## 1.0 INTRODUCTION

The Kewaunee Nuclear Power Plant is a 535 megawatt pressurized water reactor located on the Wisconsin shore of Lake Michigan in Kewaunee County. The Kewaunee Nuclear Power Plant became critical on March 7, 1974. Initial Power generation was achieved on April 8, 1974, and the Plant was declared commercial on June 16, 1974. This report summarizes the environmental operation data collected during the period January - December 1995.

Wisconsin Public Service Corporation, an operating company for the Kewaunee Nuclear Power Plant, assumes the responsibility for the environmental program at the Plant and any questions relating to this subject should be directed to Mr. Mark Reinhart, Superintendent of Radiation Protection at (414) 433-2560.

## 2.0 SUMMARY

Results of sample analyses during the period January - December 1995 are summarized in Table 4.5. Radionuclide concentrations measured at indicator locations are compared with levels measured at control locations and in preoperational studies. The comparisons indicate background-level radioactivities in all samples collected.

### 3.0 RADIOLOGICAL SURVEILLANCE PROGRAM

Following is a description of the Radiological Surveillance Program and its execution.

#### 3.1 Methodology

The sampling locations are shown in Figure 4-1. Table 4.1 describes the locations, lists for each direction and distance from the reactor, and indicates which are indicators and which are control locations.

The sampling program monitors the air, terrestrial, and aquatic environments. The types of samples collected at each location and the frequency of collections are presented in Table 4.2, using sample codes defined in Table 4.3. The collections and analyses that comprise the program are described below. Finally, the execution of the program in the current reporting year is discussed.

##### 3.1.1 The Air Program

###### Airborne Particulates

The airborne particulate samples are collected on 47 mm diameter glass fiber filters at a volumetric rate of approximately one cubic foot per minute. The filters are collected weekly from six locations (K-1f, K-2, K-7, K-8, K-15 and K-16), and dispatched by mail to TIML for radiometric analysis. The material on the filter is counted for gross beta activity approximately five days after receipt to allow for decay of naturally-occurring short-lived radionuclides.

Quarterly composites from each sampling location are analyzed for gamma-emitting isotopes by a germanium detector.

###### Airborne Iodine

Charcoal filters are located at locations K-1f, K-2, K-7, K-8, K-15 and K-16. The filters are changed bi-weekly and analyzed for iodine-131 immediately after arrival at the laboratory.

###### Ambient Gamma Radiation - TLDs

The integrated gamma-ray background is measured at six air sampling locations (K-1f, K-2, K-7, K-8, K-15 and K-16), at four milk sampling locations (K-3, K-4, K-5 and K-6), and four additional sites (K-17, located 4.25 miles west of the plant; K-27, located 1.5 miles northwest of the plant; K-30, located 1.0 miles north of the plant and K-31, located 6.25 miles north-northwest of the plant) by thermoluminescent dosimetry (TLDs). Two TLD cards, each having four main readout areas containing CaSO<sub>4</sub>:Dy phosphor, are placed at each location (eight TLDs at each location). One card is exchanged quarterly, the other card is exchanged annually and read only on an emergency basis.

### Precipitation

Monthly composites of precipitation samples collected at K-11 are analyzed for tritium activity by liquid scintillation.

#### 3.1.2 The Terrestrial Program

##### Milk

Milk samples are collected semimonthly (one gallon from each location) from May through October, and monthly (two gallons from each location) during the rest of the year from four herds that graze within four miles of the reactor site (K-4, K-5, K-12 and K-19), from two herds that graze between four and ten miles from the reactor site (K-3 and K-6), and from a dairy in Green Bay (K-28). The milk samples are analyzed for iodine-131, strontium-89 and -90, cesium-137, barium-lanthanum-140, potassium-40, calcium and stable potassium.

##### Well Water

One gallon water samples are collected quarterly from four off-site wells located at K-10, K-11, K-12 and K-13 and from two on-site wells located at K-1g and K-1h.

Gross beta and gamma spectroscopic analyses are performed on the total residue of each water sample. The concentration of potassium-40 is calculated from total potassium, which is determined by flame photometry on all samples.

Additionally, samples of water from two on-site wells (K-1g and K-1h) are also analyzed for gross alpha. Water from one on-site well (K-1g) is also analyzed for tritium, strontium-89 and strontium-90.

##### Domestic Meat

Domestic meat samples (chickens) are obtained annually (in the third quarter) at locations K-20, K-24, K-27, and K-29. The flesh is separated from the bones, gamma scanned and analyzed for gross alpha and gross beta activities.

##### Eggs

Eggs are collected quarterly at locations K-24 or K-27. The samples are gamma scanned and analyzed for gross beta, strontium-89 and strontium-90 activities.

##### Vegetables

Vegetable samples (6 varieties) are collected at locations K-17 and K-26, and two varieties of grain, if available, at location K-23. The samples are gamma scanned and analyzed for gross beta, strontium-89 and strontium-90 activities.

### Grass and Cattle Feed

Grass samples are collected during the second, third and fourth quarters from two on-site locations (K-1b and K-1f) and from six dairy farms (K-3, K-4, K-5, K-6, K-12 and K-19). The samples are analyzed for gross beta, strontium-89, strontium-90 and gamma emitting isotopes. During the first quarter, cattle feed is collected from the same six dairy farms and the same analyses are performed.

### Soil

Soil samples are collected twice a year on-site at K-1f and from the six dairy farms (K-3, K-4, K-5, K-6, K-12 and K-19). The samples are analyzed for gross alpha, gross beta, strontium-89, strontium-90 and gamma emitting isotopes.

### 3.1.3 The Aquatic Program

#### Surface Water

One-gallon water samples are taken monthly from three locations on Lake Michigan: 1) at the point where the condenser water is discharged into Lake Michigan (K-1d); 2) Two Creeks Park (K-14) located 2.5 miles south of the reactor site; and 3) at the main pumping station located approximately equidistant from Kewaunee and Green Bay, that pumps water from the Rostok water intake (K-9) located 11.5 miles north of the reactor site. Both raw and tap water are collected at K-9. Additionally, one-gallon water samples are taken monthly from three creeks that pass through the site (K-1a, K-1b, and K-1e). Samples from North and Middle Creeks (K-1a, K-1b) are collected near the mouth of each creek. Samples from the South Creek (K-1e) are collected about ten feet downstream from the point where the outflow from the two drain pipes meet. Water samples at K-14 are collected and analyzed in duplicate.

The water samples are gamma scanned and analyzed for gross beta activity in the total residue, dissolved solids and suspended solids, and potassium-40. The concentration of potassium-40 is calculated from total potassium, which is determined by flame photometry. The tritium activity is determined by liquid scintillation technique. Quarterly composites of monthly grab samples are also analyzed for tritium, strontium-89 and strontium-90.

#### Fish

Fish samples are collected during the second, third and fourth quarters at location K-1d. The flesh is separated from the bones, gamma scanned and analyzed for gross beta activity. Ashed bone samples are analyzed for gross beta, strontium-89 and strontium-90 activities.

### Slime

Slime samples are collected during the second and third quarters from three Lake Michigan locations (K-1d, K-9 and K-14), and from three creek locations (K-1a, K-1b and K-1e), if available. The samples are analyzed for gross beta activity. If the quantity is sufficient, they are also gamma scanned and analyzed for strontium-89 and strontium-90 activities.

### Bottom Sediments

Bottom sediments are collected in May and November from five locations (K-1c, K-1d, K-1j, K-9 and K-14). The samples are analyzed for gross beta, strontium-89, strontium-90 and gamma emitting isotopes. Since it is known that the measured radioactivity per unit mass of sediment increases with decreasing particle size, the sampling procedure is designed to assure collection of very fine particles.

#### 3.1.4 Program Execution

Program execution is summarized in Table 4.4. The program was executed as described in the preceding sections, with the following exceptions:

No domestic meat sample was available at location K-20 during 1995.

#### 3.1.5 Program Modifications

Eggs were not available at Schlies Farm (K-27) for the fourth quarter of 1995. The collection was made at the Fectum Farm (K-24).

### **3.2 Results and Discussion**

The results for the reporting period January to December 1995 are presented in summary form in Table 4.5. For each type of analysis of each sampled medium, this table shows the annual mean and range for all indicator locations and for all control locations. The location with the highest annual mean and the results for this location are also given.

The discussion of the results has been divided into three broad categories: the air, terrestrial, and aquatic environments. Within each category, samples will be discussed in the order listed in Table 4.4. Any discussion of previous environmental data for the Keweenaw Nuclear Power Plant refers to data collected by Teledyne Isotopes Midwest Laboratory or its predecessor, Hazleton Environmental Sciences.

The tabulated results of all measurements made in 1995 are not included in this section, although references to these results will be made in the discussion. The complete tabulation of the 1995 results is contained in Part II of the 1995 annual report on the Radiological Monitoring Program for the Keweenaw Nuclear Power Plant.

#### **3.2.1 Atmospheric Nuclear Detonations and Nuclear Accidents**

There were no reported atmospheric nuclear tests in 1995. The last reported test was conducted by the People's Republic of China on October 16, 1980. The reported yield was in the 200 kiloton to 1 megaton range.

There were no reported accidents at nuclear facilities in 1995.

#### **3.2.2 The Air Environment**

##### Airborne Particulates

In air particulates, the annual gross beta concentration at indicator and control locations measured 0.019 and 0.018 pCi/m<sup>3</sup>, respectively. These concentrations were equal or slightly lower than in 1988 (0.025 and 0.023 pCi/m<sup>3</sup>, respectively), in 1989 (0.025 and 0.024 pCi/m<sup>3</sup>, respectively), in 1990 (0.024 pCi/m<sup>3</sup> at both locations), in 1991 and in 1992 (0.018 and 0.019 pCi/m<sup>3</sup>, respectively), in 1993 (0.020 pCi/m<sup>3</sup> at both locations) and in 1994 (0.016 and 0.018 pCi/m<sup>3</sup>, respectively).

Gamma spectroscopic analyses of quarterly composites of air particulate filters yielded similar results for indicator and control locations. Beryllium-7, which is produced continuously in the upper atmosphere by cosmic radiation (Arnold and Al-Salih, 1955), was detected in all samples. All other gamma-emitting isotopes were below their respective LLD limits.

##### Airborne Iodine

Bi-monthly levels of airborne iodine-131 were below the lower limit of detection (LLD) of 0.03 pCi/m<sup>3</sup> at all locations. Thus, there is no indication of an effect of the plant operation on the local air environment.

### Ambient Gamma Radiation - TLDs

Ambient gamma radiation was monitored by TLDs at fourteen locations: seven indicator and seven control.

The quarterly TLDs at the indicator locations measured a mean dose equivalent of  $(16.7 \pm 2.3 \text{ mR}/91 \text{ days})^*$ , in agreement with the mean at the control locations of  $(15.6 \pm 1.9 \text{ mR}/91 \text{ days})^*$ , and were similar to the means obtained in 1988 (18.0 and 17.4 mR/91 days, respectively), in 1989 (17.5 and 16.9 mR/91 days, respectively), in 1990 (14.4 mR/91 days at both indicator and control locations), in 1991 (13.7 and 12.5 mR/91 days, respectively), in 1992 (15.0 and 13.8 mR/91 days, respectively), in 1993 (15.0 and 13.8 mR/91 days, respectively) and in 1994 (14.8 and 13.8 mR/91 days, respectively). All these values are slightly lower than the United States average value of 19.5 mR/91 days due to natural background radiation (National Council on Radiation Protection and Measurements, 1975). The highest annual mean was 20.4 mR/91 days, measured at the indicator location K-7.

### Precipitation

Precipitation was monitored at one indicator location, K-11. The tritium concentration was below the LLD level of 330 pCi/L in all samples.

#### 3.2.3 The Terrestrial Environment

##### Milk

Of 119 analyses for iodine-131 in milk, all were below the LLD level of 0.5 pCi/L.

Strontium-89 concentrations were below the LLD level of 1.0 pCi/L in all samples.

Low levels of Strontium-90 were found in all samples tested. The mean values were identical for indicator and control locations (1.6 pCi/L at both indicator and control locations) and were nearly identical to those in 1989 (1.6 and 1.7 pCi/L, respectively), in 1990 (1.7 and 1.6 pCi/L, respectively), in 1991 (1.6 and 1.7 pCi/L, respectively), in 1992 (1.7 and 1.6 pCi/L, respectively), in 1993 (1.7 and 1.4 pCi/L, respectively) and in 1994 (1.7 and 1.5 pCi/L, respectively).

Barium-lanthanum-140 concentrations were below the LLD of 15 pCi/L in all samples. Cesium-137 concentrations were below the LLD of 10 pCi/L in all samples.

Potassium-40 results were similar at both the indicator and control locations (1440 and 1410 pCi/L, respectively), and were essentially identical to the levels observed in 1978 through 1994.

---

\*Unless otherwise indicated, uncertainties of average values are standard deviations of the individual measurements over the period averaged. The uncertainty for each location corresponds to the two-standard deviation error of the average dose of eight dosimeters placed at the location.

### Milk (continued)

Due to the chemical similarities between strontium and calcium, and cesium and potassium, organisms tend to deposit cesium-137 in the soft tissue and muscle and strontium-89 and -90 in the bones. Consequently, the ratios of strontium-90 activity to the weight of calcium in milk and cesium-137 activity to the weight of potassium in milk were monitored in order to detect potential environmental accumulation of these radionuclides. No statistically significant variations in the ratios were observed. The measured concentrations of stable potassium and calcium are in agreement with previously determined values of  $1.50 \pm 0.21$  g/L and  $1.16 \pm 0.08$  g/L, respectively (National Center for Radiological Health, 1968).

### Well Water

Gross alpha concentration was measured at the two on-site wells, (K-1g and K-1h) and averaged 4.8 pCi/L.

Gross beta concentration in well water averaged 1.2 pCi/L in samples from the control location. The mean value for all indicator locations was 2.6 pCi/L and was similar to values observed in 1977 through 1994 (3.3, 3.4, 3.0, 3.0, 3.6, 3.2, 2.9, 2.3, 2.6, 2.5, 2.1, 3.3, 2.5, 2.0, 2.2, 2.6, 2.2 and 2.0 pCi/L respectively). The differences between mean gross beta concentrations are not statistically significant because the counting uncertainties of the individual measurements are typically 0.3 to 1.3 pCi/L in all samples.

Tritium concentration in the on-site well (K-1g) was below the LLD of 330 pCi/L in all samples.

All gamma-emitting isotopes were below their respective LLDs in all samples.

The concentrations of strontium-89 and strontium-90 in well water were below their respective detection limits of 0.7 and 0.6 pCi/L.

Potassium-40 averages were quite low (under 1.8 pCi/L), in agreement with previously measured values.

### Domestic Meat

In meat (chickens), gross alpha concentration was below the LLD level of 0.15 pCi/g wet weight in all samples. Gross beta concentration averaged 2.62 pCi/g wet weight for indicator locations and 2.99 pCi/g wet weight for the control location. The difference is not significant. Gamma-spectroscopic analyses showed that almost all of the beta activity was due to naturally occurring potassium-40. All other gamma-emitting isotopes were below their respective LLD limits.

### Eggs

In egg samples, gross beta concentration averaged 1.07 pCi/g wet weight, similar to the concentration of the naturally-occurring potassium-40 observed in the samples ( 1.26 pCi/g ). All other gamma-emitting isotopes were below their respective LLDs. The level of strontium-89 was below the LLD of 0.007 pCi/g wet weight in all samples. Strontium-90 was below the LLD level of 0.003 pCi/g wet weight in all samples.

### Vegetables

In vegetables, gross beta concentrations were similar at both the indicator and control locations (2.39 pCi/g wet weight and 1.80 pCi/g wet weight, respectively) and was due primarily to potassium-40 activity. Strontium-89 was below the LLD level of 0.006 pCi/g wet weight in all samples. Strontium-90 activity was below the LLD level of 0.002 pCi/g wet weight in all samples.

All other gamma-emitting isotopes were below their respective LLD levels.

In addition to potassium-40, naturally-occurring beryllium-7 was detected in both wheat and clover samples. These samples were of similar radioisotopic composition to the vegetables, but the concentration of radionuclides was slightly higher due to the lower water content of wheat and clover.

### Grass and Cattle Feed

In grass, mean gross beta concentrations were similar at both indicator and control locations (6.25 and 6.40 pCi/g wet weight, respectively) and in both cases was predominantly due to naturally occurring potassium-40 and beryllium-7. All other gamma-emitting isotopes were below their respective LLD's. Strontium-89 was below the LLD of 0.014 pCi/g wet weight in all samples. Strontium-90 activity was below the LLD of 0.006 pCi/g wet weight in all but one sample (0.007 pCi/g wet weight).

For cattlefeed, the mean gross beta concentration was lower at the control locations (7.33 pCi/g wet weight) than at indicator locations (12.39 pCi/g wet weight). The highest average gross beta level was in the samples from the indicator location K-4 (16.93 pCi/g wet weight), and reflected the high potassium-40 level (19.75 pCi/g wet weight) observed in the samples. The pattern was similar to that observed in 1978 through 1994. Strontium-89 levels were below the LLD level of 0.021 pCi/g wet weight in all samples. Strontium-90 activity measured 0.029 pCi/g wet at the indicator locations, similar to that observed in 1994 (0.020 pCi/g wet weight). Measured activity at the control locations was 0.026 pCi/g wet weight, (0.012 pCi/g wet in 1994). The presence of the radiostrontium is attributable to fallout from previous nuclear testing. All other gamma-emitting isotopes were below their respective LLD levels.

### Soil

No significant differences were found in gross alpha concentrations between indicator (8.93 pCi/g dry weight) and control (7.09 pCi/g dry weight) in soil samples. Mean gross beta levels were similar at indicator and control locations (23.36 and 21.74 pCi/g dry weight, respectively), and is primarily due to the potassium-40 activity. Strontium-89 was below the LLD level of 0.030 pCi/g dry weight in all samples. Strontium-90 was detected in eight of fourteen samples and levels were slightly higher at the indicator locations than at the control locations (0.086 and 0.039 pCi/g dry weight, respectively). Cesium-137 was detected in twelve of fourteen samples and was identical at both indicator and control locations ( 0.21 pCi/g dry weight). Beryllium-7 was detected above the LLD level of 0.22 pCi/g dry weight in six of the fourteen samples tested and averaged 0.69 and 0.60 pCi/g dry weight at indicator and control locations.

## Soil (continued)

Potassium-40 was detected in all samples and averaged 24.27 and 22.78 pCi/g dry weight at indicator and control locations, respectively. All other gamma-emitting isotopes were below their respective LLD's. The levels of detected activities were similar to those observed from 1979 through 1994.

### 3.2.4 The Aquatic Environment

#### Surface Water

In surface water, mean gross beta activity in suspended solids was below the LLD level of 1.3 pCi/L in all samples. Mean gross beta concentration in dissolved solids was higher at indicator locations (4.3 pCi/L) as compared to the control locations (2.2 pCi/L) and was similar to activities observed in 1978 (5.4 and 2.7 pCi/L), 1979 (5.7 and 2.7 pCi/L), 1980 (5.1 and 2.7 pCi/L), 1981 (4.3 and 2.7 pCi/L), 1982 (4.9 and 2.4 pCi/L), 1983 (5.1 and 2.6 pCi/L), 1984 (5.0 and 2.7 pCi/L), 1985 (5.6 and 2.7 pCi/L), 1986 (4.1 and 2.5 pCi/L), 1987 (5.3 and 2.5 pCi/L) in 1988 (4.8 and 3.6 pCi/L), in 1989 (5.7 and 3.0 pCi/L), in 1990 (4.1 and 2.6 pCi/L), in 1991 (5.1 and 2.2 pCi/L), in 1992 (4.5 and 2.2 pCi/L), in 1993 and 1994 (5.0 and 2.3 pCi/L). The control sample is Lake Michigan water, which varies very little in gross beta concentration during the year, while indicator samples include two creek locations (K-1a and K-1e) which are much higher in gross beta concentration and exhibit large month-to-month variations. The K-1a creek draws its water from the surrounding fields which are heavily fertilized; and the K-1e creek draws its water mainly from the Sewage Treatment Plant. In general, gross beta concentration levels were high when potassium-40 levels were high and low when potassium-40 levels were low, indicating that the fluctuations in beta concentration were due to variations in potassium-40 concentrations and not to plant operations. The fact that similar fluctuations at these locations were observed in the pre-operational studies conducted prior to 1974 supports this assessment.

Tritium concentration was below the LLD level of 330 pCi/L in all but two samples. Tritium was detected at locations K-1d and K-14b at levels of 1317 and 344 pCi/L, respectively. Both were below the limits of Appendix C, Table C-1, page C-2.

Strontium-89 concentration was below the LLD of 1.5 pCi/L in all samples. Concentrations of strontium-90 were detected at both indicator and control locations and measured 0.8 and 1.2 pCi/L, respectively.

All gamma-emitting isotopes were below their respective LLDs in all samples.

#### Fish

In fish samples, the gross beta concentration averaged 2.52 pCi/g wet weight in muscles and 1.09 pCi/g wet weight in bone fractions. In muscle, the gross beta concentration was primarily due to potassium-40 activity. The average beta concentration of 2.52 pCi/g wet weight was lower than the average of the 1973 range of 3.34 to 3.62 pCi/g wet weight. The cesium-137 concentration in muscle averaged 0.056 pCi/g wet weight and was roughly half the levels observed in 1979 and 1980 (0.12 pCi/g wet weight in both years), 1981 (0.15 pCi/g wet weight), 1982 (0.17 pCi/g wet weight), 1983 (0.14 pCi/g wet weight), 1984 (0.10 pCi/g

### Fish (continued)

wet weight), 1985 (0.11 pCi/g wet weight), 1986 (0.11 pCi/g wet weight), 1987 (0.11 pCi/g wet weight), 1988 (0.12 pCi/g wet weight), 1989 (0.11 pCi/g wet weight), 1990 (0.075 pCi/g wet weight), and 1991 (0.11 pCi/g wet weight). The levels were almost identical to those seen in 1992 (0.066 pCi/g wet weight), in 1993 (0.068 pCi/g wet weight) and in 1994 (0.067 pCi/g wet weight). The strontium-89 concentration was below the LLD of 0.078 pCi/g wet weight in all samples. Strontium-90 was detected in all bone samples and averaged 0.079 pCi/g wet weight.

### Periphyton (Slime)

In periphyton (slime) samples, mean gross beta concentrations were slightly higher at the indicator locations than at the control locations (4.18 and 2.85 pCi/g wet weight, respectively). Strontium-89 concentration was below the LLD level of 0.051 pCi/g wet weight in all samples. Strontium-90 was detected at one of the ten indicator locations at a concentration of 0.027 pCi/g wet weight. Traces of Co-58 were detected in three of the four slime samples collected from locations K-1d (condenser discharge) and K-1e (South Creek effluent) and averaged 0.102 pCi/g wet weight. Co-60 was detected in one slime sample from location K-1e (South Creek effluent) at a concentration of 0.044 pCi/g wet weight. The low level Cobalt radioactivity observed in the Periphyton (slime) is most probably due to back flow from normal routine plant effluents. The mouth of the South Creek is susceptible to back flow from Lake Michigan, implying that the radioactivity is due to routine plant effluents. Keweenaw will continue to monitor the situation and collect additional samples if conditions warrant. Cs-137 was detected in four of ten samples and averaged 0.079 pCi/g wet weight, slightly higher than 1994 (0.055 pCi/g wet weight). All other gamma-emitting isotopes, except naturally-occurring beryllium-7 and potassium-40, were below their respective LLDs.

### Bottom Sediments

In bottom sediment samples, the mean gross beta concentration was similar at indicator locations and at the control location (6.8 and 4.3 pCi/g dry weight, respectively), due primarily to potassium-40. The difference is not statistically significant.

Cesium-137 was detected in four of ten samples and averaged 0.050 pCi/g dry weight at indicator locations and less than 0.023 pCi/g dry weight at control locations. Cs-134 was below the LLD level of 0.034 pCi/g dry weight in all samples. The cesium-137 level was lower than the levels observed in 1979 (0.12 pCi/g dry weight), in 1980 (0.19 pCi/g dry weight), in 1981 (0.18 pCi/g dry weight), in 1982 (0.13 pCi/g dry weight), in 1983 (0.16 pCi/g dry weight), and in 1984 (0.07 pCi/g dry weight), and similar to concentrations observed in 1985 (0.05 pCi/g dry weight), in 1986 (0.037 pCi/g dry weight), in 1987 (0.038 pCi/g dry weight) and in 1988 (0.049 pCi/g dry weight), in 1989 (0.056 pCi/g dry weight), in 1990 (0.058 pCi/g dry weight), in 1991 (0.057 pCi/g dry weight), in 1992 (0.047 pCi/g dry weight), in 1993 (0.034 pCi/g dry weight) and in 1994 (0.050 pCi/g dry weight). Levels of Strontium-89 were below their respective LLDs of 0.036 pCi/g dry weight in all samples. Strontium-90 concentrations were below their respective LLDs of 0.013 pCi/g dry weight in all samples.

### 3.3 Land Use Census

The 1995 Land Use Census satisfies the requirements of the KNPP Radiological Environmental Monitoring Manual. Section 2.2.2 states:

A land use census shall be conducted and shall identify within a distance of 8 km (5 miles) the location, in each of the 10 meteorological sectors, of the nearest milk animal, the nearest residence and the nearest garden of greater than 50m<sup>2</sup> (500 ft<sup>2</sup>) producing broad leaf vegetation.

The 1995 Land Use Census included a complete door-to-door count of the residences, milk animals, and gardens in the ten meteorological sectors within five miles of KNPP.

This census is conducted every five years during the growing season per Health Physics Procedure HP 1.14.

In instances where multiple fields were farmed by the same individual, observations were taken using the closest field to KNPP.

Table 4.6.1 lists the results of the 1995 census. Distances calculated in the 1995 census have been verified and supersede the 1994 measurements.

Table 4.6.2 describes the changes from 1994 to 1995. Changes of ownership are also noted.

Table 4.6.3 is a comparison to the five year census of 1985 and 1990. Changes are consistent with the national trend of moving away from farming (24% decrease in farms with milk animals, 15% decrease in the number of fields farmed, and 50% decrease in the number of large gardens). Total number of homes in the area remained consistent. The difference between non-farming and farming homesteads was not tracked, but one would assume farming losses were offset by non-farming "suburban type" increases.

The 1995 Land Use Census was completed on August 31, 1995.

<sup>a</sup> GA = gross alpha, GB = gross beta, GS = gamma spectroscopy, SS = suspended solids, DS = dissolved solids, TR = total residue.

<sup>b</sup> LLD = nominal lower limit of detection based on 4.66 sigma counting error for background sample.

<sup>c</sup> Mean based upon detectable measurements only. Fraction of detectable measurements at specified locations is indicated in parentheses (F).

<sup>d</sup> Locations are specified by station code (Table 4.1), distance (miles) and direction relative to reactor site.

<sup>e</sup> Non-routine results are those which exceed ten times the control station value. If no control station value is available, the result is considered non-routine if it exceeds ten times the pre-operational value for the location.

INTERLABORATORY COMPARISON PROGRAM RESULTS

**NOTE:** Teledyne's Midwest Laboratory participates in intercomparison studies administered by U.S. EPA Environmental Monitoring Systems Laboratory, Las Vegas, Nevada. The results are reported in Appendix A. Also reported are results of International Intercomparison and Teledyne testing of TLD's, as well as, in-house spikes, blanks and duplicates. Appendix A is updated four times a year; the complete Appendix is included in March, June, September and December monthly progress reports only. Please refer to March, June, September and December progress reports for information.

### Interlaboratory Comparison Program Results

Teledyne's Midwest Laboratory (formerly Hazleton Environmental Sciences) has participated in interlaboratory comparison (crosscheck) programs since the formulation of its quality control program in December 1971. These programs are operated by agencies which supply environmental type samples (e.g., milk or water) containing concentrations of radionuclides known to the issuing agency but not to participant laboratories. The purpose of such a program is to provide an independent check on the laboratory's analytical procedures and to alert it to any possible problems.

Participant laboratories measure the concentration of specified radionuclides and report them to the issuing agency. Several months later, the agency reports the known values to the participant laboratories and specifies control limits. Results consistently higher or lower than the known values or outside the control limits indicate a need to check the instruments or procedures used.

The results in Table A-1 were obtained through participation in the environmental sample crosscheck program for milk, water and air filters during the past twelve months. Data for previous years is available upon request.

This program is conducted by the U.S. Environmental Protection Agency Intercomparison and Calibration Section, Quality Assurance Branch, Environmental Monitoring and Support Laboratory, Las Vegas, Nevada.

The results in Table A-2 were obtained for Thermoluminescent Dosimeters (TLDs), since 1976 via various International Intercomparisons of Environmental Dosimeters under the sponsorships listed in Table A-2. Also Teledyne testing results are listed.

Table A-3 lists results of the analyses on in-house "spiked" samples for the past twelve months. Data for previous years available upon request.

Table A-4 lists results of the analyses on in-house "blank" samples for the past twelve months. Data for previous years available upon request.

Table A-5 lists results of the in-house "duplicate" program for the past twelve months. Acceptance is based on the difference of the results being less than the sum of the errors. Data for previous years available upon request.

Attachment A lists acceptance criteria for "spiked" samples.

Out-of-limit results are explained directly below the result.

<sup>a</sup> Results obtained by Teledyne Brown Engineering Environmental Services Midwest Laboratory as a participant in the environmental sample crosscheck program operated by the Intercomparison and Calibration Section, Quality Assurance Branch, Environmental Monitoring and Support Laboratory, U.S. Environmental Protection Agency (EPA), Las Vegas, Nevada.

<sup>b</sup> All results are in pCi/L, except for elemental potassium (K) data in milk, which are in mg/L; air filter samples, which are in pCi/Filter.

<sup>c</sup> Unless otherwise indicated, the TBEESML results are given as the mean ± 2 standard deviations for three determinations.

<sup>d</sup> USEPA results are presented as the known values and expected laboratory precision (1s, 1 determination) and control limits as defined by the EPA.

<sup>a</sup> All results are in pCi/L, except for elemental potassium (K) in milk, which are in mg/L; air filter samples, which are in pCi/Filter; and food products, which are in mg/kg.

<sup>b</sup> All samples are the results of single determinations.

<sup>c</sup> Control limits are based on Attachment A, page A2 of this report.

NOTE: For fish, Jello is used for the spike matrix. For vegetation, Sawdust is used for the spike matrix.

**APPENDIX B**

**DATA REPORTING CONVENTIONS**

## Data Reporting Conventions

1.0. All activities except gross alpha and gross beta are decay corrected to collection time or the end of the collection period.

### 2.0. Single Measurements

Each single measurement is reported as follows:

$$x \pm s$$

where  $x$  = value of the measurement;

$s = 2s$  counting uncertainty (corresponding to the 95% confidence level).

In cases where the activity is found to be below the lower limit of detection  $L$  it is reported as

$$<L$$

where  $L$  = the lower limit of detection based on  $4.66s$  uncertainty for a background sample.

### 3.0. Duplicate analyses

3.1 Individual results:  $x_1 \pm s_1$   
 $x_2 \pm s_2$

Reported result:  $x \pm s$

where  $x = (1/2) (x_1 + x_2)$

$$s = (1/2) \sqrt{s_1^2 + s_2^2}$$

3.2. Individual results:  $<L_1$

$$<L_2$$

Reported result:  $<L$

where  $L$  = lower of  $L_1$  and  $L_2$

3.3. Individual results:  $x \pm s$

$$<L$$

Reported result:  $x \pm s$  if  $x \geq L$ ;

$<L$  otherwise

#### 4.0. Computation of Averages and Standard Deviations

- 4.1 Averages and standard deviations listed in the tables are computed from all of the individual measurements over the period averaged; for example, an annual standard deviation would not be the average of quarterly standard deviations. The average  $\bar{x}$  and standard deviation(s) of a set of  $n$  numbers  $x_1, x_2 \dots x_n$  are defined as follows:

$$\bar{x} = \frac{1}{n} \sum x$$

$$s = \sqrt{\frac{\sum (x - \bar{x})^2}{n-1}}$$

- 4.2 Values below the highest lower limit of detection are not included in the average.

- 4.3 If all of the values in the averaging group are less than the highest LLD, the highest LLD is reported.

- 4.4 If all but one of the values are less than the highest LLD, the single value  $\bar{x}$  and associated two sigma error is reported.

- 4.5 In rounding off, the following rules are followed:

4.5.1. If the figure following those to be retained is less than 5, the figure is dropped, and the retained figures are kept unchanged. As an example, 11.443 is rounded off to 11.44.

4.5.2. If the figure following those to be retained is equal to or greater than 5, the figure is dropped and the last retained figure is raised by 1. As an example, 11.445 is rounded off to 11.45.

## 1.0 INTRODUCTION

The following constitutes Part II of the final report for the 1995 Radiological Monitoring Program conducted at the Kewaunee Nuclear Power Plant (KNPP), Kewaunee, Wisconsin. Included are tabulations of data for all samples collected in 1995, statistical analyses of the data, graphs of data trends, and descriptions of radiochemical procedures. A summary and interpretation of the data presented here are published in Part I of the 1995 Annual Report on the Radiological Monitoring Program for the Kewaunee Nuclear Power Plant.

NOTE: Page 2 is intentionally left out.

<sup>a</sup> Three times a year, second (April, May, June), third (July, August, September), and fourth (October, November, December) quarters.

<sup>b</sup> To be collected in May and November.

<sup>c</sup> Monthly from November through April; semimonthly May through October.

<sup>d</sup> First quarter (January, February, March) only.

<sup>e</sup> Replaced by K-29 in summer of 1990.

<sup>f</sup> First (January, February, March), second (April, May, June), third (July, August, September) quarters 1995 only.

<sup>g</sup> Fourth (October, November, December) 1995 quarter only.

**ANNUAL REPORT - PART III  
INCIDENT REPORTS  
January - December 1995**

## INCIDENT EVALUATION FORM

Attachment 1 to Incident Report 95-212

**Title:** Milk Samples missed in accordance with SP63-164, "Environmental Sample Collection."

**Brief Abstract:** On October 27, 1995, with the plant at 97 percent power, it was discovered that a milk sample was not taken in accordance with SP63-164, Environmental Sample Collection." SP63-164 requires semi-monthly milk samples during the grazing season and monthly milk samples during the non grazing season. The second milk sample for the month of October was not taken.

The next milk sample was taken the first week of November and there were no abnormal findings.

**Cause:** The cause of the missed milk sample was due to personnel inattention to detail.  
*B3.05*

**Safety Implications:** There are no safety implications. The subsequent milk samples were tested and there were no abnormal findings.

**Reportability Determination:** This event will be included in the Annual Radiological Environmental Monitoring Report, in accordance with SP63-280, "Annual Environmental Reports."

**Corrective Actions (taken or recommended):** The individuals involved were reminded of the importance of obtaining milk samples in accordance with the KNPP Environmental Monitoring Program. This IR evaluation will be required reading for personnel responsible for obtaining environmental samples.
