REGULATORY DOCKET FILE COPY

The following sets of data constitute the annual report of the Iowa Radiation Monitoring Cooperative Agreement, NRC - 30-83-648 for the reporting period, January through December 1986.

Results of completed analyses are presented in the attached tables along with the licensee results where they were available. The data obtained in the program are well within the ranges previously encountered in the licensee monitoring program and within the ranges expected for the environmental media sampled.

None of the media sampled contained radioactivity that could be attributed to the operation of the Duane Arnold Energy Center.

Increased radioactivity due to the incident (USSR) at the Chernobyl is noted throughout the report by an *.

Direct comparison of state and licensee results was not possible in numerous instances because of differences in sampling frequency and sample analysis, e.g., whether the samples were analyzed individually or as composites. Some of the differences follow:

1. The licensee results of gamma isotopic analyses are from quarterly sites of air samples collected weekly, whereas the state results are for weekly analyses of air samples collected weekly and for quarterly composites of these same samples.
2. The licensee results of gamma isotopic analyses are from monthly analyses of water samples collected monthly, whereas the state results are for monthly composites of water samples collected weekly.
3. The licensee results of tritium analyses are from quarterly composites of water samples collected monthly, whereas the state results are for quarterly composites of monthly composites of water samples collected weekly.
4. The licensee results of gamma isotopic analyses are from monthly composites of milk samples collected weekly during the grazing season whereas, the state results are for monthly samples of milk samples collected monthly.
5. State air filters for 27 March 86, 1 May 86, and 8 May 86 were lost after gamma analysis. No gross Beta data is recorded.
6. UHL air sample from 28 August 86 had a low volume due to fan malfunction.

Crosscheck Program Results

The Radiochemistry Section of the University Hygienic Laboratory has participated in interlaboratory comparison (crosscheck) programs for many years. These programs are operated by agencies which supply environmental-type samples containing concentrations of radionuclides known to the issuing agency, but not to participating laboratories. The purpose of such a program is to provide an independent check on the laboratory's analytical procedures and to alert it to any possible problems.

Participant laboratories measure the concentrations of specified radionuclides and report them to the issuing agency. Later, the agency reports the known values to the participating laboratories and specifies control limits. Results consistently higher or lower than the known values or outside the control limits indicate a need to check the instruments or procedures used.

The results were obtained through participation in the environmental sample crosscheck program for air, water, food, and milk samples conducted by the U.S. Environmental Protection Agency Intercomparison and Calibration Section, Quality Assurance Branch, Environmental Monitoring and Support Laboratory, Las Vegas, Nevada.
