

Toshiba's U.S. ABWR Design Certification Renewal

I&C Changes

January 31, 2011

Currently Certified I&C Design

- The certified U.S. ABWR Design Control Document (DCD) Instrumentation and Control (I&C) design includes:
 - Common essential multiplexer system (EMS) to act as data highway
 - Safety System Logic and Control (SSLC):
 - Includes Reactor Protection System (RPS) and Engineered Safety Features (ESF) actuation
 - Implemented in a single, digital microprocessor-based platform

Toshiba Renewal I&C Changes

- Toshiba's Renewal incorporates the following STP 3&4 COLA I&C design changes:
 - Updated I&C architecture:
 - Replaced obsolete Fiber Distributed Data Interface (FDDI) multiplexer communication technology with current data communication technology
 - SSLC design is separated into Reactor Trip and Isolation System (RTIS) and ESF Logic and Control System (ELCS)
 - RTIS/Neutron Monitoring System (NMS) and ELCS are implemented on diverse platforms:
 - RTIS and NMS use configurable logic device-based platforms
 - ELCS uses microprocessor-based platform
 - Simplifies and reduces complexity
 - Reduces likelihood and extent of common cause failure

Toshiba Renewal I&C Changes (continued)

- Toshiba's Renewal includes STP 3&4 COLA Standard Departure STD DEP T1 3.4-1
 - Elimination of obsolete data communication technology
 - Elimination of unnecessary inadvertent ESF actuation logic
 - Clarification of digital control nomenclature and systems
 - Final selection of platforms
 - Testing and surveillance changes
- Toshiba's Renewal includes all other I&C-related departures in the STP 3&4 COLA

Toshiba Renewal I&C Changes (continued)

- STP 3&4 COLA Supplemental Sections
 - COLA Tier 2 Section 7.9S on Data Communication Systems is provided as Section 7.9 in Toshiba's DCD
 - Supplemental sections on final platforms are not included in Toshiba's DCD:
 - Tier 2 Section 7.1S
 - Recently proposed Tier 2 Section 7DS
