drum surface. The length of each tamping foot from the outside surface of the drum shall be at least 6 inches. During compaction operations, the spaces between the tamping feet shall be maintained clear of materials which would impair the effectiveness of the tamping foot rollers. Dozers shall have a minimum ground pressure of 1,650 lbs per sq ft. The CAES shall be used to direct fill placement, monitor compaction, and record the location and thickness of each soil layer being placed.

6.4.3 Inspection and Testing

The Quality Control (QC) Inspector shall visually inspect the ground preparation and fill placement operations. RRM shall be compacted to meet 90% of the laboratory determined maximum dry density as determined by (ASTM D 698). The QC Inspector shall verify that the RRM placement is constructed in accordance with Design Plans and Specifications by checking and confirming:

- Assessment tests shall be performed on RRM to assure compliance with specified requirements and to develop compaction requirements for placement. A minimum of three tests for maximum dry density (ASTM D 698) and optimum moisture content (optimum moisture plus or minus 3%) (ASTM D 2216) shall be performed for each type of RRM soil observed.
- Fill material is properly moisture conditioned, one moisture content quick test will be performed each day material is placed in accordance with (ASTM D 4643, ASTM D 4944, or ASTM D 4959) until a sufficient number have been performed to demonstrate a clear correlation allowing a reduction in testing.
- Fill material is placed in continuous and approximately horizontal lifts. The method of dumping and spreading RRM shall result in loose lifts of nearly uniform thickness, not to exceed 12".
- Compaction meets specifications.
- Compaction by CAES – the QC inspector shall monitor CAES compaction by visually inspecting the process and reviewing the computer records for each layer of soil placed.
- Verification tests of in-place density shall be performed on the initial layer of RRM and on any layers in which the CAES indicates that problems occurred obtaining compaction. In-place density will be taken every six months to verify the performance of the CAES.

Note: Companion sand cone tests and oven moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

If CAES is not used the following testing requirements shall be followed:

- Compaction Verification Tests – Perform in-place density and moisture content tests on compacted fill material in accordance with the following requirements:
    - When verification a representative sample from each principal type or combination of blended RRM materials shall be tested to establish compaction curves using ASTM D 698. A minimum of one set of compaction curves shall be developed per 10,000 cubic yards of RRM material. In-place density and moisture content tests are performed on a soil layer; a minimum of two tests shall be performed per 5,000 cubic yards of fill material placed.

- Compaction and moisture content tests shall be performed in accordance with the following methods:
    - ASTM D 1556 - Density and Unit Weight of Soil in Place by the Sand-Cone Method
    - ASTM D 2216 - Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass (Oven Moisture)
    - ASTM D 6938 - In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)
    - ASTM D 4643 - Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating
- After lift placement, moisture content shall be maintained until the next lift is placed.
- Erosion that occurs in the RRM layers shall be repaired and grades re-established.
- Freezing and desiccation of the RRM soil shall be prevented. If freezing or desiccation occurs, the affected soil shall be reconditioned as directed.
- Areas that have been repaired shall be retested as directed. Repairs to the RRM layers shall be documented including location and volume of soil affected, corrective action taken, and results of retests.

6.4.4 Demolition Debris

Demolition debris will be placed in the waste cell along with RRM material. Each container of demolition debris shall be spread in a single layer, not stacked, and placed in a manner that results in a minimum of voids around the debris. The following materials will be placed in the waste cell:

- Wood, Concrete, Masonry: Cut or break up to a maximum 3-foot size measured in any dimension.
- Structural Steel Member, Pipes, Ducts, Other Long Items: Cut into maximum 10-foot lengths.
- Concrete, Clay Tile, and Other Pipes: Crush concrete and clay tile pipes. Crush other pipes and ducts that are 6 inches or greater in diameter or, if crushing is impractical, cut pipes and ducts in half longitudinally. Do not crush asbestos-cement pipe.
- Rubber Tires Excavated at the Site: Cut into two halves around the circumference.
- Geomembranes and Other Sheet Material: Cut into strips a maximum of 4 feet wide by 4 feet long.
- Tree Limbs 4 inches in Diameter and Larger: Cut into lengths of 8 feet or less.

6.4.5 Final RRM Geometry

The top surface of the RRM shall be no greater than 2 inches above the lines and grades shown on the drawings and verified by survey or the use of the CAES. No minus tolerance will be permitted.

Perform Laboratory laboratory Density density and Moisture moisture Content content tests (ASTM D 698 and ASTM D 2216) for each type of fill material to determine the optimum moisture (optimum moisture content plus or minus 5%) and laboratory maximum density values. One representative density test per material type and every 20,000 cubic yards there after or when any change in material occurs which may affect the optimum moisture content or laboratory maximum dry density. One correlation test for moistures every 10 tests per ASTM D6938 will be performed in accordance to ASTM D 4643 or ASTM D 2216.

In the stockpile, excavations, or borrow areas, perform moisture tests to control the moisture content of material being placed as fill. Control of moisture content of fill shall be performed by conducting routine testing of moisture content by one of the following tests:

- ASTM D 2216 - Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass (Oven Moisture)
- ASTM D 4643 - Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating
- ASTM D 4944 - Field Determination of Water (Moisture) Content of Soil by the Calcium Carbide Gas Pressure Tester
- ASTM D 4959 - Determination of Water (Moisture) Content of Soil by Direct Heating
- During unstable weather, perform tests as dictated by local conditions and approved by the Construction Manager.

6.4 RESIDUAL RADIOACTIVE MATERIAL (RRM)

The objective is to place and compact the RRM in the waste cell to create a stable waste mass. The QC Inspector shall visually inspect the material preparation, ground preparation, and RRM placement operations, and shall perform in-place density tests with companion moisture tests for the CAES to verify that RRM compaction meets the compaction requirements. The QC Inspector shall verify that the RRM placement is performed in accordance with Plans and Specifications, and that the top of the placed waste matches the final grades identified in Section 6.4.5. RRM shall not be placed when frozen or over frozen subgrade. If rain water ponding has occurred, placement of RRM waste shall only be performed after the area is dewatered and approval of the Construction Manager, and QC Inspector or designee to place is obtained.

6.4.1 Moisture Modification

RRM material should be shipped from the Moab site at or near optimum moisture for compaction. Some RRM may require minor moisture modification when received at Crescent Junction site.

6.4.2 RRM Placement

Scarify at a minimum the top one inch of subsoil or preceding RRM lift using a footed roller or a dozer prior to placement of subsequent RRM layers. Fill materials shall be placed in continuous and approximately horizontal planar lifts. The method of dumping and spreading RRM shall result in loose lifts of nearly uniform thickness, average thickness not to exceed 12". Compaction equipment shall consist of footed rollers or dozers. Footed rollers shall have a minimum weight of 45,000 pounds and at least one tamping foot shall be provided for each 110 square inches of drum surface. The length of each tamping foot from the outside surface of the drum shall be at least 6 inches. During compaction operations, the spaces between the tamping feet shall be maintained clear of materials which would impair the effectiveness of the tamping foot rollers. Dozers shall have a minimum ground pressure of 1,650 lbs per sq ft. The CAES shallmay be used to direct fill placement, monitor compaction, and record the location and thickness of each soil layer being placed.

6.4.3 Inspection and Testing

The Quality Control (QC) Inspector shall visually inspect the ground preparation and fill placement operations. RRM shall be compacted to meet 90% of the laboratory determined maximum dry density as determined by (ASTM D 698). The QC Inspector shall verify that the RRM placement is constructed in accordance with Design Plans and Specifications by checking and confirming:

- Assessment tests shall be performed on RRM to assure compliance with specified requirements and to develop compaction requirements for placement. A minimum of three tests for maximum dry density (ASTM D 698) and optimum moisture content (optimum moisture plus or minus 3%) (ASTM D 2216) shall be performed for each type of RRM soil observed.
- Fill material is properly moisture conditioned, one moisture content quick test will be performed each day material is placed in accordance with (ASTM D 4643, ASTM D 4944, or ASTM D 4959) until a sufficient number have been performed to demonstrate a clear correlation allowing a reduction in testing.
- Fill material is placed in continuous and approximately horizontalplanar lifts. The method of dumping and spreading RRM shall result in loose lifts of nearly uniform thickness, average thickness of fill area not to exceed 12".
- Compaction meets specifications.
- Compaction by CAES – the QC inspector shall monitor CAES compaction by visually inspecting the process and reviewing the computer records for each layer of soil placed.
- Verification tests of in-place density shall be performed on the initial layer of RRM and on any layers in which the CAES indicates that problems occurred obtaining compaction. In-place density will be taken every six months to verify the performance of the CAES.

Note: Companion sand cone tests and oven moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

If CAES is not used the following testing requirements shall be followed:

- Compaction Verification Tests – Perform in-place density and moisture content tests on compacted fill material in accordance with the following requirements:
    - When verification a representative sample from each principal type or combination of blended RRM materials shall be tested to establish compaction curves using ASTM D 698. A minimum of one set of compaction curves shall be developed per 10,000 cubic yards of RRM material. In-place density and moisture content tests are performed on a soil layer; a minimum of two tests shall be performed per 5,000 cubic yards or 135,000 square feet of fill material placed.

- Compaction and moisture content tests shall be performed in accordance with the following methods:
    - ASTM D 1556 - Density and Unit Weight of Soil in Place by the Sand-Cone Method
    - ASTM D 2216 - Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass (Oven Moisture)
    - ASTM D 6938 - In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)
    - ASTM D 4643 - Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating
- After lift placement, moisture content shall be maintained until the next lift is placed.
- Erosion that occurs in the RRM layers shall be repaired and grades re-established.
- Freezing and desiccation of the RRM soil shall be prevented. If freezing or desiccation occurs, the affected soil shall be reconditioned as directed.
- Areas that have been repaired shall be retested as directed. Repairs to the RRM layers shall be documented including location and volume of soil affected, corrective action taken, and results of retests.

6.4.4 Demolition Debris

Demolition debris will be placed in the waste cell along with RRM material. Each container of demolition debris shall be spread in a single layer, not stacked, and placed in a manner that results in a minimum of voids around the debris. The following materials will be placed in the waste cell:

- Wood, Concrete, Masonry: Cut or break up to a maximum 3-foot size measured in any dimension.

- Structural Steel Member, Pipes, Ducts, Other Long Items: Cut into maximum 10-foot lengths.
- Concrete, Clay Tile, and Other Pipes: Crush concrete and clay tile pipes. Crush other pipes and ducts that are 6 inches or greater in diameter or, if crushing is impractical, cut pipes and ducts in half longitudinally. Do not crush asbestos-cement pipe.
- Rubber Tires Excavated at the Site: Cut into two halves around the circumference.
- Geomembranes and Other Sheet Material: Cut into strips a maximum of 4 feet wide by 4 feet long.
- Tree Limbs 4 inches in Diameter and Larger: Cut into lengths of 8 feet or less.

6.4.5 Final RRM Geometry

The top surface of the RRM shall be no greater than 2 inches above the lines and grades shown on the drawings and verified by survey or the use of the CAES. No minus tolerance will be permitted.

6.5 INTERIM COVER

After a section the RRM have been placed in the waste cell to final grade and verified by survey, an interim cover consisting of 1 ft of clean, compacted soil shall be placed over the RRM. Interim cover material will be placed and compacted directly on top of RRM to provide a buffer of uncontaminated soil prior to the placement of the final multi-layer cap.

6.5.1 Material

Interim Cover Soil will be soil from the excavation of the Crescent Junction waste cell. It will be material that has been produced on site by modifying the existing overburden soil and weathered Mancos Shale excavated on site. Overburden and weathered Mancos Shale shall be excavated, pulverized, wetted, and mixed to produce a uniform fine-grained soil near optimum moisture content for compaction. Soil shall be free of roots, debris, and organic or frozen material., and shall have a maximum clod size of 2 inch based on visual at the time of compaction.

6.5.2 Ground Preparation

The RRM beneath the proposed interim cover shall be prepared by scarifying to a minimum depth of one inch prior to the placement of the initial lift of interim cover soil.

6.5.3 Lift Placement and Thickness

The interim cover shall be constructed of fill materials placed in continuous lifts of uniform thickness. The method of dumping and spreading Interim Cover Soil over the RRM shall result in loose lifts average thickness not to exceed 12". ~~The CAES shall be~~

THICKNESS: UNC: ≤ 12" COM: N/A ELEV: N/A Debris Insp. By: N/A Date: N/A Time: N/A

Comments: QC verified that the under lying lift was scarified prior to placement of RRM. This lift is approximately 63,702 ft² with approximately 1,180 yds³ of RRM approved on it. Operations began placing this lift on 10-20-10 but did not get it approved until 10-29-10 this is the reasoning for the differnce in the lift ID and approval date. The daily moisture test for 10/22/2010 night shift was performed on this lift and passed with satisfactory results. A second moisture test was performed on the underlying lift due to excessive rains. This test failed due to high moisture. On 10-25-10 nightshift, QC performed another moisture test with failing results due to high moisture. Operations reworked the material with a CAT 825 in efforts to dry the material. On 10-29-10 QC performed two moisture test, one on the underflying lift and one on the material placed, that passed with satisfactory results. QC also performed a denstiy correlation with the Troxler gague and a Sandcone. These tests were satisfctory. PROCTORS USED WERE FROM THE UNDERLYING LIFT AND MATERIAL BEING PLACED, THIS IS WHY THERE IS DIFFERENT PROCTORS BEING USED. MH 10/29/10

Moisture content (w) $w = (M_w / M_s) \times 100$	17.0	%

Soil Description: Red, Very fine to fine sand.

Proctor ID: RRM # 82

Standard Proctor (ASTM D698)

Maximum Dry Density ($\gamma_d max$) 114.2 (lbs/ft^3)

Optimum Moisture (w_{opt}) 11.5 (%)

Required Moisture: 8.5 % to 14.5 %

Required Percent Compaction: 90.0 (%)

Dry Density $(\rho_d) = (100 \times \rho_m)/(100 + w)$

$\rho d = (100 \times$ ##### $) / (100 +$ 17.0 $) =$ 0.0 lbs/ft^3

Note: Wet Density from ASTM D 1556 (ρ_m) takes presidence over ASTM D 6938 (ρ_m)

N A

Percent Compaction = ρ_d / $\gamma_d max$ x 100

0.0 / 114.2 x 100 = 0.0 %

Comments:

Microwave oven power setting on HIGH. Initial time setting of 3 minutes and subsequent incremental drying periods of 1 minute until a change of 0.1 % or less of the initial wet mass of the soil.

TEST RESULTS:

_____ Pass Date: 10/25/10

Comments: QC verified that the lift area was scarified prior to placement. Due to weather on 10-25-10, QC performed a moisture test on the underlying lift prior to any placement. This moisture test failed due to high moisture. Operations worked the lift area and let air dry. On 9-29-10 dayshift, QC performed a moisture test with satisfactory results. Operations placed material thin to level the lift area. This is 32,303 ft². There is approximately 239 yds³ of RRM on this lift LIFT

FIELD DENSITY TEST

PROJECT: Moab UMTRA Project **OTHER** _____

LIFT IDENTIFICATION: UWK28101029-00 DATE: 10/29/2010

TEST ID NUMBER(S): Moisture test #2

TEST LOCATION: Under lying lift TEST METHOD: N/A D1556 N/A D6938

ASTM D6938 (DENSITY DETERMINATION)

Make/Model _____ Gauge Serial # _____

Last Calibration Date: N/A

Daily Standard Counts:

Density _____ Moisture _____

_____ *Method A (Direct Transmission)* or _____ *Method B (Backscatter)*

Depth Setting _____ *(inches)* A Count Time _____ *(minutes)*

Moisture Count _____ Density Count _____

Wet Density (ρ_m) _____ *(lbs/ft³)* Dry Density _____ *(lbs/ft³)*

Moisture Density _____ *(lbs/ft³)* Moisture Fraction _____ *(%)*

ASTM D1556 (DENSITY DETERMINATION)

Testing Apparatus _____ Calibrated Vol. *(lbs/ft³)* _____

Bulk Density of sand (ρ_1) _____ *g/cm³* _____ *lbs/ft³*

Mass of Sand to Fill Cone & Plate (M_2) _____ *g*

Mass of bottle & cone **before** filling cone, plate & hole		g
Mass of bottle & cone **after** filling cone, plate & hole		g
Mass of sand to fill cone, plate, & hole (M_1)		g
Mass of sand to fill hole		g
Mass of wet soil & container		g
Mass of container		g
Mass of wet soil (M_3)		g

Test Hole Volume

$V = (M_1 - M_2) / \rho_1$ _____ cm^3

Dry Mass of soil

$M_4 = 100\ M_3 / (w + 100)$ _____ g

Wet Denisty

$\rho_m = (M_3 / V) \times 62.43$ _____ lbs/ft^3

Dry Denisty

$\rho_d = M_4 / V$ _____ g/cm^3

Dry Unit Weight

$\gamma_d = \rho_d \times 62.43$ _____ lbs/ft^3

MOISTURE DETERMINATION

ASTM D4643

Container ID D-2

Mass of container & wet specimen (M_{cms})	369.1	g
Mass of container & dry specimen (M_{cds})	341.7	g
Mass of water (M_w) $M_w = M_{cms} - M_{cds}$	27.4	g
Mass of container (M_c)	163.7	g
Mass of dry specimen (M_s) $M_s = M_{cds} - M_c$	178.0	g
Moisture content (w) $w = (M_w / M_s) \times 100$	15.4	%

Soil Description: Reddish brown very fine to medium, well graded, subround to subangular silty SAND

Proctor ID: RRM #152

Standard Proctor (ASTM D698)

Maximum Dry Density ($\gamma_d max$) 108.6 (lbs/ft³)

Optimum Moisture (w_{opt}) 15.1 (%)

Required Moisture: 12.1 % to 18.1 %

Required Percent Compaction: 90.0 (%)

Dry Density (ρ_d) = $(100 \times \rho_m)/(100 + w)$

$\rho d = (\ 100 \times$ ##### $\ ) / (100 +$ 15.4 $) =$ 0.0 *lbs/ft³*

Note: Wet Density from ASTM D 1556 (ρ_m) takes presidence over ASTM D 6938 (ρ_m)

Percent Compaction = $\rho_d / \gamma_d max \times 100$

0.0 / 108.6 x 100 = 0.0 %

Comments:

Microwave oven power setting on HIGH. Initial time setting of 3 minutes and subsequent incremental drying periods of 1 minute until a change of 0.1 % or less of the initial wet mass of the soil.

TEST RESULTS:

[X] Pass Date: 10/29/10

[ ] Failed Moisture

[ ] Failed Compaction Time: 0920

By: Beachem Bosh / _____

6.7 RADON BARRIER LAYER

The initial cap layer is a 4 ft thick Radon Barrier Layer constructed of compacted clay soil. The Radon Barrier will be a low-permeability clay layer that limits radon emissions from the RRM and limits the infiltration of water from above.

6.7.1 Material

The Radon Barrier Layer will be constructed of processed Mancos Shale soil. The clay soil will be produced on site by processing excavated Mancos Shale into a fine-grained soil and adding water to bring the Mancos Shale soil to near optimum moisture content for compaction.

Assessment tests shall be performed on radon barrier material to assure compliance with specified requirements and to develop compaction requirements for placement. A minimum of three tests for maximum dry density (ASTM D 698), optimum moisture content (ASTM D 2216) shall be performed for each type of soil observed to establish the optimum moisture for radon barrier material placement. Mancos Shale soil produced for Radon Barrier fill shall be tested to determine its maximum dry density and the optimum moisture content. The moisture content shall be modified to bring the fill to optimum for compaction. As a minimum, perform the following soil tests on each 10,000 cu yds of soil:

ASTM D 4318, Liquid Limit, Plastic Limit, and Plasticity Index of Soils
ASTM D 1140, Amount of Material in Soils Finer than the No. 200 Sieve
ASTM D 422, Standard Test Method for Particle-Size Analysis in Soil
ASTM D 698, Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort.
ASTM D 2216, Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass and/or ASTM D 4643, Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating

6.7.2 Ground Preparation

The interim cover layer beneath the proposed Radon Barrier Layer shall be prepared by scarifying to a depth of one inch prior to the placement of the initial lift of Radon Barrier soil.

6.7.3 Lift Placement and Thickness

The Radon Barrier shall be constructed of fill materials placed in continuous lifts of uniform thickness. The method of dumping and spreading radon barrier shall result in loose lifts not to exceed 12". The CAES shall be used to direct fill placement, monitor compaction, and record the location and thickness of each soil layer being placed. Compaction equipment shall consist of footed rollers which have a minimum weight of 45,000 pounds and at least one foot for each 110 square inches of drum surface. The length of each tamping foot shall be at least 6 inches, from the outside surface of the

drum. During compaction operations, the spaces between the tamping feet shall be maintained clear of materials which would impair the effectiveness of the tamping foot rollers.

6.7.4 Inspection and Testing

The Quality Control (QC) Inspector shall visually inspect the processing of Mancos Shale into clay soil, ground preparation, and fill placement operations. The QC Inspector shall perform in-place density tests with companion moisture tests (optimum moisture plus or minus 3%) to verify that the CAES compaction results in a density of at least 95% of the material's maximum dry density according to ASTM D 698 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort. The QC Inspector shall verify that the Radon Barrier is constructed in accordance with Plans and Specifications by checking and confirming:

- Fill material is properly moisture conditioned, one moisture content test will be performed each day material is placed in accordance with (ASTM D 4643, ASTM D 4944, or ASTM D 4959);
- Material is placed in continuous uniform thickness lifts. The method of dumping and spreading radon barrier shall result in loose lifts not to exceed 12".
- Radon Barrier soil is processed Mancos Shale;
- Tests have been performed on the processed shale soil to determine its maximum dry density and optimum moisture content.
- Compaction – Radon Barrier fill is spread and compacted with a footed roller. The compactor shall be equipped with a Computer Aided Earthmoving System and soil placement and compaction shall be controlled by the CAES.
- Compaction by CAES – the QC inspector shall monitor CAES compaction by visually inspecting the process and reviewing the computer records for each layer of soil placed.
- Compaction Verification Tests – Perform in-place density and moisture content tests on compacted fill material in accordance with the following requirements:
    - Verification tests of in-place density shall be performed on initial layer of radon barrier placed, and on any layers in which the CAES indicates that problems occurred obtaining compaction.
    - When verification in-place density and moisture content tests are performed on a soil layer, a minimum of one test shall be preformed a minimum of 2 tests per 5,000 cubic yards of material placed.
    - Compaction and moisture content tests shall be performed in accordance with the following methods:
        - ASTM D 1556 – Density and Unit Weight of Soil in Place by the Sand-Cone Method

- ASTM D 2216 – Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
- ASTM D 6938 - In-Place Density and Water content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth
- ASTM D 4643 - Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating

Note: Companion sand cone tests and oven moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

- After placement, moisture content shall be maintained or adjusted to meet criteria.
- Erosion that occurs in the fill layers shall be repaired and grades re-established.
- Freezing and desiccation of the Radon Barrier layer shall be prevented. If freezing or desiccation occurs, the affected soil shall be removed or reconditioned as directed.
- Areas that have been repaired shall be retested as directed. Repairs to the Radon Barrier layer shall be documented including location and volume of soil affected, corrective action taken, and results of retests.

6.7.5 Initial and Confirmatory Surveys

Verification of the thickness of the Radon Barrier Layer will be performed by comparing before and after surveys of the Layer by surveying or using CAES. Prior to placement of the Radon Barrier Layer, an initial survey shall be performed of the section to be capped. The initial survey will document the pre-cap geometry of the site. After the Radon Barrier Layer has been installed, a post-installation survey will be performed on the top of the Radon Barrier fill to confirm that the total fill thickness is in accordance with the plans and specifications.

6.8 INFILTRATION AND BIOINTRUSION BARRIER (GRAVEL)

Above the Radon Barrier layer, a 6 inch thick Infiltration and Biointrusion Layer of gravel will be placed to provide a barrier to burrowing animals, and a pathway for drainage of water that has infiltrated through upper layers of the cap. The gravel will be a sandy gravel with a gradation in accordance with project plans and specifications. Rock shall be spread to the thickness indicated on the drawings or in accordance with oversizing due to scoring criteria. Rock placement shall be guided by the Computer Aided Earthmoving System to ensure that the appropriate thickness has been placed at all locations. Stone with a D50 of 2 inches or less shall be compacted with a vibratory steel drum.

6.7 RADON BARRIER LAYER

The initial cap layer is a 4 ft thick Radon Barrier Layer constructed of compacted clay soil. The Radon Barrier will be a low-permeability clay layer that limits radon emissions from the RRM and limits the infiltration of water from above.

6.7.1 Material

The Radon Barrier Layer will be constructed of processed Mancos Shale soil. The clay soil will be produced on site by processing excavated Mancos Shale into a fine-grained soil and adding water to bring the Mancos Shale soil to near optimum moisture content for compaction.

Assessment tests shall be performed on radon barrier material to assure compliance with specified requirements and to develop compaction requirements for placement. A minimum of three tests for maximum dry density (ASTM D 698), optimum moisture content (ASTM D 2216) shall be performed for each type of soil observed to establish the optimum moisture for radon barrier material placement. Mancos Shale soil produced for Radon Barrier fill shall be tested to determine its maximum dry density and the optimum moisture content. The moisture content shall be modified to bring the fill to optimum for compaction. As a minimum, perform the following soil tests on each 10,000 cu yds of soil:

ASTM D 4318, Liquid Limit, Plastic Limit, and Plasticity Index of Soils
ASTM D 1140, Amount of Material in Soils Finer than the No. 200 Sieve
ASTM D 422, Standard Test Method for Particle-Size Analysis in Soil
ASTM D 698, Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort.
ASTM D 2216, Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass and/or ASTM D 4643, Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating

6.7.2 Ground Preparation

The Iinterim Ccover layer beneath the proposed Radon Barrier Layer shall be prepared by scarifying to a minimum depth of one inch prior to the placement of the initial lift of Radon Barrier soil.

6.7.3 Lift Placement and Thickness

The Radon Barrier Layer shall be constructed of fill materials placed in continuous lifts of uniform thickness. The method of dumping and spreading radon barrier shall result in loose lifts not to exceed 12". Compaction equipment shall consist of rubber tired or footed rollers compaction equipment which have a minimum weight of 45,000 pounds. and at least one foot for each 110 square inches of drum surface. The length of each tamping foot shall be at least 6 inches, from the outside surface of the drum. During compaction operations, the spaces between the tamping feet shall be maintained clear of

materials which would impair the effectiveness of the tamping foot rollers. The in-place material may contain particles up to four inches.

Placement of mancos shale will be visually inspected to make sure there are no locations where rock type particles accumulate in a concentrated location. Particles found in a concentrated location will be removed or reworked per QC direction.

6.7.4 Inspection and Testing

The Quality Control (QC) Inspector shall visually inspect the processing of Mancos Shale into clay soil, ground preparation, and fill placement operations. The QC Inspector shall perform in-place density tests with companion moisture tests (to verify optimum moisture plus or minus 3% and of at least 95% of the material's maximum dry density according to ASTM D 698 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort. The QC Inspector shall verify that the Radon Barrier is constructed in accordance with Plans and Specifications by checking and confirming:

- Fill material is properly moisture conditioned, one moisture content test will be performed each day material is placed in accordance with (ASTM D 4643, ASTM D 4944, or ASTM D 4959);) moisture content plus or minus 3%.
- Material is placed in continuous uniform thickness lifts. The method of dumping and spreading radon barrier shall result in loose lifts not to exceed 12".
- Radon Barrier soil is processed Mancos Shale;
- Tests have been performed on the processed shale soil to determine its maximum dry density and optimum moisture content.
- Compaction – Radon Barrier fill is spread and compacted with rubber tired ora footed roller compaction equipment.
- Compaction by CAES – the QC inspector shall monitor CAES compaction by visually inspecting the process and reviewing the computer records for each layer of soil placed.
- Verification tests of in-place density shall be performed on initial layer of radon barrier placed, and on any layers in which the CAES indicates that problems occurred obtaining compaction.
- Maximum particle size in the fill material shall be 4 inches
- Placement of mancos shale will be visually inspected to make sure there are no locations where rock type particles accumulate in a concentrated location

Note: Companion sand cone tests and moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

If CAES is not used the following testing requirements shall be followed:

- Compaction Verification Tests – Perform in-place density and moisture content tests on compacted fill material in accordance with the following requirements:
    - When verification a representative sample from each principal type or combination of blended Radon Barrier materials shall be tested to establish compaction curves using ASTM D 698. A minimum of one set of compaction curves shall be developed per 10,000 cubic yards of Radon Barrier material.
    - In-place density and moisture content tests are performed on a soil layer; a minimum of two tests shall be performed per 5,000 cubic yards or 135, 000 square feet of fill material placed.
    - Fill material is properly moisture conditioned, one moisture content test will be performed each day material is placed in accordance with (ASTM D 4643, ASTM D 4944, or ASTM D 4959) moisture content plus or minus 3%.;
    - Material is placed in continuous uniform thickness lifts. The method of dumping and spreading radon barrier shall result in loose lifts not to exceed 12".
    - Radon Barrier soil is processed Mancos Shale;
    - Tests have been performed on the processed shale soil to determine its maximum dry density and optimum moisture content.
    - Compaction – Radon Barrier fill is compacted with rubber tired or footed roller compaction equipment.
    - Maximum particle size in the fill material shall be 4 inches
    - Placement of mancos shale will be visually inspected to make sure there are no locations where rock type particles accumulate in a concentrated location

- Compaction Verification Tests – Perform in-place density and moisture content tests on compacted fill material in accordance with the following requirements:

    - Verification tests of in-place density shall be performed on initial layer of radon barrier placed, and on any layers in which the CAES indicates that problems occurred obtaining compaction.
    - When verification in-place density and moisture content tests are performed on a soil layer, a minimum of one test shall be preformed a minimum of 2 tests per 5,000 cubic yards of material placed.
    - Compaction and moisture content tests shall be performed in accordance with the following methods:
        - ASTM D 1556 – Density and Unit Weight of Soil in Place by the Sand-Cone Method
        - ASTM D 2216 – Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
        - ASTM D 6938 - In-Place Density and Water content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth

- ASTM D 4643 - Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating
- ASTM D 698, Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort.

Note: Companion sand cone tests and oven moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

- After placement, moisture content shall be maintained or adjusted to meet criteria.
- Erosion that occurs in the fill layers shall be repaired and grades re-established.
- Freezing and desiccation of the Radon Barrier lLayer shall be prevented. If freezing or desiccation occurs, the affected soil shall be removed or reconditioned as directed.
- Areas that have been repaired shall be retested as directed. Repairs to the Radon Barrier lLayer shall be documented including location and volume of soil affected, corrective action taken, and results of retests.

6.7.5 Initial and Confirmatory Surveys

Verification of the thickness of the Radon Barrier Layer will be performed by comparing before and after surveys of the Layer by surveying or using CAES. Prior to placement of the Radon Barrier Layer, an initial survey shall be performed of the section to be capped. The initial survey will document the pre-cap geometry of the site. After the Radon Barrier Layer has been installed, a post-installation survey will be performed on the top of the Radon Barrier fill to confirm that the total fill thickness is in accordance with the plans and specifications.

6.8 INFILTRATION AND BIOINTRUSION BARRIER (GRAVEL)

Above the Radon Barrier lLayer, a 6 inch thick Infiltration and Biointrusion Layer of gravel will be placed to provide a barrier to burrowing animals, and a pathway for drainage of water that has infiltrated through upper layers of the cap. The gravel will be a sandy gravel with a gradation in accordance with project plans and specifications. Rock shall be spread to the thickness indicated on the drawings or in accordance with oversizing due to scoring criteria. Rock placement shall be guided by the Computer Aided Earthmoving System GPS grade control to ensure that the appropriate thickness has been placed at all locations. Stone with a D50 of 2 inches or lessThe Biointrustion Layer shall be compacted with a vibratory steel drum.

6.8.1 Erosion Protection Materials Testing

Rock for the infiltration and biointrusion barrier layer shall be tested by a commercial testing laboratory during production in accordance with the following:

Material Inspection by: B.B. Partical Size: ≤4": X ≥4": ___ Nesting: Y: ___ N: X Processed Mancos Shale Material: Y: X N: ___

Comments: This lift is approximately ~~172,358~~ 167,050 ft², with an approximate total of ~~3,192~~ 3,094 yds³ of RRM approved on this lift. On 8/11/2010 a baseline ~~th~~e survey was performed for this new lift area. QC visually inspected the area and found that it was scarified prior to placement and that the lift areas moisture content was maintained. QC observed placement throughout the day and picked a few rocks out of the material, material processing is not finished therefore final inspection was not performed. QC observed that moisture was applied to underlying lift and material being placed throughout the day. Moisture test was taken from this lift area with satisfactory results. On 8/12/2010 QC observed work on the Radon Barrier throughout the day and removed some rock form the material. At approximately 1000 hours QC performed an inspection on the material because operations felt it was ready and the material was not approved for compaction due to the material being over 4" and needing more processing. Operations continued disking, pulverizing and adding moisture to the material and at approximately 1500 hours a second inspection on the material was done and it was found to be satisfactory according to the RAIP. On 8/13/2010 QC observed operations adding moisture to the lift and compacting. Lift was not verified for compaction with the CAES due to it not being completed with compaction. QC observed operations adding moisture to the lift area on 8/16/2010 after the weekend. QC performed in place density tests for correlation with the CAES, as well as companion oven moisture tests to correlation with the Nuclear Density Gauge on this lift area. AFTER OPERATIONS COMPLETED COMPACTION ON ENTIRE LIFT AREA.

FIELD DENSITY TEST

PROJECT: Moab UMTRA Project OTHER 15 of 16 6/20/10

LIFT IDENTIFICATION: URA11100811-00 DATE: 8/12/2010

TEST ID NUMBER(S): 1

TEST LOCATION: 6795284 N 2122160 E 57 MH 1-11-11 TEST METHOD: ____ D1556 X D6938

ASTM D6938 (DENSITY DETERMINATION)

Make/Model Troxler 3430 Gauge Serial # 31674

Last Calibration Date: 3/4/10

Daily Standard Counts: *On-Cell Standard*

Density 2518 Moisture 708

Method A (Direct Transmission)

Depth Setting 6 *(inches)* Count Time 1 *(minutes)*

Moisture Count 156 Density Count 2256

Wet Density (ρ_m) 129.5 *(lbs/ft^3)* Dry Density 117.3 *(lbs/ft^3)*

Moisture Density 12.2 *(lbs/ft^3)* Moisture Fraction 10.4 *(%)*

ASTM D1556 (DENSITY DETERMINATION)

Testing Apparatus ____ Calibrated Vol. *(lbs/ft^3)* ____

Bulk Density of sand (ρ_1) ____ *g/cm^3* ____ *lbs/ft^3*

Mass of Sand to Fill Cone & Plate (M_2) ____ g

Mass of bottle & cone **before** filling cone, plate & hole		g
Mass of bottle & cone **after** filling cone, plate & hole		g
Mass of sand to fill cone, plate, & hole (M_1)		g
Mass of sand to fill hole		g
Mass of wet soil & container	N/A	g
Mass of container		g
Mass of wet soil (M_3)		g

Test Hole Volume

$V = (M_1 - M_2) / \rho_1$ ____ *cm^3*

Dry Mass of soil

$M_4 = 100\ M_3 / (w + 100)$ ____ g

Wet Denisty

$\rho_m = (M_3 / V) \times 62.43$ ____ *lbs/ft^3*

Dry Denisty

$\rho_d = M_4 / V$ ____ *g/cm^3*

Dry Unit Weight

$\gamma_d = \rho_d \times 62.43$ ____ *lbs/ft^3*

MOISTURE DETERMINATION

ASTM D4643

Container ID D-1

Mass of container & wet specimen (M_{cms})	413.9	g
Mass of container & dry specimen (M_{cds})	384.5	g
Mass of water (M_w) $M_w = M_{cms} - M_{cds}$	29.4	g
Mass of container (M_c)	164.3	g
Mass of dry specimen (M_s) $M_s = M_{cds} - M_c$	220.2	g
Moisture content (w) $w = (M_w / M_s) \times 100$	13.4	%

Dry Density $(\rho_d) = (100 \times \rho_m)/(100 + w)$

$\rho d = (100 \times 129.5) / (100 + 13.4 = 114.2$ *lbs/ft^3*

Note: Wet Density from ASTM D 1556 (ρ_m) takes presidence over ASTM D 6938 (ρ_m)

Percent Compaction = ρ_d / $\gamma_d max$ x 100

114.2 / 118.2 x 100 = 96.7 %

Soil Description: **Gray in color and consists of mostly fines.**

Proctor ID: **Radon Barrier # 8 C**

Standard Proctor (ASTM D698)

Maximum Dry Density ($\gamma_d max$) 118.2 (lbs/ft^3)

Optimum Moisture (w_{opt}) 13.3 (%)

Required Moisture: 10.3 % to 16.3 %

Required Percent Compaction: 95.0 (%)

Comments:

Johanson and Tuttle Eng. personnel performed the in place density tests. Also an EnergySolutions QC Technichian performed the companion oven moisture tests. Microwave oven power setting on HIGH. Initial time setting of 3 minutes and subsequent incremental drying periods of 1 minute until a change of 0.1 % or less of the initial wet mass of the soil.

TEST RESULTS:

X Pass Date: 8/16/10

____ Failed Moisture

____ Failed Compaction Time: 10:00

By: Kevin Keele/Kyler Edgehouse / Kevin Keele/Kyler Edgehouse (print) J and T (signature)

QA/QC APPROVAL 8.20.2010 DATE

THICKNESS: UNC: ≤12" COM: N/A ELEV: N/A Scarification Insp: YES Date: 8/2/10 Time: 1000

Material Inspection by: D.S. Partical Size: ≤4": X ≥4": ___ Nesting: Y: ___ N: X Processed Mancos Shale Material: Y: X N: ___

Comments: This lift is approximately 201,984 ft². There is approximately 5,237 yds³ of Radon material on this lift. This is the first lift of Radon Barrier material in this area. QC took pictures during processing, conditioning, and compaction of this lift area, see attached. QC performed a survey to identify the boundary line for the lift area. QC verified that the area was scarified and a baseline survey was performed prior to placement. QC verified with satisfactory results that the Interim Cover moisture was maintained until covered with Radon Barrier. Nielsons began placing the material as well as disking and adding moisture to the soil. QC performed a visual inspection on the material and found some material with particle size exceeding 4". QC performed multiple visual inspections during processing of material. material was reworked and some was removed form this lift area. A final inspection was performed on 8/10/2010 with satisfactory results. QC observed compaction and performed 3 density tests in correlation with the CAES with satisfactory results. QC also performed companion moisture tests and a companion sandcone test in correlation with the nuclear density gauge. Test #1 had high compaction results, due to test location was in a haul route for material placement.

FIELD DENSITY TEST

PROJECT: Moab UMTRA Project **OTHER** _____

LIFT IDENTIFICATION: URA11100810-00 DATE: 8/10/2010

TEST ID NUMBER(S): # 1

TEST LOCATION: 6795258 N. 2122149 E. TEST METHOD: ____ D1556 X D6938

ASTM D6938 (DENSITY DETERMINATION)

Make/Model 3430 Gauge Serial # 27523

Last Calibration Date: 8/21/09

Daily Standard Counts: *Off-Cell Standard*

Density 2217 Moisture 666

Method A (Direct Transmission)

Depth Setting 8 *(inches)* Count Time 1 *(minutes)*

Moisture Count 171 Density Count 935

Wet Density (ρ_m) 137.8 *(lbs/ft^3)* Dry Density 123.2 *(lbs/ft^3)*

Moisture Density 14.7 *(lbs/ft^3)* Moisture Fraction 11.9 *(%)*

ASTM D1556 (DENSITY DETERMINATION)

Testing Apparatus ____ Calibrated Vol. *(lbs/ft^3)* ____

Bulk Density of sand (ρ_1) ____ *g/cm^3* ____ *lbs/ft^3*

Mass of Sand to Fill Cone & Plate (M_2) ____ g

Mass of bottle & cone **before** filling cone, plate & hole		g
Mass of bottle & cone **after** filling cone, plate & hole		g
Mass of sand to fill cone, plate, & hole (M_1)		g
Mass of sand to fill hole		g
Mass of wet soil & container		g
Mass of container		g
Mass of wet soil (M_3)		g

Test Hole Volume

$V = (M_1 - M_2) / \rho_1$ ____ *cm^3*

Dry Mass of soil

$M_4 = 100\ M_3 / (w + 100)$ ____ g

Wet Denisty

$\rho_m = (M_3 / V) \times 62.43$ ____ *lbs/ft^3*

Dry Denisty

$\rho_d = M_4 / V$ ____ *g/cm^3*

Dry Unit Weight

$\gamma_d = \rho_d \times 62.43$ ____ *lbs/ft^3*

N/A

MOISTURE DETERMINATION

ASTM D4643

Container ID D3

Mass of container & wet specimen (M_{cms})	384.0	g
Mass of container & dry specimen (M_{cds})	358.3	g
Mass of water (M_w) $M_w = M_{cms} - M_{cds}$	25.7	g
Mass of container (M_c)	164.4	g
Mass of dry specimen (M_s) $M_s = M_{cds} - M_c$	193.9	g
Moisture content (w) $w = (M_w / M_s) \times 100$	13.3	%

Soil Description: **Yellowish in color, mostly consists of fines.**

Proctor ID: **Radon Barrier # 3**

Standard Proctor (ASTM D698)

Maximum Dry Density ($\gamma_d max$) 118.4 (lbs/ft^3)

Optimum Moisture (w_{opt}) 13.2 (%)

Required Moisture: 10.2 % to 16.2 %

Required Percent Compaction: 95.0 (%)

Dry Density $(\rho_d) = (100 \times \rho_m)/(100 + w)$

$\rho d = (\ 100 \times 137.8\ ) / (100 + 13.3 = 121.7$ *lbs/ft^3*

Note: Wet Density from ASTM D 1556 (ρ_m) takes presidence over ASTM D 6938 (ρ_m)

Percent Compaction = ρ_d / $\gamma_d max \times 100$

121.7 / 118.4 x 100 = 102.8 %

Comments:

This test area had higher compaction results because it was used as a haul route during placement. Microwave oven power setting on HIGH. Initial time setting of 3 minutes and subsequent incremental drying periods of 1 minute until a change of 0.1 % or less of the initial wet mass of the soil.

TEST RESULTS:

X Pass Date: 8/10/10

____ Failed Moisture

____ Failed Compaction Time: 1410

By: Kyler Edgehouse / *(print)* *(signature)*

Daily Standard Counts: *Off-Cell Standard*

Density 2217 Moisture 666

Method A (Direct Transmission)

Depth Setting 8 *(inches)* Count Time 1 *(minutes)*

Moisture Count 187 Density Count 1102

Wet Density (ρ_m) 131.3 *(lbs/ft^3)* Dry Density 115.1 *(lbs/ft^3)*

Moisture Density 16.2 *(lbs/ft^3)* Moisture Fraction 14.1 *(%)*

ASTM D1556 (DENSITY DETERMINATION)

Testing Apparatus Ω Calibrated Vol. *(lbs/ft^3)* 0.04113

Bulk Density of sand (ρ_1) 1.57 *g/cm^3* 97.8 *lbs/ft^3*

Mass of Sand to Fill Cone & Plate (M_2) 1824.6 *g*

Mass of bottle & cone **before** filling cone, plate & hole	6114.6	g
Mass of bottle & cone **after** filling cone, plate & hole	2418.7	g
Mass of sand to fill cone, plate, & hole (M_1)	3695.9	g
Mass of sand to fill hole	1871.3	g
Mass of wet soil & container	2500.0	g
Mass of container	16.2	g
Mass of wet soil (M_3)	2483.8	g

Test Hole Volume

$V = (M_1 - M_2) / \rho_1$ 1195 *cm^3*

Dry Mass of soil

$M_4 = 100\ M_3 / (w + 100)$ 2209.0 *g*

Wet Denisty

$\rho_m = (M_3 / V) \times 62.43$ 129.8 *lbs/ft^3*

Dry Denisty

$\rho_d = M_4 / V$ 1.8 *g/cm^3*

Dry Unit Weight

$\gamma_d = \rho_d \times 62.43$ 115.5 *lbs/ft^3*

MOISTURE DETERMINATION

ASTM D4643

Container ID D-3

Mass of container & wet specimen (M_{cms})	418.3	g
Mass of container & dry specimen (M_{cds})	390.2	g
Mass of water (M_w) $M_w = M_{cms} - M_{cds}$	28.1	g
Mass of container (M_c)	164.3	g
Mass of dry specimen (M_s) $M_s = M_{cds} - M_c$	225.9	g
Moisture content (w) $w = (M_w / M_s) \times 100$	12.4	%

Soil Description: Yellowish is color , mostly consists of fines.

Proctor ID: Radon Barrier # 3

Standard Proctor (ASTM D698)

Dry Density $(\rho_d) = (100 \times \rho_m)/(100 + w)$

$\rho d = (\ 100\ \times\ 129.8\ )\ /\ (100 +\ 12.4\ =\ 115.5$ *lbs/ft^3*

Note: Wet Density from ASTM D 1556 (ρ_m) takes presidence over ASTM D 6938 (ρ_m)

Percent Compaction = ρ_d / $\gamma_d max$ x 100

115.5 / 118.4 x 100 = 97.5 %

Maximum Dry Density ($\gamma_d max$) 118.4 (lbs/ft^3)

Optimum Moisture (w_{opt}) 13.2 (%)

Required Moisture: 10.2 % to 16.2 %

Required Percent Compaction: ~~90.0~~ 95.0 (%)

Comments:

Microwave oven power setting on HIGH. Initial time setting of 3 minutes and subsequent incremental drying periods of 1 minute until a change of 0.1 % or less of the initial wet mass of the soil.

TEST RESULTS:

X Pass Date: 8/10/10

Failed Moisture

Failed Compaction Time: 1425

By: Kyler Edgehouse / *(print)* *(signature)*

Material Inspection by: D.S. Partical Size: ≤4": X ≥4": __ Nesting: Y: __ N: X Processed Mancos Shale Material: Y: X N: __

Comments: This lift is approximately 122,016 ft², with an approximate total of 2,711 yds³ of Radon Barrier material approved on this lift. This is the first lift of Radon material in this area. QC verified that the area was scarified and a baseline survey was performed prior to placement. QC verified with satisfactory results that the Interim Cover moisture was maintained until covered with Radon Barrier. Nielsons began placing the material as well as disking and adding moisture to the soil. QC performed a visual inspection on the material and found particle size exceeding 4". QC performed multiple visual inspections during processing of material, material was reworked and some was removed form this lift area. A final inspection was performed on 8/10/2010 with satisfactory results. QC observed compaction and performed 2 density tests in correlation with the CAES with satisfactory results. QC also performed companion moisture tests and a companion sandcone test in correlation with the nuclear density gauge. QC took pictures during processing, conditioning, and compaction of this lift area, see attached. QC performed a survey to identify the boundary line for this lift area.

Container ID D-2

Mass of container & wet specimen (M_{cms})	467.7	g
Mass of container & dry specimen (M_{cds})	436.5	g
Mass of water (M_w) $M_w = M_{cms} - M_{cds}$	31.2	g
Mass of container (M_c)	163.5	g
Mass of dry specimen (M_s) $M_s = M_{cds} - M_c$	273.0	g
Moisture content (w) $w = (M_w / M_s) \times 100$	11.4	%

Dry Density $(\rho_d) = (100 \times \rho_m)/(100 + w)$

$\rho d = (100 \times 131.3) / (100 + 11.4 = 117.9$ *lbs/ft^3*

Note: Wet Density from ASTM D 1556 (ρ_m) takes presidence over ASTM-D 6938 (ρ_m)

Percent Compaction = ρ_d / $\gamma_d max$ x 100

117.9 / 118.4 x 100 = 99.5 %

ASTM D1556 (DENSITY DETERMINATION)

Testing Apparatus Ω Calibrated Vol. *(lbs/ft^3)* 0.04113

Bulk Density of sand (ρ_1) 1.57 *g/cm^3* 97.8 *lbs/ft^3*

Mass of Sand to Fill Cone & Plate (M_2) 1824.6 g

Mass of bottle & cone **before** filling cone, plate & hole	6363.2	g
Mass of bottle & cone **after** filling cone, plate & hole	3022.6	g
Mass of sand to fill cone, plate, & hole (M_1)	3340.6	g
Mass of sand to fill hole	1516.0	g
Mass of wet soil & container	2052.0	g
Mass of container	16.2	g
Mass of wet soil (M_3)	2035.8	g

Test Hole Volume

$V = (M_1 - M_2) / \rho_1$ 968 *cm^3*

Dry Mass of soil

$M_4 = 100\ M_3 / (w + 100)$ 1827.0 g

Wet Denisty

$\rho_m = (M_3 / V) \times 62.43$ 131.3 *lbs/ft^3*

Dry Denisty

$\rho_d = M_4 / V$ 1.9 *g/cm^3*

Dry Unit Weight

$\gamma_d = \rho_d \times 62.43$ 117.9 *lbs/ft^3*

Soil Description: Yellowish in color and consists of mostly fines.

Proctor ID: Radon Barrier #3

Standard Proctor (ASTM D698)

Maximum Dry Density ($\gamma_d max$) 118.4 (lbs/ft^3)

Optimum Moisture (w_{opt}) 13.2 (%)

Required Moisture: 10.2 % to 16.2 %

Required Percent Compaction: 95.0 (%)

Comments:

Microwave oven power setting on HIGH. Initial time setting of 3 minutes and subsequent incremental drying periods of 1 minute until a change of 0.1 % or less of the initial wet mass of the soil.

P.O. BOX 427 CENTERFIELD, UT. 84622 (435) 528-5711 FAX (435) 528-5710

- ASTM D 2216 – Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
- ASTM D 6938 - In-Place Density and Water content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth
- ASTM D 4643 - Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating

Note: Companion sand cone tests and oven moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

- After placement, moisture content shall be maintained or adjusted to meet criteria.
- Erosion that occurs in the fill layers shall be repaired and grades re-established.
- Freezing and desiccation of the Radon Barrier layer shall be prevented. If freezing or desiccation occurs, the affected soil shall be removed or reconditioned as directed.
- Areas that have been repaired shall be retested as directed. Repairs to the Radon Barrier layer shall be documented including location and volume of soil affected, corrective action taken, and results of retests.

6.7.5 Initial and Confirmatory Surveys

Verification of the thickness of the Radon Barrier Layer will be performed by comparing before and after surveys of the Layer by surveying or using CAES. Prior to placement of the Radon Barrier Layer, an initial survey shall be performed of the section to be capped. The initial survey will document the pre-cap geometry of the site. After the Radon Barrier Layer has been installed, a post-installation survey will be performed on the top of the Radon Barrier fill to confirm that the total fill thickness is in accordance with the plans and specifications.

6.8 INFILTRATION AND BIOINTRUSION BARRIER (GRAVEL)

Above the Radon Barrier layer, a 6 inch thick Infiltration and Biointrusion Layer of gravel will be placed to provide a barrier to burrowing animals, and a pathway for drainage of water that has infiltrated through upper layers of the cap. The gravel will be a sandy gravel with a gradation in accordance with project plans and specifications. Rock shall be spread to the thickness indicated on the drawings or in accordance with oversizing due to scoring criteria. Rock placement shall be guided by the Computer Aided Earthmoving System to ensure that the appropriate thickness has been placed at all locations. Stone with a D50 of 2 inches or less shall be compacted with a vibratory steel drum.

6.8.1 Biointrusion Layer Materials Testing

Rock for the infiltration and biointrusion barrier layer shall be tested by a commercial testing laboratory during production in accordance with the following:

Biointrusion Layer Material	Reference
Specific Gravity (SSD)	ASTM C-127
Absorption	ASTM C-127
Sodium Sulfate Soundness (5 cycles)	ASTM C-88 (course aggregate)
L.A. Abrasion (100 cycles)	ASTM C-131
Schmidt Rebound Hardness	ISRM Method

Test samples shall be submitted to a commercial testing lab for analysis and subsequent acceptance or rejection or the material represented by the test results, based on engineering calculations.

Rock for the infiltration and biointrusion barrier layer shall be tested for gradation in accordance with ASTMs C-117 and C-136, and other approved testing methods. Test results shall be in accordance with the Design Specification.

Rock for the infiltration and biointrusion barrier layer shall be tested a minimum of four times. The materials shall be tested initially prior to the delivery of any of the materials to the site and at the beginning of placement. Thereafter, the tests shall be performed at a minimum frequency of one test for each 10,000 cubic yards or fractions thereof produced/placed (durability tests for materials produced/gradation tests for materials placed). A final set of durability tests shall be performed near completion of production for each type material. A final gradation test shall be performed near completion of placement for each type material.

Rock for the infiltration and biointrusion barrier layer shall be material that has long-term chemical and physical durability. The material shall achieve an acceptable score for its intended use, in accordance with the rock scoring and acceptance criteria.

6.8.2 Rock Acceptance Criteria

An acceptable rock score depends on the intended use of the rock. The rock's score must meet the following criteria:

- For occasionally saturated areas, which include the top and sides of the final cover, the rock must score at least 50% or the rock is rejected. If the rock scores between 50%

and 80% the rock may be used, but a larger D50 must be provided (oversizing). If the rock score is 80% or greater, no oversizing is required.

- For frequently saturated areas, which include all channels and buried slope toes, the rock must score 65% or the rock is rejected. If the rock scores between 65% and 80%, the rock may be used, but must be oversized. If the rock score is 80% or greater, no oversizing is required.

Oversize rock as follows:

- Subtract the rock score from 80% to determine the amount of oversizing required. For example, a rock with a rating of 70% will require oversizing of 10 percent (80% - 70% = 10%).
- The D50 of the stone shall be increased by the oversizing percent. For example, a stone with a 10% oversizing factor and a D50 of 12 inches will increase to a D50 of 13.2 inches.
- The final thickness of the stone layer shall increase proportionately to the increased D50 rock size. For example, a layer thickness equals twice the D50, such as when the plans call for 24 inches of stone with a D50 of 12 inches, if the stone D50 increases to 13.2, the thickness of the layer of stone with a D50 of 13.2 should be increased to 26.4 inches.

QC Inspector shall verify that the Infiltration and Biointrusion Layer is installed in accordance with Plans and Specifications by checking and confirming:

- Gravel material gradation matches the gradation required in the specifications.
- Gravel material is placed and compacted to produce a continuous uniform thickness of at least 6 inches. As a minimum depth verification will be performed every 10,000 cu yds.
- Compaction is performed by a vibratory steel drum roller, and that the roller makes a minimum of 2 passes over the placed gravel fill.

6.9 FROST PROTECTION LAYER

Above the Infiltration and Biointrusion Layer a 3 feet thick Frost Protection Layer will be installed. This soil layer will provide protection for the low-permeability Radon Barrier Layer beneath. The Frost Protection Layer will consist of 3 ft of clean, compacted soil shall be placed directly on the gravel Infiltration and Biointrusion Layer.

6.9.1 Material

The Frost Protection Layer will be constructed of common fill. The fill shall be produced from stockpiled excavated common fill from the cell excavation, tested to determine its maximum dry density, and the moisture content modified to bring the fill to optimum for compaction in accordance with ASTM D 698.

- ASTM D 4643 - Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating
- ASTM D 698, Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort.

Note: Companion sand cone tests and oven moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

- After placement, moisture content shall be maintained or adjusted to meet criteria.
- Erosion that occurs in the fill layers shall be repaired and grades re-established.
- Freezing and desiccation of the Radon Barrier lLayer shall be prevented. If freezing or desiccation occurs, the affected soil shall be removed or reconditioned as directed.
- Areas that have been repaired shall be retested as directed. Repairs to the Radon Barrier lLayer shall be documented including location and volume of soil affected, corrective action taken, and results of retests.

6.7.5 Initial and Confirmatory Surveys

Verification of the thickness of the Radon Barrier Layer will be performed by comparing before and after surveys of the Layer by surveying or using CAES. Prior to placement of the Radon Barrier Layer, an initial survey shall be performed of the section to be capped. The initial survey will document the pre-cap geometry of the site. After the Radon Barrier Layer has been installed, a post-installation survey will be performed on the top of the Radon Barrier fill to confirm that the total fill thickness is in accordance with the plans and specifications.

6.8 INFILTRATION AND BIOINTRUSION BARRIER (GRAVEL)

Above the Radon Barrier lLayer, a 6 inch thick Infiltration and Biointrusion Layer of gravel will be placed to provide a barrier to burrowing animals, and a pathway for drainage of water that has infiltrated through upper layers of the cap. The gravel will be a sandy gravel with a gradation in accordance with project plans and specifications. Rock shall be spread to the thickness indicated on the drawings or in accordance with oversizing due to scoring criteria. Rock placement shall be guided by the Computer Aided Earthmoving System GPS grade control to ensure that the appropriate thickness has been placed at all locations. Stone with a D50 of 2 inches or lessThe Biointrustion Layer shall be compacted with a vibratory steel drum.

6.8.1 Erosion Protection Materials Testing

Rock for the infiltration and biointrusion barrier layer shall be tested by a commercial testing laboratory during production in accordance with the following:

Riprap Type A and B, and Bedding Material	Reference
Specific Gravity (SSD)	ASTM C-127
Absorption	ASTM C-127
Sodium Sulfate Soundness (5 cycles)	ASTM C-88 (course aggregate)
L.A. Abrasion (100 cycles)	ASTM C-131

Riprap Type C and D	Reference
Schmidt Rebound Hardness	ISRM Method
Splitting Tensile Strength	ISRM Method

Test results shall be submitted to MK-Environmental Servicesa commercial testing lab for analysis and subsequent acceptance or rejection or the material represented by the test results, based on engineering calculations.

Rock for the infiltration and biointrusion barrier layer shall be tested for gradation in accordance with ASTMs C-117 and C-136, and other approved testing methods. Test results shall be in accordance with the Design Specification.

Rock for the infiltration and biointrusion barrier layer shall be tested a minimum of four times. The materials shall be tested initially prior to the delivery of any of the materials to the site and at the beginning of placement. Thereafter, the tests shall be performed in place at a minimum frequency of one test for each 105,000 cubic yards or fractions thereof produced/placed (durability tests for materials produced/gradation tests for materials placed). A final set of durability tests shall be performed near completion of production for each type material. A final gradation test shall be performed near completion of placement for each type material.

Rock for the infiltration and biointrusion barrier layer shall be material that has long-term chemical and physical durability. The material shall achieve an acceptable score for its intended use, in accordance with the rock scoring and acceptance criteria.

6.8.2 Rock Acceptance Criteria

An acceptable rock score depends on the intended use of the rock. The rock's score must meet the following criteria:

- For occasionally saturated areas, which include the top and sides of the final cover, the rock must score at least 50% or the rock is rejected. If the rock scores between 50% and 80% the rock may be used, but a larger D50 must be provided (oversizing). If the rock score is 80% or greater, no oversizing is required.
- For frequently saturated areas, which include all channels and buried slope toes, the rock must score 65% or the rock is rejected. If the rock scores between 65% and 80%,

the rock may be used, but must be oversized. If the rock score is 80% or greater, no oversizing is required.

Oversize rock as follows:

- Subtract the rock score from 80% to determine the amount of oversizing required. For example, a rock with a rating of 70% will require oversizing of 10 percent (80% - 70% = 10%).
- The D50 of the stone shall be increased by the oversizing percent. For example, a stone with a 10% oversizing factor and a D50 of 12 inches will increase to a D50 of 13.2 inches.
- The final thickness of the stone layer shall increase proportionately to the increased D50 rock size. For example, a layer thickness equals twice the D50, such as when the plans call for 24 inches of stone with a D50 of 12 inches, if the stone D50 increases to 13.2, the thickness of the layer of stone with a D50 of 13.2 should be increased to 26.4 inches.

QC Inspector shall verify that the Infiltration and Biointrusion Layer is installed in accordance with Plans and Specifications by checking and confirming:

- Gravel material gradation matches the gradation required in the specifications.
- Gravel material is placed and compacted to produce a continuous uniform thickness of at least 6 inches.
- Compaction is performed by a vibratory steel drum roller, and that the roller makes a minimum of 2 passes over the placed gravel fill.

6.9 FROST PROTECTION LAYER

Above the Infiltration and Biointrusion Layer a 3 feet thick Frost Protection Layer will be installed. This soil layer will provide protection for the low-permeability Radon Barrier Layer beneath. The Frost Protection Layer will consist of 3 ft of clean, compacted soil shall be placed directly on the gravel Infiltration and Biointrusion Layer.

6.9.1 Material

The Frost Protection Layer will be constructed of common fill. The fill shall be produced from stockpiled excavated common fillcome from the cell excavation, tested to determine its maximum dry density, and the moisture content modified to bring the fill to optimum for compaction in accordance with ASTM D 698.

6.9.2 Ground Preparation

LIFTS TESTED: UBA11101004-00,UWH06101019-00,UWI12101020-00,UWN19100929-00, and UWP01101019-00,

LIFTS APPROVED: UBA11101004-00,UWH06101019-00 and UWN19100929-00

EXPLANATIONS:

RRM: Today there was a total of 2 lifts approved. A total of 2,783 yds³ of RRM approved today. The daily moisture test was taken on UWI12101020-00 that passed with satisfactory results. QC surveyed a control point and verified that the GPS was in tolerance for the dayshift.

Spoils Wedge:

Today the 68th lift was placed to 95%.

Frost Protection Layer:

Today the first lift of Frost Protection layer was started today but not finished.

Bio-Intrusion: UBA11101004-00 was approved today. Approximately 5,588 yds³ of material was approved. A Buyoff survey was preformed along with a visual inspection, both were satisfactory. This lift area was approved for Frost Protection Layer placement.

Comments: QC verified that the final surface of Radon Barrier was satisfactory prior to placement of Infiltration and Bio-Intrusion material. QC verified that the rock used was the correct material source. QC verified that the rock layer was spread to a near uniform thickness of ≥ 6" with satisfactory results. QC verified that the material had a even blend. Johansen and Tuttle personnel verified that a mimimum of two passes were performed with a smooth-drum roller on the entire lift area during compaction efforts. This lift is approximately 251,478 ft² with approximately ~~2588~~ 9657 yds³ of Bio-Intrussion approved on it. Operations began placing this lift on 10-4-10 but did not get it approved until 10-20-10. this is the reason for the difference between the lift ID and approval date. QC verified that samples collected for Sieve Analysis were collected in accordance with the current version of ASTM D75 and project specifications.. Sample's were then transported to lab for testing. See attached. 10-25-10 BB

LIFTS TESTED: UBA01101004-00

LIFTS APPROVED: UBA01101004-00

EXPLANATIONS:

RRM:

There were no lifts approved in the cell today. Due to weather all material was stockpiled. QC performed a visual inspection of the lift areas in the cell and found standing water on all lifts. Operations removed all standing water and let dry.

Bio-Intrusion: UBA01101004-00 was approved today. Approximately 2,820 yds^3 of material was approved. A Buyoff survey was preformed along with a visual inspection. both were satisfactory. This lift area was approved for Frost Protection Layer placement.

QA/QC Representative Kyler Edgehouse

LIFT ID: UBA01101004-00 NW CORNER: 6795932 N 2122072 E

THICKNESS: UNC: N/A COM: 6" ELEV: N/A Debris Insp. By: N/A Date: N/A Time: N/A

Comments: QC verified that the final surface of Radon Barrier was satisfactory prior to placement of Infiltration and Bio-Intrusion material. QC verified that the rock used was the correct material source. QC verified that the rock layer was spread to a near uniform thickness of ≥ 6" with satisfactory results. QC verified that the material had a even blend. Johansen and Tuttle personnel verified that a mimimum of two passes were performed with a smooth-drum roller over the entire lift area during compaction efforts. This lift is approximately 126,921 ft² with approximately 2,820 yds³ of Bio-Intrussion approved on it. Operations began placing this lift on 10-4-10 but did not get it approved until 10-25-10. this is the reason for the difference between the lift ID and approval date. QC verified that samples collected for Sieve Analysis were in accordance with the current version of ASTM D75. and project specification.
Samples were then transported to lab for testing purposes. 10-25-10 BB

REMARKS:

I certify that this test was performed in accordance with the current version(s) of ASTM C117 & C136/AASHTO T11 & T27

P.O. BOX 220427 CENTERFIELD, UT. 84622 (435) 528-5711 FAX (435) 528-5710

55
PAGE 4 OF 4
10.28.10 BB

and 80% the rock may be used, but a larger D50 must be provided (oversizing). If the rock score is 80% or greater, no oversizing is required.

- For frequently saturated areas, which include all channels and buried slope toes, the rock must score 65% or the rock is rejected. If the rock scores between 65% and 80%, the rock may be used, but must be oversized. If the rock score is 80% or greater, no oversizing is required.

Oversize rock as follows:

- Subtract the rock score from 80% to determine the amount of oversizing required. For example, a rock with a rating of 70% will require oversizing of 10 percent (80% - 70% = 10%).
- The D50 of the stone shall be increased by the oversizing percent. For example, a stone with a 10% oversizing factor and a D50 of 12 inches will increase to a D50 of 13.2 inches.
- The final thickness of the stone layer shall increase proportionately to the increased D50 rock size. For example, a layer thickness equals twice the D50, such as when the plans call for 24 inches of stone with a D50 of 12 inches, if the stone D50 increases to 13.2, the thickness of the layer of stone with a D50 of 13.2 should be increased to 26.4 inches.

QC Inspector shall verify that the Infiltration and Biointrusion Layer is installed in accordance with Plans and Specifications by checking and confirming:

- Gravel material gradation matches the gradation required in the specifications.
- Gravel material is placed and compacted to produce a continuous uniform thickness of at least 6 inches. As a minimum depth verification will be performed every 10,000 cu yds.
- Compaction is performed by a vibratory steel drum roller, and that the roller makes a minimum of 2 passes over the placed gravel fill.

6.9 FROST PROTECTION LAYER

Above the Infiltration and Biointrusion Layer a 3 feet thick Frost Protection Layer will be installed. This soil layer will provide protection for the low-permeability Radon Barrier Layer beneath. The Frost Protection Layer will consist of 3 ft of clean, compacted soil shall be placed directly on the gravel Infiltration and Biointrusion Layer.

6.9.1 Material

The Frost Protection Layer will be constructed of common fill. The fill shall be produced from stockpiled excavated common fill from the cell excavation, tested to determine its maximum dry density, and the moisture content modified to bring the fill to optimum for compaction in accordance with ASTM D 698.

6.9.2 Ground Preparation

The Frost Protection Layer will be placed directly on the gravel Infiltration and Biointrusion Layer.

6.9.3 Lift Placement and Thickness

The Frost Protection Layer shall be constructed of fill materials placed in continuous lifts of uniform thickness. The method of dumping and spreading of the frost protection layer shall result in loose lifts not to exceed 12". Scarification shall be performed on all areas of the upper surface of each underlying soil layer prior to placement of the next lift. Scarification shall be accomplished with approved equipment. The final lift of soil shall not be scarified. The final lift shall be smooth rolled with at least 3 passes of the approved smooth steel wheeled roller weighing a minimum of 20,000 pounds.

6.9.4 Inspection and Testing

The Quality Control (QC) Inspector shall visually inspect the material preparation, ground preparation, and fill placement operations. The QC Inspector shall perform in-place density tests with companion moisture tests (optimum moisture plus or minus 5%) to verify that the CAES compaction results in a density of at least 90% of the material's maximum dry density according to ASTM D698 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort. The QC Inspector shall verify that the frost protection layer is constructed in accordance with Plans and Specifications by checking and confirming:

- Frost Protection Layer soil is common fill;
- Tests have been performed on the common fill to determine its maximum dry density and optimum moisture content per ASTM D 698.
- Fill material is properly moisture conditioned to near optimum moisture;
- Fill material is placed in continuous and approximately horizontal lifts. The method of dumping and spreading the frost protection layer shall result in loose lifts of nearly uniform thickness, not to exceed 12".
- Compaction is properly performed.
- Compaction – Fill shall be compacted with a minimum 45,000 lb static weight compactor. The compactor shall be a footed roller capable of kneading compaction, with feet a minimum of 6 inches in length. The compactor shall be equipped with a Computer Aided Earthmoving System and soil placement and compaction shall be controlled by the CAES.

- Compaction by CAES – the QC inspector shall monitor CAES compaction by visually inspecting the process and reviewing the computer records for each layer of soil placed.
- Compaction Verification Tests – Perform in-place density and moisture content tests on compacted fill material in accordance with the following requirements:
  - Verification tests of in-place density shall be performed on initial layers of soil placed, and on any layers in which the CAES indicates that problems occurred obtaining compaction.
  - When verification in-place density and moisture content tests are performed on a soil layer, a minimum of one test shall be preformed a minimum of 2 tests per 5,000 cubic yards of fill material placed.
  - Compaction and moisture content tests shall be performed in accordance with the following methods:
    - ASTM D 1556 – Density and Unit Weight of Soil in Place by the Sand-Cone Method
    - ASTM D 2216 – Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
    - ASTM D 2922 - Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
    - ASTM D 6938 - In-Place Density and Water content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)
    - ASTM D 4643 - Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating

  Note: Companion sand cone tests and oven moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

6.9.5 Initial and Confirmatory Surveys

Verification of the thickness of the Frost Protection Layer will be performed by comparing before and after surveys of the Layer. Prior to placement of the Frost protection Layer, an initial survey shall be performed of the section to be capped. The initial survey will document the geometry of the top of the Infiltration and Biointrusion Layer. After the Frost Protection Layer has been installed, a post-installation survey will be performed on the top of the Frost Protection Layer to confirm that the total fill thickness is in accordance with the plans and specifications.

6.10 ROCK ARMORING

The final cap layer is Rock Armoring, placed over the Frost Protection Layer. The Rock Armoring will vary in size and thickness at different locations on the cap, and shall be installed in accordance with the project plans and specifications Rock shall be spread to the thickness indicated on the drawings or in accordance with oversizing due to scoring criteria. Rock placement shall be guided by the Computer Aided Earthmoving System to

the rock may be used, but must be oversized. If the rock score is 80% or greater, no oversizing is required.

Oversize rock as follows:

- Subtract the rock score from 80% to determine the amount of oversizing required. For example, a rock with a rating of 70% will require oversizing of 10 percent (80% - 70% = 10%).
- The D50 of the stone shall be increased by the oversizing percent. For example, a stone with a 10% oversizing factor and a D50 of 12 inches will increase to a D50 of 13.2 inches.
- The final thickness of the stone layer shall increase proportionately to the increased D50 rock size. For example, a layer thickness equals twice the D50, such as when the plans call for 24 inches of stone with a D50 of 12 inches, if the stone D50 increases to 13.2, the thickness of the layer of stone with a D50 of 13.2 should be increased to 26.4 inches.

QC Inspector shall verify that the Infiltration and Biointrusion Layer is installed in accordance with Plans and Specifications by checking and confirming:

- Gravel material gradation matches the gradation required in the specifications.
- Gravel material is placed and compacted to produce a continuous uniform thickness of at least 6 inches.
- Compaction is performed by a vibratory steel drum roller, and that the roller makes a minimum of 2 passes over the placed gravel fill.

6.9 FROST PROTECTION LAYER

Above the Infiltration and Biointrusion Layer a 3 feet thick Frost Protection Layer will be installed. This soil layer will provide protection for the low-permeability Radon Barrier Layer beneath. The Frost Protection Layer will consist of 3 ft of clean, compacted soil shall be placed directly on the gravel Infiltration and Biointrusion Layer.

6.9.1 Material

The Frost Protection Layer will be constructed of common fill. The fill shall be produced from stockpiled excavated common fillcome from the cell excavation, tested to determine its maximum dry density, and the moisture content modified to bring the fill to optimum for compaction in accordance with ASTM D 698.

6.9.2 Ground Preparation

The Frost Protection Layer will be placed directly on the gravel Infiltration and Biointrusion Layer.

6.9.3 Lift Placement and Thickness

The Frost Protection Layer shall be constructed of fill materials placed in continuous lifts of uniform thickness. The method of dumping and spreading of the frost protection layer shall result in loose lifts average thickness not to exceed 12". Scarification shall be performed on all areas of the upper surface of each underlying soil layer prior to placement of the next lift. Scarification shall be accomplished with approved equipment. The final lift of soil shall not be scarified. The final lift shall be smooth rolled with at least 3 passes of the approved smooth steel wheeled roller weighing a minimum of 20,000 pounds.

6.9.4 Inspection and Testing

The Quality Control (QC) Inspector shall visually inspect the material preparation, ground preparation, and fill placement operations. The QC Inspector shall perform in-place density tests with companion moisture tests (optimum moisture plus or minus 5%) and at least 90% of the material's maximum dry density according to ASTM D698 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort on the initial layer. The QC Inspector shall verify that the frost protection layer is constructed in accordance with Plans and Specifications by checking and confirming:

- Frost Protection Layer soil is common fill;
- Tests have been performed on the common fill to determine its maximum dry density and optimum moisture content per ASTM D 698.
- Fill material is properly moisture conditioned to near optimum moisture;
- Fill material is placed in continuous and approximately horizontal lifts. The method of dumping and spreading the frost protection layer shall result in loose lifts of nearly uniform thickness, average thickness not to exceed 12".
- Compaction is properly performed.
- Compaction – Frost Protection fill will be compacted with rubber tired or footed roller compaction equipment.Fill shall be compacted with a minimum 45,000 lb static weight compactor. The compactor shall be a footed roller capable of kneading compaction, with feet a minimum of 6 inches in length. The compactor shall be equipped with a Computer Aided Earthmoving System and soil placement and compaction shall be controlled by the CAES.
- Compaction by CAES – the QC inspector shall monitor CAES compaction by visually inspecting the process and reviewing the computer records for each layer of soil placed.

- Verification tests of in-place density shall be performed on initial layers of soil placed, and on any layers in which the CAES indicates that problems occurred obtaining compaction.

Note: Companion sand cone tests and moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

If CAES is not used the following testing requirements shall be followed:

- Compaction Verification Tests – Perform in-place density and moisture content tests on compacted fill material in accordance with the following requirements:
  - Verification tests of in-place density shall be performed on initial layers of soil placed, and on any layers in which the CAES indicates that problems occurred obtaining compaction.
  - When verification in-place density and moisture content tests are performed on a soil layer, a minimum of one test shall be preformed a minimum of 2 tests per 5,000 cubic yards or 135,000 square feet of fill material placed.
  - Frost Protection Layer soil is common fill;
  - Tests have been performed on the common fill to determine its maximum dry density and optimum moisture content per ASTM D 698.
  - Fill material is properly moisture conditioned to near optimum moisture;
  - Fill material is placed in continuous and approximately horizontal lifts. The method of dumping and spreading the frost protection layer shall result in loose lifts of nearly uniform thickness, average thickness not to exceed 12".
  - Compaction is properly performed.
  - Compaction – Frost Protection fill will be compacted with rubber tired or footed roller compaction equipment.
  - Compaction and moisture content tests shall be performed in accordance with the following methods:
    - ASTM D 1556 – Density and Unit Weight of Soil in Place by the Sand-Cone Method
    - ASTM D 698, Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort.
    - ASTM D 2216 – Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
    - ASTM D 2922 - Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
    - ASTM D 6938 - In-Place Density and Water content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)
    - ASTM D 4643 - Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating

Note: Companion sand cone tests and oven moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

6.9.5 Initial and Confirmatory Surveys

Verification of the thickness of the Frost Protection Layer will be performed by comparing before and after surveys of the Layer. Prior to placement of the Frost protection Layer, an initial survey shall be performed of the section to be capped. The initial survey will document the geometry of the top of the Infiltration and Biointrusion Layer. After the Frost Protection Layer has been installed, a post-installation survey will be performed on the top of the Frost Protection Layer to confirm that the total fill thickness is in accordance with the plans and specifications.

6.10 ROCK ARMORING

The final cap layer is Rock Armoring, placed over the Frost Protection Layer. The Rock Armoring will vary in size and thickness at different locations on the cap, and shall be installed in accordance with the project plans and specifications Rock shall be spread to the thickness indicated on the drawings or in accordance with oversizing due to scoring criteria. Rock placement shall be guided by the a Computer Aided Earthmoving SystemGPS system to ensure that the appropriate thickness has been placed at all locations. Stone with a D50 of 2 inches or less shall be compacted with a vibratory steel drum.

6.10.1 Erosion Protection Materials Testing

Rock for the final cover layers shall be tested by a commercial testing laboratory during production in accordance with the following:

Rock Armoring	Reference
Specific Gravity (SSD)	ASTM C-127
Absorption	ASTM C-127
Sodium Sulfate Soundness (5 cycles)	ASTM C-88 (course aggregate)
L.A. Abrasion (100 cycles)	ASTM C-131
Schmidt Rebound Hardness	ISRM Method

EXPLANATIONS:

RRM:

There were no lifts approved in the cell toady. The daily moisture test was taken on UWI12101021-00 that passed with satisfactory sults. QC surveyed a control opoint and verified that the GPS was in tolerance for dayshift.

Spoils Wedge:

N/A

Frost Protection Layer:

UFA11101020-00 was tested and approved today with a total of 3,541 yds³ of Frost Protection.

THE SANDCONE #2 WAS CALIBRATED TODAY ALONG WITH THE SAND FOR TESTING PURPOSES KE 10-21-10

QA/QC Representative Kyler Edgehouse

ENERGYSOLUTIONS

Density Sand Calibration

Worksheet

Calibration Date: 10/21/10

Previous Calibration: 2/1/10

Cone and Plate Number: 2

Electronic Balance Used: 14714971
(Serial Number)

	A	B	C
1. Weight of sand, bottle and cone before filling cone and plate, g.	7051.8	5245.1	3433.6
2. Weight of sand, bottle and cone after filling cone and plate, g.	5245.1	3433.6	1622.6
3. Weight of sand to fill cone and plate, g.	1806.7	1811.5	1811.0
4. Weight of sand, bottle and cone before filling cone, plate and 0.075 ft^3 container, g.	6860.9	6692.2	6852.8
5. Weight of sand, bottle and cone after filling cone, plate and 0.075 ft^3 container, g.	1730.5	1551.4	1718.4
6. Weight of sand to fill cone, plate and 0.075 ft^3, g.	5130.4	5140.8	5134.4
7. Weight of sand to fill cone and plate (Line 11), g.	1809.7	1809.7	1809.7
8. Weight of sand to fill 0.075 ft^3 container, g.	3320.7	3331.1	3324.7

9. Average weight of sand to fill 0.075 ft^3 container = (Line 8, A+B+C)/3, g. = 3325.5 g.

10. Loose density of sand = (Line 9)/(0.075 ft^3)(453.6 g/lb), pcf. = **97.8** pcf.

11. Average weight of sand to fill cone and plate = (Line 3, A+B+C)/3, g. = **1809.7** g.

Comments: Equipment was inspected for damage with none found.

Performed by: Mitch Hogan / [signature]
(Printed Name/Signature)

Date: 10/21/2010

MH (Initial) The sand calibration is performed in accordance with the appropriate sections of ASTM D 1556 and found to be satisfactory.

Comments:On 10/21/2010 Johansen and Tuttle personnel performed two random Troxler tests on this lift which were found to be satisfactory. Two companion moisture samples were pulled from the test locations which were found to be satisfactory as well. Nielsons completed compaction efforts of this lift at approximately 17:00. This is the first layer of Frost Protection in this area. QC verified that the Bio-Intrusion lift below had a smooth drum surface prior to placement. Compaction was verified using CAES and nuclear density gauge.

6,196 NM

Comments: This lift is 239,001 ft². There is approximatley ~~7,082~~ yds³ of frost protection on this lift.
On 10/21/2010 at 14:30 Johansen & Tuttle (J & T) personnel verified that the underlying lift area of Frost Protection material was scarified and that moisture content levels were satisfactory prior to placement of the new lift area. Nielsons then began placement and processing of this lift. Moisture conditioning efforts were found to be satisfactory.
On 10/26/2010 at 07:30 J & T personnel visually inspected the Frost Protection Layer and found that there was frost on the lift area and Nielsons was notified. J & T personnel pulled two moisture samples from the underlying lift area verifiying that the moisture was satisfactory. Moisture content was found to be within tolerance (see attached J & T moisture content forms) however, Nielsons decided to postpone placement of new material until after lunch. At 12:30 J & T personnel verified that the underlying lift area was scarified prior to placement of new material and all frost was removed. Nielsons then continued placement and processing of this lift. Moisture conditioning efforts were found to be satisfactory during placement and processing of this lift material on the lift area.
Compaction was verified using CAES 9 NM nuclear density testing.

ENERGY*SOLUTIONS*

CONTINUATION SHEET

EXPLANATIONS:

On 10/27/2010 at 07:30 J & T personnel verified that there was not any frost or frozen material on this lift area and that it was scarified prior to placement of new material. Nielsons then continued placement and processing of this lift. Nielsons finished placement of this lift at approximately 11:30 and then began the process of verifying elevation. Elevation was verified at 14:00 and Nielsons then began compaction efforts. J & T personnel also pulled a moisture sample,# 1, from the east side of the lift which passed with satisfactory results. At 16:30 J & T personnel performed a density/moisture test along with a companion moisture sample, # 2, on the west side of the lift. Both passed with satisfactory results. In correlation with the CAES system the moisture density test was performed with satisfactory results.

On 10/28/2010 at 07:45 Nielsons continued compaction efforts of this lift and finished compaction at 09:15.

Moisture Density _____ *(lbs/ft³)* Moisture Fraction _____ *(%)*

N A

ASTM D1556 (DENSITY DETERMINATION)

Testing Apparatus _____ Calibrated Vol. *(lbs/ft³)* _____

Bulk Density of sand (ρ_1) _____ *g/cm³* _____ *lbs/ft³*

Mass of Sand to Fill Cone & Plate (M_2) _____ g

Mass of bottle & cone **before** filling cone, plate & hole		g
Mass of bottle & cone **after** filling cone, plate & hole		g
Mass of sand to fill cone, plate, & hole (M_1)		g
Mass of sand to fill hole		g
Mass of wet soil & container		g
Mass of container		g
Mass of wet soil (M_3)		g

N A

Test Hole Volume

$V = (M_1 - M_2) / \rho_1$ _____ cm^3

Dry Mass of soil

$M_4 = 100\ M_3 / (w + 100)$ _____ g

Wet Denisty

$\rho_m = (M_3 / V) \times 62.43$ _____ lbs/ft^3

Dry Denisty

$\rho_d = M_4 / V$ _____ g/cm^3

Dry Unit Weight

$\gamma_d = \rho_d \times 62.43$ _____ lbs/ft^3

MOISTURE DETERMINATION

ASTM D4643

Container ID 1263

Mass of container & wet specimen (M_{cms})	1553.0	g
Mass of container & dry specimen (M_{cds})	1514.8	g
Mass of water (M_w) $M_w = M_{cms} - M_{cds}$	38.2	g
Mass of container (M_c)	1263.0	g
Mass of dry specimen (M_s) $M_s = M_{cds} - M_c$	251.8	g
Moisture content (w) $w = (M_w / M_s) \times 100$	15.2	%

Soil Description: Grey in color consists of mostly fines.

Proctor ID: Frost Protection # 2

Standard Proctor (ASTM D698)

Maximum Dry Density ($\gamma_d max$) 118.6 (lbs/ft³)

Optimum Moisture (w_{opt}) 11.9 (%)

Required Moisture: 6.9 % to 16.9 %

Required Percent Compaction: 90.0 (%)

Dry Density $(\rho_d) = (100 \times \rho_m)/(100 + w)$

$\rho d = (100 \times$ ##### $) / (100 +$ 15.2 $=$ 0.0 lbs/ft^3

Note: Wet Density from ASTM D 1556 (ρ_m) takes presidence over ASTM D 6938 (ρ_m)

N A

Percent Compaction = ρ_d / $\gamma_d max$ x 100

0.0 / 118.6 x 100 = 0.0 %

Comments:

Microwave oven power setting on HIGH. Initial time setting of 3 minutes and subsequent incremental drying periods of 1 minute until a change of 0.1 % or less of the initial wet mass of the soil.

TEST RESULTS:

X Pass Date: 10/27/10

_____ Failed Moisture

_____ Failed Compaction Time: 14:30

Comments: On **10/28/2010** at 08:15 Nielsons began placement and processing of Frost Protection material. Johansen & Tuttle personnel observed this process and verified that moisture conditioning efforts were maintained during the placement and processing of this material. Nielsons finished placement of this lift at 16:00 at which time they began the process of verifying elevation. Elevation was verified at 17:00.

On **11/01/2010** at 07:45 Nielsons began compaction efforts on this lift. At 08:30 J & T personnel performed a Troxler test and pulled a moisture sample from the lift area. Both were found to be satisfactory. At 10:45 Nielsons completed compaction efforts on this lift at which time J & T personnel performed a second Troxler test and pulled a second moisture sample. Both tests were found to be satisfactory. At approximatley 1440 this lift was approved.

This lift is approximately 123,915 ft² with approximately 3,213 yds³ if Frost Protection approved on it.

Compaction was verified using 11-9-10 BB bot the CAES system & nuclear density testing.

QC verified that Bio layer was approved prior to any placement of frost protection. 11-9-10 BB

Bulk Density of sand (ρ_1) _____ *g/cm^3* _____ *lbs/ft^3*

Mass of Sand to Fill Cone & Plate (M_2) _____ g

Mass of bottle & cone **before** filling cone, plate & hole		g
Mass of bottle & cone **after** filling cone, plate & hole		g
Mass of sand to fill cone, plate, & hole (M_1)		g
Mass of sand to fill hole		g
Mass of wet soil & container	N	g
Mass of container	A	g
Mass of wet soil (M_3)		g

Test Hole Volume

$V = (M_1 - M_2) / \rho_1$ _____ *cm^3*

Dry Mass of soil

$M_4 = 100\ M_3 / (w + 100)$ _____ g

Wet Denisty

$\rho_m = (M_3 / V) \times 62.43$ _____ *lbs/ft^3*

Dry Denisty

$\rho_d = M_4 / V$ _____ *g/cm^3*

Dry Unit Weight

$\gamma_d = \rho_d \times 62.43$ _____ *lbs/ft^3*

MOISTURE DETERMINATION

ASTM D4643

Container ID 1263

Mass of container & wet specimen (M_{cms})	1523.7	g
Mass of container & dry specimen (M_{cds})	1499.5	g
Mass of water (M_w) $M_w = M_{cms} - M_{cds}$	24.2	g
Mass of container (M_c)	1263.0	g
Mass of dry specimen (M_s) $M_s = M_{cds} - M_c$	236.5	g
Moisture content (w) $w = (M_w / M_s) \times 100$	10.2	%

Soil Description: Grey in color consists of mostly fines.

Proctor ID: Frost Protection # 2

Standard Proctor (ASTM D698)

Dry Density $(\rho_d) = (100 \times \rho_m)/(100 + w)$

$\rho d = (100 \times 118.5) / (100 + 10.2 = 107.5$ *lbs/ft^3*

Note: Wet Density from ASTM D 1556 (ρ_m) takes presidence over ASTM D 6938 (ρ_m)

Maximum Dry Density ($\gamma_d max$) 118.6 (lbs/ft^3)

Optimum Moisture (w_{opt}) 11.9 (%)

Required Moisture: 6.9 % to 16.9 %

Percent Compaction = ρ_d / $\gamma_d max$ x 100

107.5 / 118.6 x 100 = 90.6 %

Required Percent Compaction: 90.0 (%)

Comments:

Microwave oven power setting on HIGH. Initial time setting of 3 minutes and subsequent incremental drying periods of 1 minute until a change of 0.1 % or less of the initial wet mass of the soil.

TEST RESULTS:

X Pass Date: 11/1/10

_____ Failed Moisture

_____ Failed Compaction Time: 09:30

Re: Uranium Mill Tailings Remedial Action Project (UMTRA)
Disposal Cell near Crescent Junction

Dear Mr. Whitman:

On Friday, October 12, 2010, at the request of Mark Greenhalgh of Nielson Construction, a visit was made to the site of the Moab Uranium Mill Tailings Remedial Action Project (UMTRA) Disposal Cell near Crescent Junction, Utah, operated by Energy Solutions. The purpose of the visit was to evaluate the fill material being used as part of the cap layer which overlies the uranium tailing. We were asked to determine if the material being used contained less than 5 percent sandstone fragments. It is our understanding that this layer of the cap is referred to as the Biointrusion Infiltration Layer. At the time of this visit, the layer appeared to be approximately 6 to 8 inches thick. The material consisted predominately of cobble sized angular basalt with some rounded quartzite with some finer gravels. It is our understanding that this layer will be covered by additional layers of other materials.

The evaluation was conducted by randomly selecting an area 100 feet by 100 feet. The area was then systematically traversed while visually noting the number and size of the sandstone fragments within the given area. It should be noted that, in addition to the softer sandstone fragments, some relatively soft red volcanic scoria was also observed. These fragments appear to breakdown just as readily as the sandstone and have been included with the percent of sandstone. Most sandstone fragments ranged from 0.15 to 0.5 foot. Our calculated visual percentage within this area was less than 1% sandstone fragments. It is our opinion that, based on this visual inspection, this material meets the specification of containing less than 5% sandstone fragments.

If there are any questions regarding the information contained herein, please call.

Sincerely,

RB&G ENGINEERING, INC.

Michael N. Hansen

CENTRAL UTAH TESTING & INSPECTION

SIEVE ANALYSIS: AGGREGATES (ASTM C136-95 AASHTO T27-93)
MATERIALS FINER THAN No. 200 SCREEN (ASTM C117-95 AASHTO T11-91)

CLIENT: NIELSON CONSTRUCTION JOB#: 1357 DATE: 11/04/09

PROJECT: MISC. QC

SAMPLE LOCATION: FREMONT PIT - OFF BELT

MATERIAL TYPE: RIPRAP

TESTED BY: JC SAMPLED BY: CLIENT LAB #: 5159

Sieve Size	Weight Retained	Percent Retained	Percent Passing	Band/Target
4 in. (100mm)		0.0	100	100
3 in. (75mm)	16522.8	29.6	70	
2 in. (50mm)	11845.5	21.2	49	40 - 50
1 1/2 in. (37.5mm)	10787.4	19.3	30	20 - 30
1 in. (25mm)	5876.2	10.5	19	10 - 20
3/4 in. (19mm)	3618.9	6.5	13	
1/2 in. (12.5mm)	3344.9	6.0	7	5 - 25
3/8 in. (9.5mm)	277.6	1.2	6	
# 4 (4.75mm)	334.2	1.5	4	0 - 5
# 8 (2.36mm)	149.8	0.7	4	0 - 5
# 16 (1.18mm)	125.4	0.5	3	0 - 5
# 30 (600um)	101.4	0.4	3	
# 50 (300um)	98.7	0.4	2	
#100 (150um)	97.4	0.4	2	
#200 (75um)	88.5	0.4	1.4	0 - 5
-#200 (-75um)	12.7			

Total Sample Aggregate Weight: 55898.7

- 1/2" Aggregate Weight: 1597.8 - 1/2" After Wash Weight: 1285.7

REMARKS:

I certify that this test was performed in accordance with ASTM C117-95 & C136-95/AASHTO T11-91 & T27-93. John Christensen

P.O. BOX 427 CENTERFIELD, UT. 84622 (435) 528-5711 FAX (435) 528-5710

- Compaction by CAES – the QC inspector shall monitor CAES compaction by visually inspecting the process and reviewing the computer records for each layer of soil placed.
- Compaction Verification Tests – Perform in-place density and moisture content tests on compacted fill material in accordance with the following requirements:
    - Verification tests of in-place density shall be performed on initial layers of soil placed, and on any layers in which the CAES indicates that problems occurred obtaining compaction.
    - When verification in-place density and moisture content tests are performed on a soil layer, a minimum of one test shall be preformed a minimum of 2 tests per 5,000 cubic yards of fill material placed.
    - Compaction and moisture content tests shall be performed in accordance with the following methods:
        - ASTM D 1556 – Density and Unit Weight of Soil in Place by the Sand-Cone Method
        - ASTM D 2216 – Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
        - ASTM D 2922 - Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
        - ASTM D 6938 - In-Place Density and Water content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)
        - ASTM D 4643 - Determination of Water (Moisture) Content of Soil by the Microwave Oven Heating

    Note: Companion sand cone tests and oven moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

6.9.5 Initial and Confirmatory Surveys

Verification of the thickness of the Frost Protection Layer will be performed by comparing before and after surveys of the Layer. Prior to placement of the Frost protection Layer, an initial survey shall be performed of the section to be capped. The initial survey will document the geometry of the top of the Infiltration and Biointrusion Layer. After the Frost Protection Layer has been installed, a post-installation survey will be performed on the top of the Frost Protection Layer to confirm that the total fill thickness is in accordance with the plans and specifications.

6.10 ROCK ARMORING

The final cap layer is Rock Armoring, placed over the Frost Protection Layer. The Rock Armoring will vary in size and thickness at different locations on the cap, and shall be installed in accordance with the project plans and specifications Rock shall be spread to the thickness indicated on the drawings or in accordance with oversizing due to scoring criteria. Rock placement shall be guided by the Computer Aided Earthmoving System to

ensure that the appropriate thickness has been placed at all locations. Stone with a D50 of 2 inches or less shall be compacted with a vibratory steel drum.

6.10.1 Erosion Protection Materials Testing

Rock for the final cover layers shall be tested by a commercial testing laboratory during production in accordance with the following:

Rock Armoring	Reference
Specific Gravity (SSD)	ASTM C-127
Absorption	ASTM C-127
Sodium Sulfate Soundness (5 cycles)	ASTM C-88 (course aggregate)
L.A. Abrasion (100 cycles)	ASTM C-131
Schmidt Rebound Hardness	ISRM Method

Test samples shall be submitted to a commercial testing lab for analysis and subsequent acceptance or rejection or the material represented by the test results, based on engineering calculations.

Rock for the final cover layers shall be tested for gradation in accordance with ASTMs C-117 and C-136, and other approved testing methods. Test results shall be in accordance with the Design Specification.

Rock for the final cover layers shall be tested a minimum of four times. The materials shall be tested initially prior to the delivery of any of the materials to the site and at the beginning of placement. Thereafter, the tests shall be performed prior to placement at a minimum frequency of one test for each 10,000 cubic yards or fractions thereof produced/placed (durability tests for materials produced/gradation tests for materials placed). Where the total volume is less than 30,000 cubic yards, the test frequency shall be one test for each type material when approximately one-third and two thirds of the total volume of material has been produced/placed. A final set of durability tests shall be performed near completion of production for each type material. A final gradation test shall be performed near completion of placement for each type material.

Rock for the final cover layers shall be rock material that has long-term chemical and physical durability. Rock for final cover layers shall achieve an acceptable score for its intended use, in accordance with the rock scoring and acceptance criteria.

At the quarry operations periodically a geologist will inspect the stockpiles to ensure the percent of other than grey basalt does not exceed 10% for rock for the final cover layers.

6.10.2 Rock Acceptance Criteria

An acceptable rock score depends on the intended use of the rock. The rock's score must meet the following criteria:

- For occasionally saturated areas, which include the top and sides of the final cover, the rock must score at least 50% or the rock is rejected. If the rock scores between 50% and 80% the rock may be used, but a larger D50 must be provided (oversizing). If the rock score is 80% or greater, no oversizing is required.
- For frequently saturated areas, which include all channels and buried slope toes, the rock must score 65% or the rock is rejected. If the rock scores between 65% and 80%, the rock may be used, but must be oversized. If the rock score is 80% or greater, no oversizing is required.

Oversize rock as follows:

- Subtract the rock score from 80% to determine the amount of oversizing required. For example, a rock with a rating of 70% will require oversizing of 10 percent (80% - 70% = 10%).
- The D50 of the stone shall be increased by the oversizing percent. For example, a stone with a 10% oversizing factor and a D50 of 12 inches will increase to a D50 of 13.2 inches.
- The final thickness of the stone layer shall increase proportionately to the increased D50 rock size. For example, a layer thickness equals twice the D50, such as when the plans call for 24 inches of stone with a D50 of 12 inches, if the stone D50 increases to 13.2, the thickness of the layer of stone with a D50 of 13.2 should be increased to 26.4 inches.

QC Inspector shall verify that the Rock Armoring is installed in accordance with Plans and Specifications by checking and confirming:

- Stone gradations match the gradation required in the specifications and based on visual verification, fines (material < 200 mesh) are dispersed evenly throughout the rock.
- Stone material is placed to produce the thickness required by the plans for each area. As a minimum, depth verification will be performed every 10,000 cu yds.

Note: Companion sand cone tests and oven moisture tests must be performed along with nuclear tests until a sufficient number have been performed to demonstrate a clear correlation.

6.9.5 Initial and Confirmatory Surveys

Verification of the thickness of the Frost Protection Layer will be performed by comparing before and after surveys of the Layer.
