**APPENDIX I**  
**Methods of Historic Analysis**

## Methods for Historic Artifact Analysis

### Introduction

Historic artifacts recovered during investigations are subjected to identification and analysis using GAI's Historic Coding scheme. Artifact analysis is focused on creating an inventory of artifact classes and sub-classes to examine issues of chronology and function for each site containing historic/modern components.

Whenever possible, proveniences were assigned dates based on Mean Dates (MOD) and Termini Post Quem (TPQ), or the earliest possible date for each specific context.

Once washed, artifacts are sorted into major artifact classes such as ceramics, glass, metal, small finds, and clothing. The materials are then subjected to a preliminary analysis, which includes a basic description of artifacts by material class, and relevant attributes. Included among the recorded attributes, as applicable, are:

- type
- beginning and end dates of production
- form
- motif/decoration
- color
- manufacturing technique
- functional group
- base
- finish
- embossment
- maker's mark/manufacturer
- material
- pattern class and subclass.

### Artifact Class and Sub-Class Codes

#### Class Codes

Class Code	Class
1	Kitchen
2	Architecture
4	Personal
5	Clothing
6	Arms
7	Furnishings
8	Tobacco Pipes
9	Activities
11	Faunal
12	Floral
13	Prehistoric
99	Unidentifiable

#### Sub-Class Codes

Sub-Class codes are used in association with the class codes, to further identify the basic typology of the artifacts. Sub-Classes may not give an exact determination of the artifacts, but it better refines the artifact type so that, in a database format, the artifact can be looked up more efficiently. One example

of this is the toy sub-class that covers all toy types from marbles to dolls to baseballs. Another example could be the use of the ceramic sub-class that, like the toy subclass, may not provide intricate details of the object (such as color or form) but helps narrow down the typology.

After artifacts are sorted into their proper class and sub-class more detailed analysis takes place based on the type of object.

Sub-Class Code	Sub-Class
32	Activities-Other
76	Ammunition
49	Architectural Decorative Elements
50	Architectural-Other
78	Arms Related-Other
33	Automobile Related
66	Belts/Straps
95	Bone
2	Bottles/Jars
46	Brick, Block
45	Building Materials
30	Cans/Tins
1	Ceramics
65	Cloth
68	Clothing Fasteners
69	Clothing Related-Other
58	Coins
29	Commercial Kiln
28	Commercial Pharmaceutical
57	Cosmetics
3	Cutlery
8	Decorative Table Glass
41	Door Parts
44	Electrical
19	Farming
52	Flooring Materials
34	Flowerpots
80	Furniture Hardware
84	Furniture Related-Other
81	Furniture-Decorative
5	Glassware-Other
75	Gun Parts
77	Gunflints
20	Hand Tools
21	Heating
16	Household Items
61	Hygiene
99	Indeterminate
55	Jewelry
56	Keys
7	Kitchen Related-Other
6	Kitchenware (Utensils, Pots, etc.)

Sub-Class Code	Sub-Class
83	Lighting
25	Livestock/Pets
15	MachineParts/Hardware
27	Manufacturing
31	Misc.Small Hardware
47	Mortar, Cement
23	Musical
42	Nails,Spikes,Etc.
62	Perfume/Cologne
63	Personal-Other
59	Pharmaceutical
53	Plaster
43	Plumbing
24	Recreation
85	Red Clay
60	Religious/Ritual
51	Roofing Materials
22	Sewing
96	Shell
67	Shoe Parts
88	Smoking Related-Other
87	Stoneware
17	Toys
26	Transportation
4	Tumblers, Stemware
86	White Ball Clay
40	Window Glass
54	Wood
18	Writing

### Ceramic Artifacts

Historic ceramic analysis is focused on identifying ware and type categories, form, motif, colors, percent complete, other decorative attributes, and maker's marks, in order to interpret site chronology. Maker's marks are described in detail and dated, when possible. Depending on the percentage completed, a decorative pattern can be identified and dated. The minimum number of vessels (MNI) is defined once the sherds were coded and cross-mended.

Ware type is the first trait that is assessed for analysis, and is based on the ceramic paste and base glaze types. The most common ware types for kitchen ceramic are:

#### Ware Types

- Yellowware..... *yellow paste with a yellow glaze*
- Creamware ..... *creamy colored paste as well as a cream-colored glaze*
- Pearlware ..... *white paste with a blue green tinted glaze*
- Ironstone ..... *white paste with a blue gray tinted glaze*
- Whiteware ..... *white paste with a white glaze*
- Stoneware ..... *gray, buff, or red paste with a gray, cream, or brown glaze*
- Redware ..... *red paste with a clear, brown, or black glaze*
- Porcelain ..... *vitreous or semi-vitreous white paste with a generally white glaze*

### Vessel Part

Part is the portion of the vessel that has been recovered. The most common vessel parts are:

Rim ..... *the top rim of a bowl, plate, or cup*

Body ..... *the general pieces that do not connect to a rim or base. This is where most of the decoration is placed on a piece*

Base ..... *the base or foundation of a piece. Most times this is where the maker's mark is placed*

### Decoration

Decoration encompasses many different techniques, some of which are datable. The most common techniques used are:

Hand painted ..... *simple designs used to decorate, usually*

Sponge ware ..... *technique that uses sponges dipped in paint used to decorate*

Transfer print ..... *a technique where a general design is laid out and transferred in a small dotted pattern onto the surface of a vessel*

Decal ..... *an updated form of transfer printing where a pre-made design is adhered to the vessel*

Shell edge ..... *blue, green, or red color is used to decorate the outer edge of a plate*

### Glass Artifacts

Glass artifacts, much like ceramics, are tabulated according to major groups (e.g., bottle glass, window glass, lamp glass, tableware, tumblers), and then separated into functional categories whenever possible.

Dating information is based on the identification of diagnostic technological attributes (e.g., mold seams and evidence of snap-case manufacture), in addition to identifiable bottle embossments.

Attributes recorded for glass artifacts include:

- manufacturing technique
- decoration
- finish type
- base type
- color
- functional group/form

The beginning and end dates for every datable attribute is determined. Maker's marks and embossments are identified, described and dated, when possible. A Maker's Mark is the unique identifying mark of a specific company that is placed on the base of plate, bowls, cups, and bottles

### Manufacturing Technique

Manufacturing Technique is the process by which the glass object is made. The most common types of manufacture are:

- Free Blown
- Blown in Mold
- Machine Made
- Molded with Applied or Improved Finish

## Decoration

Decoration of glass can come in the form of a blown or etched design in the body of a piece or in the application of color labels.

### Finish/Base Type

Finish type refers to the type of rim/lip on the bottle. The type of finish can, in some cases, be used to provide a date range of bottle manufacture. The way that the finish was applied (by hand or by machine) can also be a determining factor in age. Some of the more common bottle finishes are:

- Crown Finish
- Blob Top Finish
- Oil Finish
- Bead Finish
- Sheared Finish
- String Rim Finish
- Patent Finish
- Prescription Finish

## Color

Color is also an age-determining factor, since some unique colors were used for a limited time. The most common colors in historic glass are

- Sun Colored Amethyst
- Cobalt
- Olive Green
- Amber
- White Opaque
- Aqua
- Clear

## Form

Form is the part of the vessel that has been recovered. The most common vessel forms are:

Lip/Rim ..... *the top rim of a bottle or glass*

Body ..... *the general pieces that do not connect to a rim or base. This is where most of the decoration is placed on a piece*

Base ..... *the base or foundation of a piece. Most times this is where the maker's mark is placed*

## Other Artifacts

Other historic/modern artifact classes include architectural debris (e.g., bricks, nails, window glass, etc.), clothing (type and materials identified when possible), and miscellaneous small finds. When necessary, attributes such as character, wear, decoration, and material are coded, as well.

Nails and screws can be assigned date ranges based upon their type of manufacture. The most datable types are:

- Cut nails
- Wrought nails
- Wire nails
- Self-starting screws

### Artifact Dating

Artifact dating is based on the identification of maker's marks, diagnostic-manufacturing methods, such as bottle mold seams, bottle pontil marks, ceramic bodies and glazes, and known dates of production. A general guideline of accepted dates has been set up and is to be used for dating artifacts that have no maker's marks.

Artifact Type		Begin Date	End Date	Mean Date	Reference
Creamware	Plain	1775	1820	1797.5	South 1977

## Appendix J: Methods for Analysis of Prehistoric Lithic Artifacts

### Introduction

This appendix provides an overview of the methods of lithic analysis used for this project. After washing and labeling, prehistoric artifacts recovered during the investigation were divided into specific artifact types, with a number of variables recorded for each type. Five basic categories of information can be derived from lithic artifacts: depositional, temporal/stylistic, functional, technological, and raw material. Each of these aspects of the lithic record are interrelated and cannot be completed divorced from one another. Raw material analysis identifies the lithic materials that were exploited; this information permits inferences to be made about procurement strategies and the related issues of exchange and settlement mobility. Technological analysis examines tool design and methods of production, maintenance, and recycling; this information helps to document the organization of technology and to address issues such as site function. Functional analysis determines the tasks in which tools were employed; this information also helps to document the organization of technology and site function. Temporal/stylistic analysis provides chronological as well as other cultural information; typically, however, only the most formalized stone tools are usually diagnostic (e.g., projectile points), and even these items tend to be less sensitive to temporal change or regional styles than are ceramics. Information about depositional processes help to identify activity areas, tool kits, and larger-scale site formation processes; this information is derived from crossmending and plotting artifact distributions.

The methods and procedures used to generate data about these five aspects of the lithic record are outlined below. As lithic artifacts were analyzed, information was recorded on analysis sheets as a series of codes; then, the codes were entered into a computer database program, Microsoft Access. For the purposes of data analysis and manipulation, this database was then converted to Excel data manipulation and table generation. These computer programs facilitated a better understanding of site-use.

### Artifact Classes and Types

The analytical approach to stone tool production and use used here can be described as techno-morphological; that is, artifacts were grouped into general classes and further divided into specific types based upon key morphological attributes, which are linked to or indicative of particular stone tool production (reduction) strategies. Function was inferred from morphology as well as from use-wear. Surfaces and edges were examined for traces of use polish and damage with the unaided eye and with a 10x hand lens. A conservative approach to the identification of utilized and edge-retouched flakes was taken because of a number of other factors can produce similar edge-damage, such as, trampling of materials on living surfaces, spontaneous retouch during flake detachment, and trowel contact. Data derived from experimental and ethnoarchaeological research were relied upon in the identification and interpretation of artifact types. The works of Adams (2002), Andrefsky (1998), Callahan (1979), Clark (1986), Crabtree (1972), Flenniken (1981), Gould (1980), Parry (1987), Whittaker (1994) were drawn upon most heavily.

Organized by artifact classes, specific artifact types are listed below, followed by their code and a brief definition. All types were quantified by both count and weight in grams. Also discussed below are the specific variables or attributes that were recorded and how they were coded.

## Bifaces

Bifaces are chipped stone tools that have been shaped by the removal of flakes from both faces or sides of a cobble or large flake. In most cases, they are hafted and used as projectile points and/or knives. Technically, bifaces are also cores, because the flakes detached from them during production and maintenance can be used as tools themselves. Attributes recorded on bifaces include raw material, cortex, condition, and maximum length, width, and thickness, recorded in mm. The condition of fragmentary projectile points is coded as tip (TIP), medial section (MED), and base (BAS). Based on attribute characteristics bifaces were then classified according to the following types:

1. Early-Stage Bifaces (EB) are cobbles or large flakes that have had their edges bifacially trimmed and a few large reduction flakes detached. These bifacial blanks are equivalent to Callahan's (1979) Stage 2 bifaces. Because of their crude condition, these bifaces can be hard to distinguish from freehand cores. In fact, early-stage production failures could easily be recycled into these other tool types.
2. Middle-Stage Bifaces (MB) look more like bifaces; they have been initially thinned and shaped. A lenticular cross section is developing, but edges are sinuous, and patches of cortex may still remain on one or both faces. These bifaces are roughly equivalent to Callahan's (1979) Stage 3 bifaces. Biface reduction is a continuum; therefore, middle-stage bifaces are often difficult to distinguish from early- and late-stage bifaces, depending upon the point at which their reduction was halted. In addition, rejected bifaces may have been used for other tasks (recycled).
3. Late-Stage Bifaces (LB) are essentially finished bifaces; they are well thinned, symmetrical in outline and cross section, and edges are centered. Small areas of cortex may still exist on one or both faces. These bifacial performs are roughly analogous to Callahan's (1979) Stage 4 bifaces.
4. Projectile Points (PP) are finished bifaces that were hafted and functioned as projectiles and/or knives. Intact projectile points and basal fragments were assigned to previous established point types.
5. Drills (DR) are slender bifaces that were used to perforate or pierce various materials, perhaps using a rotary motion. On occasion, projectiles are reworked into drills.
6. Choppers (CP) are large bifaces that have been employed in tasks that required heavy-duty cutting or chopping. These implements are often crudely formed and can be mistaken for cores or early-stage bifaces.
7. Other Bifaces (OB) are bifaces that do not fit easily into the above types (the note field may be used to record distinctive attributes).
8. Indeterminate Biface Fragments (IB) are sections of bifaces that are too badly damaged to be assigned to a specific type.

## Unifaces

Unifaces include both formal tools, like endscrapers, and informal tools, like utilized and edge-retouched flakes. Flakes from cores or bifaces can be used as informal (expedient) tools or worked into formal tools. Three uniface types were recognized, and their raw material, cortex, and condition (whole or broken) was recorded. Maximum length, width, and thickness are recorded in mm.

1. Endscrapers (ES) are formalized uniface tools that have uniformly retouched edges, which creates a working edge and a standardized shape. The working edge is transverse to the long axis of the tool, and retouching often erases obvious indications that the tool is made on a flake. In some cases, endscrapers are bifacially worked, but they are still classified as unifactes.
2. Sidescrapers (SS) are formalized unifactes that have uniformly retouched edges, creating a working edge with a relatively standardized shape. The working edge or edges are parallel to the long axis of the tool (or lateral margin of the original flake).
3. Retouched Flakes (RF) are expedient tools that have had one or more edges retouched, either to resharpen the working edge, to create a dulled edge for grasping, or to form a specific edge angle or shape. The flake itself could have been detached from a core or biface. It should be noted that severe edge-damage can be difficult to discern from intentional retouching. Retouch flake scars on edges typically exceed 2 mm in length.
4. Utilized Flakes (UF) are expedient tools that exhibit traces of use damage and/or polish on one or more edges. These flakes could have been detached from cores or bifaces, and they were employed with no prior modification. Both retouched flakes and utilized flakes represent simple tools that were usually employed in cutting and scraping tasks, and after tasks were completed, they were discarded. A discriminating criterion versus retouched flakes includes flake scars less than 2 mm in length.
5. Notched Flakes (NF) or spokeshaves are a special type of retouched flakes. The unifacial retouching of one or more flake edges resulted in a concave working edge(s).
6. Graver Flakes (GF) are a special type of retouched flake. Unifacial retouch of one or more edges resulting in acute projections distinguishes the morphology of this tool type.
7. Denticulated Flakes (DT) are a special type of retouched flake, with spaced unifacial flake removals from one or more edges forming a toothed or serrated edge.
8. Other Uniface Types (OU) are unifactes that do not fit easily into existing types.
9. Indeterminate Uniface Fragments (IU) are unifactes that are too fragmentary to be assigned to a specific type.

#### Cores

Cores are cobbles or blocks of raw material that have had one or more flakes detached, but they have not been shaped into tools or used extensively for tasks other than that of a nucleus from which flakes have been struck. Cores come in various shapes and sizes, depending upon their degree of reduction and the methods of reduction that were applied. Three core types were identified and variables recorded include raw material and cortex.

1. Freehand Cores (FC) are blocks or cobbles that have had flakes detached in multiple directions by holding the core in one hand and striking it with a hammerstone held in the other (Crabtree 1972). This procedure generates flakes that can be used for expedient tools or can be reworked into formalized tools. Freehand percussion cores come in various shapes and sizes, depending upon the raw material form and degree of reduction.
2. Bipolar Cores (BC) are usually cobbles that have had flakes detached by direct hard-hammer percussion on an anvil: the core is placed on the anvil and struck on the top with a hammerstone (Crabtree 1972; Hayden 1980). Cores typically assume a tabular shape, exhibit heavy crushing and battering, and flake scars tend to run between areas of crushing and battering. Bipolar cores are normally smaller than freehand cores. Most flakes that are

detached are only suitable for expedient flake tools. Bipolar reduction can also be used to recycle tools into usable flakes.

3. Tested Cobbles (TC) are unmodified cobbles, blocks, or nodules that have had a few flakes detached to examine raw material quality.
4. Other Core Types (OC) are cores that do not fit easily into existing types.
5. Blade Core (BC) displays multiple parallel removals of blades, often resulting in cone-like shape.

#### Debitage

Debitage includes all types of chipped-stone waste that bears no obvious traces of having been utilized or intentionally modified. All flakes were sorted by raw material type, and weighed. During detailed analysis, flakes were also sorted into the following categories:

1. Decortication Flakes (DF) are intact flakes with 50 percent or more cortex covering their dorsal surface. These are the first series of flakes detached during lithic reduction.
2. Early-Reduction Flakes (ER) are intact or nearly intact flakes with less than 50 percent dorsal cortex, fewer than four dorsal flake scars, on average, and irregularly shaped striking platforms with minimal faceting and lipping. Platform grinding is not always present. These flakes could have been detached from early-stage bifaces or cores of the freehand and bipolar types.
3. Biface-Reduction Flakes (BF) are intact or nearly intact flakes with multiple overlapping dorsal flake scars and small elliptically shaped platforms with multiple facets. Platform grinding is usually present. Platforms are distinctive because they represent tiny slivers of what once was the edge of a biface. Biface-reduction flakes are generated during the middle- and late-stages of biface reduction and also during biface maintenance (resharpening).
4. Bipolar-Reduction Flakes (BP) are intact or nearly intact flakes that have been struck from a bipolar core. They typically exhibit sheared cones or bulbs, closely spaced ripples, and crushed and splintered platforms. Crushing can also occur on the distal ends or terminations of these flakes, but it is a common misconception that platforms and bulbs are present on both ends of each flake. Not all flakes that are generated during bipolar reduction are readily distinguishable as bipolar flakes, and large amounts of shatter are usually generated.
5. Block Shatter (BS) are angular or blocky fragments that do not possess platforms or bulbs. Generally the result of uncontrolled fracturing along inclusions or internal fracture planes, block shatter is most frequently produced during the early reduction of cores and bifaces. Block shatter is common in bipolar reduction, and it is equivalent to "primary shatter" (Binford and Quimby 1963).
6. Flake Shatter (FS) consists of small, flat fragments or splinters that lack platforms, bulbs, and other obvious flake attributes. Flake shatter is generated throughout a reduction sequence but is most common in later stages. It is a common by-product of bipolar reduction and is equivalent to "secondary shatter" (Binford and Quimby 1963). Trampling of debitage on living surfaces also generates flake shatter, while thermal fracturing produces both flake and block shatter.
7. Flake Fragments (FF) are sections of flakes that are too fragmentary to be assigned to a particular flake type.

8. Indeterminate Flakes (IF) are flakes that could not be confidently assigned to any debitage category.

9. Blades (BI) consist of flakes with dimensions of length measuring at least twice width, and displaying parallel lateral margins. Where recovered in large numbers, may be associated with prepared core and blade reduction technique (Crabtree 1972).

Detailed analysis included collecting data on cortex (see below). In addition, GAI recorded data on flake size using a template with concentric circles at 1, 2, 3, 4, 5, 6, 7, and 8 cm diameters. An artifact had to fit into the size grade by its maximum width. These size grades were labeled 1, 2, 3, etc.... If an artifact was size grade 1, it means the artifact, in maximum width, fit within and did not exceed the 1 cm diameter template boundaries.

#### Cobble Tools

Alluvial and glacial cobbles were often used prehistorically for various tasks with little or no prior modification. Cobbles of igneous and metamorphic rock were used as hammers, anvils, grinding stones, or a combination of functions. Battered, crushed, pitted, and/or smooth surfaces identify these cobbles as tools. When multiple functions are evident, the cobble is assigned to the artifact type that best represents its "dominant" or "primary" function; additional functions were recorded in the note field of the coding sheet. Two types of cobble tools were identified and raw material and condition were recorded.

1. Hammerstones (HS) are cobbles that show evidence of battering and crushing along their margins, indicating that they were intentionally used as percussors.

2. Manos (MN) or grinding stones are hand-sized cobbles with one or more flat surfaces that were used to crush and grind various materials, as is evidenced by smoothed and polished surfaces.

3. Metates (MT) or grinding slabs are large cobbles or blocks of bedrock with one or two flat or concave surfaces which exhibit evidence of grinding and crushing.

4. Pestles (PT) are linear cobbles that exhibit crushing and smoothing one or both ends or poles. Pestles can also be formalized tools that were shaped by pecking and grinding.

5. Mortars (MR) are large cobbles or blocks of bedrock with at least one deeply concave surface, which was used to crush and grind various materials.

6. Anvil Stones (AV) are cobbles or blocks of bedrock that were used as a base on which to rest materials while they were struck with a hammer. Surfaces that are interpreted as anvils tend to possess shallow, coarse-textured depressions with amorphous outlines.

7. Pitted Cobbles (PC) or "nutting stones" are cobbles or blocks of bedrock with at least one smooth depression no greater than about 4 cm in diameter. These depressions differ from anvil depressions in that they are smoother, often deeper, and tend to be circular or oval. These depressions are believed to be the result of processing nuts, as compared to anvil depressions, which are attributed to bipolar reduction.

8. Netsinkers (NS) are either notched cobbles or crudely flaked slabs. In the former, freehand or bipolar percussion was used to remove one or two flakes from both ends or sides of a flat cobble to create notches. In the latter, flakes or slabs of coarse-grained stone are shaped by the removal of flakes. These items are believed to have been attached to nets, but some specimens could have functioned as bolas stones.

9. Abraders (AB) are chunks of sandstone or related materials that were used to shape and sharpen tools made of various materials. Slotted abraders are believed to have been used in the manufacture and maintenance of bone and wood tools (e.g., needles, awls, and arrow shafts), and flat abraders are believed to have been used in the manufacture and maintenance of stone tools (e.g., chipped stone platform preparation and polishing of groundstone tools) in addition to tools of bone and wood tools.

10. Other Cobble Tools (OT) are cobbles that do not fit into the above types. (Key attributes are recorded in the note field.) Broken cobble tools are assigned to one of the above types or are placed with the cracked rock if badly damaged.

#### Groundstone

1. Grooved Axes (AX) are formal tools that were designed to be hafted, and their primary function was heavy-duty woodworking.

2. Celts (CL) are ungrooved axes; they were still hafted but by a different method.

3. Adzes (GA) or gouges manufactured by granitic materials by pecking and grinding were hafted and functioned as heavy-duty woodworking tools, much like their chipped-stone counterparts.

4. Steatite Bowls (SB) are stone cooking vessels that were manufactured by carving, grinding, and polishing.

5. Other Groundstone Tools (OG) are those tools and ornaments that are not covered by the above types, for example, bannerstones, pipes and pendants.

6. Unfinished Groundstone (UF) consist of whole or fragmentary specimens that show some degree of modification (flaking, pecking, and/or grinding) indicating a represent unfinished groundstone implements, discarded during manufacture.

7. Indeterminate Groundstone Fragments (IG) are sections of groundstone tools or ornaments that are too badly damaged to be assigned to a specific type.

#### Fire-Cracked Rock

Fire-Cracked Rock (FCR) includes all fragments of lithic debris that cannot be attributed to stone tool production. Most specimens represent fire-cracked rock: cobbles and/or chunks of local bedrock that were used in heating and cooking activities.

#### Minerals

(a "type" category that applies to unmodified or minimally modified minerals found at a site):

1. Hematite (HM) is a high-grade form of iron ore.

2. Limonite (LM) is a low-grade earthy form of iron ore; it is softer, lighter in weight, and lighter in color than hematite. Limonite is typically brown or yellow, while hematite is red or reddish brown.

3. Mica (MC) is a light-weight mineral that readily splits into thin elastic layers.

4. Steatite (ST) is an impure form of talc that is easily worked because of its softness and massive structure.

5. Quartz Crystals (QC) are transparent crystals of silica.

6. Galena (GL) is the principal ore of lead; its luster is metallic, and cleavage is cubic.

7. Other Minerals (OM) are minerals that are not listed above.

### Other Analytic Coding

#### Raw Material Analysis

1. Lithic Raw Material Type: lithic raw material identification was conducted on the entire lithic artifact assemblages. Lithic raw material types were identified on the basis of macroscopic characteristics: color, texture, hardness, and inclusions (Luedtke 1992).
2. Cortex was recorded for all chipped-stone artifacts with the following codes: A = absent, B = block cortex, C = cobble cortex, I = indeterminate cortex, and X = no observation. Block cortex denotes lithic procurement from primary sources or outcrops, while cobble cortex denotes secondary sources (e.g., gravel bars and glacial till). Generally, block cortex is flat and may be coarse textured, while cobble cortex is rounded, smooth, and often polished. Chert cobbles can contain internal fracture planes, however, and when exposed by knapping, can appear similar to block cortex. Cortex is coded as indeterminate when it was unclear whether the cortex exhibited on an artifact was cobble or block. No observation is coded when the presence or absence of cortex could not be determined; this is normally limited to argillite.

#### Stylistic Analysis

Only projectile points were stylistically analyzed. In this analysis, the effects of resharpening and recycling on projectile point morphology were considered. Finished bifaces were segregated into groups on the basis of morphology and technology. The latter refers to those aspects of production, maintenance, recycling, and hafting that are "preserved" on the surfaces of each specimen through evidence of percussion and pressure flaking, edge grinding, breakage, morphology etc..

#### General Tool Attributes

1. Condition was recorded for tools as: whole (whl); base (bas); distal section (tip); medial section (med), and indeterminate (brk).
2. Size was recorded on stone tools as: length, width, and thickness (recorded to 0.1 mm).
3. Weight: recorded to 0.1 g.

**INTRODUCTION**

Phase II archaeological investigations within the Bell Bend project area included the collection of soil samples and carbon concentrations for the recovery of plant macro-remains. Plant artifacts were collected and analyzed from six sites (36LU280, 36LU281, 36LU283, 36LU285, 36LU286 and 36LU288) (see Table 01). Site 36LU288 is a multi-component site containing predominantly prehistoric occupations located on the west bank of the North Branch Susquehanna River. The other five sites within the study area describe a cluster of rural residences and farms northeast of the town of Berwick. Study of plant remains collected from cultural contexts at the Bell Bend sites informs our understanding of the prehistory of the region and the culture history of loosely-tied nineteenth and twentieth century rural homes and farmsteads.

Table 01: Summary of archeobotanical samples.

Site	Description	FLOTATION			HAND-COLLECTED
		No. of Samples	Volume (liters)	Weight of Carbonized Plant Material (grams)	No. of Samples
36LU280	Late 19th - mid 20th century farmstead	5	27	91.995	0
36LU281	Stone house foundation	3	28	2.78	0
36LU283 Sink House	20th century house	11	59.5	2.56	0
36LU285	19th century structure	6	38.5	36.005	0
36LU286 Kinser Farmstead	ca. 1845 to ca. 2005 dwellings and outbuildings	4	35	0.525	0
36LU288	Multi-component Prehistoric	5	57	27.46	2
6 sites		34	245	161.325	2

**METHODS**

Archaeological soil samples were individually processed at GAI's Homestead, Pennsylvania laboratory using a Flote-Tech flotation system equipped with 0.325mm fine fraction and 1.0mm coarse fraction screens. The Flote-Tech system is a multi-modal flotation system, which facilitates the separation and recovery of plant macro-remains from the soil matrix by agitation in water. Processing resulted in two (light and heavy) fractions of material. Samples were air dried. Recovered fractions were submitted to archeobotanical consultant Justine McKnight in Severna Park, Maryland and analyzed following the procedures described below.

Dry heavy and light fractions were carefully passed through graduated geological sieves to provide divisions for analysis. The processed samples yielded carbonized and non-carbonized plant remains. Non-carbonized plant remains observed in the flotation-derived botanical assemblage included modern root fibers, deciduous leaves, non-carbonized seeds, nut parts, thorns and non-carbonized wood fibers (many with paint adhering to one surface. While non-carbonized plant remains are usually excluded from routine archeobotanical analyses (Minnis 1981; Keepax 1977), it is the opinion of the analyst that many of the unburned plant remains recovered from the Bell Bend sites represent meaningful artifacts directly associated with the culture history of the sites. Accordingly, a modified analytical approach was adopted which included identification (but not quantification) of non-carbonized plant remains, and a discussion of their significance to the archaeology. The burned or unburned status of the recovered plant artifacts is made clear in this report in order to acknowledge the very different preservational biases affecting the recovered remains.

Working beneath low power magnification, carbonized botanical remains were separated from fraction matrices. The greater-than or equal-to 2mm carbonized botanical specimens were examined under 10X to 40X magnification and sorted into general categories of material (i.e. wood, seed, nutshell, cultigen, etc.). Descriptions were recorded for each category of the greater-than or equal-to 2mm plant material. The less-than 2mm size fractions were examined under low magnification, and scanned for the remains of seeds and cultivated plants. Non-carbonized plant remains (in some cases individual samples contained *abundant* wood debris) were describe and identified, but they were not quantified or separated from fraction matrices.

Identifications were routinely attempted on all nut, seed, cultigen and miscellaneous plant remains encountered, and on a sub-sample of twenty randomly selected wood fragments from each sample containing *more* than twenty specimens, in accordance with standard practice (Pearsall 2000). Identifications of all classes of botanical remains were made to the genus level when possible, to the family level when limited diagnostic information was available, and to the species level only when the assignment could be made with absolute certainty. All identifications were made under low magnification (10X to 40X) with the aid of standard texts (Edlin 1969; Kozłowski 1972; Martin and Barkely 1961; Panshin and deZeeuw 1980), and checked against plant specimens from a modern reference collection representative of the flora of Pennsylvania. Specimen weights were recorded using an Mettler electronic balance accurate to 0.01 grams.

## **RESULTS OF ANALYSIS: HISTORIC SITES**

### **36LU280, Site 3**

Located on an upland flat in an agricultural field, Site 36LU280 describes a farmstead built between 1873 and 1939 and demolished prior to the mid-1950s. Phase II archaeological investigations documented a variety of domestic features and kitchen and architectural artifacts. Archeobotanical studies at 36LU280 included the processing of five flotation samples from three features (Feature 4 [burn pit], Feature 5 [trash pit], and Feature 6 [post mold]). Flotation processing of 27 liters of feature fill produced 81.995 grams of carbonized plant macro-remains (a mean average of 3.0369 grams per liter). In addition to carbonized archeobotanical remains,

the Site 36LU280 features produced non-carbonized wood and seeds. Sample matrices contained an array of natural ecofacts, including non-carbonized roots, gravel and rock, and spherical carbon residue. This residue is a bi-product of the burning of plant materials high in silica - such as grasses. The silica melts and fuses into droplets that persist in the archaeological record. Cultural artifacts noted with the samples include coal, brick fragments, shell, clear glass, iron fragments and bone.

The archeobotanical assemblage from Site 36LU280 included burned and unburned wood, the carbonized remains of nuts and seeds, abundant non-carbonized seeds, and a variety of miscellaneous carbonized plant materials including stem, fungi, amorphous carbon and papery tissue. An inventory of the botanical contents of each flotation sample is provided in Table 02. Recovered plant materials are discussed in detail below by material type.

### Wood

Wood remains comprised the most abundant plant material type recovered from Site 36LU280. Wood was recovered in both burned and unburned condition. All of the identifiable wood was pine (*Pinus spp.*).

Wood charcoal was present in all of the samples analyzed from Site 36LU280. A site total of 5,744 fragments was recovered. Of these, 50 fragments were randomly selected for identification (a maximum of 20 fragments per sample). Eight-eight percent of the sub-sample selected for identification was pine (*Pinus spp.*), 12 percent was unidentifiable. Wood charcoal was most abundant within Feature 4 (see Table 03), a fact attributable to the features function as a burn pit.

Table 03: Wood charcoal densities by feature.

Feature	Fragments per liter of feature fill	Grams wood charcoal per liter
4	477.83	6.465
5	0.42	0.003
6	1.09	0.007

Unburned wood fibers were abundant within the Feature 5 flotation samples. A 20-fragment per sample sub-sample confirmed the presence of pine (*Pinus spp.*) and oak (*Quercus spp.*) woods within this trash pit.

### Nut

Nut remains from Site 36LU280 were limited to a single carbonized acorn (*Quercus spp.*) cap fragment from Feature 4 (FS 116).

### Seeds

Carbonized seeds from the 36LU280 flotation samples were limited to a single sumac seed (*Rhus sp.*) from the burn pit Feature 4.

Non-carbonized seeds were both ubiquitous and abundant within all samples analyzed. Non-

carbonized seeds occurred in all 5 flotation samples analyzed from Site 36LU280, with eight discrete taxa represented: pigweed (*Amaranthus sp.*), goosefoot/pigweed (*Chenopodium/Amaranthus*), carpetweed (*Mollugo verticillata*), purselane (*Portulaca oleracea*), cinquefoil (*Potentilla spp.*), raspberry/blackberry (*Rubus spp.*), elder (*Sambucus canadensis*), and grape (*Vitis sp.*). While many of these seed represent edible plants or edible plant parts, they are also common weedy contaminants in archeobotanical samples. Their importance to historic ethnobotany at the site cannot be evaluated with confidence.

### **Miscellaneous**

A variety of miscellaneous carbonized plant remains were documented within the flotation samples studied from Feature 4 (the burn pit). These include a fragment of stem tissue, amorphous carbon, a fungal fructification fragment, and abundant unidentifiable papery tissue.

### **Summary**

The archeobotanical assemblage from Site 36LU280 reveals details of plant use and landscape on a rural farmstead occupied from the late nineteenth century through the first half of the twentieth century. Of the three features sampled, Feature 4 (a burn pit) provides the greatest diversity of plant remains preserved though carbonization. Non-carbonized plant remains dominate the flotation assemblages from Feature 5 (trash pit) and Feature 6 (a post mold). Pine wood dominates both the charcoal and unburned wood assemblages from the site, which suggests that the wood may be architecturally-derived, as pine woods provided an affordable lumber source throughout the late 1800's into the present. An array of weed seeds, an acorn fragment, and miscellaneous plant materials documented within the site assemblage indicate that the sampled features contained a portion of trash or incidental debris.

### **36LU281, Site 4**

Composed of a stone house foundation constructed and used during the nineteenth century. Site 36LU281 is located within an agricultural field on an upland flat. Archeobotanical studies at 36LU281 included the processing and analysis of three flotation samples from two features associated with the house: Feature 1 (the cellar hole) and Feature 3 (a post mold). Flotation processing of 28 liters of feature fill produced 2.78 grams of carbonized plant macro-remains (a mean average of 0.099 grams per liter). In addition to carbonized archeobotanical remains, the Site 36LU281 features contained abundant non-carbonized seeds. Sample matrices were composed of a rocky matrix with coal and coal clinker, and a variety of natural ecofacts and cultural artifacts (bone, non-carbonized roots, oak flowers, insects, millipedes, small terrestrial gastropods, fish scales, eggshells, brick fragments and bone).

Archeobotanical remains from Site 36LU281 include wood charcoal and non-carbonized seeds. An inventory of the botanical contents of each flotation sample is provided in Table 04. Recovered plant materials are discussed in detail below by material type.

### **Wood**

Wood charcoal was recovered from each of the three flotation samples analyzed from Site 36LU281. Charcoal totaled 343 fragments weighing 2.78 grams. Of this total, 60 fragments were randomly selected for identification (a maximum of 20 fragments per sample). While 77

percent of the wood sub-sample was not minimally classifiable to the genus level, a variety of local forest elements were identified: White oak (*Quercus spp. LEUCOBALANUS*) was the most abundant taxon identified, accounting for 12 percent of the assemblage. American chestnut (*Castanea dentata*) (seven percent), hickory (*Carya spp.*) (two percent) and bald cypress (*Taxodium distichum*) (two percent) were also identified.

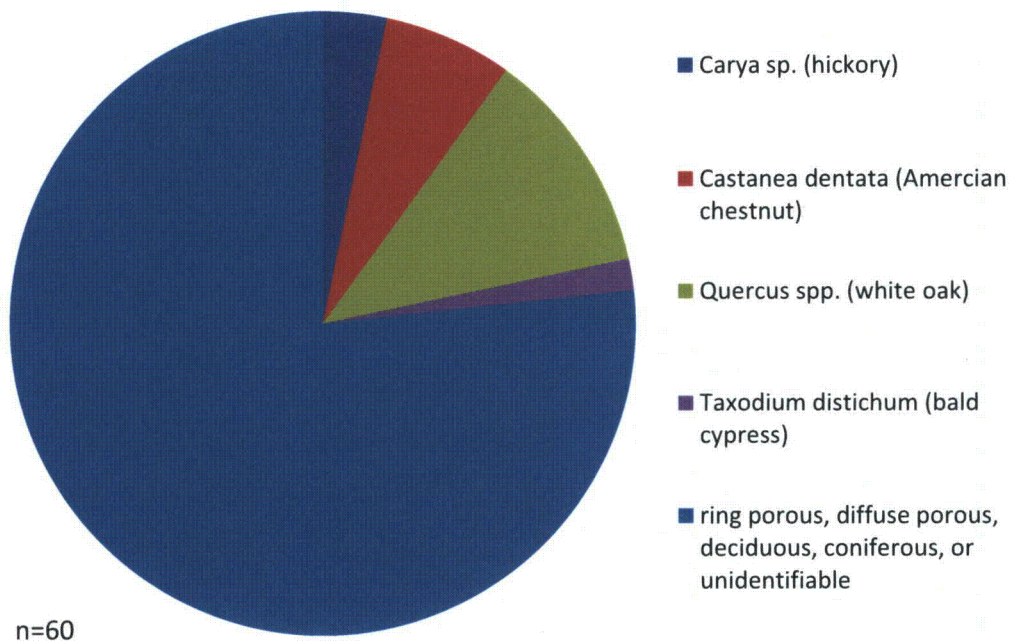

Figure 01: Composition of wood charcoal from site 36LU281 flotation samples.

### Seeds

Non-carbonized seeds were present within all three samples analyzed from Site 36LU281, but the upper level of the cellar hole feature (Feature 1) contained the greatest abundance and diversity of non-carbonized seeds. Ten taxa are represented in the seed assemblage from 36LU281: Pigweed (*Amaranthus sp.*), carpetweed (*Mollugo verticillata*), sheep sorrel (*Oxalis stricta*), purselane (*Portulaca oleracea*), panic/foxtail grass (*Panicum/Setaria.*), knotweed /dock (*Polygonum/Rumex*), raspberry/blackberry (*Rubus spp.*), elder (*Sambucus canadensis*), catchfly (*Silene sp.*) and chickweed (*Stellaria media.*). While many of these seeds represent edible plants or edible plant parts, they are also common weedy contaminants in archeobotanical samples from open site environments. Their importance to historic ethnobotany at Site 36LU281 remains uncertain.

### Summary

Archeobotanical materials secured from the primary cellar hole and associated postmold at Site 36LU281 provide baseline data regarding plant use at the site during the historic era. Wood charcoal data from the site document a suite of native forest taxa that could have entered the

archaeological record as fuel wood or as construction material. An array of non-carbonized seeds representing common weeds were noted within the flotation samples, but were particularly abundant within Level 1 (the uppermost level) of the cellar hole (Feature 1). It is likely that these seeds are modern intrusions unrelated to historic plant use at the site.

### 36LU283, Sink House Site

The Sink House Site (36LU283) is located on an upland flat in an agricultural field. The site includes the remains of a house and dependencies - including a well, barn and silo foundation. Archival evidence documents construction of a dwelling on the site between 1913 and 1920, and its demolition between 1987 and 1989. Phase II investigations at the site included excavation of eight cultural features. Two of these were sampled for plant macro-remains. Soil samples were collected for flotation processing from Feature 2 (the house cellar) and Feature 5 (an ash dump from which three zones - A, B and C were sampled).

Flotation processing of 59.5 liters of feature fill from the Sink House site produced a scant 2.56 grams of carbonized plant macro-remains (a mean average of only 0.043 grams per liter). In addition to carbonized archeobotanical remains, the Site 36LU283 features produced non-carbonized seeds and woody thorns. Sample matrices contained an array of natural materials, including non-carbonized roots, snails, gravel and rock, root fibers, and deciduous leaf fragments. Cultural artifacts noted with the samples include coal, clinker, concrete rubble, brick fragments, glass, iron fragments, crushed shell, paint, plaster, asphalt roofing shingle fragments, linoleum pieces (?), twisted fibers (string or yarn) and bone.

Archeobotanical materials recovered from the Sink House site include wood charcoal, carbonized wheat kernels, burned cherry seeds, and non-carbonized weed seeds and woody thorns. An inventory of the botanical contents of each flotation sample analyzed from the Sink House site is provided in Table 05. Recovered plant materials are discussed by material type in the following section.

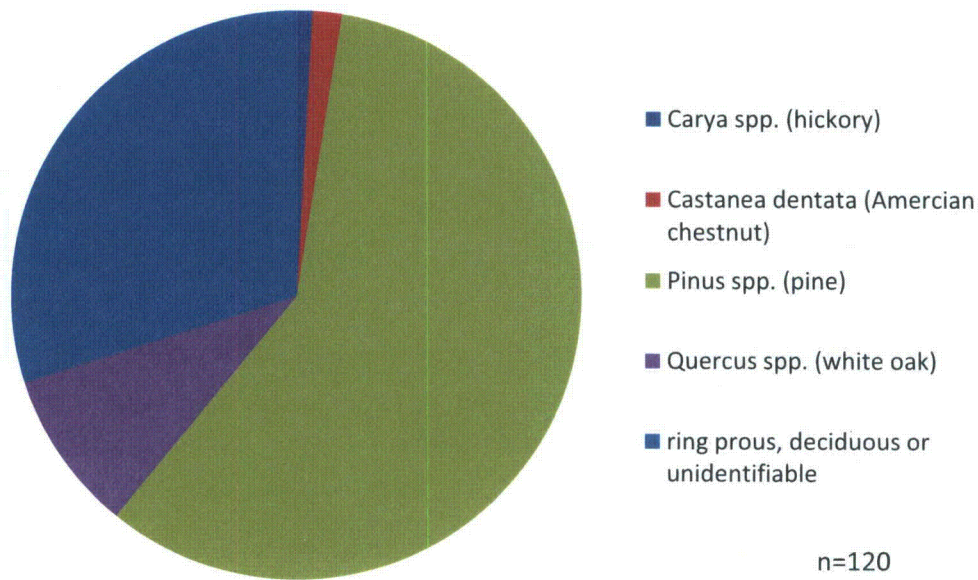

Figure 02: Composition of wood charcoal from Sink House Site (36LU283) flotation samples.

### Wood

Wood charcoal was the most abundant plant material type recovered from Site 36LU283. A site total of 565 fragments of burned wood weighing 2.37 grams was recovered. Of these, 120 fragments were randomly selected for identification (a maximum of 20 fragments per sample). The assemblage was overwhelmingly dominated by pine (*Pinus spp.*) (see Figure 02), which accounted for 58 percent of the sub-sample selected for identification. White oak (*Quercus spp. LEUCOBALANUS group*) (nine percent), American chestnut (*Castanea dentata*) (two percent), and hickory (*Carya spp.*) (one percent) were also identified. Thirty percent of the sub-sample selected for identification was not minimally classifiable to the Genus level.

### Seeds

Three carbonized wild black cherry seeds (*Prunus serotina*) were recovered from Level 1 of the ash dump (Feature 5b) (see Figure 03).

Figure 03: Wild black cherry (*Prunus serotina*) seed recovered from Feature 5b (FS#255). scale = 1mm increments

Non-carbonized seeds were both ubiquitous and abundant within all of the flotation samples analyzed from the Sink House Site. Non-carbonized seeds occurred in all 11 flotation samples analyzed, with 13 discrete taxa were represented: carpetweed (*Acalypha sp.*), goosefoot/pigweed (*Chenopodium/Amaranthus*), carpetweed (*Mollugo verticillata*), panic/foxtail grass (*Panicum/Setaria*), knotweed (*Polygonum sp.*), purselane (*Portulaca oleracea*), poke (*Phytolacca americana*), raspberry/blackberry (*Rubus spp.*), sumac (*Rhus sp.*), cherry (*Prunus sp.*), elder (*Sambucus canadensis*), grape (*Vitis sp.*), and knotweed family (POLYGONACEAE).

While many of these seed represent edible plants or edible plant parts, they are also common weedy contaminants in archeobotanical samples. It is not clear if these seeds were elements in the historic ethnobotany of the Sink House site.

### **Cultigens**

Eleven specimens of carbonized bread wheat (*Triticum aestivum*) were recovered from Level 2 of Feature 5C (ash dump) (see Figure 04). These plant artifacts confirm a cultural reliance on small grains at the Sink House site, and may indicate that wheat was farmed on the property.

Figure 04: Wheat (*Triticum aestivum*) kernels from Feature 5C (FS#330).  
Scale 1mm increments

### **Miscellaneous**

Miscellaneous plant remains within the Sink House Site flotation samples were limited to woody thorns from the Ash dump (Feature 5B). These thorns compare favorably with rose [*Rosa spp.*].

### **Summary**

The archeobotanical assemblage documented at the Sink House Site 36LU283 provides

information about plant use and landscape form and function on a twentieth century farmstead. A house cellar (Feature 2) and large ash dump (Feature 5) were sampled for plant macro-remains. The cellar feature yielded small quantities and a low diversity of plant materials - with pine, white oak and unidentifiable wood charcoal and unburned seeds recovered. The ash dump (Feature 5) produced a rich array of plant macro-remains, including abundant wood charcoal (predominantly pine, with hickory, white oak, American chestnut, and unspecific wood types), carbonized comestibles including wheat kernels and cherry pits, as well as non-carbonized seeds and woody thorns.

The botanical remains from the Sink House Site features reveal: A reliance on pine lumber for construction and possibly for fuel; The use and possible cultivation of wheat; The use of wild black cherry - which produces an edible fruit and cherry (a native tree common to disturbed habitats and field/forest edges); And the presence of an abundance of weedy species common to disturbed settings and 'edge' environments (such as fencerows, forest edges, the peripheries of house or barn yards).

### **36LU285, Site 9**

Site 36LU285 occupies an agricultural field on a level upland. Drain pipes and associated trenches, post molds, a possible structure, a refuse dump and a burned feature were identified during Phase II archaeological investigations, and these appear to relate to occupation of the site ca. 1815 through 1900. Three cultural features were sampled for plant macro-remains: Feature 1 (refuse dump); Feature 3 (possible structural interior); Feature 5 (drainage trench). A site total of six samples were submitted for study. Analysis of recovered plant remains from these features provides information regarding human-plant relationships at the site during the nineteenth century.

Thirty-eight and one half liters of feature fill were flotation processed from the Site 36LU285 excavations, producing 36.005 grams of carbonized plant macro-remains (a mean average of only 0.935 grams per liter). In addition to carbonized archeobotanical remains, the Site 36LU285 features contained an array of unburned seeds. Sample matrices contained natural ecofacts and cultural artifacts including non-carbonized roots, rocks, root fibers, coal, clinker, brick fragments, eggshell, glass (clear and colored), iron fragments, asphalt roofing shingle fragments, twisted fibers, woven fabric, shoe parts, brass/copper fastenings, copper wire, ceramics, insect eggs, tinfoil and spherical carbon residue - which is produced when plants high in silica (i.e. grasses) burn and the silica melts and fuses into droplets which persist in the soil record.

Site 36LU285 yielded a variety of plant material types, including wood charcoal, carbonized field crops, burned seeds, and coniferous needle fragments. In addition, unburned seeds were both ubiquitous and abundant within the features. The botanical contents of each flotation sample analyzed from Site 36LU285 are inventoried in Table 06. Below, the archeobotanical assemblage is discussed by material type.

### **Wood**

Wood charcoal was the most abundant plant material type recovered from Site 36LU285. A site

total of 2,503 fragments of burned wood weighing 35.34 grams was recovered. Of these, 120 fragments were randomly selected for identification (a maximum of 20 fragments per sample). Figure 05 illustrates the overwhelming predominance of pine (*Pinus spp.*) within the samples (pine charcoal accounted for 63 percent of the sub-sample selected for identification). White oak (*Quercus spp. LEUCOBALANUS group*) (21 percent), unspecified oak (*Quercus spp.*) (three percent), and maple (*Acer sp.*) (one percent) were also identified. Thirteen percent of the sub-sample selected for identification was not minimally classifiable to the Genus level.

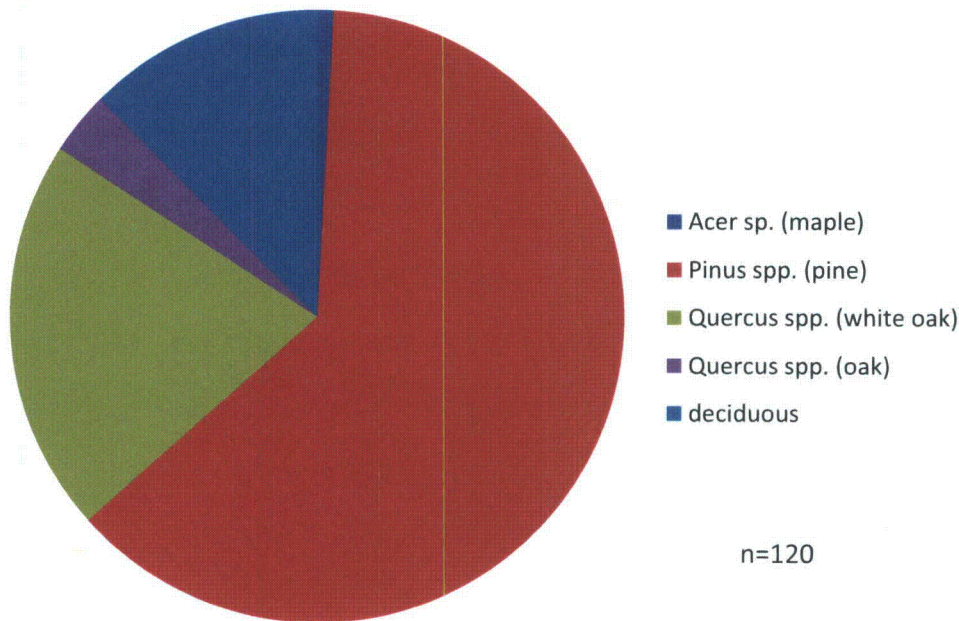

Figure 05: Composition of wood charcoal from Site 36LU285.

### Seeds

Carbonized seeds within the Site 36LU285 flotation samples total 25 specimens, all of which were recovered from the refuse dump Feature 1. Thistle (*Cirsium sp.*) (nine seeds), ragweed (*Ambrosia sp.*) (two seeds) and pigweed (*Amaranthus sp.*) (1 seed) were identified.

Non-carbonized seeds occurred within 100 percent of the samples analyzed from Site 36LU285. Ten distinct taxa were identified: carpetweed (*Acalypha sp.*), pigweed (*Amaranthus sp.*), goosefoot/pigweed (*Chenopodium/Amaranthus*), geranium (*Geranium sp.*), poke (*Phytolacca americana*), raspberry/blackberry (*Rubus spp.*), sumac (*Rhus sp.*), elder (*Sambucus canadensis*), grape (*Vitis sp.*), and nightshade family (*SOLANACEAE*). Many of these seeds represent edible plants or edible plant parts, but they are also found in similar associations as modern contaminants in archeobotanical samples. Their importance to historic ethnobotany at Site 36LU285 cannot be evaluated with confidence.

### Cultigens

The remains of cultivated field crops were well-represented at Site 36LU285 by maize and

wheat. Twenty-one specimens of maize (*Zea mays*) (a variety of morphological elements) (Figure 06) and a single wheat (*Triticum aestivum*) kernel fragment (Figure 07) were recovered from the refuse dump Feature 1 (Levels 4 and 6). The presence of these plant artifacts confirms a cultural reliance on field agriculture at Site 36LU285, and suggest that the cultivation of these plants played a role in the economy of the site.

#### Miscellaneous

Four fragments of carbonized coniferous needle material were recovered from the refuse dump (Feature 1).

Figure 06: Maize (*Zea mays*) cupules from Feature 1 (FS# 136)  
scale=1 mm increments

Figure 07: Wheat (*Triticum aestivum*) kernel half from Feature 1 (FS#134).  
Scale 1mm increments

### Summary

Phase II archaeological investigations at the nineteenth century farmstead Site 36LU285 included the study of plant artifacts from three features. Feature 1, a refuse dump contained the greatest quantity and diversity of plant macro-remains, including wood charcoal (mostly pine), the field crops maize and wheat, and burned and unburned seeds. Feature 5 (drainage trench) samples yielded pine (with oak) wood charcoal and unburned seeds. Similarly, Feature 3 (possible structure interior) contained pine (with white oak) wood charcoal and unburned seeds.

Details of food histories and farm operation are indicated by the archeobotanical assemblage from Site 36LU285, and the refuse dump feature provided a particularly valuable data set. Pine lumber provided a building material of choice for farm outbuilding construction and possibly as a fuel. An agricultural setting for the site is suggested by the presence of maize cob elements and wheat in the presence of common agricultural weed seeds thistle, pigweed and ragweed. The data from the drainage trench and possible structural interior (Feature 5 and Feature 3) are less instructive, but provide evidence for the use of pine and oak woods. Unburned seeds were recovered in abundance from all of the flotation samples analyzed from Site 36LU285. All of the unburned seeds identified represent weedy taxa common to disturbed areas and agricultural settings.

### 36LU286, Kinser Farmstead

The Kinser Farmstead (Site 36LU286) describes a rural farmstead occupied ca. 1845 to ca. 2005. The site occupies an agricultural field on an upland flat and contains the remains of a house (built ca. 1845) and a variety of outbuildings constructed throughout the nineteenth and twentieth centuries. Phase II archaeological investigations at Kinser Farmstead documented a variety of

structural features and kitchen and architectural artifacts.

Archeobotanical studies at 36LU286 included the processing of four flotation samples from three select features (Feature 1 [stone foundation], Feature 4 [stone foundation], and Feature 5 [builders trench]). Flotation processing of an estimated 35 liters of feature fill produced 0.525 grams of carbonized plant macro-remains (a mean average of approximately 0.015 grams per liter). In addition to carbonized archeobotanical remains, the Kinser Farmstead features contained abundant non-carbonized wood fragments and seeds. Sample matrices contained an array of natural ecofacts and cultural artifacts, including non-carbonized roots, gravel and rock, coal, clinker, brick fragments, shell, insects, earth worms and bone fragments.

The archeobotanical assemblage from Site 36LU286 included burned and unburned wood, amorphous carbon, and non-carbonized seeds. An inventory of the botanical contents of each flotation sample analyzed from Site 36LU286 is provided in Table 07. Recovered plant materials are discussed in detail below by material type.

### Wood

Wood remains comprised the most abundant plant material type recovered from the Kinser Farm site flotation samples. Wood was recovered in both burned and unburned condition.

Wood charcoal was present in all of the samples analyzed from Site 36LU286. A site total of 77 fragments was recovered. Of these, 31 fragments were randomly selected for identification (a maximum of 20 fragments per sample). White oak dominated the assemblage, accounting for 45 percent of the sub-sample selected for identification. Pine (*Pinus spp.*) (10 percent) was also identified. Forty-five percent of the wood sample selected for identification was not minimally classifiable to the Genus level. (See Figure 08).

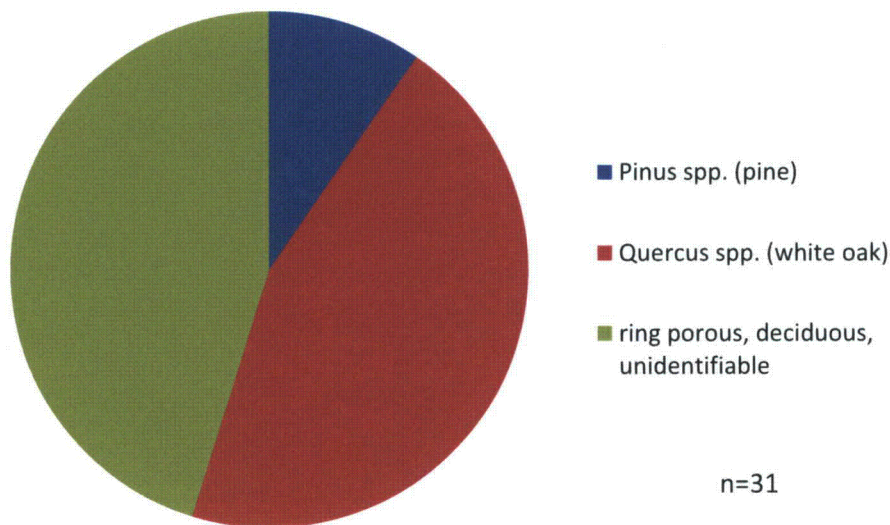

Figure 08: Composition of wood charcoal from the Kinser Farm Site (36LU286).

In addition to wood charcoal, unburned wood fibers were present in Feature 4 (the stone foundation). A 20 fragment sub-sample of this unburned wood was identified exclusively as pine (*Pinus spp.*).

### Seeds

Non-carbonized seeds were present in all of the flotation samples analyzed from the Kinser Farmstead site. Thirteen different taxa were represented: pigweed (*Amaranthus sp.*), goosefoot (*Chenopodium sp.*), geranium (*Geranium sp.*), carpetweed (*Mollugo verticillata*), purselane (*Portulaca oleracea*), sheep sorrel (*Oxalis stricta*), panic/foxtail grass (*Panicum/Setaria*), poke (*Phytolacca americana*), knotweed/dock (*Polygonum/Rumex*), cherry (*Prunus sp.*), raspberry/blackberry (*Rubus spp.*) elder (*Sambucus canadensis*) and grass (*POACEAE*). While many of these seed represent edible plants or edible plant parts, they are also common weedy contaminants in archeobotanical samples. It is unclear if they are relevant to site ethnobotany.

### Miscellaneous

A single fragment of amorphous carbon was recovered from Feature 5.

### Summary

The archeobotanical assemblage from the Kinser Farm site provides a small data set from 150 years of farm history ca. 1845 to ca. 2005. Wood dominated the flotation assemblage, with both carbonized (predominantly white oak) and unburned (pine) woods recovered. Of the three features sampled (all of which relate to structural elements), the builder's trench (Feature 5) produced the greatest densities of plant macro-remains, with wood charcoal, amorphous carbon. The house foundation (Feature 1) yielded only limited plant remains - a single fragment of wood charcoal and a few non-carbonized seeds. Feature 4 (stone foundation) produced unidentifiable wood charcoal and non-carbonized pine wood fibers and non-carbonized seeds. The site assemblage from Kinser farm provides no clear evidence of plant food utilization, food production, or animal husbandry. A preference for local forest resources and affordable lumber is indicated by the predominance of white oak and pine woods in the site wood assemblages.

### RESULTS OF ANALYSIS: PREHISTORIC SITE 36LU288

Site 36LU288 is a multi-component site located on a low terrace approximately 90 meters west of the North Branch Susquehanna River. Phase II testing of the upper levels of the site confirmed the presence of multiple prehistoric occupations (diagnostic artifacts included a Late Woodland Levanna point and a fragment of a probable Paleoindian point). Recovery of window and container glass indicates that there was also historic occupation of the site.

Archeobotanical data was collected from two prehistoric hearth features excavated at Site 36LU288: Two flotation samples were collected from Feature 2 and three flotation samples and two hand-collected carbon samples were collected from Feature 1.

Flotation processing of 57 liters of feature fill produced 27.46 grams of carbonized plant macro-remains (a mean average of approximately 0.482 grams per liter). In addition to wood charcoal, the 36LU288 hearth feature flotation samples contained a few non-carbonized seeds. Sample

matrices were composed of natural materials and cultural artifacts, including non-carbonized roots, gravel and rock, coal, clinker, small snails and soil peds. An inventory of the botanical contents of each flotation sample analyzed from Site 36LU288 is provided in Table 08. The two hand-collected carbon samples analyzed from Feature 1 contained deciduous wood charcoal in a matrix of sediment. The contents of the two carbon samples studied from Feature 1 are presented in Table 09. Recovered plant materials are discussed in detail below by material type.

Table 09: Contents of hand-collected carbon samples from Site 36LU288.

fs numbers	242-243	236-237, 239-341
feature	1	1
total sample weight (grams)*	4.9	11.15
Wood Charcoal (number of >2mm frags)	71	295
weight (grams)	4.14	7.78

<i>Quercus</i> spp. (oak)	9	
ring porous taxa	6	
deciduous taxa	5	
total fragments identified	20	20

\* moist weight

### Wood

Wood charcoal was present in all five of the flotation samples analyzed from the hearth features at Site 36LU288. A total of 1,935 fragments of carbonized wood weighing 27.46 were flotation-recovered. Of these, a random sub-sample of 100 fragments (a maximum of 20 fragments per sample) was selected for identification, revealing an overwhelming predominance of oak species.

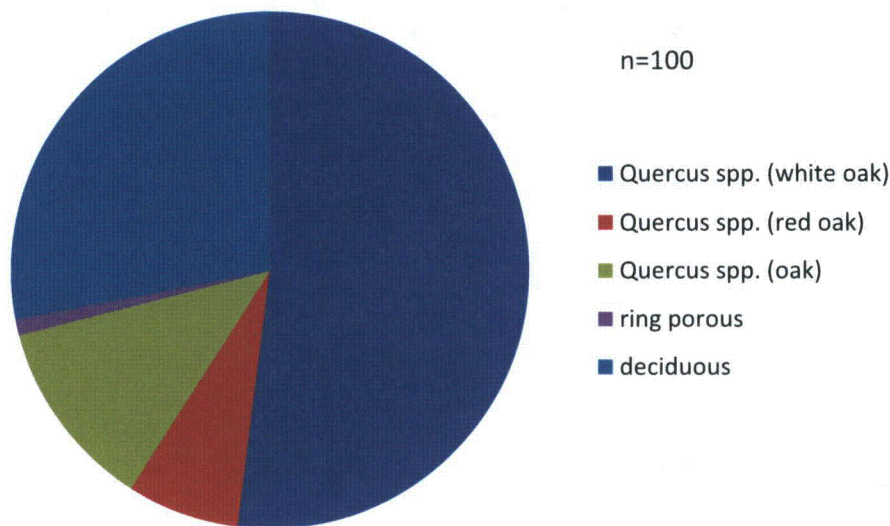

Figure 09: Composition of wood charcoal from flotation samples analyzed from 36LU288.

The hand-collected carbon samples from Feature 1 were composed of wood charcoal, with a total of 366  $\geq$ 2mm fragments recovered. Identification of a 20-fragment per sample sub-sample revealed that oak woods dominated the assemblage.

### Seeds

Non-carbonized seeds were present in all five of the flotation samples analyzed from Site 36LU288. Pigweed (*Amaranthus sp.*), carpetweed (*Mollugo verticillata*) and raspberry/blackberry (*Rubus spp.*) were identified. Non-carbonized seeds within prehistoric features are usually interpreted as intrusive modern specimens (Minnis 1981; Keepax 1977). All species identified within the 36LY288 flotation samples represent weedy taxa with a common distribution in the vicinity of the project area (Rhoads and Klein 1993). The recovery of non-carbonized plant remains may reveal specific contamination episodes associated with animal (i.e. gastropod, rodent, insect) burrowing, the action of root growth and decay, aeolian processes, historic land use activities (i.e. plowing), or by the combined effects of these factors.

Table 10: Samples submitted for radiocarbon dating from Site 36LU288.

Site 36LU288 Phase II		
FS Number	Feature	Sample Type
242-243	1	<i>Hand-collected</i>
236, 237, 239-341	1	<i>Hand-collected</i>
262/264	2	<i>Flotation</i>
263, 265	2	<i>Flotation</i>

In order to accurately date the age of select features at Site 36LU288, carbonized plant remains were submitted for radiocarbon dating. Table 10 lists the selected contexts which are also acknowledged in red within Tables 08 and 09. Letters of transmittal are appended to this report. Assay results are pending.

### Summary

The prehistoric hearth features (Features 1 and 2) at Site 36LU288 provide baseline information regarding fuel wood preference and landscape conditions in the vicinity of the site. The predominance of oak woods reveals the selection of high-calorie woods for fuel (Graves 1919), and harvest of locally abundant trees. The dearth of comestible plant remains from the sampled features prevents any interpretation of site economy or foodways during prehistory.

### DISCUSSION

Phase II archaeological investigations within the Bell Bend project area provide information about a geographically-tied community of rural farmsteads occupied during various portions of the nineteenth and twentieth centuries. In addition to a historic component, Site 36LU288 also contained evidence of prehistoric occupations spanning the Paleoindian through Late Woodland

periods. Archeobotanical remains studied from the six sites (36LU280, 36LU281, 36LU283, 36LU285, 36LU286 and 36LU288) provide evidence about how people used the local landscape and filled their needs for food and fuel.

Archeobotanical data from Bell Bend project area contributes to a more complete understanding of the history of landscape development in eastern Pennsylvania. The site lies within the Ridge and Valley Section of the Oak-Chestnut Forest Region as described by Braun (1950), and within the Appalachian Oak Forest according to Kuchler (1964). Using Bailey's *Ecoregions* (1976) the project area lies within the Central Appalachian Broadleaf Forest Province, and in close proximity to the Laurentian Mixed Forest Province to the north and the Eastern Broadleaf forest that extends eastward (see Figure 11). Native vegetation over the project area was a tall broadleaf deciduous forest dominated by oaks and hickories. Sub-dominants would have included maples, American chestnut, beech, yellow poplar and some pine. The wood assemblages recovered archaeologically from the sites within the Bell Bend project area are composed of taxa characteristic of this native forest association. Oaks, particularly white oak species, dominate the prehistoric archeobotanical assemblage from Site 36LU288 and concur with native forest cover projections for the region. The predominance of pine woods within the historic contexts sampled suggests that pine lumber was intentionally selected as a building material for the construction of homes and farm outbuildings.

Archeobotanical remains collected from six sites within the Bell Bend project area contribute to our understanding of human-plant histories in Eastern Pennsylvania. Phase II archaeological investigations at five sites with nineteenth and twentieth century occupations produced a suite of burned and unburned plant artifacts that reveal a cultural choices. Pine woods were the most common wood type across the Bell Bend historic sites, suggesting that pine lumber was procured for the construction of farm structures and homes. Evidence for nineteenth and twentieth century foodways and farm operation are provided by wheat remains from Sites 36LU283 and 36LU285 and maize from Site 36LU285. Phase II archaeological investigations at prehistoric site 36LU288 document a cultural preference for oak woods for fuel in hearth features. The ubiquity and abundance of non-carbonized seeds within the flotation samples analyzed from all sites indicates that recent land use was favorable to disturbance-loving species and agricultural weeds.

- Appendix A - Preparedness, Prevention, and Contingency Plan for Construction Activities

## **1.0 PROJECT OVERVIEW**

### **1.1 Project Description and Purpose**

This Erosion and Sedimentation Control Plan (E&SCP) sets forth a work plan for activities associated with a Phase II National Register Site Evaluation of archaeological Site 36LU286 (Kisner Farmstead) at the Bell Bend Nuclear Power Plant (BBNPP) Project (Project), Salem Township, Luzerne County, Pennsylvania, conducted on behalf of UniStar Nuclear Development LLC (UniStar). The BBNPP study area is located adjacent to the existing PPL Susquehanna LLC's Susquehanna Steam Electric Station (SSES), west of the North Branch Susquehanna River and north of the town of Berwick. UniStar proposes the potential development of a nuclear power generation unit in this locality. The current Project involves removal of surface gravel within an approximately 0.7-acre portion of archaeological Site 36LU286, as the initial stage of Phase II investigations of this site.

The purpose of this E&SCP document is to minimize and/or avoid potential adverse environmental impacts due to the construction activities associated with the removal of surface gravel at Site 36LU286. The proposed practices are intended to maintain, to the fullest extent practicable, the integrity of sensitive resources such as wetlands and streams or protected habitats, if any, located within the work areas. This document was prepared in accordance with the PA Department of Environmental Protection's (PaDEP's) *Erosion and Sediment Pollution Control Program Manual*, dated April 2000.

Phase II investigations of Site 36LU286 are being performed as part of the Phase II National Register Site Evaluations of seven archaeological sites within the BBNPP project area. Site 36LU286 has dimensions of 128x137 meters (420x450 feet). The area of surface gravel within the site is centrally located and measures approximately 40x70 meters (130x230 feet), or 0.7 acres. It has an estimated thickness of approximately 10 centimeters (4 inches).

### **1.2 Acreage Disturbed**

The total area to be disturbed is approximately 0.9 acres, which includes the area of surface gravel and a gravel stockpile.

### **1.3 Project Date**

Construction is scheduled for September 2009.

### **1.4 Plan Preparers**

The principal preparers of this E&SCP are Mr. Allan D. Schuck, Engineer-in-Training, and Mr. Samuel W. Laporte, Engineer-in-Training, of GAI Consultants, Inc. (GAI), Pittsburgh Office, 385 East Waterfront Drive, Homestead, PA (412-476-2000). Mr. Schuck has over five years of environmental compliance experience, including the preparation and review of E&SCPs. Mr. Laporte has over three years of environmental compliance experience.

## **2.0 FACILITY DESCRIPTION**

### **2.1 Topographic Features**

The Project site is characterized by flat to moderately sloped areas. The existing site is made up of open areas with good vegetation and existing gravel areas. Stormwater runoff normally follows well-established natural watercourses throughout the area. The location of this Project area is indicated on the United States Geological Survey topographic map provided on Figure 1, Project Location Map. The location of existing waterbodies and wetlands are shown on Figure 2, Resource Location Map.

## 2.2 Soils

Based on the *Soil Survey of Luzerne County, Pennsylvania* (United States Department of Agriculture, Soil Conservation Service, 2000), the soils in the Project area are classified:

- ChA – Chenango gravelly loam, 0 to 3 percent slopes;
- RdA – Rexford loam, 0 to 3 percent slopes.

The Chenango gravelly loam, ChA, is a well-drained soil with an approximate depth to water table of approximately 80 inches. This soil has no flooding potential. ChA is prime farmland. Permeability is moderately rapid to rapid in the subsoil and substratum. Available water capacity is low to very low. This soil has a slight erosion hazard rating.

The Rexford loam, RdA, is a poorly drained soil. This soil has no flooding potential. RdA is prime farmland. This soil has a slight erosion hazard rating. This soil is limited due to a seasonal high water table.

Locations of soils are provided on the Soils Map (Figure 3).

## 2.3 Past, Present, and Proposed Land Uses and Alterations

Site 36LU286 (Kisner Farmstead) contains an existing area of surface gravel measuring approximately 40x70 meters (130x230 feet). The gravel layer has an estimated thickness of approximately 10 centimeters (4 inches). The proposed Project will consist of the mechanical removal of this surface gravel to permit subsequent archaeological hand-excavations (e.g. 50-cm (20-inch) diameter shovel test pits and 1x1-meter (3x3-foot) test units). The ground disturbance will be temporary and there will be no permanent changes to the topography of the land. An existing access road will be used to access the Project location. No upgrades to the access road are anticipated.

## 2.4 Amount of Runoff

Runoff volume generated from disturbed areas will be low to moderate and primarily dependent on pre-existing moisture conditions.

The runoff will be corrected with sediment barriers. Filter fabric fence will be installed down gradient of construction activities and soil stockpiles to minimize any accelerated sediment runoff; therefore, no permanent adverse effects are anticipated during construction.

## 2.5 Recycling and Disposal Methods

Litter will be controlled by picking up the garbage at the end of each day. Any other debris that should arise will be collected at the end of the day.

## 2.6 Plan Drawings

Erosion and Sediment control locations are provided on Figure 4. Best Management Practices (BMP) details and figures are provided on Figure 4.1.

### **3.0 CONSTRUCTION SEQUENCE**

#### **3.1 General Construction Sequence**

This E&SCP is a standard plan used on-site and historically typical of E&SCPs submitted to County Conservation Districts. E&S control locations are shown on Figure 4. E&S control details are shown on Figure 4.1.

1. A copy of the E&SCP must be available at the Project site at all times.
2. At least three days prior to starting any earth disturbance activities, GAI will notify the Pennsylvania One Call System Incorporated at 1-800-242-1776.
3. Temporary sediment barriers, including appropriately sized filter fabric fence will be placed downslope of work areas and around stockpile locations prior to any excavation work to ensure, to the maximum extent practicable, that no significant erosion of native soils or sedimentation occurs.
4. The existing gravel will be removed and stockpiled.
5. The excavations will occur in the areas where the gravel has been removed.
6. Waste or excess materials not suitable for the on-site stockpile or backfill shall be disposed of at a PaDEP-approved waste site. Materials will be re-used or recycled as possible, including topsoil and other materials, as appropriate. No off-site stockpile/spoil piles are anticipated as part of this Project. If needed, any off-site stockpile/spoil piles shall be at a Luzerne Conservation District (LCD)/PaDEP-approved site with an approved E&S Plan.
7. The gravel will be replaced into its original location. The contours will not change from pre to post construction.

### **4.0 BEST MANAGEMENT PRACTICES**

#### **4.1 BMP Installation and Removal Sequence**

This is a typical installation and removal sequence for general excavation in upland areas. BMP locations are provided on Figure 4. BMP details are shown on Figure 4.1.

##### **Installation of the Filter Fabric Fence**

The filter fabric fence shall be installed downslope of the disturbed work areas. The filter fabric fence shall be installed at existing level grade by using two-inch by two-inch wooden support stakes driven a minimum of 18 inches into the earth and spaced a maximum of eight feet apart. Both ends of each fence section shall be extended at least eight feet upslope at 45 degrees to the main fence alignment. The filter fabric fence shall remain in place until the gravel is replaced. .

#### **4.2 BMP Maintenance Plan**

GAI personnel will be present during construction activities to inspect the filter fabric fence. Silt fence details are provided on Figure 4.1. The filter fabric fence will be maintained as follows:

- Damaged filter fabric fence will be repaired or replaced as soon as practicable, but no more than 72 hours after discovering damage.

- Equipment, soil stockpiles and other materials are to remain upslope of the filter fabric fence during maintenance activities.
- Stockpile slopes will be 2:1 or flatter and stockpiles will not exceed 35 feet in height.
- Sediment will be removed from filter fabric fence, once accumulations have reached one-half the above ground height of the fence.
- Any section of the filter fabric fence that has been topped or undermined by natural forces will be replaced as soon as practicable, but no more than 72 hours after discovering damage.
- At the end of each construction day, all sediment deposited on paved roadways shall be removed and returned to the construction site.
- Sediment will be removed and placed in an upland construction area, spread out, and revegetated by seeding and mulching or disposed of. All waste or excess materials not suitable for the on-site stockpile shall be disposed of at a LCD/PaDEP approved waste site. Materials will be re-used or recycled as possible, including topsoil and other materials as appropriate. Any off-site stockpile/spoil piles shall be at a LCD/PaDEP approved site with an approved E&S Plan.

Work will be performed according to the Preparedness, Prevention, and Contingency Plan for Construction Activities provided in Appendix A.

**APPENDIX A**

**PREPAREDNESS, PREVENTION, AND  
CONTINGENCY PLAN FOR CONSTRUCTION ACTIVITIES**

## APPENDIX A

### PREPAREDNESS, PREVENTION, AND CONTINGENCY PLAN FOR CONSTRUCTION ACTIVITIES

#### SPILL PREVENTION METHODS

Construction activities related to archeological digs sometimes require storage of hazardous and non-hazardous products and wastes. All efforts will be made to prevent spills of any amount of these products. The scope of this plan is intended to cover activities related to construction of archeological digs. The following items will be followed to help avoid spills and minimize the impact of spills that accidentally occur:

- Bulk quantities of both diesel fuel and gasoline may be stored at the work area in aboveground tanks, which will be diked or be of double-wall secondary containment design, or smaller containers. No underground tanks will be used. A Material Safety Data Sheet for each hazardous material will be on site.
- Fuel will be stored at the equipment staging area within secondary containment and as much as practical all equipment will be refueled there. Any equipment that must be refueled in the field will be fueled from tanks carried to the work area.
- Lesser quantities of fuel and solvents and lubricants (i.e., motor oils, hydraulic fluid) may be stored at the work area as necessary to service equipment provided that this storage does not conflict with other parts of this plan. Secondary containment will be provided for these storage areas.
- All fuel storage areas will be located at least 200 feet from active private water wells, and at least 400 feet from municipal water wells. Equipment servicing, lubricating, and refueling will also be in accordance with these requirements whenever possible.
- Use of hazardous materials for vehicle maintenance will follow the same requirements mentioned above for equipment refueling. Impervious or sorbent materials will be placed under the work area before the work begins. Additional sorbent materials will also be readily available. Waste materials created during maintenance (i.e., used oil) will be collected for proper disposal. The work site and the vehicle will be inspected after the maintenance work is complete to ensure that all hazardous materials are properly contained. All waste material, including partially used or empty containers, discarded parts, dirty rags, and used sorbent material, as well as discarded hazardous materials containers (i.e., oil cans, grease tubes) will be collected and placed in open-top drums for proper disposal.
- All motor fuel, lube oil, chemicals, and other polluting substances will be tightly sealed and clearly labeled during transportation and storage.
- Fuel trucks, pumps, mechanics' vehicles, and contractor personnel vehicles will be equipped with spill kits containing absorbent materials approved for petroleum products.
- Runoff resulting from construction equipment washing operations will not be permitted to directly enter any waterbody or wetland area.
- Construction equipment, vehicles, materials, hazardous materials, chemicals, fuels, lubricating oils, and petroleum products will be parked, stored, or serviced 100 feet from all waterbodies and wetlands when not in use and when possible.
- Any materials, equipment, hazardous materials, chemicals, fuels, lubricating oils, and petroleum products that must be used within 100 feet of a waterbody or wetland to

support the work will only be used within the secondary containment protection and will be stored within temporary secondary containment during work hours. No materials, hazardous materials, chemicals, fuels, lubricating oils, or petroleum products that are not contained within equipment will be stored within 100 feet of a waterbody or wetland. All other sections of this plan will be followed for spill prevention and mitigation and cleanup methods.

## **MITIGATION AND CLEANUP METHODS**

In the event of a spill into or in the vicinity of waterbodies or wetlands, the following will occur:

- the source will be immediately stopped;
- the spill will be contained by placing sorbent booms or constructing dikes;
- the spill will be collected with sorbent materials, skimmed off water surfaces with booms, and/or the contaminated soil will be excavated; and
- the waste materials will be properly disposed in accordance with state and federal requirements.

The affected areas will be restored as closely as possible to their previous condition. All spills must be reported immediately to the PPL SSES Unit 1 Supervisor and to PPL Bell Bend staff:

SSES Unit 1, Unit Supervisor, 570-542-3903

Mr. Terry Harpster, Vice President, Bell Bend 570 802-1111

Ms. Karen Scopelliti, Project Administrator, Bell Bend 570 802-8113 ,

The Unit 1 Supervisor will contact State and/or Federal environmental agencies (if applicable) for notification requirements.

## 1.0 Project Overview

### 1.1 Project Description and Purpose

This Erosion and Sedimentation Control Plan (E&SCP) sets forth a work plan for activities associated with a Phase II National Register Site Evaluation of archaeological Site 36LU288 (GAI Site 5) at the Bell Bend Nuclear Power Plant (BBNPP) Project (Project), Salem Township, Luzerne County, Pennsylvania, conducted on behalf of UniStar Nuclear Development LLC (UniStar). The BBNPP study area is located adjacent to the existing PPL Susquehanna LLC's Susquehanna Steam Electric Station (SSES), west of the North Branch Susquehanna River and north of the town of Berwick. UniStar proposes the potential development of a nuclear power generation unit in this locality. The current Project involves mechanical stripping of the plowzone in select localities (totaling approximately 0.94 acres) within archaeological Site 36LU288, as part of Phase II investigations of this site.

The purpose of this E&SCP document is to minimize and/or avoid potential adverse environmental impacts due to the construction activities associated with plowzone stripping at Site 36LU288. The proposed practices are intended to maintain, to the fullest extent practicable, the integrity of sensitive resources such as wetlands and streams or protected habitats, if any, located within the work areas. This document was prepared in accordance with the PA Department of Environmental Protection's (PaDEP's) *Erosion and Sediment Pollution Control Program Manual*, dated April 2000.

Phase II investigations of Site 36LU288 are being performed as part of the Phase II National Register Site Evaluations of seven archaeological sites within the BBNPP project area. Site 36LU288 has dimensions of approximately 152x260 meters (500x850 feet/ 9.7 acres) and is situated within a large, previously cultivated field on the floodplain/low terrace west of the North Branch Susquehanna River. Initial Phase II fieldwork will include surface collection and the hand-excavation of 50-cm-diameter shovel test pits and 1x1-meter test units within the site area. Following the completion of hand excavations, mechanical plowzone stripping of approximately 3,800 m<sup>2</sup> (0.94 acres/40,904 ft<sup>2</sup>) will be conducted in select localities in order to expose cultural features at the plowzone/subsoil interface. A backhoe with a flat blade will be used to remove the plowzone in approximately 2-meter (6.5 foot)-wide strips to the top of the subsoil (approximately 40 cm below surface). The size and location of plowzone strips will be determined based on the results of surface collection, shovel testing and test unit excavations. All excavations will be backfilled upon completion.

### 1.2 Acreage Disturbed

The total area to be disturbed by plowzone stripping is approximately 0.94 acres, consisting of a series of 2-meter (6.5-foot) wide strips whose location will be determined by the results of initial Phase II surface collection and hand excavations.

### 1.3 Project Date

Construction is scheduled for October 2009.

### 1.4 Plan Preparers

The principal preparers of this E&SCP are Mr. Allan D. Schuck, Engineer-in-Training, and Mr. Samuel W. Laporte, Engineer-in-Training, of GAI Consultants, Inc. (GAI), Pittsburgh Office, 385 East Waterfront Drive, Homestead, PA (412-476-2000). Mr. Schuck has over five years of environmental compliance experience, including the preparation and review of E&SCPs. Mr. Laporte has over three years of environmental compliance experience.

## **2.0 Facility Description**

### **2.1 Topographic Features**

The Project (Site 36LU288) is characterized by generally level terrain. The Project lies within a large, open, previously cultivated field on the floodplain/low terrace west of the North Branch Susquehanna River. Stormwater runoff normally follows well-established natural watercourses throughout the area. The location of this Project area is indicated on the United States Geological Survey topographic map provided on Figure 1, Project Location Map.

### **2.2 Soils**

Based on the *Soil Survey of Luzerne County, Pennsylvania* (United States Department of Agriculture, Soil Conservation Service, 2000), the soils in the Project area are classified:

- Ps – Pope soil, zero to four percent slopes.

The Pope soil, Ps, is a well-drained soil with a depth-to-water table of over 60 inches. This soil has no flooding potential. The soil is a prime farmland. Permeability is moderate in the subsoil and substratum. This soil is considered erosion resistant with a K factor of less than or equal to 0.37. Locations of soils are provided on the Soils Map (Figure 2).

### **2.3 Past, Present, and Proposed Land Uses and Alterations**

Site 36LU288 (GAI Site 5) occupies the eastern portion of a large, previously cultivated field on the floodplain/low terrace west of the North Branch Susquehanna River. It is bordered by woodlands to the north and east (between the field and the river) and by a farm lane to the south. The proposed Project will consist of the mechanical removal of the surface plowzone layer in 2-meter (6.5-foot) wide strips in select localities within the site (totaling approximately 0.94 acres). The location of the plowzone strips will be determined based on the results of initial Phase II investigations. The plowzone has an estimated average depth of 40 cm. The ground disturbance will be temporary and there will be no permanent changes to the topography of the land. An existing access road will be used to access the Project location. No upgrades to the access road are anticipated.

### **2.4 Amount of Runoff**

Runoff volume generated from disturbed areas will be low to moderate and primarily dependent on pre-existing moisture conditions.

The runoff will be corrected with sediment barriers. Filter fabric fence will be installed down gradient of construction activities and soil stockpiles to minimize any accelerated sediment runoff; therefore, no permanent adverse effects are anticipated during construction.

### **2.5 Recycling and Disposal Methods**

Litter will be controlled by picking up the garbage at the end of each day. Any other debris that should arise will be collected at the end of the day

### **2.6 Plan Drawings**

Erosion and Sediment control locations are provided on Figure 3.0. Best Management Practices (BMP) details and figures are provided on Figure 3.1.

## **3.0 Construction Sequence**

### **3.1 General Construction Sequence**

This E&SCP is a standard plan used on-site and historically typical of E&SCPs submitted to County Conservation Districts. E&S control locations are shown on Figure 3.0. E&S control details are shown on Figure 3.1.

1. A copy of the E&SCP must be available at the Project site at all times.
2. At least three days prior to starting any earth disturbance activities, GAI will notify the Pennsylvania One Call System Incorporated at 1-800-242-1776.
3. Temporary sediment barriers, including appropriately sized filter fabric fence will be placed downslope of work areas and around stockpile locations prior to plowzone stripping activities to ensure, to the maximum extent practicable, that no significant erosion of native soils or sedimentation occurs.
4. The plowzone soils within the selected 2-meter (6.5-foot) wide strips will be removed and will be stockpiled adjacent to the strips.
5. Hand excavations will occur, as necessary, in the areas where the plowzone has been removed.
6. Waste or excess materials not suitable for the on-site stockpile or backfill shall be disposed of at a PaDEP-approved waste site. Materials will be re-used or recycled as possible, including topsoil and other materials, as appropriate. No off-site stockpile/spoil piles are anticipated as part of this Project. If needed, any off-site stockpile/spoil piles shall be at a Luzerne Conservation District (LCD)/PaDEP-approved site with an approved E&S Plan.

The plowzone soils will be replaced into their original location. The contours will not change from pre to post construction.

#### **4.0 Best Management Practices**

##### **4.1 BMP Installation and Removal Sequence**

BMP locations are provided on Figure 3.0. BMP details are shown on Figure 3.1.

###### *Installation of the Filter Fabric Fence*

*The filter fabric fence shall be installed downslope of the disturbed work areas. The filter fabric fence shall be installed at existing level grade by using two-inch by two-inch wooden support stakes driven a minimum of 18 inches into the earth and spaced a maximum of eight feet apart. Both ends of each fence section shall be extended at least eight feet upslope at 45 degrees to the main fence alignment. The filter fabric fence shall remain in place until the plowzone stripping task is complete.*

##### **4.2 BMP Maintenance Plan**

GAI personnel will be present during construction activities to inspect the filter fabric fence. Filter fabric fence details are provided on Figure 3.1. The BMPs will be maintained as follows:

- Damaged filter fabric fence will be repaired or replaced as soon as practicable, but no more than 72 hours after discovering damage
- Equipment, soil stockpiles and other materials are to remain upslope of the filter fabric fence during maintenance activities.
- Stockpile slopes will be 2:1 or flatter and stockpiles will not exceed 35 feet in height.
- Sediment will be removed from filter fabric fence, once accumulations have reached one-half the above ground height of the fence.

- Any section of the filter fabric fence that has been topped or undermined by natural forces will be replaced as soon as practicable, but no more than 72 hours after discovering damage.
- At the end of each construction day, all sediment deposited on paved roadways shall be removed and returned to the construction site.
- Sediment will be removed and placed in an upland construction area, spread out, and revegetated by seeding and mulching or disposed of. All waste or excess materials not suitable for the on-site stockpile shall be disposed of at a LCD/PaDEP approved waste site. Materials will be re-used or recycled as possible, including topsoil and other materials as appropriate. Any off-site stockpile/spoil piles shall be at a LCD/PaDEP approved site with an approved E&S Plan.
- Work will be performed according to the Preparedness, Prevention, and Contingency Plan for Construction Activities provided in Appendix A.

**APPENDIX A**

**PREPAREDNESS, PREVENTION, AND  
CONTINGENCY PLAN FOR CONSTRUCTION ACTIVITIES**

## APPENDIX A

**PREPAREDNESS, PREVENTION, AND  
CONTINGENCY PLAN FOR CONSTRUCTION ACTIVITIES****SPILL PREVENTION METHODS**

Construction activities related to archeological investigations sometimes require the use of equipment that may contain hazardous and non-hazardous products and wastes. All efforts will be made to prevent spills of any amount of these products. The scope of this plan is intended to cover activities related to construction activities associated with archeological investigations. The following items will be followed to help avoid spills and minimize the impact of spills that accidentally occur:

- Bulk quantities of both diesel fuel and gasoline may be stored at the work area in aboveground tanks, which will be diked or be of double-wall secondary containment design, or smaller containers. No underground tanks will be used. A Material Safety Data Sheet for each hazardous material will be on site.
- Fuel will be stored at the equipment staging area within secondary containment and as much as practical all equipment will be refueled there. Any equipment that must be refueled in the field will be fueled from tanks carried to the work area.
- Lesser quantities of fuel and solvents and lubricants (i.e., motor oils, hydraulic fluid) may be stored at the work area as necessary to service equipment provided that this storage does not conflict with other parts of this plan. Secondary containment will be provided for these storage areas.
- All fuel storage areas will be located at least 200 feet from active private water wells, and at least 400 feet from municipal water wells. Equipment servicing, lubricating, and refueling will also be in accordance with these requirements whenever possible.
- Use of hazardous materials for vehicle maintenance will follow the same requirements mentioned above for equipment refueling. Impervious or sorbent materials will be placed under the work area before the work begins. Additional sorbent materials will also be readily available. Waste materials created during maintenance (i.e., used oil) will be collected for proper disposal. The work site and the vehicle will be inspected after the maintenance work is complete to ensure that all hazardous materials are properly contained. All waste material, including partially used or empty containers, discarded parts, dirty rags, and used sorbent material, as well as discarded hazardous materials containers (i.e., oil cans, grease tubes) will be collected and placed in open-top drums for proper disposal.
- All motor fuel, lube oil, chemicals, and other polluting substances will be tightly sealed and clearly labeled during transportation and storage.
- Fuel trucks, pumps, mechanics' vehicles, and contractor personnel vehicles will be equipped with spill kits containing absorbent materials approved for petroleum products.
- Runoff resulting from construction equipment washing operations will not be permitted to directly enter any waterbody or wetland area.

Construction equipment, vehicles, materials, hazardous materials, chemicals, fuels, lubricating oils, and petroleum products will be parked, stored, or serviced 100 feet from all waterbodies and wetlands when not in use and when possible

- Any materials, equipment, hazardous materials, chemicals, fuels, lubricating oils, and petroleum products that must be used within 100 feet of a waterbody or wetland to support the work will only be used within the secondary containment protection and will be stored within temporary secondary containment during work hours. No materials, hazardous materials, chemicals, fuels, lubricating oils, or petroleum products that are not contained within equipment will be stored within 100 feet of a waterbody or wetland. All other sections of this plan will be followed for spill prevention and mitigation and cleanup methods.

### **MITIGATION AND CLEANUP METHODS**

In the event of a spill into or in the vicinity of waterbodies or wetlands, the following will occur:

- the source will be immediately stopped;
- the spill will be contained by placing sorbent booms or constructing dikes;
- the spill will be collected with sorbent materials, skimmed off water surfaces with booms, and/or the contaminated soil will be excavated; and
- the waste materials will be properly disposed in accordance with state and federal requirements.

The affected areas will be restored as closely as possible to their previous condition. All spills must be reported immediately to the PPL SSES Unit 1 Supervisor and to PPL Bell Bend staff:

SSES Unit 1, Unit Supervisor,	570-542-3903
Mr. Terry Harpster, Vice President, Bell Bend	570 802-1111
Ms. Karen Scopelliti, Project Administrator, Bell Bend	570 802-8113 ,

The Unit 1 Supervisor will contact State and/or Federal environmental agencies (if applicable) for notification requirements.

RE: Radiocarbon Dating Results For Samples 36LU288FEA1, 36LU288FEA2

Dear Ms. Munford:

Enclosed are the radiocarbon dating results for two samples recently sent to us. They each provided plenty of carbon for accurate measurements and all the analyses proceeded normally. As usual, the method of analysis is listed on the report with the results and calibration data is provided where applicable.

As always, no students or intern researchers who would necessarily be distracted with other obligations and priorities were used in the analyses. We analyzed them with the combined attention of our entire professional staff.

If you have specific questions about the analyses, please contact us. We are always available to answer your questions.

Thank you for prepaying the analyses. A receipt is enclosed with the paper report copy. As always, if you have any questions or would like to discuss the results, don't hesitate to contact me.

Sincerely,

Digital signature on file

## REPORT OF RADIOCARBON DATING ANALYSES

Ms. Barbara A. Munford

Report Date: 3/2/2010

GAI Consultants, Incorporated

Material Received: 2/22/2010

Sample Data	Measured Radiocarbon Age	13C/12C Ratio	Conventional Radiocarbon Age(*)
Beta - 275531 SAMPLE : 36LU288FEA1 ANALYSIS : AMS-ADVANCE delivery MATERIAL/PRETREATMENT : (charred material): acid/alkali/acid 2 SIGMA CALIBRATION : Cal BC 2200 to 2010 (Cal BP 4150 to 3960) AND Cal BC 2000 to 1980 (Cal BP 3950 to 3930)	3730 +/- 40 BP	-26.5 o/oo	3710 +/- 40 BP
Beta - 275532 SAMPLE : 36LU288FEA2 ANALYSIS : AMS-ADVANCE delivery MATERIAL/PRETREATMENT : (charred material): acid/alkali/acid 2 SIGMA CALIBRATION : Cal BC 1870 to 1840 (Cal BP 3820 to 3790) AND Cal BC 1820 to 1790 (Cal BP 3770 to 3740) Cal BC 1780 to 1620 (Cal BP 3730 to 3570)	3430 +/- 40 BP	-25.6 o/oo	3420 +/- 40 BP

Dates are reported as RCYBP (radiocarbon years before present, "present" = AD 1950). By international convention, the modern reference standard was 95% the 14C activity of the National Institute of Standards and Technology (NIST) Oxalic Acid (SRM 4990C) and calculated using the Libby 14C half-life (5568 years). Quoted errors represent 1 relative standard deviation statistics (68% probability) counting errors based on the combined measurements of the sample, background, and modern reference standards. Measured 13C/12C ratios (delta 13C) were calculated relative to the PDB-1 standard.

The Conventional Radiocarbon Age represents the Measured Radiocarbon Age corrected for isotopic fractionation, calculated using the delta 13C. On rare occasion where the Conventional Radiocarbon Age was calculated using an assumed delta 13C, the ratio and the Conventional Radiocarbon Age will be followed by "\*\*". The Conventional Radiocarbon Age is not calendar calibrated. When available, the Calendar Calibrated result is calculated from the Conventional Radiocarbon Age and is listed as the "Two Sigma Calibrated Result" for each sample.

# CALIBRATION OF RADIOCARBON AGE TO CALENDAR YEARS

(Variables: C13/C12=-26.5:lab. mult=1)

Laboratory number: **Beta-275531**

Conventional radiocarbon age: **3710±40 BP**

2 Sigma calibrated results: **Cal BC 2200 to 2010 (Cal BP 4150 to 3960) and  
(95% probability) Cal BC 2000 to 1980 (Cal BP 3950 to 3930)**

Intercept data

Intercepts of radiocarbon age  
with calibration curve: **Cal BC 2130 (Cal BP 4080) and  
Cal BC 2080 (Cal BP 4030) and  
Cal BC 2060 (Cal BP 4010)**

1 Sigma calibrated results: **Cal BC 2190 to 2180 (Cal BP 4140 to 4120) and  
(68% probability) Cal BC 2140 to 2030 (Cal BP 4100 to 3980)**
