TELEGRAM

SENT 2:30PM

8/7/74

Mr. Dwane Boyd
Resident Inspector - Atomic Energy Commission
Directorate of Regulatory Operations Region III
Two Rivers Municipal Hospital
Two Rivers, Wisconsin

SUBJECT: Docket 50-305
Operating License DPR-43
Abnormal Occurrence Report

In accordance with the requirements of Technical Specifications, Paragraph 6.6.2.a, 1.0a.1.(b) and 3.3.b.2.A, we submit the following:

Report Number: 50-305/74-11

Occurrence Date: July 22, 1974 1540

Facility: Kewaunee Nuclear Power Plant
Kewaunee, Wisconsin

Identification of Occurrence: One fan coil unit out of service

Conditions Prior to Occurrence: Reactor Critical - 93% Power

Normal Operating Temperature 560°F
System Operating Pressure - 2226 psig

Description of Occurrence:

Control Operator attempted to open a service water return valve on one fan coil unit, from the control room. Valve would not open due to thermal overloads having opened the circuit preventing valve from opening. It was discovered that the installed heaters were too small, causing the thermal overloads. The Tech. Spec. requirement (Para. 3.3.b.2.A) is to have the fan coil unit in operation within seven days. Larger heaters were in stock which were used to get the valve and fan coil unit back into service. The reason that the seven days was exceeded, was that the replacement of heaters was being done on a design change request and administrative procedures neglected to point out the seven day requirement. The fan coil was placed in service on August 6th.

cc: Mr. J. F. O'Leary - Director
Directorate of Licensing
