Assumptions to the Annual Energy Outlook 2010

Table 8.1. Generating Capacity Types Represented in the Electricity Market Module

Existing coal steam plants ¹		
High Sulfur Pulverized Coal with Wet Flue Gas Desulfurization		
Advanced Coal - Integrated Coal Gasification Combined Cycle		
Advanced Coal with carbon sequestration		
Oil/Gas Steam - Oil/Gas Steam Turbine		
Combined Cycle - Conventional Gas/Oil Combined Cycle Combustion Turbine		
Advanced Combined Cycle - Advanced Gas/Oil Combined Cycle Combustion Turbine		
Advanced Combined Cycle with carbon sequestration		
Combustion Turbine - Conventional Combustion Turbine		
Advanced Combustion Turbine - Steam Injected Gas Turbine		
Molten Carbonate Fuel Cell		
Conventional Nuclear		
Advanced Nuclear - Advanced Light Water Reactor		
Generic Distributed Generation - Baseload		
Generic Distributed Generation - Peak		
Conventional Hydropower - Hydraulic Turbine		
Pumped Storage - Hydraulic Turbine Reversible		
Geothermal		
Municipal Solid Waste		
Biomass - Integrated Gasification Combined-Cycle		
Solar Thermal - Central Receiver		
Solar Photovoltaic - Single Axis Flat Plate		
Wind		
Wind Offshore		

¹The EMM represents 32 different types of existing coal steam plants, based on the different possible configuration of No_x, particulate and SO₂ emission control devices, as well as future options for controlling mercury.

¹Online year represents the first year that a new unit could be completed, given an order date of 2009. For wind, geothermal and landfill gas, the online year was moved earlier to acknowledge the significant market activity already occuring in anticipation of the expiration of the Production Tax Credit.

²A contingency allowance is defined by the American Association of Cost Engineers as the "specific provision for unforeseeable elements if costs within a defined project scope; particularly important where previous experience has shown that unforeseeable events which will increase costs are likely to occur."

³The technological optimism factor is applied to the first four units of a new, unproven design. It reflects the demonstrated tendency to underestimate actual costs for a first-of-a-kind unit.

⁴Overnight capital cost including contingency factors, excluding regional multipliers and learning effects. Interest charges are also excluded. These represent costs of new projects initiated in 2009.

⁵O&M = Operations and maintenance.

⁶For hydro, wind, and solar technologies, the heatrate shown represents the average heatrate for conventional thermal generation as of 2008. This is used for purposes of calculating primary energy consumption displaced for these resources, and does not imply an estimate of their actual energy conversion efficiency.

⁷Capital costs are shown before investment tax credits are applied.

⁸Combustion turbine units can be built by the model prior to 2011 if necessary to meet a given region's reserve margin.

⁹Because geothermal and hydro cost and performance characteristics are specific for each site, the table entries represent the cost of the least expensive plant that could be built in the Northwest Power Pool region, where most of the proposed sites are located.

Sources: The values shown in this table are developed by the Energy Information Administration, Office of Integrated Analysis and Forecasting, from analysis of reports and discussions with various sources from industry, government, and the Department of Energy Fuel Offices and National Laboratories. They are not based on any specific technology model, but rather, are meant to represent the cost and performance of typical plants under normal operating conditions for each plant type. Key sources reviewed are listed in the 'Notes and Sources' section at the end of the chapter.
