#### MATERIALS LICENSE

Amendment No. 84

Pursuant to the Atomic Energy Act of 1954, as amended, the Energy Reorganization Act of 1974 (Public Law 93-438), and Title 10, Code of Federal Regulations. Chapter 1, Parts 30, 31, 32, 33, 34, 35, 39, 40 and 70, and in reliance on statements and representations heretofore made by the licensee, a license is hereby issued authorizing the licensee to receive, acquire, possess, and transfer hyproduct, source, and special nuclear material designated below; to use such material for the purposets) and at the place(s) designated below; to deliver or transfer such material to persons authorized to receive it in accordance with the regulations of the applicable Part(s). This license shall be deemed to contain the conditions specified in Section 183 of the Atomic Energy Act of 1954, as amended, and is subject to all applicable rules, regulations and orders of the Nuclear Regulatory Commission now or hereafter in effect and to any conditions specified below.

#### CONDITIONS

B. Notwithstanding Paragraph A of this Condition, sealed sources designed to emit alpha particles shall be tested for leakage and/or contamination at intervals not to exceed 3 months.

からのはまないとのできる からないのかいかん

- C. In the absence of a certificate from a transferor indicating that a test has been made within six months prior to the transfer, a sealed source or detector cell received from another person shall not be put into use until tested.
- D. Each sealed source fabricated by the licensee shall be inspected and tested for construction defects, leakage, and contamination prior to any use or transfer as a sealed source.
- E. Sealed sources and detector cells need not be leak tested if:
  - (i) they contain only hydrogen 3; or
  - (ii) they contain only a gas; or
  - (iii) the half-life of the isotope is 30 days or less; or
  - (iv) they contain not more than 100 microcuries of beta and/or gamma emitting material or not more than 10 microcuries of alpha emitting material; or
  - (v) they are not designed to emit alpha particles, are in storage, and are not being used. However, when they are removed from storage for use or transfer to another person, and have not been tested within the required leak test interval, they shall be tested before use or transfer. No sealed source or detector cell shall be stored for a period of more than 10 years without being tested for leakage and/or contamination.
- F. The test shall be capable of detecting the presence of 0.005 microcurie of radioactive material on the test sample. Records of leak test results shall be kept in units of microcuries and shall be maintained for inspection by the Commission. If the test reveals the presence of 0.005 microcurie or more of removable contamination, a report shall be filed with the U.S. Nuclear Regulatory Commission and the source shall be removed from service and decontaminated, repaired, or disposed of in accordance with Commission regulations. The report shall be filed within 5 days of the date the leak test result is known with the U.S. Nuclear Regulatory Commission, Region I, ATTN: Chief, Nuclear Materials Safety Branch, 475 Allendale Road, King of Prussia, Pennsylvania 19406. The report shall specify the source involved, the test results, and corrective action taken.
- G. The licensee is authorized to collect leak test samples for a /sis by the licensee. Alternatively, tests for leakage and/or contaminat a may be performed by persons specifically licensed by the Commission or an Agreement State to perform such services.

#### CONDITIONS

- 16. In lieu of using the conventional radiation caution colors (magenta or purple on yellow background) as provided in 10 CFR 20.203(a)(1), the licensee is hereby authorized to label detector cells and cell baths, containing licensed material and used in gas chromatography devices, with conspicuously etched or stamped radiation caution symbols.
- 17. Detector cells containing a titanium tritide foil or a scandium tritride foil shall only be used in conjunction with a property operating temperature control mechanism which prevents foil temperatures from exceeding that specified by the manufacturer.
- 18. The licensee shall conduct a physical inventory every 6 months to account for all sources and/or devices received and possessed under the license. Records of inventories shall be maintained for 5 years from the date of each inventory.
- 19. The licensee shall not acquire licensed material in a sealed source or in a device that contains a sealed source unless the source or device has been registered with the Nuclear Regulatory Commission under 10 CFR 32.210 or with an Agreement State.
- 20. The licensee may transport licensed material in accordance with the provisions of 10 CFR 71, "Packaging and Transportation of Radioactive Material."
- 21. The licensee shall maintain and execute the response measure of his Radiological Emergency Contingency Plan submitted to the Commission on March 28, 1990. The licensee shall also maintain procedures as necessary to implement the plan. The licensee shall make no change in his Radiological Emergency Contingency Plan that would decrease the response effectiveness of the plan without prior Commission approval as evidenced by license amendment. The licensee may make changes to his Radiological Emergency Contingency Plan without prior Commission approval if the changes do not decrease the response effectiveness of the plan, and shall maintain records of changes that are made to the plan without prior approval for period of two years from the date of the changes and shall furnish the Chief, Nuclear Materials Safety Branch, Division of Radiation Safety and Safeguards, U.S. Nuclear Regulatory Commission, Region I, 475 Allendale Road, King of Prussia, Pennsylvania 19406, a report containing a description of each change within six months after the change is made.
- 22. The licensee is authorized to hold radioactive material with a physical half-life of less than 65 days and sulfur-35, scandium-46, strontium-85, and tin-113 for decay-in-storage before disposal in ordinary trash provided:
  - A. Radioactive waste to be disposed of in this manner shall be held for decay a minimum of 10 half-lives.
  - B. Before disposal as normal waste, radioactive waste shall be surveyed to determine that its radioactivity cannot be distinguished from background. All radiation labels shall be removed or obliterated.

B. R. Squibb & Sons, Inc. ATTN: Larry Gaines One Squibb Drive P. O. Box 191 New Brunswick, New Jersey 08903-0191

Dear Mr. Gaines:

Please find enclosed an amendment to your NRC Material License.

Please review the enclosed document carefully and be sure that you understand all conditions. If there are any errors or questions, please notify the Region I Material Licensing Section, (215) 337-5093, so that we can provide appropriate corrections and answers.

Please be advised that you must conduct your program involving licensed radioactive materials in accordance with the conditions of your NRC license, representations made in your license application, and NRC regulations. In particular, please note the items in the enclosed, "Requirements for Materials Licensees."

Since serious consequences to employees and the public can result from failure to comply with NRC requirements, the NRC expects licensees to pay meticulous attention to detail and to achieve the high standard of compliance which the NRC expects of its licensees.

You will be periodically inspected by NRC. A fee may be charged for inspections in accordance with 10 CFR Part 170. Failure to conduct your program safely and in accordance with NRC regulations, license conditions, and representations made in your license application and supplemental correspondence with NRC will result in prompt and vigorous enforcement action against you. This could include issuance of a notice of violation, or in case of serious violations, an imposition of a civil penalty or an order suspending, modifying or revoking your license as specified in the General Policy and Procedures for NRC Enforcement Actions, 10 CFR Part 2, Appendix C.

-2

We wish you success in operating a safe and effective licensed program.

Sincerely,

Original Signed By: Francis M. Costello

Francis M. Costello, Chief Research, Development and Decommissioning Section Division of Radiation Safety and Safeguards

### **AMENDMENT REQUEST**

Dear Mr. Demitriadis:

As discussed, attached is the additional information you had requested concerning the Bristol-Myers Squib amendment request dated December 11, 1990, the NRC information request (Docket No. 030-05222; Control No. 114080) and the Bristol-Myers Squibb response dated, March 23, 1992.

Sincerely,

Danlel K. Balkunow Radiation Safety Officer

MAY 1 3 1992

# NRC Request A. (February 18, 1992):

A brief statement of why the increase is necessary. The particular isotopes which necessitate the increase should be stated. The volume of contaminated waste to be produced should be estimated.

# Response (March 23, 1992):

It will enable us to include five additional radionuclides that produced from 300-500 ft<sup>3</sup> of low-level radioactive waste annually in the storage and decay process. These nuclides are essential in our research and development operation. They include:

Nuclide	T'A
<sup>35</sup> S	87 days
<sup>46</sup> Sc	83.8 days
<sup>85</sup> Sr	65.2 days
88 <b>Y</b>	106.6 days
<sup>113</sup> Sn	115 days

Future R&D projects most likely will include other nuclides that would fall within the 65- to 120-day T1/2 time frame.

### Additional information on last point of response to NRC Request A (May 8, 1992):

Listed below is the projected amount of waste by the number of drums of all categories that could possibly be stored in an interim waste storage facility. These numbers are extremely conservative and the actual numbers will be dependent upon:

- The overall continued expansion of radioactive material users
- Revision of the storage and decay program to include radionuclides with half lives of 65 days to 120 days
- Limited access to a disposal facility for some categories of waste
- Federal, state and local regulatory pressures

BRISTOL-MYERS SQUIBB RADIOACTIVE WASTE GENERATION Projection for 1993 through 1998 Number of 85-Gallon Drums							
Waste Category	1993	1994	1995	1996	1997	1998	
Dry Waste	137	150	161	169	176	184	
Absorbed Liquid	137	150	161	169	176	184	
Animal Carcasses	231	252	273	285	297	311	
Aqueous Vlais	5 ·	. 5	5	. 6	в	6	
Total Drums Per Year	510	557	600	629	655	685	
Cumulative Total Drums	5 o <b>510</b> o 🐔	1069	1871	2302	2960	3648	

# NRC Request D. (February 18, 1992):

A description of the instrumentation and the monitoring procedure that will be used to determine that the waste is free of radioactive contamination at the end of the storage period. This must include an explicit statement of the MDA which will be achieved.

# Response (March 23, 1992):

The instrumentation used to determine that the waste is free of radioactive contamination will be the most sensitive detector that is designed for the measurement or detection of the types of radiation associated with the radioactive waste being held for decay.

After 10 or more half lives have occurred, the waste will be removed from storage, the waste container opened and the contents will be monitored for residual contamination in a low background area.

If any detectable activity above background is noted, the radioactive material and generator will be identified, the waste repackaged and returned to storage.

# Additional information (May 8, 1992):

The detectors/monitoring equipment that will be used to monitor for residual contamination will have an MDA/LLD sensitive enough to detect and comply with the recommended "Beta Gamma" contamination levels described in Table 1 of the NRC "Guidelines for decontamination of facilities and equipment prior to release for unrestricted use or termination of licenses for byproduct, source or special nuclear material."

Examples of detectors/equipment and anticipated MDA/LLD that will be used for final surveys are as follows:

DIRE	CT SURVEY INSTRUMENTA	ATION
Type of Radiation	Instrumentation*	Anticipated MDA/LLD
Low Energy ß (S35)	Eberline HP100A gas proportional	800 dpm/100 cm <sup>2</sup>
Low Energy γ (I <sup>125</sup> )	Eberline LEG-1	5000 dpm/100 cm <sup>2</sup>
Medium to High Energy $\gamma$ ( $1^{131}$ , Sn $^{113}$ )	HP210 Pancake	5000 dpm/100 cm <sup>2</sup>
Medium to High Energy γ (I <sup>131</sup> , Sn <sup>113</sup> )	μR meter	10 <i>μ</i> R/hr
REMOV	ABLE SURVEY INSTRUMEN	TATION
Low Energy β/γ (S <sup>35</sup> , I <sup>125</sup> )	Liquid Scintillation Counter	25 dpm/100 cm <sup>2</sup>
Medium to High Energy Y	Solid Scintillator or Pancake Probe	100 dpm/100 cm <sup>2</sup>

NECEINED-BECION IN

OFFICIAL RECORD COPY ML 10

7/4080

# NRC Request A.:

A brief statement of why the increase is necessary. The particular isotopes which necessitate the increase should be stated. The volume of contaminated waste to be produced should be estimated.

# Response:

As you are aware, we are currently authorized by the NRC to hold radioactive materials with a physical half life of < 65 days for decay in storage before disposal in ordinary trash, provided: (1) material is held for a minimum of 10 half lives; (2) it is surveyed and found it to be less than background; (3) all radiation labels are removed or obliterated; and (4) records are maintained of the final survey results.

The State of New Jersey has also authorized us to hold radioactive material with a physical half life of < 300 days for decay in storage before disposal as ordinary trash under the same conditions identified above by the NRC.

- (1) We wish to include radioactive materials with physical half lives of ≤ 120 days in our storage and decay program for the following reasons:
  - There will be no approved burial site in the State of New Jersey or our Compact for disposal of radioactive waste beginning January 1, 1993.
  - The three existing disposal sites will no longer be available to radioactive waste generators outside their Compacts and/or States in which the burial sites reside.
  - To significantly reduce the amount of space necessary during the interim storage period.
  - To reduce the volume of radioactive waste that will be stored during the interim storage period.
  - It will enable us to include five additional radionuclides that produced from 300-500 ft<sup>3</sup> of low-level radioactive waste annually in the storage and decay process. These nuclides are essential in our research and development operation. They include:

<u>Nuclide</u>	11/2
<sup>35</sup> S	87 days
<sup>46</sup> Sc	83.8 days
<sup>85</sup> Sr	65.2 days
88 <sub>Y</sub>	106.6 days
<sup>113</sup> Sn	115 days

Future R&D projects most likely will include other nuclides that would fall within the 65-to 120-day T½ time frame.

### NRC Request B.:

A copy of the instructions which will be provided to employees concerning the segregation of radioactive waste. These procedures shall provide a high degree of assurance that long-lived isotopes will not be included with those of shorter half-life and will be adequate to assure that the waste is properly labelled or identified, especially with regard to isotope.

#### Response:

Attached is an operating procedure designed to provide guidance to employees who will generate waste which must be segregated by form and half life (T½) [see Attachment 1].

#### NRC Request C.:

A description of the records that will be maintained and/or the labelling that will be used to track and identify the waste as it is placed in storage and removed for disposal.

#### Response:

All containers that are to be placed in interim storage will be labelled and identified with the following information:

- a) Isotope
- b) Activity in millicuries
- c) Date
- d) Half life of radionuclide(s) the container holds
- e) Date placed in storage (may be the same as c)
- 1) All containers will be marked with conventional radioactive warning labels
- Identification number or bar code

Radioactive waste placed in storage will be identified by drum number, waste form and any other information that might be needed for tracking purposes. This information will be maintained in some type of log, be it a computer data acquisition system or an actual book.

#### NRC Request D.:

A description of the instrumentation and the monitoring procedure that will be used to determine that the waste is free of radioactive contamination at the end of the storage period. This must include an explicit statement of the MDA which will be achieved.

### Response:

The instrumentation used to determine that the waste is free of radioactive contamination will be the most sensitive detector that is designed for the measurement or detection of the types of radiation associated with the radioactive waste.

After 10 or more half lives have occurred, the waste will be removed from storage, the waste container opened and the contents will be monitored for residual contamination in a low background area.

If any detectable activity above background is noted, the radioactive material and generator will be identified, the waste repackaged and returned to storage.

#### **NRC Request E.:**

A description of the containers in which the waste will be stored and an evaluation that they are appropriate to the waste form and are likely to survive the proposed storage interval.

#### Response:

All containers used for the storage of this radioactive waste will be DOT 17H steel containers with standard 7A specification. In order to maintain the life expectancy of the containers, they will be stored in an environment whose temperature and humidity are regulated to avoid the extremes of these parameters.

#### NRC Request F.:

A description of the storage facility, including security and fire protection features and data, demonstrating that it is large enough to hold the expected volume of waste for a reasonable time period into the future, and adequate to protect the waste containers from deterioration due to environmental conditions.

#### Response:

The facility will be a 14,000 sq. ft. single-story metal structure with the potential for future expansion. The building is located on the New Brunswick site. It has been designed to store raw waste forms for a period of seven years and will include volume reduction applications, including but not necessarily limited to a storage and decay program, compaction and segregation.

A fire protection system will be installed that will encompass the potential fire hazard associated with this particular type of waste and in accordance with NFPA and applicable New Jersey uniform construction codes.

Security of the building will be designed to limit access and egress of only authorized personnel. The proposed security monitoring system will be capable of providing surveillance when the building is not occupied.

All of the building areas that are to be inhabited by operational personnel will have a one-pass air system which will be exhausted through appropriate filters before being released into the general environment. The drum storage area will be equipped with an emergency auxiliary exhaust system that if necessary can be bypassed to provide a true one-pass recirculating system. In any mode, the ventilation system will exhaust to the general environment through appropriate filters.

All exhausted air from the building will be properly monitored to ensure all releases are in compliance with NRC regulatory requirements.

The temperature and humidity within the facility will be controlled to provide a comfortable level for operational personnel, while at the same time achieving a suitable environment appropriate for the long-term storage of various forms of radioactive waste, that will be stored in sealed radioactive waste storage container.

Remote area radiation monitors will be located throughout the facility where appropriate.

All activities involving the processing and storage of radioactive materials at this facility will be conducted in accordance with Bristol-Myers Squibb's radiation safety program, under the control of the Radiation Safety Officer and the Radiation Safety Committee.

#### I. PURPOSE

To provide a uniform procedure for the segregation of radioactive waste within designated parameters of half life.

#### II. RESPONSIBILITY

It is the responsibility of all generators to segregate their radioactive waste according to half life (T½) and waste form.

#### III. PROCEDURE

A. Segregate all radioactive waste with T½ less than a 120 days

Under no circumstances should radioactive waste with a half life greater than 120 days be combined with waste whose T½ is less than 120 days.

- B. Obtain the appropriate laboratory radioactive waste containers to hold the particular waste form (e.g., Category "R", "W", "L", etc.).
- C. If you intend to generate radioactive waste that could result in material with a T½ less than 120 days and T½ greater than 120 days, obtain a suitable number of containers to successfully achieve the segregation task.
- D. Add radioactive waste to the container(s) according to the procedure outlined for the particular waste form insuring that waste with a T½ less than 120 days is placed in containers designated for that particular half life and waste form.
- E. Record the radioactivity, date of disposal, isotope and half life on the Radioactive Waste Disposal Record Card(s).
- F. When full, properly seal and remove the container to the radioactive waste consolidation area.

# VI. WASTE CONSOLIDATION PROCEDURE

- A. Responsible waste consolidation personnel will accept the segregated waste if:
  - 1. The laboratory radioactive waste container used is appropriate.
  - 2. Waste material is in a sealed clear 4-mil plastic bag or other appropriate container.
  - 3. No mixed waste forms are evident.
  - 4. Radioactive Waste Disposal Record Card is properly and legibly completed and indicates that the T½ of the materials are within designated parameters.
  - 5. Lids are securely fit onto container.
  - 6. No surface of the laboratory radioactive waste container exceeds 30 mR/hr.
- B. If the container is found to be acceptable based upon above monitoring procedure, the responsible waste person will authorize the transfer of waste to the 55-gallon drum designated for the appropriate radioactive material half life (T½). Prior to transferring sealed bags, the room number from which the waste was generated must be recorded on the plastic liner or equivalent waste form container.
- C. The Radioactive Waste Disposal Record Card from each lab container must be removed from the 5-gallon cover and attached to the 55-gallon drum in which the waste is being discarded. Only nuclides with suitable half lives shall be placed into the same 55-gallon waste drum.
- D. When the 55-gallon drum is filled, the responsible waste person will transcribe the information from each lab container record card onto a final Waste Disposal Record Card attached to the cover of the 55-gallon drum. The amount of activity for each isotope may be totalled and transcribed as a single entry after allowing for <u>decay</u> to a common date (the date the drum is scheduled for shipment or placed in storage).

- E. Label each 5-gallon Radioactive Waste Disposal Record Card with the drum number of the 55-gallon waste container in which its contents were discarded.
- F. Place all Radioactive Waste Disposal Record Cards which were removed from the 5-gallon containers in an envelope and maintain on file.
- G. Secure the 55-gallon waste consolidation/container with a bolt and ring.
- H. Remove to a staging area in preparation for removal by a contractor, for further processing/compaction or for storage in the interim waste storage facility.

License No. 29-00139-02 Docket No. 030-05222 Control No. 114080

E. R. Squibb and Sons, Inc.
Squibb Institute for Medical Research
ATTN: Daniel K. Balkunow
Radiation Safety Officer
One Squibb Drive
P. O. Box 191
New Brunswick, New Jersey 08903-0191

Dear Mr. Balkunow:

This is in reference to your application dated December 11, 1990 to amend License No. 29-00139-02.

Please describe your procedures for your decay-in-storage program in more detail. We need some additional information before we can process your application.

Please describe the following:

- a. A brief statement of why the increase is necessary. The particular isotopes which necessitate the increase should be stated. The volume of contaminated waste to be produced should be estimated.
- b. A copy of the instructions which will be provided to employees concerning the segregation of radioactive waste. These procedures must provide a high degree of assurance that long-lived isotopes will not be included with those of shorter half-life and must be adequate to assure that the waste is properly labelled or identified, especially with regard to isotope.
- c. A description of the records that will be maintained and/or the labelling that will be used to track and identify the waste as it is placed in storage and removed for disposal.
- d. A description of the instrumentation and the monitoring procedure that will be used to determine that the waste is free of radioactive contamination at the end of the storage period. This must include an explicit statement of the MDA which will be achieved.

E. R. Squibb and Sons, Inc.

- e. A description of the containers in which the waste will be stored and an evaluation that they are appropriate to the waste form and are likely to survive the proposed storage interval,
- f. A description of the storage facility, including security and fire protection features and data, demonstrating that it is large enough to hold the expected volume of waste for a reasonable time period into the future, and adequate to protect the waste containers from deterioration due to environmental conditions.

We will continue our review upon receipt of this information. Please reply in duplicate to my attention at the Region I office and refer to Mail Control No. 114080. The reviewer for this licensing action is Anthony Dimitriadis. If you have any technical questions regarding this deficiency letter please call the reviewer at (215) 337-6953.

If we do not receive a reply from you within 30 calendar days from the date of this letter, we shall assume that you do not wish to pursue your application.

Sincerely,

Original Signed By: Francis M. Costello

RE: License Amendment License #29-00139-02

Dear Mr. Costello:

- 1) Dr. A. Tobia will no longer be a member of the Radiation Safety Committee and has been replaced by Mr. Robert Endries. Attached is Mr. Endries' biographical profile.
- 2) Ms. Christine M. Tuday, currently an alternate member of the Radiation Committee, will replace Dr. P. Fernandes on the Committee. Attached is Ms. Tuday's biographical profile.
- 3) Mr. William H. Gaylord III has been appointed as a member of the Radiation Safety Committee. Attached is Mr. Gaylord's biographical profile.
- Currently, E. R. Squibb & Sons is licensed to store and decay radionuclides with half lives of 65 days for a minimum of 10 half lives, monitor for any residual radioactivity and if acceptable, dispose of as normalicative trash. In order to aid in the future reduction of radioactive waste volume, it would be more advantageous to our operations if the 65 day half life radionuclide criteria was changed to include radionuclides with half lives of 120 days. Would you please amend our license to include radionuclides with half lives of 120 days.

114030

The current individual possession limit for Hydrogen-3 at Squibb's facilities in Lawrenceville, NJ and 675 College Road East, Princeton Forrestal Center, Plainsboro, NJ, is two curies. Please increase this limit from two to five curies (Part 6, Section E). In addition, please increase the "total possession" limit for these facilities from the current five to six curies (Part 6, Section D).

I trust this information is adequate and clear. Should you have any questions regarding the above requests, please contact me.

Included is a check for \$180.00 to cover the fee for the license amendment.

Daniel K. Balkunow

#### ACCOMPLISHMENTS

My microorganism isolation work has lead to the following Bristol-Myers Squibb anti-infective compounds for which patents are applied:

Scopularin Culpin No. 4,914,245 Peptifluorin Neopeptifluorin

#### OBJECTIVE

General Facility Administration and Research Administration management

#### SUMMARY

Five wars of thold; it creasing responsibility in Facilities work in transcription multiple departments providing services covering fifteen different locations. Financial control and management of services and supplies in excess of \$8 million, capital control in excess of \$1.5 million per year and manpower supervision of fifty. In addition, significant responsibilities include compliance with Federal, State and Local regulations covering nazardous waste disposal and medical waste disposal.

#### EXPERIENCE

BRISTOL-MYERS SOUIBB, Princeton, New Jersey. (tormerly Squibb Corporation)

1985 to Present

FACILITY SERVICES MANAGER
Worldwide Facilities Administration

March 1987 to Present

Facility and administrative management, expense and capital budget plepatation and financial control for services to Squipb world neadquarters and 19 satellite facilities. Services include Research Laboratory support, in-Plant printing and reprographics, In-Plant micrographics, inventory control for supply stores and hazardous waste disposal compliance and management. Responsible for the conduction of site approvals for disposal facilities, contract negotiations, insurance evaluations and assurance of Legal review.

RESEARCH SERVICES MANAGER

June 1985 to March 1987

Management of support services to Research and Development, including preparation of sterile culture media, sterile glassware, decontamination of pathological agents and glassware washing services. Provide consumable materials for research use through Research Supply Store. Supervision of 17 union employees.

STATE OF CONNECTICUT, Newtown, Connecticut. Fairfield Hills Hospital

1984 to 1985

#### PHYSICIAN ASSISTANT INTERNAL MEDICINE

Responsible for evaluation and treatment of acute and chronic medical problems in hospitalized patients. Performance of physical examinations, medical histories and evaluation of diagnostic tests under supervision of physician. Acted as infection control coordinator responsible for identification, treatment and prevention of infectious outbreaks in hospitalized population.

GUILFORD BOARD OF EDUCATION GUILIDIO Connecticus.
Guilford High School
