## PREFACE

Staff members of the Environmental, Inc., Midwest Laboratory were responsible for the acquisition of data presented in this report, with the exception of Appendices D and E, which were completed by DAEC personnel. All environmental samples, with the exception of aquatic, were collected by personnel of DAEC. Aquatic samples were collected by the University of Iowa Hygienic Laboratory.

The report was prepared by Environmental, Inc., Midwest Laboratory, with the exception of Appendices D and E, which were prepared by DAEC personnel.

## 1.0 INTRODUCTION

This report summarizes and interprets results of the Radiological Environmental Monitoring Program conducted by Environmental, Inc., Midwest Laboratory at the Duane Arnold Energy Center, Palo, Iowa, during the period January - December, 2010. This Program monitors the levels of radioactivity in the air, terrestrial, and aquatic environments in order to assess the impact of the plant on its surroundings.

Tabulation of the individual analyses made during the year are included in Part II of this report.

The Duane Arnold Energy Center (DAEC) is a boiling water reactor, located in Linn County, Iowa, on the Cedar River, and owned and operated by NextEra Energy Resources. Initial criticality was attained on March 23, 1974. The reactor reached 100% power on August 12, 1974. Commercial operation began on February 1, 1975.

## 2.0 SUMMARY

The Radiological Environmental Monitoring Program, as required by the U.S. Nuclear Regulatory Commission (NRC) Technical Specifications for the Duane Arnold Energy Center, is herein described. Results for the year 2010 are summarized and discussed.

Trace levels of tritium in groundwater were reported from the sampling of monitoring wells within the Site Protected Area. REMP threshold reporting levels were not exceeded.

Program findings show only background levels of radioactivity in the environmental samples collected in the vicinity of the Duane Arnold Energy Center. No effect on the environment is indicated in the areas surrounding the site of the Duane Arnold Energy Center.

### **3.0 RADIOLOGICAL ENVIRONMENTAL MONITORING PROGRAM**

#### **3.1 Program Design and Data Interpretation**

The purpose of the Radiological Environmental Monitoring Program at the Duane Arnold Energy Center (DAEC) is to assess the impact of the plant on its environment. For this purpose, samples are collected from the air, terrestrial, and aquatic environments and analyzed for radioactive content. In addition, ambient gamma radiation levels are monitored by thermoluminescent dosimeters (TLDs).

Sources of environmental radiation include the following:

- (1) Natural background radiation arising from cosmic rays and primordial radionuclides;
- (2) Fallout from atmospheric nuclear detonations;
- (3) Releases from nuclear power plants; and
- (4) Industrial and medical radioactive waste.

In interpreting the data, effects due to the DAEC operation must be distinguished from those due to other sources.

A major interpretive aid in assessment of these effects is the design of the monitoring program at the DAEC which is based on the indicator-control concept. Most types of samples are collected both at indicator locations (nearby, downwind, or downstream) and at control locations (distant, upwind, or upstream). A station effect would be indicated if the radiation level at an indicator location was significantly larger than that at the control location. The difference would have to be greater than could be accounted for by typical fluctuations in radiation levels arising from other sources.

An additional interpretive technique involves analyses for specific radionuclides present in the environmental samples collected from the DAEC site. The DAEC's monitoring program includes analyses for strontium-90 and iodine-131, which are fission products, and tritium, which is produced by cosmic rays, atmospheric nuclear detonations, and also by nuclear power plants. Most samples are also analyzed for gamma-emitting isotopes with results for the following groups quantified: zirconium-95, cesium-137, and cerium-144. These three gamma-emitting isotopes were selected as radiological impact indicators because of the different characteristic proportions in which they appear in the fission product mix produced by a nuclear reactor and that produced by a nuclear detonation. Each of the three isotopes is produced in roughly equivalent amounts by a reactor: each constitutes about 10% of the total activity of fission products ten (10) days after reactor shutdown. On the other hand, ten (10) days after a nuclear explosion, the contributions of zirconium-95, cerium-144, and cesium-137 to the activity of the resulting debris are in the approximate ratio 4:1:0.03 (Eisenbud, 1963). The other group quantified consists of niobium-95, ruthenium-103 and -106, cesium-134, barium-lanthanum-140, and cerium-141. These isotopes are released in small quantities by nuclear power plants, but to date their major source of injection into the general environment has been atmospheric nuclear testing. Nuclides of the next group, manganese-54, cobalt-58 and -60, and zinc-65, are activation products and arise from activation of corrosion products. They are typical components of nuclear power plant effluents, but are not produced in significant quantities by nuclear detonations. Nuclides of the final group, beryllium-7, which is of cosmogenic origin, and potassium-40, a naturally-occurring isotope, were chosen as calibration monitors and provide a comparison between levels of naturally occurring radionuclides and radionuclides that could be attributed to the operation of the plant.

## Program Design and Data Interpretation (continued)

Characteristic properties of isotopes quantified in gamma-spectroscopic analysis are presented in Table 5.1. Other means of distinguishing sources of environmental radiation can be employed in interpreting the data. Current radiation levels can be compared with previous levels, including those measured before the Plant became operational. Results of the DAEC's Monitoring Program can be related to those obtained in other parts of the world. Finally, results can be related to events known to cause elevated levels of radiation in the environment, e.g., atmospheric nuclear detonations.

### 3.2 Program Description

The sampling and analysis schedule for the environmental radiological monitoring program at the DAEC is summarized in Table 5.2 and is briefly reviewed below. Table 5.3 defines the sampling location codes used in Table 5.2 and specifies for each location its distance, direction, and sector relative to the reactor site. The types of samples collected at each location and the frequency of collections are presented in Table 5.4 using codes defined in Table 5.5.

To monitor the air environment, airborne particulates are collected on membrane filters by continuous pumping at nine locations. Airborne iodine is collected by continuous pumping through charcoal filters. Eight of the nine locations are indicators and one is a control (D-13). Filters are changed and counted weekly. Particulate filters are analyzed for gross beta activity. If gross beta activity exceeds ten times the yearly mean of the control samples, gamma isotopic analysis is performed. Quarterly composites of airborne particulates from each location are analyzed for gamma emitting isotopes.

Charcoal filter samples are analyzed weekly for iodine-131.

Ambient gamma radiation is monitored at a total of 46 locations. A TLD is placed at each location and is exchanged and analyzed quarterly. The TLD locations are distributed as follows:

- Two on-site locations
- Eighteen in a circle within a 0.5 mi. radius from the DAEC stack.
- Six in 22.5° sectors within 1 mi. from the DAEC stack.
- Ten in 22.5° sectors between 1 and 3 miles from the DAEC stack.
- Ten control locations greater than 3 miles from the DAEC stack.

A precipitation sample is collected monthly from one on-site location and analyzed for gamma-emitting isotopes. A quarterly composite is analyzed for tritium.

Milk samples are collected monthly from one indicator and one control location during the non-grazing season, October through April, and biweekly during the grazing season, May 1 through September 30. The samples are analyzed for iodine-131 and gamma-emitting isotopes.

For additional monitoring of the terrestrial environment, grain, hay and broad leaf vegetation samples are collected annually, as available, from nine locations: one control (D-108) and eight indicators (D-16, D-57, D-58, D-72, D-94, D-96, D-109 and D-118). Grain, hay and broad leaf (green leafy) vegetation samples are analyzed for gamma-emitting isotopes and at least two broad leaf vegetation samples are analyzed for iodine-131. An alternative site for broadleaf vegetation (D-15, indicator) may be sampled, if available.

If cattle are slaughtered for home use, a meat sample is collected annually, during or immediately following a grazing period from animals grazing on-site. The sample is analyzed for gamma-emitting isotopes.

Program Description (continued)

Potable ground water is collected quarterly from a treated municipal water system (D-53), the inlet to the municipal water treatment system (D-54), three indicator locations (D-55, D-57, D-58) and one control location (D-72). Non-potable water is collected from six on-site locations (MW-01 to MW-06). Two monitoring wells are sampled from each site, at shallow (A) and intermediate (B) depths, and analyzed for gross beta and tritium. If gross beta activity exceeds ten times the yearly mean of the control samples (or 7 pCi/liter), gamma isotopic, strontium-89 and strontium-90 analyses are performed.

Soil samples are collected annually at the two on-site locations, D-15a and D-16. The samples are analyzed for strontium-90, tritium and gamma-emitting isotopes.

Surface water is collected monthly from four river locations, D-49 (Lewis Access, Control, 4 mi. upstream), D-50 (Inlet), D-51 (Discharge) and D-61 (downstream of Discharge). In addition, Pleasant Lake (D-99) surface water and sewage effluent from location (D-107) is also monitored. The monthly samples are analyzed for tritium and gamma-emitting isotopes. Additional analyses are performed on samples collected from the control and indicator locations, D-49 and D-61. Analyses for low-level iodine-131 are performed on monthly collections and quarterly composites are prepared and analyzed for strontium-89 and strontium-90.

The aquatic environment is also monitored by upstream and downstream (D-49 and D-61) semiannual collections of fish. River bottom sediment is collected semiannually at the plant's intake and discharge (D-50 and D-51) and downstream of the sewage plant (D-107a). The samples are analyzed for gamma-emitting isotopes.

### 3.3 Program Execution

The program was executed as described in the preceding section with the following exceptions.

#### (1) Airborne Particulates / Airborne Iodine:

No air particulate/ air iodine sample was available from location D-15 for the week ending 02/04/10.

There was no particulate matter collected on the filter.

Partial samples were collected at location D-7, for the weeks ending 05/13/10 and 08/12/10. Detection limits for I-131 were not met due to power interruptions, caused by a faulty line cord.

Air particulate / air iodine samples were not available at location D-6, for the weeks ending 08/05/10 through 09/02/10. The sampler site was shut down due to construction.

A partial sample (205 m<sup>3</sup>) was collected at location D-15, for the week ending 09/30/10, due to a power outage.

#### (2) Surface Water:

Surface water from locations D-50 and D-99 could not be sampled for the December 8, 2010 collection. The water was frozen.

#### (3) Milk:

Milk samples for locations D-108 and D-110, collected June 15, 2010, were damaged and lost in transit.

#### (4) Vegetation:

Vegetation samples were not collected at location D-94 in 2010. The sampling station was removed from the program in November, 2010.

#### (5) Precipitation:

Lower limits of detection could not be reached for the February, 2010 precipitation collection, due to insufficient sample volume (250 ml.).

#### **3.4      Laboratory Procedures**

The Iodine-131 analyses in milk and water were made using a sensitive radiochemical procedure involving separation of iodine using an ion-exchange method, solvent extraction and subsequent beta counting. Levels of iodine-131 in vegetation and concentrations of airborne iodine-131 in charcoal samples were determined by gamma spectroscopy.

Gamma-spectroscopic analyses are performed using high-purity germanium (HPGe) detectors. The gamma isotopic analysis provides a spectrum with an energy range from 80 to 2048 KeV. Specific isotopes included in the gamma library are Mn-54, Fe-59, Co-58, Co-60, Zn-65, Zr-95, Nb-95, Ru-103, Ru-106, I-131, Ba-La-140, Cs-134, Cs-137, Ce-141, and Ce-144. Naturally occurring gamma-emitters, such as Be-7, K-40 and Ra daughters, are frequently detected but may not be listed.

Tritium was measured by liquid scintillation.

Analytical Procedures used by Environmental, Inc. are on file and are available for inspection. Procedures are based on those prescribed by the Health and Safety Laboratory of the U.S. Dep't of Energy, Edition 28, 1997, U.S. Environmental Protection Agency for Measurement of Radioactivity in Drinking Water, 1980, and the U.S. Environmental Protection Agency, EERF, Radiochemical Procedures Manual, 1984.

Environmental, Inc., Midwest Laboratory has a comprehensive quality control/quality assurance program designed to assure the reliability of data obtained. Details of the QA Program are presented elsewhere (Environmental, Inc., Midwest Laboratory, 2011). The QA Program includes participation in Interlaboratory Comparison (crosscheck) Programs. Results obtained in crosscheck programs are presented in Appendix A.

#### **3.5      Program Modifications**

A new revision to the study plan (rev. 22) was issued in November of 2010. The revision included new conditional requirements for analysis of groundwaters:

Groundwater from potable wells is analyzed for gross beta and tritium. A gamma isotopic analysis will be performed if gross beta activity exceeds 3 pCi/L, or tritium activity exceeds MDA. If reactor by-product gamma emitters are identified, OR if gross beta measures > 7 pCi/L, or more than ten times the annual mean of the control samples, then additional analyses for Ni-63, Sr-89, Sr-90 and alpha emitters will be performed.

Samples from the six on-site monitoring wells are analyzed for tritium. If the tritium concentration is greater than 1000 pCi/L, conditional analyses for Ni-63, Sr-89, Sr-90 and alpha and gamma emitters are performed.

Vegetation samples were no longer available from sampling site D-94 in 2010. The station was removed from the program in November, 2010.

## 4.0 RESULTS AND DISCUSSION

All collections and analyses were made as scheduled, except for those listed in Table 5.6.

Results are summarized in Table 5.7 as recommended by the Nuclear Regulatory Commission. For each type of analysis and sample medium, the table lists the mean and range of all indicator and control locations, as well as that location with the highest mean and range.

Tabulated results of measurements are not included in this section, although reference to these results will be made in discussion. A complete tabulation of results for 2010 is contained in Part II of the Annual Report on the Radiological Environmental Monitoring Program for the Duane Arnold Energy Center.

### 4.1 Atmospheric Nuclear Detonations and Nuclear Accidents

There were no reported atmospheric nuclear tests in 2010.

### 4.2 Program Findings

Results obtained show background levels of radioactivity in the environmental samples collected outside of the Site Protected Area in 2010. The trace levels of strontium-90 and cesium-137, still measurable in soil and sediment samples, are attributed to deposition of fallout from previous decades.

Tritium was identified in some groundwater samples collected within the site Protected Area. In no instances were REMP threshold reporting levels exceeded. (ODAM, Table 6.3-3)

### Airborne Particulates

The average annual gross beta concentrations in airborne particulates were identical at indicator and control locations ( $0.028 \text{ pCi/m}^3$ ) and similar to levels observed from 1995 through 2009. The results are tabulated below.

<u>Year</u>	<u>Indicators</u>	<u>Controls</u>		<u>Year</u>	<u>Indicators</u>	<u>Controls</u>
Concentration ( $\text{pCi/m}^3$ )						
1995	0.025	0.024		2003	0.029	0.029
1996	0.024	0.023		2004	0.028	0.028
1997	0.023	0.023		2005	0.031	0.031
1998	0.024	0.024		2006	0.029	0.027
1999	0.026	0.027		2007	0.031	0.031
2000	0.026	0.027		2008	0.029	0.029
2001	0.026	0.026		2009	0.031	0.030
2002	0.027	0.027		2010	0.028	0.028

Average annual gross beta concentrations in airborne particulates.

4.2 Program Findings, Airborne Particulates (continued)

Gamma spectroscopic analysis of quarterly composites of air particulate filters yielded similar results for indicator and control locations. Beryllium-7, which is produced continuously in the upper atmosphere by cosmic radiation (Arnold and Al-Salih, 1955) was detected in all samples, with an average activity of 0.081 pCi/m<sup>3</sup> for all locations. All other gamma-emitting isotopes were below their respective LLD limits.

Airborne Iodine

Weekly levels of airborne iodine-131 were below the required limit of 0.030 pCi/m<sup>3</sup> in all samples, excepting station D-7 for the weeks ending 05/13/10 and 08/12/10 (Sec. 3.3).

Ambient Radiation (TLDs)

At ten control locations, TLD readings averaged 17.3 mR/quarter. At locations within a half mile, one mile and three mile radius of the stack, measurements averaged 19.7 mR/quarter, 19.3 mR/quarter and 17.3 mR/quarter, respectively. The two on-site locations D-15 and D-16 averaged 18.2 mR/quarter. The average for all locations was 18.6 mR/quarter. This is lower than the estimated average natural background radiation for Middle America, 19.5 mR/quarter, which is based on data on Pages 71 and 108 of the report, "Natural Background Radiation in the United States" (National Council on Radiation Protection and Measurements, 1975). The terrestrial absorbed dose (uncorrected for structural and body shielding) ranges from 8.8 to 18.8 mrad/quarter and averages 11.5 mrad/quarter for Middle America. Cosmic radiation and cosmogenic radionuclides contribute 8.0 mrad/quarter for a total average of 19.5 mrad/quarter. No plant effect is indicated.

Precipitation

Precipitation from the on-site location D-16 was analyzed for tritium and gamma-emitting isotopes. No tritium activity was measured above the LLD of 159 pCi/L. No gamma-emitting isotopes were detected.

Milk

Iodine-131 results were below the detection limit of 0.5 pCi/L in all samples.

No gamma-emitting isotopes, except naturally occurring potassium-40, were detected in any milk samples. This is consistent with the finding of the National Center for Radiological Health that most radiocontaminants in feed do not find their way into milk due to the selective metabolism of the cow. The common exceptions are radioisotopes of potassium, cesium, strontium, barium, and iodine (National Center for Radiological Health, 1968).

In summary, milk data for 2010 show no radiological effects of plant operation.

## 4.2 Program Findings (continued)

### Ground Water (potable)

The annual mean for gross beta activity 2.6 pCi/L, similar to levels observed from 1991 through 2009. The location with the highest mean was D-58, a farm 1.0 mile distant from the plant. Tritium activity measured below the LLD of 164 pCi/L in all samples.

No effect from plant operation is indicated.

### Ground Water (Site Monitoring Wells)

Twelve on-site monitoring wells (six shallow and six intermediate depth) were sampled in 2010 and analyzed for gross beta and tritium.

The annual mean for gross beta activity in six intermediate depth wells measured 2.6 pCi/liter. Measurements for the shallow wells averaged 3.1 pCi/liter. The highest mean (5.0 pCi/L) was observed at shallow well MW-6A. The same pattern of concentration was observed in 2009. The most likely cause of higher beta activity is contribution from naturally-occurring isotopes. No plant effect was indicated.

Tritium activity measured below the LLD of 164 pCi/L in all twenty four samples collected from the intermediate depth wells. Activity was identified in nine of the twenty-nine samples taken from shallow wells and ranged from 169 to 1817 pCi/L. The highest mean (792 pCi/L) was observed at shallow well MW-1A, lower than concentrations measured in 2009. The activity has been attributed to "washout" from gaseous effluents.

### Vegetation

Iodine-131 concentrations in broadleaf vegetation were below the LLD level of 0.018 pCi/g wet weight in all samples.

With the exception of potassium-40, which was observed in all vegetation samples (broadleaf, grain, and forage), all other gamma-emitting isotopes were below detection limits. No effect from plant operation is indicated.

### Soil

Strontium-90 activity measured below an LLD of 0.023 pCi/g dry weight in both on-site locations. Cesium-137 activity averaged 0.14 pCi/g dry weight. Strontium-90 and cesium-137 activities are similar or less than levels observed from 1991 through 2009, these levels are generally attributable to deposition of fallout from previous decades.

Naturally-occurring potassium-40 averaged 11.82 pCi/g dry weight. No effect from the plant operation is indicated.

The soil was distilled and analyzed for tritium. One of the two samples tested indicated slight activity (176 pCi/L) above the background level of 165 pCi/L and is attributed to rainwater washout of tritium from gaseous effluents.

## Program Findings (continued)

### Surface Water

Surface water was tested for tritium and gamma emitting isotopes in seventy samples from six locations. No measurable tritium activity was detected above an LLD of 179 pCi/L. Gamma-emitting isotopes were below detection limits.

An analysis for I-131 was performed on samples from locations D-49 (control) and D-61 (0.5 mi. downstream, indicator). All samples tested below detection limits.

Quarterly composites were also prepared from the samples collected at locations D-49 and D-61 and tested for strontium-89 and strontium-90. All samples tested below detection limits.

No plant effect on surface water is indicated.

### Fish

Fish were collected in May and September, 2010, and analyzed for gamma-emitting isotopes. With the exception of naturally-occurring potassium-40 no gamma-emitting isotopes were identified in edible portions of fish. The potassium-40 level was similar at both the indicator and control locations (2.97 and 3.45 pCi/g wet, respectively). No plant effect on the fish population is indicated.

### River Sediments

River sediments were collected in June and September, 2010, and analyzed for gamma-emitting isotopes. Potassium-40 activity ranged from 6.95 – 11.79 pCi/g dry weight and averaged 9.12 pCi/g dry weight.

Cs-137 activity measured below a detection limit of 0.039 pCi/g dry, less than levels observed from 1991 through 2009, trace cesium activity is generally attributable to deposition of fallout from previous decades.

All other gamma-emitting isotopes were below detection limits. There is no indication of a plant effect.

### **4.3    Supplementary Groundwater Testing**

There were no REMP sample analyses results that warranted communications to State and Local Stakeholders.

Refer to Part II, Appendix A for results of additional/ancillary samples collected in support of the Nuclear Industry Ground Water Protection Initiative.

## 5.0 TABLES AND FIGURES

Table 5.1 Characteristic properties of isotopes quantified in gamma-spectroscopic analyses.

Designation	Comment	Isotope	Half-life <sup>a</sup>
<b>Naturally Occurring</b>			
A. Cosmogenic	Produced by interaction of cosmic rays with atmosphere	Be-7	53.2 d
B. Terrestrial	Primordial	K-40	$1.26 \times 10^9$ y
II. Fission Products <sup>b</sup>	Nuclear accidents and detonations constitute the major environmental source.		
A. Short-lived		I-131 Ba-140	8.04 d 12.8 d
B. Other than Short-lived		Nb-95 Zr-95 Ru-103 Ru-106 Cs-134 Cs-137 Ce-141 Ce-144	35.15 d 65 d 39.35 d 368.2 d 2.061 y 30.174 y 32.5 d 284.31 d
III. Activation Products	Typically found in nuclear power plant effluents	Mn-54 Fe-59 Co-58 Co-60 Zn-65	312.5 d 45.0 d 70.78 d 5.26 y 245 d

<sup>a</sup> Half-lives are taken from Appendix E of Environmental Quarterly, 1 January 1978, EML-334 (U. S. Department of Energy, 1978).

<sup>b</sup> Includes fission-product daughters.

Table 5.2 Sample collection and analysis program.

	Sample Point	Description	Sampling and Collection Frequency	
Ground Water (potable)	53	Treated Municipal Inlet to Municipal Water Treatment System	Grab sample at least once per quarter.	Gross beta and tritium activity analysis on quarterly sample. If gross beta measures greater than ten times the annual mean of the control samples, or 7 pCi/L, perform gamma isotopic and Sr-89 and Sr-90 analyses.
	54	On-site well		
	55 57, 58 72 (C)	Wells off-site and within 4 km of DAEC		
On-site Ground Water (Monitoring Wells)	On-site wells: MW-01A, B (SSE) MW-02A, B (ESE) MW-03A, B (NW) MW-04A, B (S) MW-05A, B (SSW) MW-06A, B (NE)

	113			
	114			
	115			
	116			
River Sediment	50 51 107a	Plant Intake (C) Plant Discharge North Drainage Ditch (on-site)	At least once every six months.	Gamma isotopic analysis of each sample.
Vegetation	16, 57, 58 72, 94, 96, 109, 118 108 (C)	Farms that raise food crops. grain, green leafy, and forage. At least one sample should be broadleaf vegetation.	Annually at harvest time. One sample of each: grain, green leafy, and forage. At least one sample should be broadleaf vegetation.	Gamma isotopic analysis of edible portions.  I-131 analysis on broadleaf vegetation.
Fish	49 61	Cedar River upstream of DAEC not influenced by effluent (C)  Downstream of DAEC in influence of effluent	One sample per 6 months (once during January through June and once during July through December).	Gamma isotopic analysis on edible portions.
Milk <sup>c</sup>	108 (C) 110	Control Farm near Watkins, Iowa  Dairy Farm 7.8 mi. SW	At least once per two weeks during the grazing season.  At least once per month during the non-grazing season.	Gamma isotopic and iodine-131 analyses of each sample.

Table 5.2 Sample collection and analysis program, (continued).

Exposure Pathway and/or Sample Type	Sampling Location <sup>a</sup>			Type and Frequency of Analysis <sup>b</sup>
	Sample Point	Description	Sampling and Collection Frequency	
Precipitation	16	On-site	Monthly	Gamma isotopic on all samples. Tritium on quarterly composites.
Meat <sup>d</sup>		On-site	Annually	Gamma Isotopic
Soil	15a, 16	On-site	Annually	Gamma Isotopic, Sr-90 and tritium

<sup>a</sup> (C) denotes control location. All other locations are indicators.

<sup>b</sup> Gamma isotopic analysis and analysis for gamma-emitting nuclides refer to high resolution gamma ray spectrum analysis.

<sup>c</sup> The grazing season is considered to be May 1 through September 30.

<sup>d</sup> Only sampled when meat is butchered for home use.

<sup>a</sup> GB = Gross beta; GS = Gamma spectroscopy

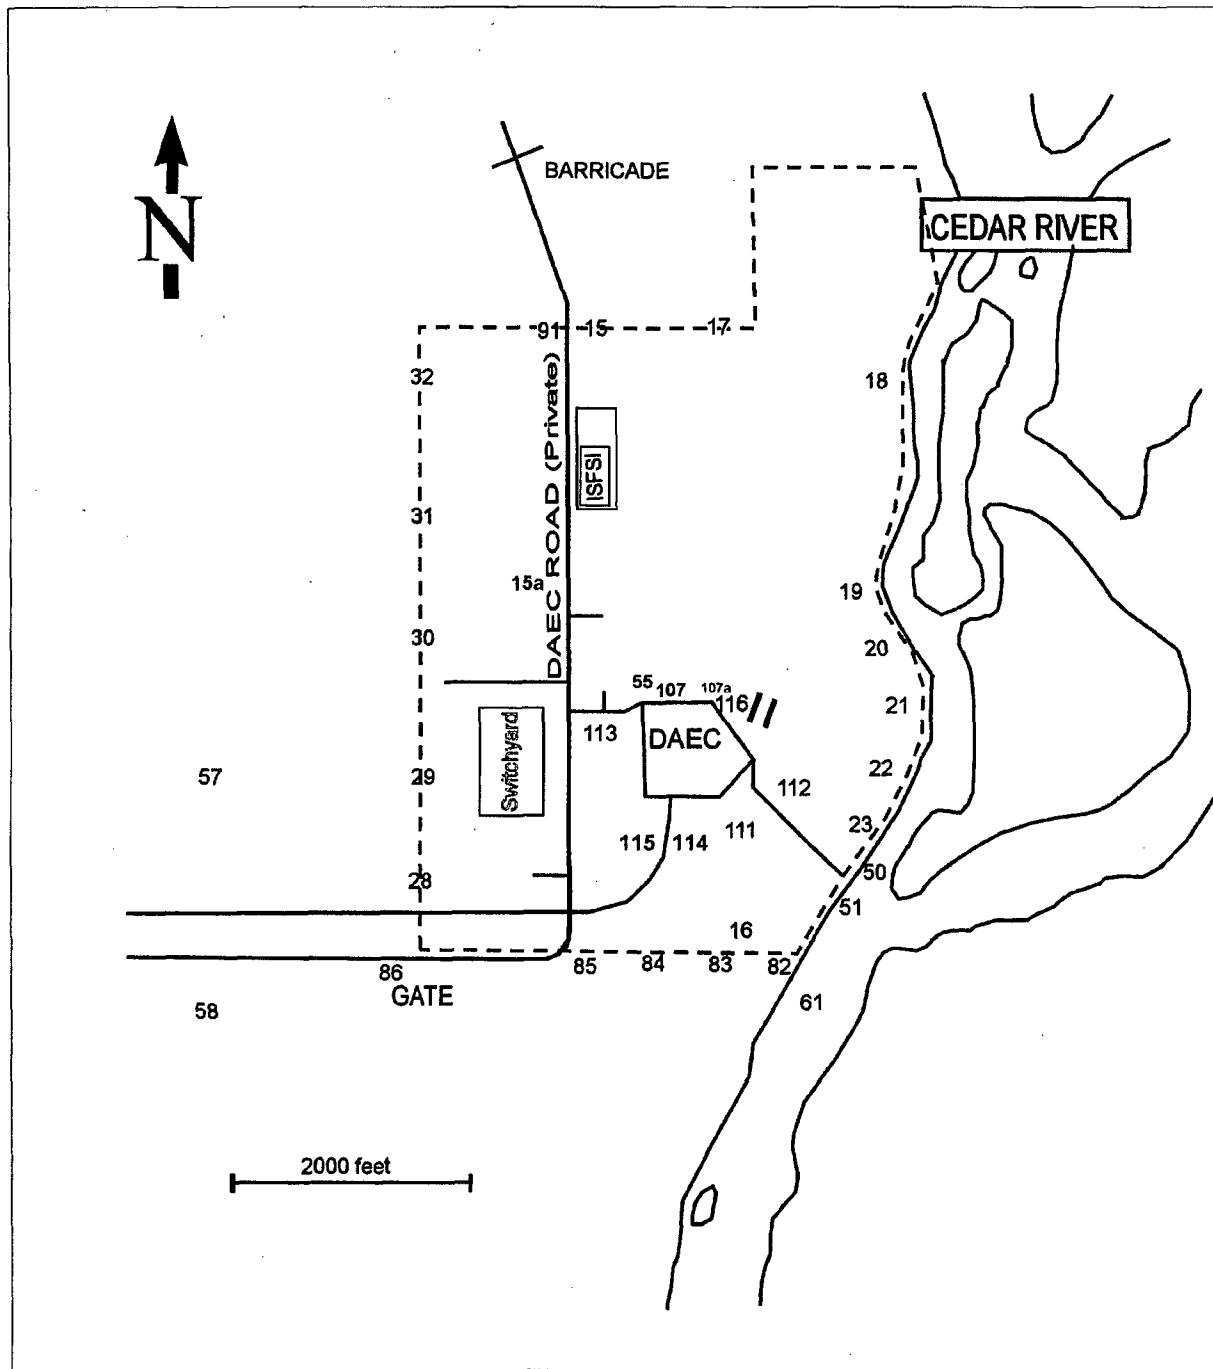

<sup>b</sup> LLD = Nominal lower limit of detection based on 4.66 sigma counting error for the background sample.

<sup>c</sup> Mean and range based upon detectable measurements only. Fraction of detectable measurements at specified locations is indicated in parentheses (F).

<sup>d</sup> Locations are specified by: (1) Name and code (Table 5.3); and (2) distance, direction and sector relative to reactor site.

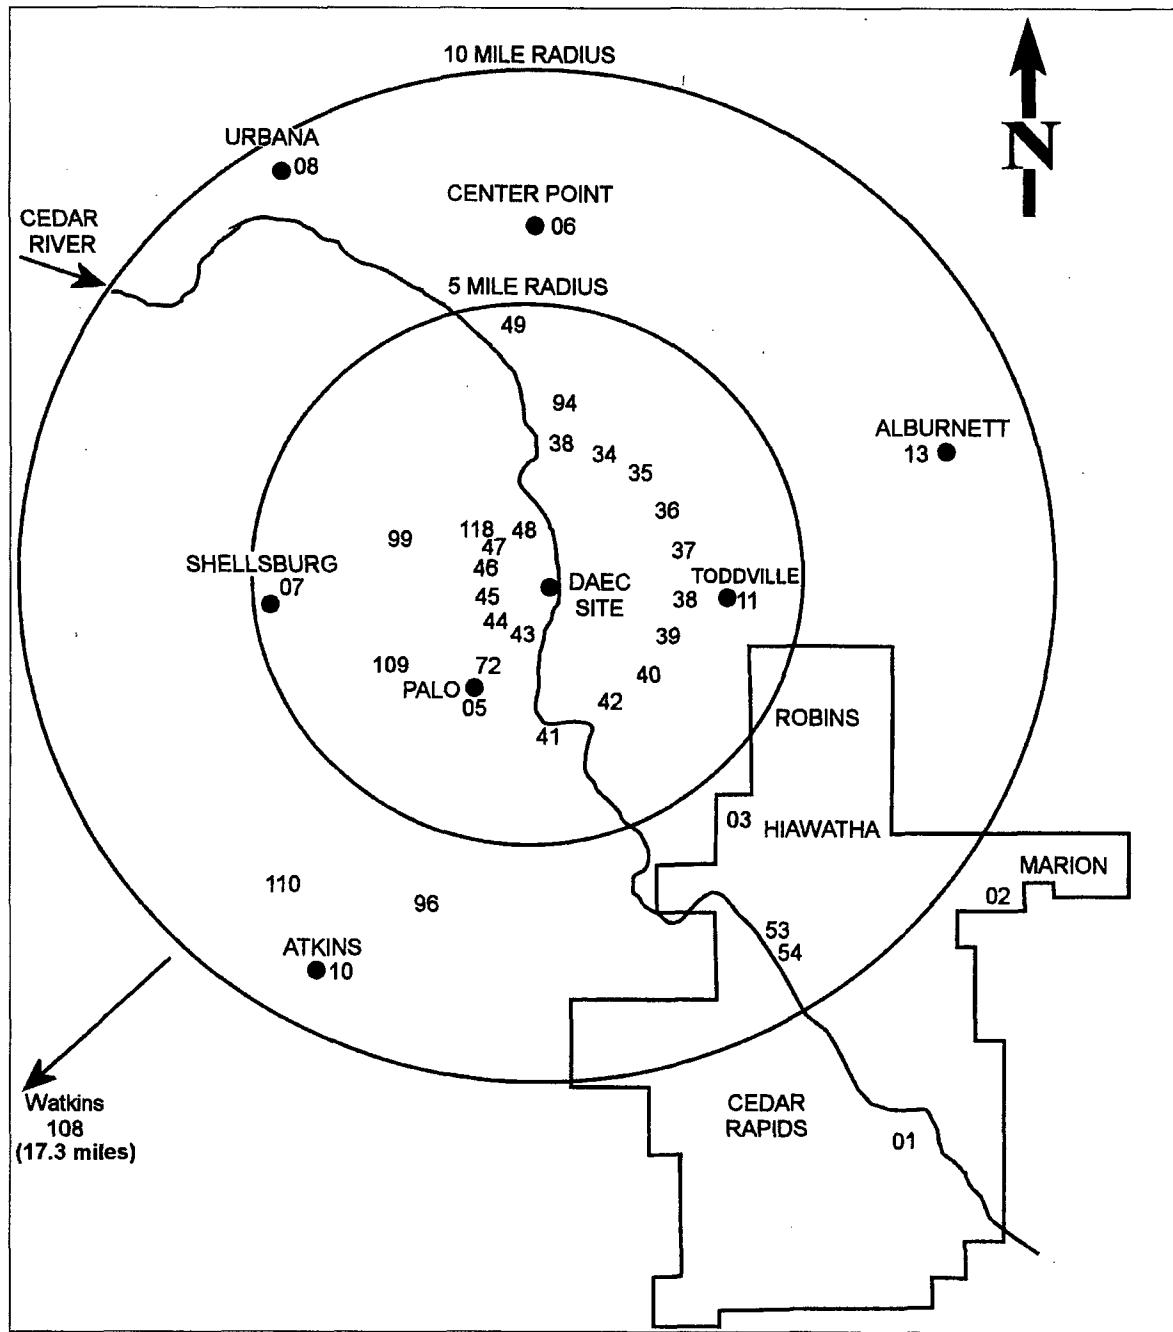

<sup>e</sup> Non-routine results are those which exceed ten times the control station value for the location. If a control station value is not available, the result is considered non-routine if it exceeds ten times the preoperational value for the location.

## APPENDIX A

### INTERLABORATORY COMPARISON PROGRAM RESULTS

**NOTE:** Environmental Inc., Midwest Laboratory participates in intercomparison studies administered by Environmental Resources Associates, and serves as a replacement for studies conducted previously by the U.S. EPA Environmental Monitoring Systems Laboratory, Las Vegas, Nevada. Results are reported in Appendix A. TLD Intercomparison results, in-house spikes, blanks, duplicates and mixed analyte performance evaluation program results are also reported. Appendix A is updated four times a year; the complete Appendix is included in March, June, September and December monthly progress reports only.

January, 2010 through December, 2010

Appendix A  
Interlaboratory Comparison Program Results

Environmental, Inc., Midwest Laboratory has participated in interlaboratory comparison (crosscheck) programs since the formulation of its quality control program in December 1971. These programs are operated by agencies which supply environmental type samples containing concentrations of radionuclides known to the issuing agency but not to participant laboratories. The purpose of such a program is to provide an independent check on a laboratory's analytical procedures and to alert it of any possible problems.

Participant laboratories measure the concentration of specified radionuclides and report them to the issuing agency. Several months later, the agency reports the known values to the participant laboratories and specifies control limits. Results consistently higher or lower than the known values or outside the control limits indicate a need to check the instruments or procedures used.

Results in Table A-1 were obtained through participation in the environmental sample crosscheck program administered by Environmental Resources Associates, serving as a replacement for studies conducted previously by the U.S. EPA Environmental Monitoring Systems Laboratory, Las Vegas, Nevada.

Table A-2 lists results for thermoluminescent dosimeters (TLDs), via International Intercomparison of Environmental Dosimeters, when available, and internal laboratory testing.

Table A-3 lists results of the analyses on in-house "spiked" samples for the past twelve months. All samples are prepared using NIST traceable sources. Data for previous years available upon request.

Table A-4 lists results of the analyses on in-house "blank" samples for the past twelve months. Data for previous years available upon request.

Table A-5 lists REMP specific analytical results from the in-house "duplicate" program for the past twelve months. Acceptance is based on the difference of the results being less than the sum of the errors. Complete analytical data for duplicate analyses is available upon request.

The results in Table A-6 were obtained through participation in the Mixed Analyte Performance Evaluation Program.

Results in Table A-7 were obtained through participation in the environmental sample crosscheck program administered by Environmental Resources Associates, serving as a replacement for studies conducted previously by the Environmental Measurement Laboratory Quality Assessment Program (EML).

Attachment A lists the laboratory precision at the 1 sigma level for various analyses. The acceptance criteria in Table A-3 is set at  $\pm 2$  sigma.

Out-of-limit results are explained directly below the result.

Attachment A

ACCEPTANCE CRITERIA FOR "SPIKED" SAMPLES

LABORATORY PRECISION: ONE STANDARD DEVIATION VALUES FOR VARIOUS ANALYSES<sup>a</sup>

Analysis	Level	One standard deviation for single determination
Gamma Emitters	5 to 100 pCi/liter or kg > 100 pCi/liter or kg	5.0 pCi/liter 5% of known value
Strontium-89 <sup>b</sup>	5 to 50 pCi/liter or kg > 50 pCi/liter or kg	5.0 pCi/liter 10% of known value
Strontium-90 <sup>b</sup>	2 to 30 pCi/liter or kg > 30 pCi/liter or kg	5.0 pCi/liter 10% of known value
Potassium-40	$\geq 0.1$ g/liter or kg	5% of known value
Gross alpha	$\leq 20$ pCi/liter > 20 pCi/liter	5.0 pCi/liter 25% of known value
Gross beta	$\leq 100$ pCi/liter > 100 pCi/liter	5.0 pCi/liter 5% of known value
Tritium	$\leq 4,000$ pCi/liter > 4,000 pCi/liter	$\pm 1\sigma =$ $169.85 \times (\text{known})^{0.0933}$ 10% of known value
Radium-226,-228	$\geq 0.1$ pCi/liter	15% of known value
Plutonium	$\geq 0.1$ pCi/liter, gram, or sample	10% of known value
Iodine-131, Iodine-129 <sup>b</sup>	$\leq 55$ pCi/liter > 55 pCi/liter	6 pCi/liter 10% of known value
Uranium-238, Nickel-63 <sup>b</sup>	$\leq 35$ pCi/liter > 35 pCi/liter	6 pCi/liter 15% of known value
Technetium-99 <sup>b</sup>		
Iron-55 <sup>b</sup>	50 to 100 pCi/liter > 100 pCi/liter	10 pCi/liter 10% of known value
Other Analyses <sup>b</sup>	---	20% of known value

<sup>a</sup> Liquid sample results are reported in pCi/Liter, air filters( pCi/filter), charcoal (pCi/m<sup>3</sup>), and solid samples (pCi/g).<sup>b</sup> Laboratory codes as follows: W (water), MI (milk), AP (air filter), SO (soil), VE (vegetation), CH (charcoal canister), F (fish).<sup>c</sup> Results are based on single determinations.<sup>d</sup> Control limits are established from the precision values listed in Attachment A of this report, adjusted to ± 2σ.

NOTE: For fish, Jello is used for the Spike matrix. For Vegetation, cabbage is used for the Spike matrix.

<sup>a</sup> Liquid sample results are reported in pCi/Liter, air filters( pCi/filter), charcoal (pCi/charcoal canister), and solid samples (pCi/kg).<sup>b</sup> I-131(G); iodine-131 as analyzed by gamma spectroscopy.<sup>c</sup> Activity reported is a net activity result. For gamma spectroscopic analysis, activity detected below the LLD value is not reported.

Note: Duplicate analyses are performed on every twentieth sample received in-house. Results are not listed for those analyses with activities that measure below the LLD.

<sup>a</sup> Results are reported in units of pCi/L, except for air filters (pCi/Filter), food products, vegetation, soil, sediment (pCi/g).

<sup>b</sup> Analysis was repeated, result of reanalysis: 4.83 ± 0.29 pCi/L.

<sup>a</sup> Results obtained by Environmental, Inc., Midwest Laboratory as a participant in the Department of Energy's Mixed Analyte Performance Evaluation Program, Idaho Operations office, Idaho Falls, Idaho

<sup>b</sup> Results are reported in units of Bq/kg (soil), Bq/L (water) or Bq/total sample (filters, vegetation).

<sup>c</sup> Laboratory codes as follows: STW (water), STAP (air filter), STSO (soil), STVE (vegetation).

<sup>d</sup> MAPEP results are presented as the known values and expected laboratory precision (1 sigma, 1 determination) and control limits as defined by the MAPEP. A known value of "zero" indicates an analysis was included in the testing series as a "false positive". MAPEP does not provide control limits.

<sup>a</sup> Results obtained by Environmental, Inc., Midwest Laboratory as a participant in the crosscheck program for proficiency testing administered by Environmental Resources Associates, serving as a replacement for studies conducted previously by the Environmental Measurements Laboratory Quality Assessment Program (EML).

<sup>b</sup> Laboratory codes as follows: STW (water), STAP (air filter), STSO (soil), STVE (vegetation).

<sup>c</sup> Unless otherwise indicated, the laboratory result is given as the mean ± standard deviation for three determinations.

<sup>d</sup> Results are presented as the known values, expected laboratory precision (1 sigma, 1 determination) and control limits as provided by ERA. A known value of "zero" indicates an analysis was included in the testing series as a "false positive". Control limits are not provided.

<sup>e</sup> Analysis was repeated using total dissolution. Results of the reanalysis,

U-233/234: 1137 ± 254 pCi/kg, U-238: 1193 ± 116 pCi/kg, Total Uranium: 2379 ± 254 pCi/kg.

APPENDIX B

DATA REPORTING CONVENTIONS

## Data Reporting Conventions

- 1.0. All activities, except gross alpha and gross beta, are decay corrected to collection time or the end of the collection period.

### 2.0. Single Measurements

Each single measurement is reported as follows:  $x \pm s$   
where:  $x$  = value of the measurement;  
 $s = 2\sigma$  counting uncertainty (corresponding to the 95% confidence level).

In cases where the activity is less than the lower limit of detection  $L$ , it is reported as:  $< L$ ,  
where  $L$  = the lower limit of detection based on  $4.66\sigma$  uncertainty for a background sample.

### 3.0. Duplicate analyses

If duplicate analyses are reported, the convention is as follows. :

- 3.1. Individual results: For two analysis results;  $x_1 \pm s_1$  and  $x_2 \pm s_2$   
Reported result:  $x \pm s$ ; where  $x = (1/2)(x_1 + x_2)$  and  $s = (1/2) \sqrt{s_1^2 + s_2^2}$
- 3.2. Individual results:  $< L_1, < L_2$       Reported result:  $< L$ , where  $L$  = lower of  $L_1$  and  $L_2$
- 3.3. Individual results:  $x \pm s, < L$       Reported result:  $x \pm s$  if  $x \geq L$ ;  $< L$  otherwise.

### 4.0. Computation of Averages and Standard Deviations

- 4.1 Averages and standard deviations listed in the tables are computed from all of the individual measurements over the period averaged; for example, an annual standard deviation would not be the average of quarterly standard deviations. The average "x" and standard deviation "s" of a set of n numbers  $x_1, x_2 \dots x_n$  are defined as follows:

$$\bar{x} = \frac{1}{n} \sum x \quad s = \sqrt{\frac{\sum (x - \bar{x})^2}{n-1}}$$

- 4.2 Values below the highest lower limit of detection are not included in the average.
- 4.3 If all values in the averaging group are less than the highest LLD, the highest LLD is reported.
- 4.4 If all but one of the values are less than the highest LLD, the single value x and associated two sigma error is reported.
- 4.5 In rounding off, the following rules are followed:
- 4.5.1. If the number following those to be retained is less than 5, the number is dropped, and the retained numbers are kept unchanged. As an example, 11.443 is rounded off to 11.44.
- 4.5.2. If the number following those to be retained is equal to or greater than 5, the number is dropped and the last retained number is raised by 1. As an example, 11.445 is rounded off to 11.45.

APPENDIX C

Maximum Permissible Concentrations  
of Radioactivity in Air and Water  
Above Background in Unrestricted Areas

Table C-1. Maximum permissible concentrations of radioactivity in air and water above natural background in unrestricted areas<sup>a</sup>.

	Air (pCi/m <sup>3</sup> )		Water (pCi/L)
Gross alpha	$1 \times 10^{-3}$	Strontium-89	8,000
Gross beta	1	Strontium-90	500
Iodine-131 <sup>b</sup>	$2.8 \times 10^{-1}$	Cesium-137	1,000
		Barium-140	8,000
		Iodine-131	1,000
		Potassium-40 <sup>c</sup>	4,000
		Gross alpha	2
		Gross beta	10
		Tritium	$1 \times 10^6$

<sup>a</sup> Taken from Table 2 of Appendix B to Code of Federal Regulations Title 10, Part 20, and appropriate footnotes. Concentrations may be averaged over a period not greater than one year.

<sup>b</sup> Value adjusted by a factor of 700 to reduce the dose resulting from the air-grass-cow-milk-child pathway.

<sup>c</sup> A natural radionuclide.

## APPENDIX D

### SUMMARY OF THE LAND USE CENSUS

## Appendix D

### Summary of the Land Use Census

The Duane Arnold Energy Land Use Census for 2010 was completed during September of 2010. All milk animals, residences and gardens greater than 500 square feet were identified within three miles for each of the 16 meteorological sectors. If none were identified within the three mile range, additional surveys were performed out to a distance of five miles.

The Cedar River was surveyed by boat on July 21<sup>st</sup>, 2010 for water use downstream of the DAEC to Cedar Rapids. This survey identified no new usages of river water from previous surveys. Irrigation at the strawberry farm in Palo has been discontinued. Recreational fishing is the only identified food pathway use of Cedar River water between the DAEC and the City of Cedar Rapids eight miles down-river.

There were 75 vegetable gardens identified during the performance of the 2010 Census. This number is less than the number of gardens found in the 2009 survey by two. In the sector towards the Southwest, the distance to the nearest vegetation receptor changed from 4370 meters to 4380 meters. There were no other changes to the locations of the nearest vegetable receptors.

There were no changes in the observed milk animal or cattle locations within the 3 mile radius of the plant in the past year.

The locations of the nearest residence for each sector remained the same as 2009. In 2010, only three new homes were constructed within three miles of the DAEC.

Since the last performance of the land use census, a new drinking water well has been identified within a two mile radius of the site. The well is located 3,200 meters towards the West-North-West. The well is (hydrologically) up-gradient of the site. There were no other new land use or water use activities that could affect the Site Hydrogeological Conceptual Model.

In accordance with the DAEC's Environmental Sampling Procedure ESP 4.4, "Land Use Census", no changes in land use were identified that would adversely affect the safe operation of the DAEC, or that would warrant an update of the DAEC Updated Final Safety Analysis Report (UFSAR). Examples of land use that would warrant an UFSAR update include new hazards near the DAEC such as new gas pipelines or new installations utilizing toxic gases.

NextEra Energy Resources, Duane Arnold has committed to compliance with NEI 07-07, "Nuclear Energy Institute's Industry Ground Water Protection Initiative: Per NEI 07-07, the following information is presented:

- Per Objectives 2.2 and 2.4, there were no on-site leaks or spills that warranted notification of state or local officials or other local stakeholders.
- No radioactive reactor by-product material was identified in samples taken by the DAEC's Radiological Environmental Monitoring Program (REMP) above the threshold concentration levels for reporting.

## APPENDIX E

### ANNUAL RADIATION DOSE ASSESSMENT

## Appendix E

### Annual Radiation Dose Assessment

The annual offsite radiation dose to a member of the public was determined by assessment of environmental dosimetry results and by calculations based on monitored effluent releases.

#### Section A.                  Dose Contribution from Direct Radiation

Direct radiation dose from the operation of the DAEC was reported by TLDs placed at locations in the surrounding environment as described in the Offsite Dose Assessment Manual (ODAM).

1. Pre-operational and 2010 TLD results were evaluated with a paired difference statistical test. The evaluation concluded that there were no significant differences in the TLD populations for the 0.5 mile and 1 mile TLD populations.
2. As stated in Part 1 of this report, no plant effect was indicated by the TLDs when dose results were compared to the estimated average natural background for Middle America.

#### Section B.                  Estimated Offsite Dose from Effluent Releases

- The contribution of dose to a member of the public most likely to be exposed from liquid and gaseous effluent releases was calculated using the Meteorological Information and Dose Assessment System (MIDAS) computer program in accordance with the ODAM. The calculation methods follow those prescribed by Regulatory Guide 1.109, "Calculation of Annual Doses to Man from Routine Releases of Reactor Effluents for the Purpose of Evaluating Compliance with 10 CFR Part 50, Appendix I".
- Following calculation of offsite doses, the appropriateness of REMP sampling station types and locations was reviewed. The current sampling scheme was determined to be more than adequate for the identified receptors.

**Results of the MIDAS dose calculations are displayed below.**

1. The hypothetical maximally exposed organ due to liquid effluents was the liver of a child with an estimated dose equivalent of 0.00000229 mrem.
2. The whole body dose equivalent to the hypothetical maximally exposed individual due to liquid effluents was 0.00000229 mrem.
3. The maximum dose to air at the site boundary from noble gases released was 0.000541 mrad from gamma radiation at 1,257 meters towards the North-North-West.
4. The maximum dose to air at the site boundary from noble gases released was 0.000647 mrad beta radiation at 1,257 meters towards the North-North-West.
5. The whole body dose equivalent to the hypothetical maximally exposed individual from noble gases was 0.000320 mrem, at 805 meters towards the West.
6. The skin dose equivalent to the hypothetical maximally exposed individual from noble gases was 0.000650 mrem, at 805 meters towards the West.
7. The hypothetical maximally exposed organ due to airborne iodines and particulates with half-lives greater than eight days was the thyroid of a child at 805 meters to the West, with an estimated dose equivalent of 0.00636 mrem.

## **Carbon14**

The estimate of gaseous carbon-14 (C-14) released from the Duane Arnold Energy Center was derived using guidance from the EPRI document, "Estimation of Carbon-14 in Nuclear Power Plant Gaseous Effluents", Report 1021106, issued December 2010. The total amount of C-14 released in 2010 was estimated to be 8.17 Curies.

Using the dose calculation methodology from Regulatory Guide 1.109, the resultant maximally exposed receptor organ from C-14 is the bone of a child, located 1.5 miles to the West-South-West of the site. The dose is 9.8E-02 mrem. (0.098 mrem).

### **Conclusion:**

No measurable dose due to the operation of the DAEC was detected by environmental TLDs in 2009. The calculated doses are below the regulatory limits stated in Appendix I to 10 CFR 50 and in 40 CFR 190.

## **Estimated Maximum Offsite Individual Doses for 2010**

Type	Age Group	Distance (meters)	Direction	Dose or Dose Equivalent (mrem)	Annual 10 CFR 50, Appendix I "Limit"
<b>Direct Radiation (as measured by TLDs)</b>				None	*
<b>Liquid Releases</b>					
Whole Body Dose	Child		S	0.00000229 mrem	3 mrem
Organ Dose	Child - Liver		S	0.00000229 mrem	10 mrem
<b>Noble Gas</b>					
Gamma Air Dose		1,257	NNW	0.000541 mrad	10 mrad
Beta Air Dose		1,257	NNW	0.000647 mrad	20 mrad
Whole Body	All	805	W	0.000320 mrem	5 mrem
Skin	Child	1,620	NNW	0.000650 mrem	15 mrem
<b>Particulates &amp; Iodines</b>					
Organ Dose	Child – Thyroid	805	W	0.00636 mrem	15 mrem
<b>Carbon 14</b>					
Organ Dose	Child – Bone	2,470	WSW	0.098 mrem	15 mrem

\*

There is no Appendix I limit for direct radiation. It is listed here to demonstrate compliance with 40 CFR 190 limits of 25 mrem whole body and 75 mrem thyroid.

## **1.0 INTRODUCTION**

The following constitutes a supplement to the Annual Report for the Radiological Environmental Monitoring Program conducted at the Duane Arnold Energy Center, Palo, Iowa in 2010. Results of completed analyses are presented in the attached tables.

For information regarding sampling locations, type and frequency of collection, and sample codes, please refer to Part I, Tables 5.3 - 5.5 and Figures 5.1 and 5.2.

All concentrations, except gross beta and airborne iodine, are decay corrected to the time of collection. Airborne I-131 is decayed to the midpoint of the collection period.

The required values for lower limits of detection (LLD) for gamma emitting isotopes are established through the Offsite Dose Assessment Manual (ODAM). Naturally occurring radioisotopes, such as Be-7, K-40 and Ra daughters, are frequently detected, but may not be listed for every sample medium.

## 2.0 PROGRAM DEVIATIONS

---

Sample Type	Analysis	Location(s)	Collection Date or Period	Comments
AP/AI	Gross Beta Gamma	D-15	02-04-10	No particulates found deposited on filter.
P	Gamma	D-16	2-25-10	Required limits of detection not met due to insufficient sample volume.
AP/AI	Gross Beta Gamma	D-7	05-13-10	Partial sample, 77 m3, due to faulty line cord.
MI	I-131, Gamma	D-108	06-15-10	Sample damaged and lost in transit.
MI	I-131, Gamma	D-110	06-15-10	Sample damaged and lost in transit.
AP/AI	Gross Beta Gamma	D-6	08-05-10 to 09-02-10	No sample due to construction
AP/AI	Gross Beta Gamma	D-7	08-12-10	Partial sample, 85 m3, due to faulty line cord.
AP/AI	Gross Beta Gamma	D-15	09-30-10	Partial sample, 205 m3, due to power outage.
