Fardane-

P.O. Box 1200, Green Bay, Wisconsin 54305

April 9, 1976

Mr. J. G. Keppler, Regional Director Office of Inspection & Enforcement Region III U. S. Nuclear Regulatory Commission 799 Roosevelt Road Glen Ellyn, Illinois 60137

Dear Mr. Keppler:

gulatory Docket File

Subject: Docket 50-305 Operating License DPR-43 Reportable Occurrence 76-7

The Kewaunee Plant design includes a dual containment concept. This dual containment consists of the primary containment vessel constructed of steel and the secondary containment including the shield building and the special ventilation zone within the auxiliary building. The Technical Specification 4.4 requires local leak rate test performed on the primary containment penetration and sets action levels for repair activities if certain criteria were exceeded. Provided the criteria is exceeded, penetration repair and retest is the required course of action.

The Kewaunee Plant containment vessel is very leak tight with an $L_a = 1140$ scfh or less than .016%/hr. If a leakage of 0.1 L_a is exceeded for leakage to the special ventilation zone, the penetration which caused the excessive leakage must be repaired and retested.

During the local leak rate tests performed at our recent refueling outage, penetrations found leaking on the order of 0.1 L_a were repaired and retested. No single penetration was discovered to be leaking to the extent that the specification action level was reached.

Upon completion of the local leak rate testing the measured leakages of all penetrations prior to any repair was computed. This totalization for the penetration to the special ventilation zone exceeded 0.1 L_a . The measured leakage to the special ventilation zone was 0.110 L_a prior to any repair activity. Since no single penetration contributed overwhelmingly to this leakage, no single component should be singled out as the cause for

4220

Mr. J. G. Keppler Page 2 April 9, 1976

exceeding the 0.1 L_a action level. With approximately fifty major penetrations to the Special Ventilation Zone, the allowable leak rate of 114 scfh is an extremely demanding requirement.

A report of the local leak test measurements will be provided in accordance with 10 CFR 50, Appendix J.

Please find attached a Licensee Event Report in regards to this matter.

Very truly yours,

E. W. James

Senior Vice President Power Supply & Engineering
