License No.: DPR-35

Pilgrim Fuel Cycle 19, Core Operating Limits Report, Revision 31

LETTER NUMBER: 2.11.039

Dear Sir or Madam:

The enclosed revision of Pilgrim's Core Operating Limits Report (COLR) is submitted in accordance with the requirements of Pilgrim's Technical Specification 5.6.5. Revision 31 provides cycle-specific limits for operating Pilgrim during cycle 19.

This letter contains no new commitments.

Should you require further information concerning COLR, Revision 31, please contact me at (508) 830-8403.

Sincerely,

A handwritten signature in black ink, appearing to read "Joseph R. Lynch".

Joseph R Lynch

Licensing Manager

<u>Revision</u>	<u>Effective Date</u>	<u>Description</u>
8A	Effective date based on issuance of license amendment by NRC	Applicable for use during Cycle 8 Operation
9A	Effective date based on issuance of license amendment by NRC for ARTS and SAFER/GESTR	Applicable for use during Cycle 9 operation
10A	Effective date based on initial startup of Cycle 10	Applicable for use during Cycle 10 Operation
11A	Effective date based on initial startup of Cycle 11	Applicable for use during Cycle 11 Operation
11B	Effective upon final approval	Applicable for use during Cycle 11 Operation
11C	Effective upon final approval	Applicable for use during Cycle 11 Operation
11D	Effective upon final approval	Applicable for use during Cycle 11 Operation
12A	Effective date based on issuance of license amendment by NRC for SLMCPR of 1.08	Applicable for use during Cycle 12 Operation
12B	Effective upon final approval	Renumbered Table 3.3-2 to 3.3-1, Sh. 2 of 2 and Table 3.3-1 to 3.3-1, Sh. 1 of 2
12C	Effective upon final approval	Changed Tech Spec section numbers referenced due to Tech Amendment #177. Pages affected: 6, 24
12D	Effective upon final approval	Incorporated stability log-term solution option I-A.
13A	Effective upon final approval	Applicable for use during Cycle 13 Operation
14A	Effective upon final approval	Applicable for use during Cycle 14 Operation
15A	Effective upon final approval	Applicable for use during Cycle 15 Operation
15B	Effective upon final approval	Changed MAPLHGR Limits for GE14 fuel in response to an input error GE corrected.
16A	Effective upon final approval	Applicable for use during Cycle 15 Operation
16B	Effective upon final approval	Applicable for use during Cycle 16 Operation Core Loading Change to replace leaking fuel bundle JLG621. Clarified P-F Map graphic on P. 36. Applicable for use during Cycle 16 Operation
25	Effective upon final approval	Limits for Single Loop Operation were incorporated. Rev number scheme changed to Merlin Convention
26	Effective upon final approval	Applicable for use during Cycle 17 Operation
27	Effective upon final approval	Corrected typographical errors on p. 30, 34, 38, 39 per CR-PNP-2008-256 and 285
28	Effective upon final approval	Extended Tables 3.1-1 to 63.5 GWD/ST (70 GWD/MT), updated Fig. 3.1-1, section 3.1 & references, addressed CR-PNP-2009-01066
29	Effective upon final approval	Applicable for use during Cycle 18 Operation
30	Effective upon final approval	Applicable for use during Cycle 19 Operation
31	Effective upon final approval	Corrected typographical error on fig.3.4-1

**PILGRIM NUCLEAR POWER STATION  
PNPS CORE OPERATING LIMITS REPORT**

RTYPE: G4.02

**1.0 INTRODUCTION**

This report provides the cycle-specific limits for operation of the Pilgrim Nuclear Power Station (PNPS) during Cycle 19. In this report, Cycle 19 will be referred to as the present cycle.

Although this report is not a part of the PNPS Technical Specifications, the Technical Specifications refer to this report for the applicable values of the following fuel-related parameters:

	<u>Reference Technical Specification</u>
APRM Flux Scram Trip Setting (Run Mode)	Table 3.1.1
APRM Rod Block Trip Setting (Run Mode)	Table 3.2.C-2
Rod Block Monitor Trip Setting	Table 3.2.C-2
Average Planar Linear Heat Generation Rate	3.11.A
Linear Heat Generation Rate (LHGR)	3.11.B
Minimum Critical Power Ratio (MCPR)	3.11.C
Power/Flow Relationship	3.11.D
Reactor Vessel Core Design	4.2

If any of the core operating limits in this report is exceeded, actions will be taken as defined in the referenced Technical Specification.

The core operating limits in this report have been established for the present cycle using the NRC-approved methodology provided in the documents listed in Technical Specification 5.6.5. These limits are established such that the applicable limits of the plant safety analysis are met.

**1.1 Stability Option 1-D Exclusion Region and Buffer Zone.**

The reactor shall not be intentionally operated within the Exclusion Region given in Figure 3.4-1, for Two Loop Operation (TLO) and Figure 3.4-2 for Single Loop Operation (SLO). Immediate exit is required for inadvertent entry into the exclusion region.

The reactor shall not be intentionally operated within the Buffer Zone given in Figure 3.4-1 for TLO and Figure 3.4-2, for SLO when the on-line Stability Monitor is inoperable.

Allowable values for APRM Scram and Rod Block trip set points are defined in Section 2.

**PILGRIM NUCLEAR POWER STATION  
PNPS CORE OPERATING LIMITS REPORT**

RTYPE: G4.02

**2.0 INSTRUMENTATION TRIP SETTINGS:**

**2.1 APRM Flux Scram Trip Setting (Run Mode)**

Ref. Technical Specifications: Table 3.1.1

APRM flux scram Allowable Trip Set points (ATSP) for TLO are shown on Figure 2.1-1. The scram set point curve clamps power at 120% of rated core thermal power. Formulae used to develop Figure 2.1-1 are listed in Table 2.1-1.

APRM flux scram Allowable Trip Set points (ATSP) for SLO are shown on Figure 2.1-2, respectively. The scram set point curve clamps power at 120% of rated core thermal power. Formulae used to develop Figure 2.1-2 are listed in Table 2.1-2.

In accordance with Technical Specification Table 3.1.1, Note 15, for no combination of loop recirculation flow rate and core thermal power shall the APRM flux scram trip setting be allowed to exceed 120% of rated thermal power. Flow clamp feature is not used in Cycle 19.

**Drive Flow to Core Flow relationship:**

APRM Trip settings use Drive flow to determine the power trip setting for both scrams and rod blocks, as the drive flow is a more reliable flow indication than core flow. The analysis calculates the stability based trip settings based on Core Flow.

Drive Flow ( $W_D$ ) normalization with core flow shall be done such that 100% Drive Flow with Two Loops corresponds to 100% Rated Core Flow of 69 M#/hr.

## 2.2 APRM Rod Block Trip Setting (Run Mode)

Reference Technical Specifications: Table 3.2.C-2, 3.1.B.1

When the mode switch is in the RUN position, the Average Power Range Monitor (APRM) rod block Allowable Trip setting ( $ATSP_{RB}$ ) as a function of drive flow for Two Loop Operation shall be as given by Figure 2.2-1. The  $ATSP_{RB}$  is clamped at 115% of rated core thermal power. Formulae that form the basis of the Figure 2.2-1 are listed in Table 2.2-1. The flow clamp feature is not used in Cycle 19.

When the mode switch is in the RUN position, the Average Power Range Monitor (APRM) rod block Allowable Trip setting ( $ATSP_{RB}$ ) as a function of drive flow for Single Loop Operation shall be as given by Figure 2.2-2. The  $ATSP_{RB}$  is clamped at 115% of rated core thermal power. Formulae that form the basis of the Figures 2.2-2 are listed in Table 2.2-2. The flow clamp feature is not used in Cycle 19.

## 2.3 Rod Block Monitor Trip Setting

References:

Technical Specification Table 3.2.C-2, Ref. 5.15, Ref. 5.10 Table 4.5 (b)

Allowable values for the power-dependent Rod Block Monitor trip set points shall be:

Reactor Power, P (% of Rated)	Trip Set point (Allowable Value) (% of Reference Level)
$P \leq 25.9$	Not applicable (All RBM Trips Bypassed)
$25.9 < P \leq 62.0$	122
$62.0 < P \leq 82.0$	118
$82.0 < P$	113

The allowable value for the RBM downscale trip set point shall be  $\leq 94.0\%$  of the reference level. The RBM downscale trip is bypassed for reactor power  $\leq 25.9\%$  of rated (Technical Specification Table 3.2.C-1, Note 5). Analytical Value of Rod Block set point of 117% is justified as the Rod Withdrawal Error is expected to reduce MCPR by 0.28 if this set point is used. Since the minimum OLMCPR value is 1.49, a reduction of 0.28 in MCPR, starting with operation at OLMCPR, is expected to lower MCPR to 1.21. This is substantially above the Safety Limit MCPR of 1.08. Allowable value of the HTSP is set at 113 % to provide additional conservatism to account for uncertainties. Table 4-5(b) of Reference 5.10 with a more restrictive OLMCPR of 1.35 was used to determine the RBM set points with margin.

3.0 CORE OPERATING LIMITS

3.1 Maximum Average Planar Linear Heat Generation Rate (MAPLHGR)

Reference Technical Specification: 3.11.A

During power operation, MAPLHGR for each fuel type as a function of axial location and average planar exposure shall not exceed the applicable limiting value. The applicable limiting value for each fuel type is the smaller of the flow-dependent and power-dependent MAPLHGR limits, MAPLHGR<sub>F</sub> and MAPLHGR<sub>P</sub>. The flow-dependent MAPLHGR limit, MAPLHGR<sub>F</sub>, is the product of the MAPLHGR flow factor, MAPFAC<sub>F</sub>, shown in Figure 3.1-2 and the MAPLHGR for rated power and flow conditions, given in Tables 3.1-1 and 3.1-2 for GE14 and GNF2, respectively. The power-dependent MAPLHGR limit, MAPLHGR<sub>P</sub>, is the product of the MAPLHGR power factor, MAPFAC<sub>P</sub> in Figure 3.1-3 and the MAPLHGR limit for rated power and flow conditions, given in Tables 3.1-1 and 3.1-2.

MAPLHGR for rated power and flow conditions for the most limiting lattice in each fuel type (excluding natural uranium lattices) are presented in Figure 3.1-1.

MAPLHGR limits are based on ECCS-LOCA considerations. For each lattice type, the MAPLHGR values for rated power and flow conditions are listed in Tables 3.1-1 and 3.1-2, which are obtained from the Supplemental Reload Licensing Report (Ref. 5.15).

Pbypass is the power level below which more restrictive thermal limits are applied, as the Turbine Stop Valve closure and Turbine Control Valve fast closure scamps are assumed to be bypassed. It can be set anywhere in the range from 32.5% power to 45% power. Pbypass is currently set at 32.5% power. If this setting is changed in the future, then the appropriate thermal limits can be determined using Tables 3.1-1 and 3.1-2 with Figure 3.1-3.

When in Single Loop Operation, an SLO Multiplier of 0.8 for GE14 fuel and 0.89 for GNF2 fuel applies to the Rated MAPLHGR limit. At off rated conditions, MAPLHGR limit is the lower of the SLO Multiplier times the rated MAPLHGR limit, the MAPLHGR<sub>P</sub> or MAPLHGR<sub>F</sub>.

Per the GNF letter in Reference 5.22, the dashes on the MAPLHGR Tables in the SRLR indicate that no specific calculation of MAPLHGR limit was done at that point. Additionally, the limit value given for last exposure state point listed is applicable for higher exposures up to 63.5 GWD/ST (70 GWD/MT). This is consistent with LOCA analysis reports (References 5.3 and 5.21). As in previous cycle, 3D monicore is designed to apply the MAPLHGR limits consistent with this explanation.

**3.2 Linear Heat Generation Rate (LHGR)**

**Reference Technical Specification: 3.11.B**

When reactor power is greater than 25%, the LHGR of any rod in any fuel assembly at any axial location shall not exceed the rated power and rated core flow limits presented in Reference 5.17. Figure 3.2-1 represents LHGR curves for GE14 fuel. Proprietary detailed values for both GE14 and GNF2 fuels are in Reference 5.17. At other than rated power and rated flow conditions, the applicable limiting LHGR value for each fuel type is the smaller of the flow- and power-dependent LHGR limits, LHGR<sub>F</sub> and LHGR<sub>P</sub>. The flow-dependent LHGR limit, LHGR<sub>F</sub>, is the product of the LHGR flow factor, LHGRFAC<sub>F</sub>, shown in Figure 3.2-2 and the LHGR for rated power and flow conditions in Reference 5.17. The power-dependent LHGR limit, LHGR<sub>P</sub>, is the product of the LHGR power factor, LHGRFAC<sub>P</sub>, shown in Figure 3.2-3 and the LHGR for rated power and flow conditions in Reference 5.17.

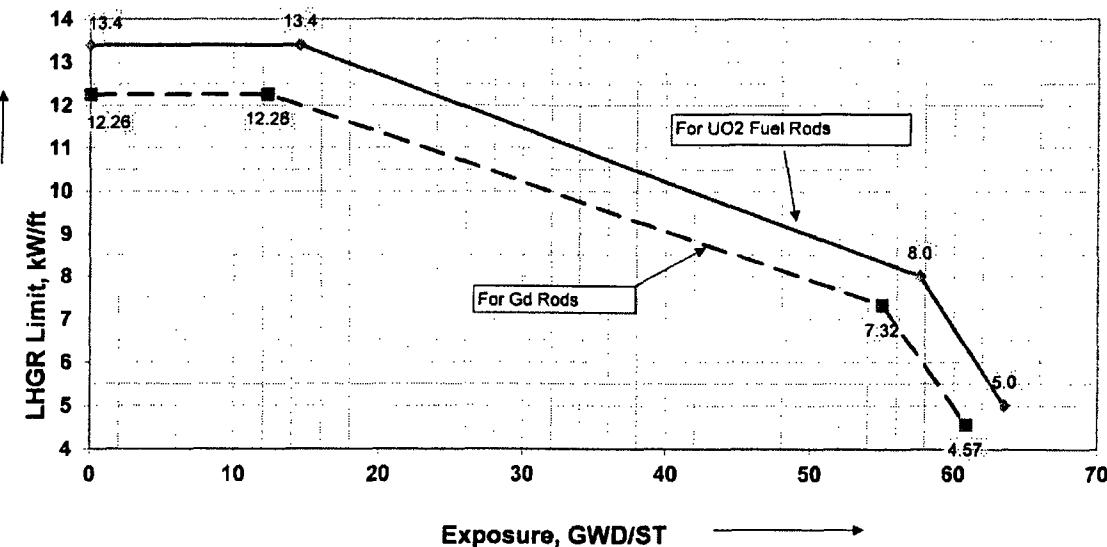

LHGR Curves in Figure 3.2-1 are representative curves for UO<sub>2</sub> fuel rods and Gd containing rods for GE14 Fuel. A Figure comparable to Figure 3.2-1 for GNF2 is not included because GNF has requested Entergy to protect this proprietary information. Gd containing fuel rods have different LHGR limits that are also exposure dependent. Reference 5.17 documents the detailed proprietary curves and values for both GE14 and GNF2 fuels. Reference 5.23 documents the GESTAR II compliance of GNF2 fuel, as amended. Amendment 33 to GESTAR II incorporated Prime T-M methods. Cycle 19 LHGR limits are based on using PRIME for UO<sub>2</sub> fuel rods and GESTR-M for Gd rods, as GESTR-M limits for Gd rods are more conservative.

Pbypass is the power level below which more restrictive thermal limits are applied, as Turbine Stop Valve closure and Turbine Control Valve Fast Closure scrams are assumed to be bypassed. Pbypass can be set in anywhere in the range 32.5 to 45% core thermal power. Pbypass is currently set at 32.5% power.

PNPS CORE OPERATING LIMITS REPORT**

RTYPE: G4.02

**3.3 Minimum Critical Power Ratio (MCPR)**

**Reference Technical Specification: 3.11.C**

During power operation, the MCPR shall be greater than or equal to the Operating Limit MCPR (OLMCPR). The operating limit MCPR is the greater of the flow- and power-dependent MCPR operating limits, MCPR<sub>F</sub> and MCPR<sub>P</sub>. The flow-dependent MCPR operating limit, MCPR<sub>F</sub>, is provided in Figure 3.3-1. For power level less than  $P_{bypass}$ , the MCPR<sub>P</sub> is independent of the fuel type and can be directly read from Figure 3.3-2, when Turbine Bypass is operable and from Figure 3.3-3, when Turbine Bypass is out of service.

Above  $P_{bypass}$ , MCPR<sub>P</sub> is the product of the rated power and flow MCPR operating limit presented in Table 3.3-1, and the K<sub>P</sub> factor presented in Figure 3.3-2, when Turbine Bypass is in service and from Figure 3.3-3, when Turbine Bypass is out of service. The rated power and flow MCPR operating limits presented in Tables 3.3-1 are functions of  $\tau$ .

Both Figures 3.3-2 and 3.3-3 include normal and reduced feed water temperature operating modes. For SLO MCPR<sub>P</sub> and MCPR<sub>F</sub> are raised by 0.03 compared to TLO values shown in Figures 3.3-2 and 3.3-3.

The value of  $\tau$  in Table 3.3-1 shall be equal to 1.0, unless it is calculated from the results of the surveillance testing of Technical Specification 4.3.C. TS 4.11.C defines  $\tau$ .

Bypass is the power level below which more restrictive thermal limits are applied, as Turbine Stop Valve Closure and Turbine Control Valve Fast Closure scamps are assumed to be bypassed. Bypass can be set anywhere in the range 32.5% to 45% core thermal power. Bypass is currently set at 32.5%.

PNPS CORE OPERATING LIMITS REPORT**  
**Table 3.3-1**

RTYPE: G4.02

MCPR Operating Limits At Rated Power and Rated Flow

The MCPR Operating Limit for Two Loop Operation ( $OLMCPR_{TLO}$ ) is a function of fuel type, exposure, and  $\tau$ , which is derived from scram timing measurements.

Tau		<u>GNF2</u>		<u>GE14</u>	
		BOC to MOC	MOC to EOC	BOC to MOC	MOC to EOC
From	To				
0.0		1.50	1.55	1.46	1.51
0.0	0.1	1.51	1.56	1.48	1.53
0.1	0.2	1.52	1.57	1.49	1.55
0.2	0.3	1.53	1.58	1.50	1.57
0.3	0.4	1.54	1.59	1.51	1.58
0.4	0.5	1.55	1.60	1.52	1.60
0.5	0.6	1.56	1.61	1.53	1.62
0.6	0.7	1.57	1.62	1.54	1.63
0.7	0.8	1.58	1.63	1.55	1.65
0.8	0.9	1.59	1.64	1.56	1.67
0.9	1.0	1.60	1.65	1.57	1.68

BOC = Beginning Of Cycle

MOC = Middle of Cycle = End Of Rated Power Operation At Rated Flow (EOR) – 1.455 GWd/ST

EOC = End Of Cycle

Note: The rated OLMCPR Limits given above apply to both normal and reduced Feedwater Temperature as well as Turbine Bypass Valve OOS and Turbine bypass Valves in service. Off rated MCPR limits are given in Figures 3.3-1, 3.3-2 and 3.3-3 as taken from the Supplemental Reload Licensing Report (Reference 5.15).

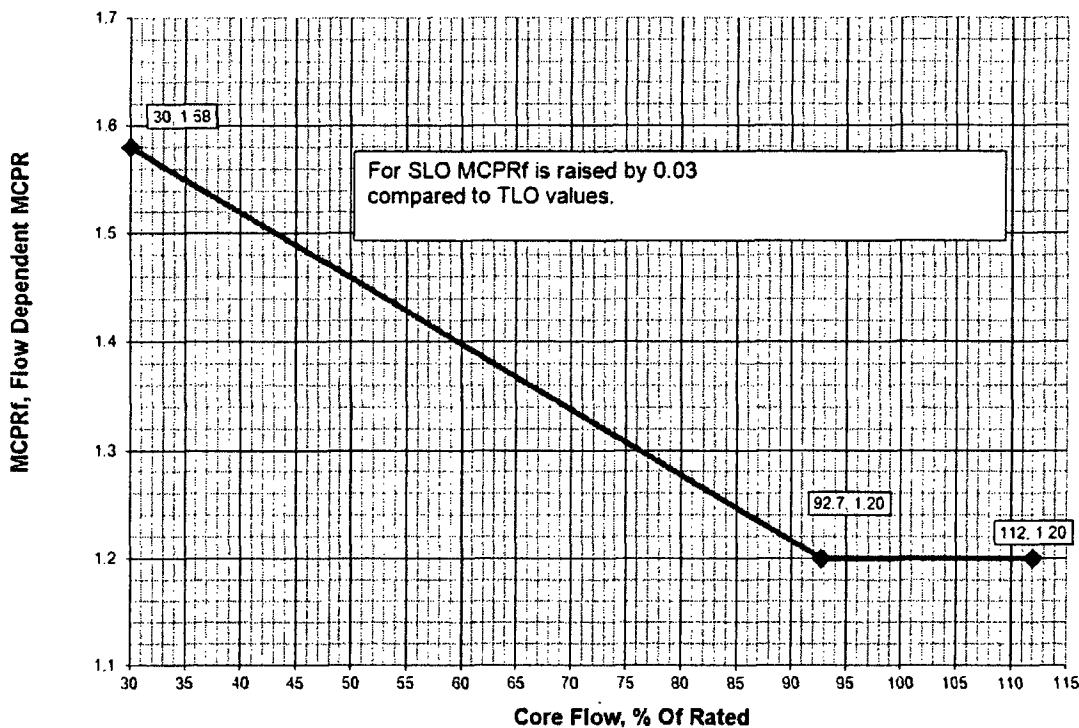

Single Loop Operation

$OLMCPR_{SLO} = 0.03 + OLMCPR_{TLO}$ , where  $OLMCPR_{TLO}$  is selected from the Table above.

3.4 Power/Flow Relationship During Power Operation

Reference Technical Specification: 3.11.D

The Cycle 19 stability analysis does not credit the flow clamp feature of the FCTR cards. The dominance of Core Wide Oscillations was demonstrated without the use of the flow clamp. APRM Flux scram and Rod Block curves without the flow clamp are therefore applicable to Cycle 19.

The power/flow relationship shall not exceed the limiting values shown on the Power/Flow Operating Maps in Figures 3.4-1 when in Two Loop Operation and 3.4-2 when in Single Loop Operation.

Cycle 19 operation is not fully analyzed for reduced feedwater temperature for issues other than thermal limits. This report contains only the thermal limit analysis results for reduced feed water temperature mode.

The exclusion and the buffer regions shown in Figures 3.4-1 and 3.4-2 are based on Stability Solution I-D (references 5.4, 5.12, 5.15 and 5.20). Cycle 19 Stability Analysis utilizes Reference 5.24 ODYSY LTR that removed the decay ratio adder of 0.15. Figures 3.4-1 and 3.4-2 show APRM Scram and Rod Block lines using Allowable values as a function of Core Flow.

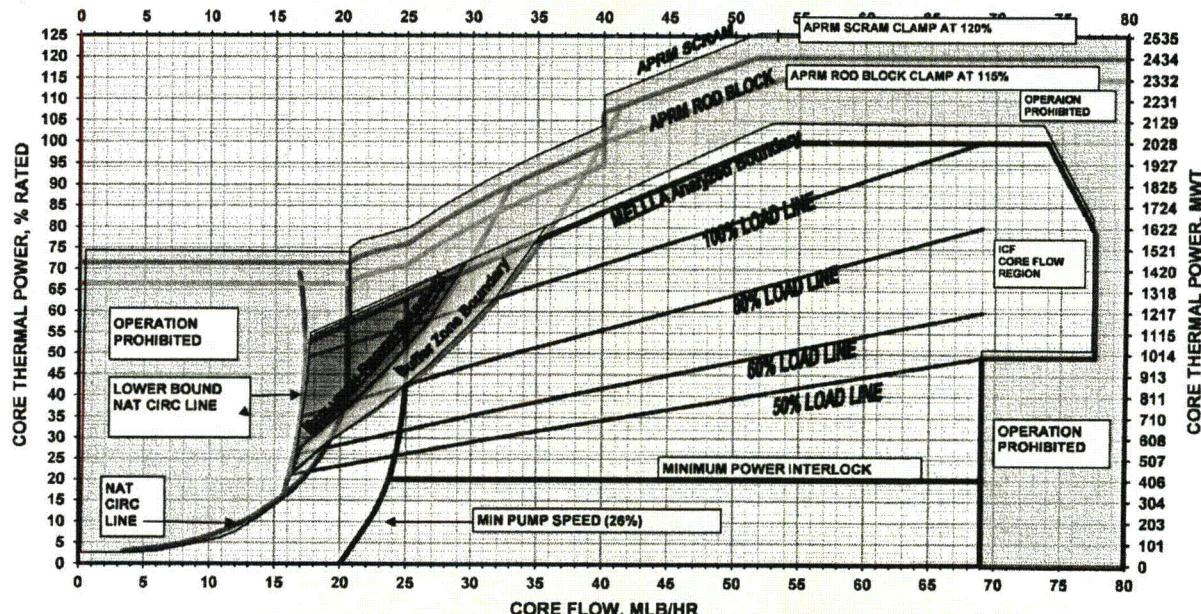

Single Loop Analysis limits maximum Core Flow to 52% of Rated Core Flow and maximum Power to 65% of Rated due to SLO vessel internal vibration (Ref. 5.7, p. 1-2).

Various lines on the Power to flow map are described in Ref. 5.14.

Reference Technical Specification: 4.2

The reactor vessel core for the present cycle consists of 580 fuel assemblies of the types listed below. The core loading pattern (Ref. 5.15) for each type of fuel is shown for the present cycle in Figure 4.0-1.

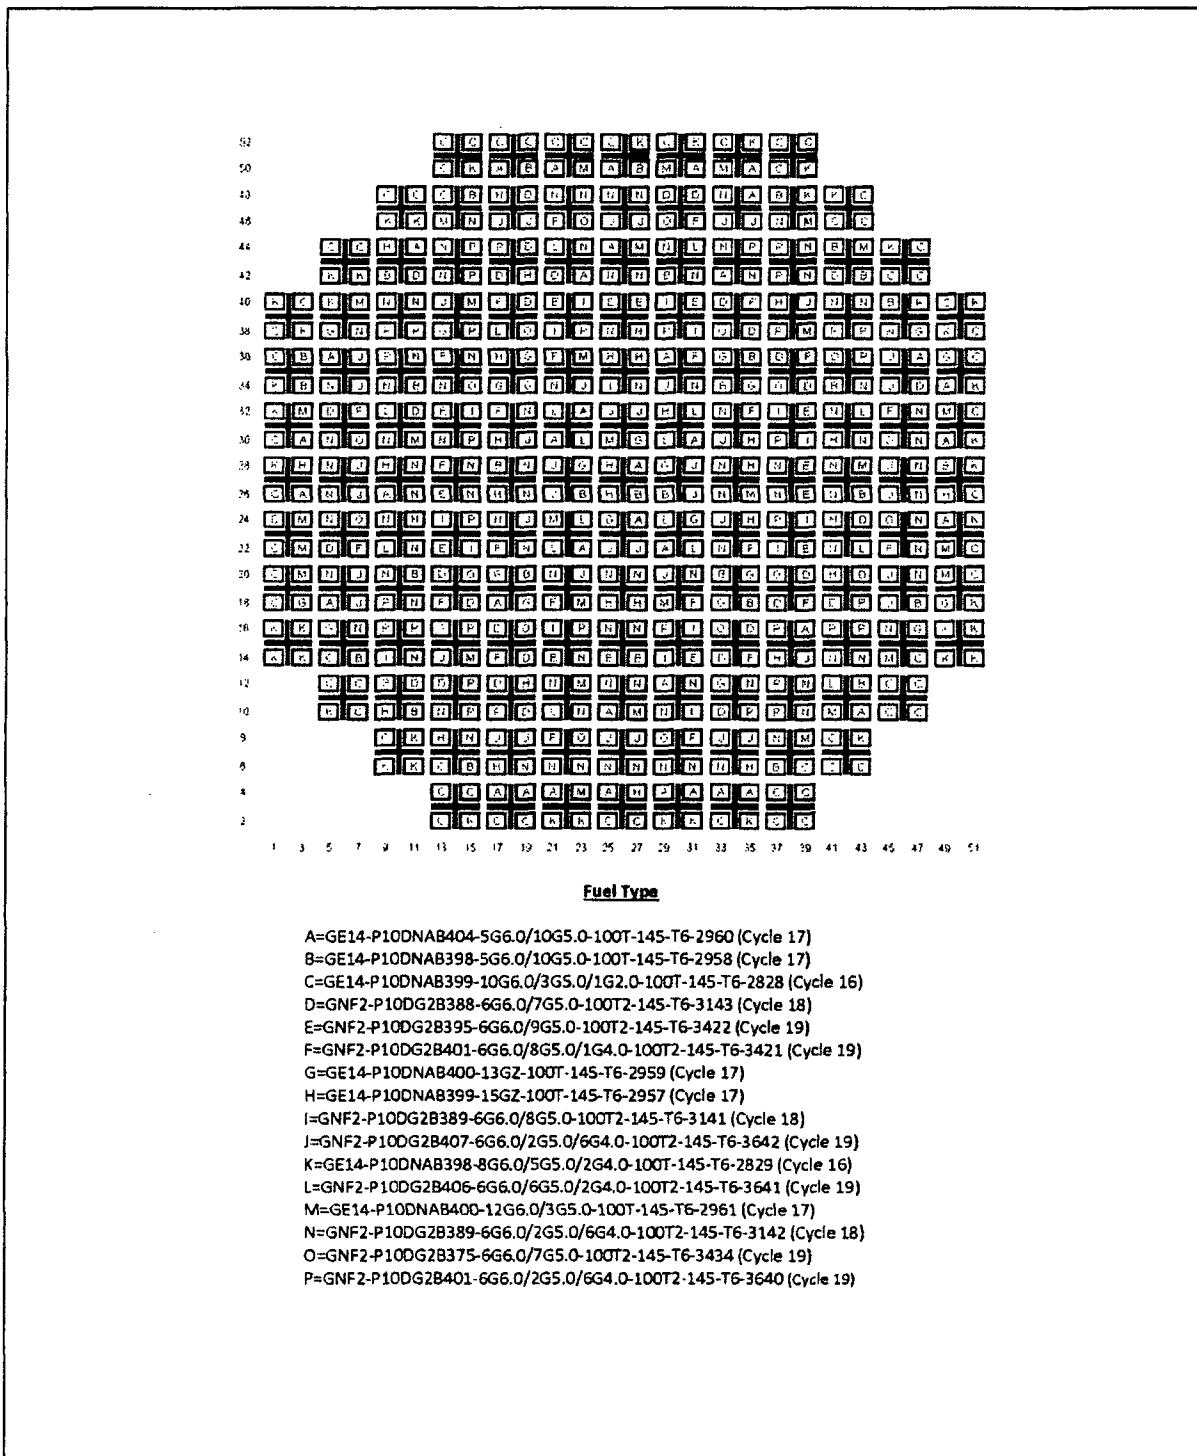

Fuel Type	Cycle Load	Number
<b>Irradiated:</b>

<b>Total:</b>		<b>580</b>

- The reactor vessel core contains 145 cruciform-shaped control rods. The control materials used are either boron carbide powder ( $B_4C$ ) compacted to approximately 70% of the theoretical density or a combination of boron carbide powder and solid hafnium.
