QUESTIONS for Structural Engineering Branch 2 (ESBWR/ABWR Projects) (SEB2)

Question 03.08.05-23**(Follow-up to RAI 155, Supplement 4, Question 03.08.05-16)**

The RAI response identified the sections in the FSAR that describe the soil properties used in many of the various seismic analyses and designs of Seismic Category I structures. From the review of this information, it is not clear whether all of the key soil parameters have been included in these FSAR sections. In addition, the staff notes that the information contained in FSAR Tier 1, Table 5.0-1 "Site Parameters" and FSAR Tier 2, Table 2.1-1 "Site Design Envelope," is not complete. Some of the soil parameters that are not included are the soil friction angle, the 3.0" global differential settlement criteria referred to in the response to RAI 3.8.5-15, and other key parameters that were relied upon in the design of the foundation walls and evaluations for foundation stability associated with FSAR Section 3.8. Therefore, to meet 10 CFR 52.47 (a) (1), AREVA is requested to ensure that FSAR Tier 1, Table 5.0-1 "Site Parameters" and FSAR Tier 2, Table 2.1-1, include the key soil parameters (e.g., soil angle of internal friction, global settlement criteria, properties used for soil backfill, and soil bearing capacity criteria with a factor of safety appropriate for the design load combinations for all seismic Category I structures) which were postulated in the analyses and design of the Seismic Category I structures and foundations.

Response to Question 03.08.05-23

U.S. EPR FSAR Tier 2, Table 2.1-1, Section 2.5.4.2, Section 2.5.4.3, and Table 3.8.1-17 will be revised to include the minimum and maximum soil angle of internal friction and the soil density values used in the analysis and design of Seismic Category I structures and foundations. The maximum soil angle of internal friction is included so that the lateral passive wall pressure will not exceed the design capacity of the below grade walls. Values higher than the maximum soil angle of internal friction may be evaluated on a site-specific basis to demonstrate the design of Seismic Category I below grade walls. U.S. EPR FSAR Tier 1, Table 5.0-1 will be revised to include the minimum soil angle of internal friction.

Table 03.08.05-23-1 shows the variation of soil density with depth for the dynamic analyses. The soil density variation with depth is currently reflected in U.S. EPR FSAR Tier 2, Tables 3.7.1-6, 3.7.1-8, 3.7.1-9, and 3.7.2-9. U.S. EPR FSAR Tier 2, Tables 3.7.1-6, 3.7.1-8, and 3.7.1-9 show the shear wave velocity and depth of soil layers used in the soil structure interaction (SSI) analysis of the Nuclear Island (NI), Emergency Power Generating Building (EPGB), and Essential Service Water Building (ESWB), respectively. U.S. EPR FSAR Tier 2, Table 3.7.2-9 provides the soil properties associated with different shear wave velocities, including the soil density. U.S. EPR FSAR Tier 2, Table 2.1-1 will be revised to specify the soil density values used in the dynamic analyses.

The static and dynamic soil bearing pressure values will be provided in the Response to RAI 376, Question 03.08.05-28 (NI) and RAI 376, Question 03.08.05-31 (EPGB and ESWB).

The global settlement between adjacent structures is a function of the design of the umbilicals between structures. The design of umbilicals is not in the scope of the design certification, and global settlement is not included in the U.S. EPR FSAR as a key soil parameter.

FSAR Impact:

U.S. EPR FSAR Tier 1, Table 5.0-1 and Tier 2, Table 2.1-1, Sections 2.5.4.2, 2.5.4.3, and Table 3.8-17 will be revised as described in the above response and indicated on the enclosed markup.

1. The effect of the extreme liquid winter precipitation event on roof loads is negligible due to the lack of parapets. ~~The maximum 48-hour PMWP liquid of 32 inches is based on data obtained from National Oceanic and Atmospheric Administration Hydrometeorological Report No. 53 “Seasonal Variation of 10-square-mile Probable Maximum Precipitation Estimates, United States East of the 105th Meridian” for the three winter months—December through February. However, the effect of rainfall events on roof loads is negligible, due to the lack of parapets.~~
2. By definition, 0% percent exceedance temperature values exclude peaks of temperatures that last less than two hours. The 0% percent exceedance values are based on conservative estimates of 100 year return period values and historic extreme values, whichever is bounding.
3. For maximum values, data from the summer months of June, July, and August are used. For minimum values, data from the winter months of December, January, and February are used.

4. Minimum angle of internal friction is associated with the soil’s ability to develop the minimum coefficient of static friction.

3. By definition, zero percent exceedance temperature values exclude peaks of temperatures less than two hours in duration. The zero percent exceedance temperature values are based on conservative estimates of 100-year return period values and historic extreme values, whichever is bounding.
4. For maximum values, data from the summer months or June, July, and August are used. For minimum values, data from the winter months of December, January, and February are used.
5. ~~Deleted COL applicant to confirm potential UHS cooling tower interference effects on safety-related air intakes do not result in air intake inlet conditions that exceed the site design envelope ambient air conditions (refer to COL Item 2.0.1 in Table 1.8.2 — U.S. EPR Combined License Information Items).~~
6. The atmospheric dispersion parameters for the equipment hatch and depressurization shaft releases are bounded by the parameters for the releases via the Safeguard Building canopy.
7. Soil densities provided in this table are associated with the structural design of basemats and walls below grade. Soil densities used in dynamic soil structure interaction analyses are defined in terms of the value of the shear wave velocity in Table 3.7.2-9. The shear wave velocity layers and depths are defined in Table 3.7.1-6, Table 3.7.1-8 and Table 3.7.1-9.
8. Minimum angle of internal friction is associated with the soil's ability to develop the minimum coefficient of static friction.
9. Maximum angle of internal friction is associated with the passive soil pressure coefficient so that soil pressure acting on walls below grade does not exceed capacity. If the maximum angle of internal friction is higher than 30 degrees, a site-specific analysis will be performed using the site-specific soil parameters and site-specific SSE to demonstrate that the capacity of the below grade walls is not exceeded.

03.08.05-23

2.5.3 Surface Faulting

No surface faulting is considered to be present under foundations for Seismic Category I structures in the U.S. EPR (GDC 2).

A COL applicant that references the U.S. EPR design certification will investigate site-specific surface and subsurface geologic, seismic, geophysical, and geotechnical aspects within 25 miles around the site and evaluate any impact to the design. The COL applicant will demonstrate that no capable faults exist at the site in accordance with the requirements of 10 CFR 100.23 and of 10 CFR 50, Appendix S. If non-capable surface faulting is present under foundations for safety-related structures, the COL applicant will demonstrate that the faults have no significant impact on the structural integrity of safety-related structures, systems, or components.

2.5.4 Stability of Subsurface Materials and Foundations

The stability of subsurface materials under the ~~and~~ foundations for Seismic Category I structures is demonstrated in Section 3.8.5 for the U.S. EPR ~~10-generic~~ soil profiles described in Section 3.7.1 and Section 3.7.2. As described in Section 3.8.5, lateral soil pressure loads under saturated conditions are considered for the design of below-grade walls. Soil loads are based on the parameters described in Section 2.5.4.2.

A COL applicant that references the U.S. EPR design certification will present site-specific information about the properties and stability of soils and rocks that may affect the nuclear power plant facilities under both static and dynamic conditions, including the vibratory ground motions associated with the CSDRS and the site-specific SSE.

2.5.4.1 Geologic Features

Geologic features are site specific and will be addressed by the COL applicant.

2.5.4.2 Properties of Subsurface Materials

The following soil properties are used for design of U.S. EPR Seismic Category I structures.

- Soil density:
 - Saturated soil = 134 lb/ft³.
 - Moist soil = 128 lb/ft³.
 - Dry soil = 110 lb/ft³.

03.08.05-23

- Angle of internal friction = ~~35~~26.6 degrees minimum, 30 degrees maximum.

- ~~Coefficient of friction acting on foundation basemats and near surface foundations for Seismic Category I structures – 0.7.~~ Coefficient of friction for all interfaces between the foundation basemat and soil for Seismic Category I structures is 0.5 minimum.

For a cohesionless soil site, the soil below and adjacent to the safety-related foundation basemat will have a minimum friction angle ~~in excess of 35~~26.6 degrees. For a cohesive soil site, the soil will have an undrained strength equivalent to or exceeding a drained strength of 35~~26.6~~ degrees (yielding a friction coefficient greater than or equal to 0.75).

03.08.05-23

The backfill soil adjacent to any safety-related structure will have a maximum angle of internal friction of 30 degrees to limit passive pressure developed on the below grade exterior walls. If the maximum angle of internal friction is higher than 30 degrees, a site-specific analysis will be performed using the site-specific soil parameters and site-specific SSE to demonstrate that the capacity of the below grade walls is not exceeded.

Section 2.5.4.5 discusses the use of mud mats under the foundation basemats to facilitate construction. When used, the governing friction value at the interface zone is determined by a thin soil layer (soil-on-soil) under the mud mat. As indicated above, the underlying soil (expected to be compacted backfill or lean concrete) will have a friction angle greater than ~~35~~26.6 degrees. Typical values of friction coefficient between concrete and dry soil and rock are in the range of approximately 0.75. Due to the interlock of concrete with soil as the concrete is placed, the friction between the mud mat and underlying soil media is generally higher than the friction resistance of soil-on-soil so that continuity of load transfer across the interface is maintained. Waterproofing systems are addressed in Section 3.4.2.

Earthquake induced soil pressures for the design of the U.S. EPR are developed in accordance with Section 3.5.3 of ASCE 4-98 (Reference 2). Maximum ground water and maximum flood elevations used for determining lateral soil loads for the U.S. EPR are as specified in Table 2.1-1.

A COL applicant that references the U.S. EPR design certification will reconcile the site-specific soil and backfill properties with those used for design of U.S. EPR Seismic Category I structures and foundations described in Section 3.8.

2.5.4.3 Foundation Interfaces

Foundation interfaces with underlying materials are site specific and will be addressed by the COL applicant. The COL applicant will confirm that the site soils and backfill material have (1) minimum sliding coefficient of friction ~~of equal to at least 0.75~~, (2) adequate shear strength to provide adequate static and dynamic bearing capacity, (3) adequate elastic and consolidation properties to satisfy the limits on settlement described in Section 2.5.4.10.2, ~~and~~ (4) adequate dynamic properties (i.e., shear wave

velocity and strain-dependent modulus-reduction and hysteretic damping properties). and (5) properties so that the earthquake design loading on the below grade walls is not exceeded (i.e., the site-specific angle of internal friction, unit soil weight, and seismic wall movements do not cause design limits of the walls to be exceeded because of the passive lateral earth pressure on the walls to support the Seismic Category I structures of the U.S. EPR under earthquake loading.

2.5.4.4 Geophysical Surveys

Geophysical surveys are site specific and will be addressed by the COL applicant.

2.5.4.5 Excavations and Backfill

Excavations and backfill are site-specific and will be addressed by the COL applicant. Additional backfill requirements are identified in Section 3.8.5.4. Mud mats may be provided under foundations for ease of construction. Mud mats may be designed as structural plain concrete elements on a site-specific basis in accordance with ACI 318 (Reference 3).

2.5.4.6 Ground Water Conditions

Ground water conditions are described in Section 2.4 and provided in Table 2.1-1 for the U.S. EPR. Ground water conditions are considered in the structural design of the U.S. EPR, as described in Section 3.8. However, groundwater conditions are not explicitly considered in the SSI analyses described in Section 3.7.1 and Section 3.7.2.

The COL applicant will address site-specific ground water conditions.

2.5.4.7 Response of Soil and Rock to Dynamic Loading

Section 2.5.2 notes that the design of the U.S. EPR is based on the assumption that the shear wave velocities assumed for the ~~10-generic~~ soil profiles described in Section 3.7.1.3 are strain-compatible properties. For SSI analysis for the U.S. EPR, assumed relationships to depict the strain-dependent modulus-reduction and hysteretic damping properties are not explicitly considered. The COL applicant will address site-specific response of soil and rock to dynamic loading, including the determination of strain-dependent modulus-reduction and hysteretic damping properties.

2.5.4.8 Liquefaction Potential

The design of the U.S. EPR assumes that the plant is not founded on liquefiable materials (GDC 2).
