Subject: Long term loss of power danger!

May 11, 2011 (9:10 am)

OFFICE OF SECRETARY
RULEMAKINGS AND
ADJUDICATIONS STAFF

Dear NRC,

I would like you to immediately post petition PRM-50-96 for public comment. I can't believe that there is no plan to deal with a long term power outage if battery back up fails and fuel resupply is impossible to emergency generators. Your faith that all power outages will be short term is mind boggling. Also, all 23 GE mk1 reactors should be shut down as soon as possible. This containment system has failed in Japan in a mild loss of power accident. This containment system is allowing radiation to be picked up 10,000 miles from Japan in Massachusetts. If you cannot shut down these reactors please make them first on the list to receive the upgrades listed in PRM-50-96 after your organization wisely corrects a 40 year old safety issue that can destroy this country. While your organization may consider radiation in milk to be a good thing that can be remedied by the government simply raising the amount of radiation that is "safe" to consume, I'm not fooled by this.

Yours Truly,

Leigh Mcleod
