Surveillance testing during full power operation showed that one of two blowdown line containment isolation valves would not shut completely. This placed the facility under LCO TS 3.6.a. Supervisory review indicated valve operation difficulties occurred on 1/4/78. This same valve failed to shut fully again on 2/14/78 following adjustment of the packing gland. This valve has operated satisfactorily since being repaired. Since the other containment isolation valve remained fully operable throughout this period, there was no effect on plant operation or public safety.

Dry, hard packing caused the failure of this limitorquè operated valve by imposing excessive torque requirements on the operator. The valve was repacked and has operated satisfactorily during subsequent testing.
