PROPOSED CHANGE TO RTS-115B TO DUANE ARNOLD ENERGY CENTER TECHNICAL SPECIFICATIONS

The holder of License DPR-49 for the Duane Arnold Energy Center propose to amend Appendix A and Appendix B (Technical Specifications) to said license by deleting current pages and replacing them with the attached new proposed pages. A list of the affected pages is included.

For administrative purposes, the material on some pages has been moved to different pages in order to accommodate addition and removal of new pages. In these instances only the page number is changed.

This revision to the application for amendment is submitted to incorporate comments discussed in the November 3 and 4, 1982 meeting between Iowa Electric and NRC Staff representatives. The following is a summary of the proposed changes. Due to the scope of this change, the summary is not intended to be all inclusive, but is provided to point out some of the more significant changes.

- Appendix B to DPR-49 (Environmental Technical Specifications and Bases) is deleted in its entirity. This change was made in proposed change RTS-115A.
- Definition 35, Members of the Public, has been added.
- Definition 36, Site Boundary has been added.

8304120278 830406 PDR ADUCK 0500033

PDR

- Specification 3.16.1 Action a and b have been revised. 10 CFR Part 20.405(c) requires a report in the event a 40 CFR 190 limit or a license condition related to compliance with 40 CFR 190 is violated.
- The time 31 days has been changed to 30 days in each instance in order to be consistent with existing specifications.
- Specifications 3.2.D.1 and 4.2.D.1 which include requirements on main condenser off-gas radioactivity monitoring have been revised. Potential off-site exposure to main condenser off-gas has been recalculated on the bases that the off-gas system is explosion resistant, includes a 30 minute delay line, and that off-gas is released via the off-gas stack. After 30 minutes decay in the delay line, 1 Ci/sec of noble gases released produces a potential off-site dose of 60 millirems in two hours of exposure. This is less than 1% of the 25 rem limit specified in 10 CFR Part 100.1(a)(1) or the 5 rem criterion mentioned in NUREG-0133, Section 5.6.2.
- There is no public drinking water withdrawal of record from the Cedar River within three miles downstream of the DAEC. For this reason:
 - The Action item related to 40 CFR 141, the Safe Drinking Water Act, has been deleted from Specification 3.14.3.

- * The LLD for I-131 in water is changed to 500 pCi/liter.
- * an LLD value, 3000 pCi/l, is proposed in Table 3.16-2 for H-3 in samples of water not used as a source of drinking water.
- * a reporting value 3000 pCi H-3/liter is proposed in Table
 3.16-1 for H-3 in samples of water not used as drinking water.
- Specification 4.14.4 was redundant to Specification 3.14.4, hence has been deleted. Specification 4.14.2.1 is an appropriate surveillance requirement for Specification 3.14.4.
- In the event circumstances require an analysis and a report to satisfy 40 CFR Part 190, it should not be necessary to repeat the analysis and report at the end of the year. Thus a statement of intent has been added to the Basis 3/4.16.1.
- Specification 3.15.5 has been revised to reflect that at least one train of the Waste Gas System be operated at any time the reactor is operating. Consequently, the surveillance specifications on operability and dose projection are not useful and have been deleted.

OPERATING LICENSE DPR-49

DUANE ARNOLD ENERGY CENTER IOWA ELECTRIC LIGHT AND POWER COMPANY

DOCKET NO. 50-331

MARCH, 1983

22. INSTRUMENTATION

- a. Instrument Calibration or Channel Calibration An Instrument Calibration means the verification or adjustment of an instrument signal output so that it corresponds, within acceptable range and accuracy, to a known value(s) of the parameter which the instrument monitors. The acceptable range and accuracy of an instrument and its setpoint are given in the system design control document and its setpoint is used in the Technical Specifications. Instrument calibration may be performed by any series of sequential, overlapping, or total channel steps such that the entire instrument is calibrated. Instrument calibration includes the Instrument or Channel Functional Test, as appropriate.
- b. Channel A channel is an arrangement of a sensor and associated components used to evaluate plant variables and produce discrete outputs used in logic. A channel terminates and loses its identity where individual channel outputs are combined in logic.
- c. Instrument or Channel Functional Test An Instrument or Channel Functional Test for
 - (1) Analog channels means the injection of a simulated signal into the channel as close to the sensor as practicable to verify the proper response, alarm, and/or initiating action.
 - (2) Bistable channels means the injection of a simulated signal into the sensor to verify the proper response, alarm and/or initiating action.
- d. Instrument or Channel Check An instrument or channel check is a qualitative determination of acceptable operability by observation of instrument with other independent instruments measuring the same variable.
- e. Logic System Functional Test A logic system functional test means a test of all relays and contacts of a logic circuit to insure all components are operable per design intent. Where practicable, action will go to completion; i.e., pumps will be started and valves operated.
- f. Trip System A trip system means an arrangement of instrument channel trip signals and auxiliary equipment required to initiate action to accomplish a protective trip function. A trip system may require one or more instrument channel trip signals related to one or more plant parameters in order to initiate trip system action. Initiation of protective action may require the tripping of a single trip system or the coincident tripping of two trip systems.

g. Protection Action - An action initiated by the protection system when a limit is reached. A protective action can be at a channel or system level. 22. Instrumentation - Continued

- h. Protective Function A system protective action which results from the protective action of the channels monitoring a particular plant condition.
- i. Simulated Automatic Actuation Simulated automatic actuation means applying a simulated signal to the sensor to actuate the circuit in question.
- j. Logic A logic is an arrangement of relays, contacts, and other components that produces a decision output.
 - 1) Initiating A logic that receives signals from channels and produces decision outputs to the actuation logic.
 - Actuation A logic that receives signals (either from initiating logic or channels) and produces decision outputs to accomplish a protective action.
- k. Primary Source Signal The first signal, which by plant design, should initiate a reactor scram for the subject abnormal occurrence (see FSAR Subsection 14.5).
- Source Check A Source Check is the assessment of channel response when the channel sensor is exposed to a radioactive source.

23. FUNCTIONAL TESTS

A functional test is the manual operation or initiation of a system, subsystem, or component to verify that it functions within design tolerances (e.g., the manual start of a core spray pump to verify that it runs and that it pumps the required volume of water).

24. SHUTDOWN

The reactor is in a shutdown condition when the reactor mode switch is in the shutdown mode position and no core alterations are being performed.

25. ENGINEERED SAFEGUARD

An engineered safeguard is a safety system, the actions of which are essential to a safety action required in response to accidents.

26. SURVEILLANCE FREQUENCY

Periodic surveillance tests, checks, calibrations and examinations shall be performed within the specified surveillance intervals. These intervals may be adjusted plus or minus 25%. The operating cycle interval as pertaining to instrument and electrical surveillance shall never exceed 15 months. In cases where the elapsed interval has exceeded 100% of the specified interval, the next surveillance interval shall commence at the end of the original specified interval.

27. FREQUENCY NOTATION

| NOTATION | FREQUENCY | | |
|----------|--------------------------------|--|--|
| S | At least once per 12 hours. | | |
| D | At least once per 24 hours. | | |
| W | At least once per 7 days. | | |
| M | At least once per 31 days. | | |
| Q | At least once per 92 days. | | |
| SA | At least once per 184 days. | | |
| A | At least once per year. | | |
| R | At least once per 18 months. | | |
| S/U | Prior to each reactor startup. | | |
| P | Prior to each release. | | |
| NA | Not applicable. | | |

28. FIRE SUPPRESSION WATER SYSTEMS

A fire suppression water system shall consist of a water source, pumps, and distribution piping with associated sectionalizing control or isolation valves. Such valves include yard hydrant curb valves, the first valve ahead of the water flow alarm device on each sprinkler, hose standpipe or deluge system riser.

29. OFFSITE DOSE ASSESSMENT MANUAL

The Offsite Dose Assessment Manual (ODAM) is a manual containing the methodology and parameters to be used in the calculation of offsite doses due to radioactive gaseous and liquid effluents and in the calculation of radioactive gaseous and liquid effluent monitoring instrumentation alarm/trip setpoints.

30. GASEOUS RADWASTE TREATMENT SYSTEM

A Gaseous Radwaste Treatment System is any system designed and installed to reduce radioactive gaseous effluents by collecting primary coolant system offgases from the primary system and providing delay or holdup for the purpose of reducing radioactivity prior to release to the environment.

31. PURGE - PURGING

PURGE or PURGING is the controlled process of discharging air or gas from a confinement to maintain temperature, pressure, humidity, concentration or other operating condition, in such a manner that replacement air or gas is required to purify the confinement.

32. VENTING

VENTING is the controlled process of discharging air or gas from a confinement to maintain temperature, pressure, humidity, concentration or other operating condition, in such a manner that replacement air or gas is not provided or required during the process. Vent, used in system names, does not imply a VENTING process.

33. PROCESS CONTROL PROGRAM (PCP)

The PROCESS CONTROL PROGRAM shall generally describe the essential process controls and checks used to assure that a process for solidifying radioactive waste from a liquid system produces a product that is acceptable for burial according to 10 CFR Part 61.56.

34. MEMBER(S) OF THE PUBLIC

Member(s) of the Public are persons who are not occupationally associated with Iowa Electric Light and Power Company and who do not normally frequent the DAEC site. The category does not include contractors, contractor employees, vendors, or persons who enter the site to make deliveries or to service equipment.

35. SITE BOUNDARY

The Site Boundary is that line beyond which the land is neither owned, nor leased, nor otherwise controlled by IELP. FSAR Figure 1.5-1 identifies the DAEC Site Boundary. For the purpose of implementing radiological effluent technical specifications, the Unrestricted Area is that land (offsite) beyond the Site Boundary.

LIMITING CONDITIONS FOR OPERATION

ť.

C. <u>Control Rod Block Actuation</u>

- The limiting conditions of operation for the instrumentation that initiates control rod block are given in Table 3.2-C.
- 2. The minimum number of operable instrument channels specified in Table 3.2-C for the Rod Block Monitor may be reduced by one in one of the trip systems for maintenance and/or testing, provided that this condition does not last longer than 24 hours in any thirty day period.
- D. <u>Radiation Monitoring Systems-</u> <u>Isolation & Initiation</u> <u>Functions</u>
- 1. <u>Steam Air Ejector Offgas</u> System
 - a) At least one post treatment steam air ejector offgas system radiation monitor shall be operable during reactor power operation. The monitors shall be set to initiate immediate closure of the steam air ejector isolation valves if the monitor exceeds a trip setting equivalent to 1.0 Ci/sec.
 - b) In the event no monitor is operable, gases from the steam air ejector offgas system may be released to the environment for up to 72 hours provided (1) the charcoal bed of the offgas delay system is not bypassed, and (2) the offgas stack noble gas activity monitor is operable.

Otherwise, be in HOT STANDBY within 24 hours.

SURVEILLANCE REQUIREMENT

C. Control Rod Block Actuation

Instrumentation shall be functionally tested, calibrated and checked as indicated in Table 4.2-C.

System logic shall be functionally tested as indicated in Table 4.2-C.

- D. <u>Radiation Monitoring Systems-</u> <u>Isolation & Initiation</u> Functions
- 1. <u>Steam Air Ejector Offgas</u> System

Instrumentation shall be functionally tested, calibrated and checked as indicated in Table 4.2.D.

System logic shall be functionally tested as indicated in Table 4.2-D.

3.2.D.1 BASES

1. Main Condenser Offgas

Restricting the gross radioactivity rate of noble gases from the main condenser provides reasonable assurance that the total body exposure to an individual at the exclusion area boundary will not exceed a small fraction of the limits of 10 CFR Part 100 in the event this effluent is inadvertently discharged directly to the environment without treatment. This specification implements the requirements of General Design Criteria 60 and 64 of Appendix A to 10 CFR Part 50.

Channel(s) shall be OPERABLE and in service except that channels of service are permitted for maintenance and required tests, checks, or calibrations.

**Pump curves may be utilized to estimate flow; in such case, action statement 21 is not required.

3.14-5

TABLE 3.14-1 (Continued)

TABLE NOTATION

- ACTION 18 With no channel OPERABLE, effluent may be released provided that prior to initiating a release:
 - 1. At least two samples are analyzed in accordance with Specification 4.14.2.1, and;
 - 2. A technically qualified member of the Facility Staff verifies the release rate calculations and discharge valving determined by another technically qualified Facility Staff member.

Otherwise, suspend release of radioactive effluents via this pathway.

- ACTION 20 With no channel OPERABLE, effluent releases via the affected pathway may continue provided the effluent is sampled and analyzed for gross radioactivity at least once per eight hours during actual release. The analysis shall be capable of detecting $10^{-7} \mu$ Ci/ml.
- ACTION 21 With no channel OPERABLE, effluent releases via this pathway may continue provided the flow rate is estimated with pump curves at least once per batch during actual releases.

- (1) The CHANNEL FUNCTIONAL TEST shall also demonstrate that automatic isolation of this pathway and control room alarm annunciation occurs if any of the following conditions exist:
 - 1. Instrument indicates measured levels above the alarm/trip setpoint.
 - 2. Circuit failure.
 - 3. Instrument indicates a downscale failure.
 - 4. Instrument controls not set in operate mode.
- (2) The CHANNEL FUNCTIONAL TEST shall also demonstrate that control room alarm annunciation occurs if any of the following conditions exist:
 - 1. Instrument indicates measured levels above the alarm/trip setpoint.
 - 2. Circuit failure.
 - 3. Instrument indicates a downscale failure.
 - 4. Instrument controls not set in operate mode.
- (3) The CHANNEL CALIBRATION shall include the use of a known radioactive source (traceable to the National Bureau of Standards radiation measurement system or acceptable non-NBS standards) positioned in a reproducible geometry with respect to the sensor and emitting beta or gamma radiation in the range measured by the channel. CHANNEL CALIBRATION may normally be done during refueling outages.
- (5) CHANNEL CHECK shall consist of verifying indication of flow during periods of release. CHANNEL CHECK shall be made at least once daily on any day on which continuous, periodic, or batch releases are made.
- (6) On any day on which a release is made, a SOURCE CHECK shall be made at least once, prior to the first release.

TABLE 4.14-2 (Continued)

TABLE NOTATION

a. The LLD is defined, for purposes of these specifications, as the smallest concentration of radioactive material in a sample that will yield a new count, above system background, that will be detected with 95% probability with only 5% probability of falsely concluding that a blank observation represents a "real" signal.

For a particular measurement, which may include radiochemical separation:

$$LLD = \frac{4.66 \text{ S}_{b}}{\text{E \bullet V \bullet 2.22 \bullet Y \bullet exp (-\lambda \Delta t)}}$$

where

LLD is the lower limit of detection as defined above (picocuries per unit mass or volume)

 S_b is the standard deviation of the background counting rate or of the counting rate of a blank sample as appropriate (counts per minute)

E is the counting efficiency (counts per disintegration)

V is the sample size (units of mass or volume)

2.22 is the number of disintegrations per minute per picocurie,

Y is the fractional radiochemical yield, when applicable,

 λ is the radioactive decay constant for the particular radionuclide, and

 Δ t for effluents is the elapsed time between the midpoint of sample collection and the time of counting.

Alternatively, exp (- $\lambda \Delta t$) may be replaced by $\frac{\lambda t_1}{1 - \exp(-\lambda t_1)} \times \exp(-\lambda t_2)$

Where:

 \boldsymbol{t}_1 is the total sampling time or sample compositing time

 t_2 is the elapsed time between the end of sample collection and the time of counting.

Analyses shall be performed in such a manner that the stated LLDs will be achieved under routine conditions with typical valves of E, V, Y, and Δt for the radionuclides Mn-54, Fe-59, Co-58, Co-60, Zn-65, Mo-99, Cs-134, Cs-137, Ce-141, and Ce-144. Occasionally background fluctuations, unavoidably small sample sizes, interfering radionuclides, or other uncontrollable circumstances may render these LLDs unachievable.

3.14-10

3.14.1 and 4.14.1 BASES

1. Radioactive Liquid Effluent Instrumentation

The radioactive liquid effluent instrumentation is provided to monitor and control, as applicable, the release of radioactive material in liquid effluents. The OPERABILITY and use of these instruments implements the requirements of 10CFR Part 50, Appendix A, General Design Criteria 60, 63, and 64. The alarm and/or trip setpoints for these instruments are calculated in the manner described in the ODAM to assure that the alarm and/or trip will occur before the limit specified in 10CFR Part 20.106 is exceeded.

Instrumentation is expected to be OPERABLE and in service when required by Specification. An instrument may be removed from service voluntarily for the purpose of tests, checks, calibration, or preventative maintenance without declaring the channel inoperable.

3.14.2 and 4.14.2 BASES

1. Liquid Effluent Concentration

Specification 3/4.14.2 is provided to satisfy the regulation governing the maximum concentration of radioactive material in liquid effluent that may be released to an unrestricted area as stated in 10CFR Part 20.106 and the regulation requiring surveys needed to determine compliance stated in Part 20.201.

Conformance to Specification 3.14.2, when applied to the activity concentration in the river at the site boundary due to liquid effluent, would assure that the average activity concentration in liquid effluent released to the unrestricted area is a small fraction of the limit specified in Part 20.106.

3.14.3 and 4.14.3 BASES

1. Dose Due to Radioactive Effluents

Specifications 3.14.3, 3.15.3, and 3.15.4 implement the requirements of 10CFR Part 50.36a and of 10 CFR Part 50, Appendix I, Section IV. These specifications state Limiting Conditions of Operation (LCO) to keep levels of radioactive materials in LWR effluents as low as is reasonably achievable. Compliance with these specifications will also keep average releases of radioactive material in effluents at small percentages of the limits specified in 10CFR Part 20.106. Surveillance requirements provide for the measurement of releases and calculation of doses to verify compliance with the Specifications. Action statements in these Specifications implement the requirements of 10CFR Part 50.36(c)(2) and 10CFR Part 50, Appendix I, Section IV.A in the event a LCO is not met.

10CFR Part 50 contains two distinctly separate statements of requirements pertaining to effluents from nuclear power reactors. The first concerns a description of equipment to maintain control over

radioactive materials in effluents, determination of design objctives, and means to be employed to keep radioactivity in effluents ALARA. This requirement is stated in Part 50, Section 34a and Appendix I, Section II. Appendix I, Section III stipulates that conformance with the guidance on design objectives be demonstrated by calculations since demonstration is expected to be prospective.

The second statement is a requirement for developing limiting conditions of operation in Technical Specifications. It is stated in 10CFR Part 50, Section 36a and Appendix I, section IV. Both the intent of the Commission and the requirement are clearly stated in the Opinion of the Commission.³ Relevant paragraphs from the document follow:

Section 50.36a(b) of 10CFR Part 50 provides that licensees shall be guided by certain considerations in establishing and implementing operating procedures specified in technical specifications which take into account the need for operating flexibility and at the same time ensure that the licensee will exert his best efforts to keep levels of radioactive materials in effluents as low as practicable. The Appendix I that we adopt provides more specific guidance to licensees in this report.

A. The Rule

Section IV of Appendix I specifies action levels for the licensee. If, for any individual light-water-cooled nuclear power reactor, the quantity of radioactive material actually released in effluents to unrestricted areas during any calendar quarter is such as to cause radiation exposure, calculated on the same basis as the design-objective exposure, which would exceed one-half the annual design-objective exposure, the licensee shall make an investigation to identify the causes of these high release rates, define and initiate a program of action to correct the situation, and report these actions to the Commission within 30 days of the end of the calendar quarter.

The conclusion of the NRC Staff in the Appendix I Rulemaking Hearing⁴ seemed to agree with that of the Commission. The Staff recommended, "...that the limiting conditions for operation described in Appendix I, Section IV be applicable upon publication to technical specifications included in any license authorizing operation of a light-water-cooled nuclear power reactor..." (p. 73).

The action to be taken by a licensee in the event a limiting condition is exceeded, is stated in Appendix I, Section IV.A and in the Opinion of the Commission.⁵ Technical Specifications 3/4.14.3, 3/4.15.3, and 3/4.15.4 submitted for the DAEC conform to this requirement.

³NRC Commissioners, "Opinion of the Commission," in the Appendix I Rulemaking Hearing, Docket Rm-50-2, p. 101-102, April 30, 1975.

⁴NRC Staff, "Concluding Statement of the Regulatory Staff," in the Appendix I Rulemaking Hearing, Docket RM-50-2, pp 17, 69, 73, 115, February 1974. Guidance for developing technical specifications for surveillance and monitoring is included in Appendix I, Section IV.B.

Although"it is expected that the annual releases of radioactive material in effluents from light-water-cooled nuclear power reactors can generally be maintained within the levels set forth as numerical guides for design objectives in Section II" (Appendix I, Section IV), no recommendation was made by either the Staff in its Concluding Statement⁶ or by the Commission in its Opinion⁷ that the design objective values should appear as technical specification limits. The Opinion of the Commission and the statement of Appendix I are clear. Limiting conditions of operation (LCO) related to the quantity of radioactive material in effluents released to an unrestricted area stated in technical specifications shall conform to Appendix I, Section IV.A. Licensee action in the event an LCO is exceeded should meet Section IV.A. Finally, surveillance and monitoring of effluents and the environment should conform to Section IV.B.

2. Liquid Effluents

With the implementation of Specification 3.14.3, there is reasonable assurance that Station operation will not cause a radionuclide concentration in public drinking water taken from the River that exceeds the standard for anthropogenic radioactivity in community drinking water. The equations in the ODAM for calculating doses due to measured releases of radioactive material in liquid effluent will be consistent with the methodology in Regulatory Guide 1.109 and 1.113. The assessment of personal doses will examine potential exposure pathways including, as appropriate, consumption of fish and water taken from the River downstream of the discharge canal.

3.14.4 and 4.14.4 BASES

1. Liquid Waste Treatment

This specification implements the requirements of 10CFR Part 50.36a (a) (1) that operating procedures be established and followed and that equipment be maintained and used to keep releases to the environment as low as is reasonably achievable. The specification intends that appropriate portions of the system which were used to establish compliance with the design objectives in 10CFR Part 50, Appendix I, Section II be used when specified to provide reasonable assurance that releases of radioactive material in liquid effluent will be kept as low as is reasonably achievable. The components in the liquid radwaste system which are appropriate to process liquid waste in order to satisfy Specification 4.14.4 are the floor drain demineralizer and the radwaste demineralizer.

⁵NRC Commissioners, p. 101. ⁶NRC Staff ⁷NRC Commissioners The activity concentration, 0.01μ Ci/ml, below which liquid radwaste treatment would not be cost-beneficial, and therefore not required, is demonstrated below.

The quantity of radioactive material in liquid effluent released annually from the DAEC has been calculated to be¹

total iodines 0.11 curie total others (less H³) 0.25Total 0.36 curie

The population dose commitment resulting from the radioactive material in liquid effluent released annually has been calculated to be¹

| thyroid | | 0.164 | man | rem |
|------------|-------|-------|-----|-----|
| total body | | 0.114 | | |
| J. | Total | 0.278 | man | rem |

Therefore, population doses are about 1.5 man rem per curie of iodine released and about 0.5 man rem per curie of other radionuclides (less H^3) released in liquids. On the basis of gross activity, the population dose is about one man rem per curie released in liquids.

The volume of liquid waste processed and intended for discharge is estimated to be:

Low Purity Waste 5700 gal/day = 1.8 x 10⁶ gal/yr Chemical Waste 600 gal/day = 1.9 x 10⁵ gal/yr

Since the same DAEC equipment is used to process both streams, the total volume to be processed is about 2 x 10^6 gal/yr.

The annual cost to operate the radwaste processing equipemnt, based on Dirty Waste Ion Exchange operation, has been estimated² (neglecting credit for capital recovery) to be \$88000 per year. Thus the unit volume operating cost is about:

 $\frac{\$88000/yr}{2 \times 10^{6} \text{ gal/yr}} = \$0.05/gal$

Thus the operating cost to treat a 4000 gallon batch of chemical waste by ion exchange would be about \$200. The operating cost to treat a 10000 gallon batch of floor drain waste by ion exchange would be about \$500.

²Ibid., based on Regulatory Guide 1.110

¹ "Evaluation of the Duane Arnold Energy Center to demonstrate Conformance to the Design Objectives of 10CFr50, Appendix I, "Iowa Electric Light & Power Company, May 1976.

Assuming the cost-benefit balance is \$1000 expenditure per man rem reduced and assuming treatment removes all radioactivity from the liquid, then

 the activity concentration in a Chemical Waste batch below which treatment is not cost-beneficial is

$$C = \frac{\$200}{4000 \text{ gal x 3785 } \text{ml}} \times \frac{1 \text{ curie x 10^6}}{\text{man rem}} \times \frac{100}{\text{curie x 1 man rem}} \times \frac{1000}{1000}$$

$$C = 0.013 \ \mu Ci/ml$$

(2) the activity concentration in a batch of Floor Drain Waste below which treatment is not cost-beneficial is

$$C = \frac{\$500}{10000 \text{ gal x 3785 } \frac{\text{ml}}{\text{gal}}} \times \frac{1 \text{ curie x 10^6}}{\text{man rem}} \frac{\mu \text{Ci}}{\text{curie}} \times \frac{1 \text{ man rem}}{\$1000}$$

$$C = 0.013 \ \mu Ci/ml$$

Liquid waste treatment with the evaporator at DAEC has been shown to be neither cost-beneficial nor necessary to comply with 10CFR50 Appendix I, Section II design objectives.

Consequently, liquid radwaste treatment to achieve an activity concentration below 0.01 $_{\mu}\text{Ci/ml}$ in liquid effluent is not justified.

TABLE 3.15-1 (Continued)

TABLE NOTATION

@ Refer to ODAM Figure 3-1 for location of effluent monitoring points R1 thru R6.

Channels shall be OPERABLE and in service except that channels out of service are permitted for the purpose of required tests, checks, calibration, and preventative maintenance without declaring the channel to be inoperable.

- * During releases via this pathway.
- ** During main condenser offgas treatment system operation.

***During operation of the main condenser air ejector.

- ACTION 25 With no channel OPERABLE, gases from the main condenser offgas treatment system may be released to the environment for up to 72 hours provided:
 - 1. The offgas delay system is not bypassed; and
 - 2. The offgas stack noble gas activity monitor is OPERABLE:

Otherwise, be in at least HOT STANDBY within 24 hours.

- ACTION 26 With no channel OPERABLE, effluent releases via this pathway may continue provided the flow rate is estimated whenever operation of a main exhaust fan combination is changed in the system.
- ACTION 27 With no channel OPERABLE, effluent releases via this pathway may continue if grab samples are taken at least once per eight hours and these samples are analyzed for gross activity within 24 hours or if an alternate monitoring system is utilized. Drywell purge is permitted whenever the offgas stack monitor or its alternate monitor is operating.
- ACTION 28 Deleted
- ACTION 29 With one channel OPERABLE, operation of the main condenser offgas treatment system may continue provided the recombiner temperature sensor is operable. When only one of the preceeding methods is operable, the offgas system may be operated provided gas samples are collected at least once per day and analyzed for hydrogen within the ensuing four hours.
- ACTION 31 With the no channel OPERABLE, effluent releases via this pathway may continue, provided samples required in Table 4.15-2 are continuously collected with auxiliary sampling equipment.

RADIOACTIVE GASEOUS WASTE SAMPLING AND ANALYSIS PROGRAM

DAEC-1

TABLE 4.15-2 (Continued)

TABLE NOTATION

- a. Table 4.14-2, Note a is a definition of the lower limit of detection (LLD).
- b. Analyses shall be performed following an increase of more than 50% in the steady state releases as indicated by a noble gas activity monitor, after factoring out the effect due to a change in reactor power.
- c. Sample media shall be changed at least once per seven days and the analysis completed within 48 hours after changing (or after removal from the sampler). Analyses shall also be performed within 48 hours following an increase of more than 50% in the steady state release as indicated by a noble gas activity monitor, after factoring out the effect due to a change in reactor power. When samples collected for 24 hours or less are analyzed, the corresponding LLD may be increased by a factor of 10.
- d. The ratio of the sample flow rate to the sampled stream flow rate shall be known for the time period covered by each dose or dose rate calculation made in accordance with Specifications 3.15.2, 3.15.3 and 3.15.4.
- e. The principal gamma emitters for which the LLD specification will apply are exclusively the following radionuclides: Kr-87, Kr-88, Xe-133, Xe-133m, Xe-135, and Xe-138 for gaseous emissions and Mn-54, Fe-59, Co-58, Co-60, Zn-65, Mo-99, Cs-134, Cs-137, Ce-141 and Ce-144 for particulate emissions. This list does not mean that only these nuclides are to be detected and reported. Other peaks which are measurable and identifiable, together with the above nuclides, shall also be identified and reported. Nuclides which are below the LLD may be reported as "less than" their respective LLD and should not be reported as being present at the LLD of the nuclide. Each measured radionuclide concentration is used in a required concentration or dose calculation only if it is detected at or above the LLD. When unusual circumstances persist more than 30 days and cause LLD higher than required, the reasons shall be documented in the Semiannual Radioactive Material Release Report.
- f. A quarterly composite sample shall include an equal fraction of each weekly particulate sample collected during the quarter.
- g. An H-3 grab sample will also be taken from the Offgas Stack or Reactor Building Vent when the reactor head is removed.

3.15.1 and 4.15.1 BASES

1. Radioactive Gaseous Effluent Instrumentation

The radioactive gaseous effluent instrumentation is provided to monitor the release of radioactive materials in gaseous effluents and, as appropriate, to control potential releases. Instrumentation for monitoring the concentration of potentially explosive gas mixtures in the main condenser offgas treatment system is also provided. The presence of instruments for monitoring both radioactive and explosive gaseous effluents is depicted in ODAM Figure 3-1. The OPERABILITY and use of these instruments implements the requirements of 10CFR Part 50, Appendix A, General Design Criteria 60, 63, and 64.

Offgas post-treatment monitors are operable during reactor power operation with their trip setting at a value not exceeding a limit computed by a method described in the Offsite Dose Assessment Manual. If both instruments reach their high trip point or if one reaches the high trip point and the other reaches a downscale trip point, the SJAE offgas isolation values close immediately.

Reactor building exhaust ventilation shaft radiation monitors initiate isolation of the reactor building normal ventilation and start standby gas treatment when a high trip point is reached.

DAEC is equipped with a radioactive gaseous effluent monitoring system which includes detectors at the offgas stack (R3), the reactor building vent (R4), and the turbine building vent (R5). A remote indication and control unit (RIC) located near each detector displays the detector reading and, whenever the setpoint is exceeded, an indicator light. The data are also routed to a control computer and a control room display but do not cause a trip to isolate the ventilated area. In the event the control computer and/or control room display fail to function or are voluntarily taken out of service, it is intended that each affected RIC display be observed at least once per hour (in which case the affected channel remains OPERABLE). In the event the detector reading and the indication of exceeding the monitor setpoint are not provided at either the control room or the RIC, then the affected channel is not OPERABLE and DAEC will either perform the appropriate ACTION or will provide an alternate monitoring system. This permits DAEC to retain the GE gaseous monitoring system as an alternate system for normal effluent monitoring when the Kaman system is temporarily inoperable. When used as an alternate monitoring system, the GE system is subject to the requirements stated in Specifications 3.15.1 and 4.15.1 and to LLD requirements stated in Table 4.15-2, Item C.

3. Gaseous Effluents

Assessments of dose required by Specifications 4.15.3 and 4.15.4 to verify compliance with Appendix I, Section IV are based on measured radioactivity in gaseous effluent and on calculational methods stated in the ODAM. Pathways of exposure and location of individuals are selected such that the dose to a nearby resident is unlikely to be

Guides 1.109 and 1.111. Cumulative and projected assessments of dose made during a quarter are based on historical average, i.e., quarterly averaged conditions measured at DAEC. Assessment made for the annual radiological environmental report will be based on annual averages of atmospheric conditions during the period of release.

3.15.2 and 4.15.2 BASES

Gaseous Effluent Concentration

This specification is intended to ensure that the concentration of radioactive material in the unrestricted area beyond the site boundary due to gaseous effluents from DAEC will maintain doses within the annual dose limits to unrestricted area provided in 10 CFR Part 20. Compliance with these limits also reasonably assures that radioactive material in gaseous effluents will not result in exposure of a member of the public in an unrestricted area to annual averaged concentrations exceeding the limit in 10 CFR Part 20.106. The occupancy time of members of the public who may occasionally be on the site is expected to be low enough to compensate for any less atmospheric dispersion on site than to the environs offsite.

Assessment of compliance is based upon an effluents measurement program defined in Table 4.15-2 and methodology stated in the ODAM. The resolving time of the measurements, ie., the sample integration time, bounds the minimum averaging time of the effluent measurements. waste streams. The Standby Gas Treatment System is considered an Engineered Safety Feature and not an exhaust ventilation treatment system. Thus the exhaust ventilation system discharges via the reactor building vent.

3.15.3 and 4.15.3 BASES

Doses due to Noble Gases

These specifications implement the requirements of 10 CFR Part 50, Appendix I, Section IV.A and B.1.

3.15.4 and 4.15.4 BASES

Doses due to Iodine and Particulates in Air

These specifications implement 10 CFR Part 50, Appendix I, Section IV.A and B.1. The dose calculation methods in the ODAM depend on existing pathways of exposure to a member of the public or more conservative conditions assumed (yielding a higher calculated dose). Calculations and methods are such that an estimate of the dose to a member of the public is not likely to be underestimated substantially.

3.15.5 and 4.15.5 BASES

1. Gaseous Radwaste Treatment

This specification implements the requirement of 10 CFR Part 50.36a (a)(1) that operating procedures be established and followed and that equipment be maintained and used to keep releases to the environment as low as is reasonably achievable. In order to satisfy Technical Specification 3.15.5, every reasonable effort shall be made to maintain and operate at least one train of the Offgas System charcoal adsorbers with pre-and aft-particulate filters to process radioactive gaseous effluent prior to release. The specification that the Offgas System which was used to establish compliance with the design objectives in 10CFR Part 50, Appendix I, Section II be used when specified provides reasonable assurance that the releases of radioactive materials in gaseous effluents will be kept as low as is reasonably achievable.

ODAM Figure 3-1 is a flow diagram depicting gaseous radioactive waste streams. The Standby Gas Treatment System is considered an Engineered Safety Feature and not an exhaust ventilation treatment system. Thus the exhaust ventilation system discharges via the reactor building vent.

3.15.6 and 4.15.6 BASES

1. Explosive Gas Mixture

Specification 3/4.15.6 is provided to ensure that the concentration of potentially explosive gas in the offgas treatment sytem downsteam of the recombiners is maintained below the flammability limit of a hydrogen and oxygen mixture in the system. Keeping the mixture below its flammability limit will provide assurance that offgas treatment system integrity and operability is maintained and that the radioactive material concentration is the offgas will be controlled in conformance with 10CFRPart 50, Appendix A, Criterion 60.

| LIMITING CONDITIONS FOR OPERATION | SURVEILLANCE REQUIREMENT |
|---|--|
| 3.16.1 The annual dose or dose commitment to any member of the public due to radiation and radioactive material in effluents from DAEC shall not exceed 75 mrem to his thyroid or 25 mrem to his total body or any other organ. | 4.16.1 <u>Dose Calculations</u> . Cumulative dose contributions from liquid and gaseous effluents to a member of the public offsite shall be evaluated at least once every year as described in the ODAM. |
| APPLICABILITY: At all times. | , |
| ACTION: | |
| a. If the calculated dose from radioactive material released in liquid or gaseous effluents exceeds twice the limits of Specifications 3.14.3, 3.15.3, or 3.15.4, perform an assessment of compliance with 10 CFR 190 and limit subsequent releases such that the dose or dose commitment to a member of the public is ≤ 75 mrem to his thyroid and ≤ 25 mrem to his total body or any other organ over 12 consecutive months including the period of elevated release. | |
| b. If the estimated dose exceeds either limit in Specification 3.16.1, prepare and submit a Special Report to the NRC within 30 days in lieu of any other report; it shall include the cause of the release of exposure, an estimate of the dose to the likely most exposed member(s) of the public, corrective actions taken or planned to prevent a recurrence, and a schedule for achieving compliance. If the condition causing the limit(s) to be exceeded has not been corrected, the Special Report may also state a request for a variance in accordance with the provisions of 40 CFR Part 190. In that event, the request is timely and a variance is granted until NRC action on the request is complete. | |

DAEC-1

TABLE 3.16-2 (Continued)

TABLE NOTATION

a. The LLD is defined, for purposes of these specifications, as the smallest concentration of radioactive material in a sample that will yield a new count, above system background, that will be detected with 95% probability with only 5% probability of falsely concluding that a blank observation represents a "real" signal.

For a particular measurement, which may include radiochemical separation:

 $LLD = \frac{4.66 S_b}{E \bullet V \bullet 2.22 \bullet Y \bullet exp (-\lambda \Delta t)}$

where

LLD is the lower limit of detection as defined above (picocuries per unit mass or volume)

 S_b is the standard deviation of the background counting rate or of the counting rate of a blank sample as appropriate (counts per minute)

E is the counting efficiency (counts per disintegration)

V is the sample size (units of mass or volume)

2.22 is the number of disintegrations per minute per picocurie,

Y is the fractional radiochemical yield, when applicable,

 $\boldsymbol{\lambda}$ is the radioactive decay constant for the particular radionuclide, and

 Δ t for environmental samples is the elapsed time between sample collection, or end of the sample collection period, and time of counting

Analyses shall be performed in such a manner that the stated LLDs will be achieved under routine conditions. With typical values of E, V, Y, and Δt for the radionuclides named in the Table. Occasionally background fluctuations, unavoidably small sample sizes, the presence of interfering nuclides, or other uncontrollable circumstances may render these LLDs unachievable. In such cases, the contributing factors shall be identified and described in the Annual Radiological Environmental Operating Report.

When a radionuclide attributable to DAEC but not listed in this table is measured (more than the LLD) it shall be reported. Any nuclide that is below the LLD for the analysis should not be reported as being present at the LLD level.

Reporting Levels^(a)

(a) - The reporting level is exceeded when one or more radionuclides is detected in a sample and

 $\frac{\text{concentration (1)}}{\text{reporting level (1)}} + \frac{\text{concentration (2)}}{\text{reporting level (2)}} + \dots \ge 1.$

(b) - For drinking water samples. This is 40CFR Part 141 value.

(c) - For samples of water not used as a source of drinking water.

(d) - Total for parent and daughter.

DAEC-1

3.16.1 and 4.16.1 BASES

1. Dose

Specification 3.16.1 is provided to comply with the dose limitation requirement of 40CFR190. This specification requires the assessment of dose to demonstrate that a person (a nearby resident) has not received a radiation dose exceeding that specified in 40CFR190. There is no other licensed nuclear fuel cycle faclity within 50 miles of DAEC, thus it is assumed that the dose from other uranium fuel cycle facilities is negligible. In the event a report is required to satisfy Specification 3.16.1, Action b, it shall be deemed adequate to satisfy the reporting requirement in Specification 6.11.1.e.(5).

3.16.2 and 4.16.2 BASES

1. Radiological Environmental Monitoring

The radiological environmental monitoring program, including the land use census, is conducted to satisfy the requirements of 10CFR Part 50, Appendix I, Section IV.B.2 and .3. The minimum radiological monitoring program required by this specification provides measurements of radiation and of radioactive materials in those exposure pathways and for those radionuclides which lead to the highest potential radiation exposures of individuals resulting from the station operation. This monitoring program thereby supplements the radiological effluent monitoring program by verifying that the measurable concentrations of radioactive materials and levels of radiation are not higher than expected on the basis of the effluent measurements and modeling of the environmental exposure pathways.

The land use census is conducted annually to identify changes in use of the unrestricted area in order to recommend modifications in monitoring programs for evaluating individual doses from principal exposure pathways. It may be conducted by door-to-door survey, by aerial survey, or by consulting with local agricultural or governmental authorities.

In order that radiological environmental monitoring stations may be relocated to reflect current conditions, the locations of stations required by Table 3.16-1 are described in a section of the Offsite Dose Assessment Manual. Revisions thereto are administered in accordance with Specification 6.15. IELP may conduct additional environmental monitoring exclusive of the requirements of Specifications 3.16.2 and 6.11.1.e.

3.16.3 BASES

1. Interlaboratory Comparison Program

The requirement for participation in an Interlaboratory Comparison Program is provided to ensure that independent checks on the precision and accuracy of the measurements of radioactive material in environmental sample matrices are performed as part of the quality assurance program for environmental monitoring in order to demonstrate that the results are reasonably valid.

3.16.4 and 4.16.4 BASES

1. Radioactive Waste Solids

This specification implements the requirements of 10 CFR Part 50.36a(a), the General Design Criterion 60 of 10 CFR Part 50 Appendix A, and of 10 CFR Part 61.56 on characteristics of low-level radioactive wastes destined for disposal by burial. Applicable requirements on packaging and delivery of packages of radioactive material to a carrier for transport stated in 10 CFR Part 71 and on transportation of hazardous materials in 49 CFR 171-179 are not restated in the technical specifications.

Processing waste to meet characteristics permitted under 10 CFR Part 61.56 may include solidification, preparation for deposit in a high integrity container, or any form acceptable under Part 61 for shipment to and receipt by a licensed disposal facility or licensed radioactive waste processor.

It is intended that a Contractor may perform the waste processing provided he operates according to an NRC approved Process Control Program.

- e. Investigation of all violations of the Technical Specifications including the preparation and forwarding of reports covering evaluation and recommendations to prevent recurrence to the Director-Nuclear Generation and to the Chairman of the Safety Committee.
 - f. Review of those Reportable Occurrences requiring 24 hour notification to the Commission.
 - g. Review of facility operations to detect potential safety hazards.
 - h. Performance of special reviews, investigations or analyses and reports thereon as requested by the Chairman of the Safety Committee.
 - i. Review of the Plant Security Plan and implementing procedures and shall submit recommended changes by the Chairman of the Safety Committee.
 - j. Review of the Emergency Plan and implementing procedures and shall submit recommended changes to the Chairman of the Safety Committee.
 - k. Review of every unplanned release of radioactivity to the environs for which a report to the NRC is required.
 - 1. Review of changes to the Offsite Dose Assessment Manual.

6.5.1.7 Authority

The Operations Committee shall:

a. Recommend to the Plant Superintendent-Nuclear written approval or disapproval of items considered under Specification 6.5.1.6 (a) through (d) above.

6.5-3

- g. Any other area of facility operation considered appropriate by the Safety Committee or the President.
- h. Design change request safety evaluations at least once per 24 months.
- i. The DAEC Fire Protection Program and implementing procedures at least once per 24 months.
- j. The Process Control Program and implementing procedures at least once per 24 months.
- k. The Offsite Dose Assessment Manual and implementing procedures at least once per 24 months.

6.5.2.9 Authority

The Safety Committee shall report to and advise the President on those areas of responsibility specified in Specifications 6.5.2.7 and 6.5.2.8.

6.5.2.10 Records

Records of Safety Committee activities shall be prepared, approved and distributed as indicated below:

a. Minutes of each Safety Committee meeting shall be prepared, approved and forwarded to the President within 14 days following each meeting.

- b. Reports of reviews encompassed by Specification 6.5.2.7 above,
 shall be prepared, approved and forwarded to the President within
 14 days following completion of the review.
- c. Audit reports encompassed by Specification 6.5.2.8 above, shall be forwarded to the President and to the management positions responsible for the areas audited within 30 days after completion of the audit.
- 6.5.3 Other Review and Audit
- 6.5.3.1 Fire Protection Inspection
- 6.5.3.1.1 An independent fire protection and loss prevention inspection and audit shall be performed annually utilizing either qualified offsite licensee personnel or an outside fire protection firm.
- 6.5.3.1.2 An inspection and audit by an outside qualified fire consultant shall be performed at intervals no greater than three years.

6.8 PLANT OPERATING PROCEDURES

- 6.8.1 Written procedures involving nuclear safety, including applicable check-off lists and instructions, covering areas listed below shall be prepared, and approved as specified in Subsection 6.8.2. All procedures shall be implemented and maintained.
 - Normal startup, operation, and shutdown of systems and components of the facility.
 - 2. Refueling operation.
 - 3. Actions to be taken to correct specific and foreseen potential malfunctions of systems or components, including responses to alarms, suspected primary system leaks, and abnormal reactivity changes.
 - Emergency and off-normal condition procedures.
 - 5. Preventive and corrective maintenance operations which could have an effect on the nuclear safety of the facility.
 - Surveillance and testing requirements of equipment that could have an effect on the nuclear safety of the facility.
 - 7. Procedures required by the Emergency Plan.

6.8-1

- 8. Procedures required by the plant Security Plan.
- 9. Operation of radioactive waste systems.
- 10. Fire Protection Program implementation.
- 11. A preventive maintenance and periodic visual examination program to reduce leakage from systems outside containment that would or could contain highly radioactive fluids during a serious transient to as low as practical levels. This program shall also include provisions for performance of periodic systems leak tests of each system no less frequently than at refueling cycle intervals.
- 12. Program to ensure the capability to accurately determine the airborne iodine concentration in vital areas under accident conditions, including training of personnel, procedures for monitoring and provisions for maintenance of sampling and analysis equipment.
- 13. Offsite Dose Assessment Manual.

14. Process Control Plan.

- 6.8.2 Procedures described in 6.8.1 above, and changes thereto, shall be reviewed by the Operations Committee and approved by the Plant Superintendent-Nuclear prior to implementation, except as provided in 6.8.3 below.
- 6.8.3 Temporary minor changes to procedures described in 6.8.1 above which do not change the intent of the original procedure may be made with the concurrence of two members of the plant management staff, at least one of whom shall hold a senior operator license. Such changes shall be documented and promptly reviewed by the Operations Committee and by the Plant Superintendent-Nuclear. Subsequent incorporation, if necessary, as a permanent change, shall be in accord with 6.8.2 above.

- 10. Records of radioactive effluent monitor setpoints and setpoint determinations.
- 6.10.2 The following records shall be retained for the duration of the Facility Operating License.
 - Record and drawing changes reflecting facility design modifications made to systems and equipment described in the Final Safety Analysis Report.
 - 2. Records of new and irradiated fuel inventory, fuel transfers and assembly burnup histories.
 - 3. Records of facility radiation and contamination surveys.
 - 4. Records of radiation exposure for all individuals entering radiation control areas.
 - 5. Records of gaseous and liquid radioactive material released to the environment.
 - Records of transient or operational cycles for those facility components designed for a limited number of transients or cycles.

c. Monthly Operating Report

Routine reports of operating statistics and shutdown experience shall be submitted on a monthly basis to the NRC to arrive no later than the 15th of each month following the calendar month covered by the report.

d. Semiannual Radioactive Material Release Report

- (1) A report of radioactive materials released from the Station shall be submitted to the NRC within 60 days after January 1 and July 1 of each year. Each report shall include the information specified in item (2) below covering the preceeding six months.
- (2) A Semiannual Radioactive Material Release Report shall include a summary by calendar quarter of the quantities of radioactive liquid and gaseous effluents and radioactive solid waste released from the Station. The data should be reported in the format in Tables 6.11-3a through 6.11-3c.

e. Annual Radiological Environmental Report

An annual report of radiological environmental surveillance activities required by Specification 3.16.2 shall be submitted to the NRC before May 1 of the following year. Each report shall include the following information:

(1) A summary description of the radiological environmental monitoring program required by Specification 3.16.2.

- (2) A map and a table of distances and directions of locations of sampling stations required in Table 3.16-1.
- (3) A summary of the land use census required in Specification4.16.2.2.
- (4) Results of analyses of samples required by the radiological environmental monitoring program, Table 3.16-1, summarized in the format of Table 6.11-4. In the event some results are not available, the reasons shall be explained in the report. In the event the missing results are obtained, they shall be submitted in a supplementary report as soon as is reasonable.
- (5) An assessment of radiation doses to a member of the public likely to be the most exposed due to radioactive liquid and gaseous effluents released from DAEC during the year. The assessment shall be performed as described in the ODAM.
- (6) A summary of meteorological data collected during the year. Alternatively, summary meteorological data may be retained by Iowa Electric Light and Power Company and made available to the NRC upon request.

DAEC-1

f. Other Reports

Table 6.11.-1 lists some of the routine reports required by 10 CFR Parts 20, 40, 50 and 70, including those listed in Specification 6.11.1.

6.11.2 REPORTABLE OCCURRENCES

Reportable occurrences, including corrective actions and measures to prevent reoccurrence, shall be reported to the NRC. Supplemental reports may be required to fully describe final resolution of occurrence. In case of corrected or supplemental reports, a licensee event report shall be completed and reference shall be made to the original report date.

a. <u>Prompt Notification With Written Followup</u>. The types of events listed below shall be reported as expeditiously as possible, but within 24 hours by telephone and confirmed by telegraph, mailgram, or facsimile transmission to the Director of the appropriate Regional Office, or his designate no later than the first working day following the event, with a written followup report within two weeks. The written followup report shall include, as a minimum, a completed copy of a licensee event report form shall be supplemented, as needed, by additional narrative material to provide complete explanation of the circumstances surrounding the event.

- (1) Failure of the reactor protection system or other systems subject to limiting safety system settings to initiate the required protective function by the time a monitored parameter reaches the setpoint specified as the limiting safety system setting in the technical specifications or failure to complete the required protective function.
- Note: Instrument drift discovered as a result of testing need not be reported under this item but may be reportable under items 6.11.2.a(5), 6.11.2.a(6) or 6.11.2.b(1) below.
- (2) Operation of the unit or affected systems when any parameter or operation subject to a limiting condition is less conservative than the least conservative aspect of the limiting condition for operation established in the technical specifications.
- Note: If specified action is taken when a system is found to be operating between the most conservative and the least conservative aspects of a limiting condition for operation listed in the technical specifications, the limiting condition for operation is not considered to have been violated and need not be reported under this item, but it may be reportable under item 6.11.2.b(2) below.
 - (3) Abnormal degradation discovered in fuel cladding, reactor coolant pressure boundary, or primary containment.

- Note: Leakage of valve packing or gaskets within the limits for identified leakage set forth in technical specifications need not be reported under this item.
- (4) Reactivity anomalies, involving disagreement with the predicted value of reactivity balance under steady state conditions during power operation, greater than or equal to $1\% \ \Delta k/k$; a calculated reactivity balance indicating a shutdown margin less conservative than specified in the technical specifications; short-term, reactivity increases that correspond to a sustained reactor period of less than 5 seconds or, if sub-critical, an unplanned reactivity insertion of more than 0.5% $\Delta k/k$ or occurrence of any unplanned criticality.
- (5) Failure or malfunction of one or more components which prevents or could prevent, by itself, the fulfillment of the functional requirements of system(s) used to cope with accidents analyzed in the SAR.
- (6) Personnel error or procedural inadequacy which prevents or could prevent, by itself, the fulfillment of the functional requirements of systems required to cope with accidents analyzed in the SAR.
- Note: For items 6.11.2.a(5) and 6.11.2.a(6) reduced redundancy that does not result in a loss of system function need not be reported under this section but may be reportable under items 6.11.2.b(2) and 6.11.2.b(3) below.

- (7) Conditions arising from natural or man-made events that, as a direct result of the event require plant shutdown, operation of safety systems, or other protective measures required by technical specifications.
- (8) Errors discovered in the transient or accident analyses or in the methods used for such analyses as described in the safety analysis report or in the bases for the technical specifications that have or could have permitted reactor operation in a manner less conservative than assumed in the analyses.
- (9) Performance of structures, systems, or components that requires remedial action or corrective measures to prevent operation in a manner less conservative than assumed in the accident analyses in the safety analysis report or technical specifications bases; or discovery during plant life of conditions not specifically considered in the safety analysis report or technical specifications that require remedial action or corrective measures to prevent the existence or development of an unsafe condition.
- Note: This item is intended to provide for reporting of potentially generic problems.
- b. <u>Thirty Day Written Reports</u>. The reportable occurrences discussed below shall be the subject of written reports to the Director of

the appropriate Regional Office within thirty days of occurrence of the event. The written report shall include, as a minimum, a completed copy of a licensee event report form. Information provided on the licensee event report form shall be supplemented, as needed, by additional narrative material to provide complete explanation of the circumstances surrounding the event.

- (1) Reactor protection system or engineered safety feature instrument settings which are found to be less conservative than those established by the technical specifications but which do not prevent the fulfillment of the functional requirements of affected systems.
- (2) Conditions leading to operation in a degraded mode permitted by a limiting condition for operation or plant shutdown required by a limiting condition for operation.
- Note: Routine surveillance testing, instrument calibration, or preventative maintenance which require system configurations as described in items 6.11.2.b(1) and 6.11.2.b(2) need not be reported except where test results themselves reveal a degraded mode as described above.
- (3) Observed inadequacies in the implementation of administrative or procedural controls which threaten to cause reduction of degree of redundancy provided in reactor protection systems or engineered safety feature systems.

6.11-9

- (4) Abnormal degradation of system other than those specified in Item6.11.2.(a)(3) designed to contain radioactive material resultingfrom the fission process.
- NOTE: Sealed sources or calibration sources are not included under this item. Leakage of valve packing or gaskets within the limits for identified leakage set forth in technical specification need not be reported under this item.
- (5) An unplanned offsite release of 1) more than one curie of radioactive material in liquid effluents, 2) more than 150 curies of noble gas in gaseous effluents, or 3) more than 0.05 curies of radioiodine in gaseous effluents. The report of an unplanned offsite release of radioactive material shall be submitted within 30 days of the occurrence and shall include the following information:
 - 1. A description of the event and equipment involved.
 - 2. Cause(s) for the unplanned release.
 - 3. Actions taken to prevent recurrence.
 - 4. Consequences of the unplanned release.

This report shall also be deemed to satisfy the reporting requirement of 10 CFR Part 20.405 (a)(5).

DAEC-1

6.11.3 UNIQUE REPORTING REQUIREMENTS

Special reports in lieu of any other report shall be submitted to the NRC Regional Administrator within the time period specified for each report. These reports shall be submitted covering the activities identified below pursuant to the requirements of the applicable reference specification.

DAEC-1

- a. Reactor vessel base, weld and heat affected zone metal test specimens (Specification 4.6.A.2).
- I-131 dose equivalent exceeding 50% of equilibrium value (Specification 4.6.B.1.h).
- c. Inservice inspection (Specification 4.6.G).
- d. Reactor Containment Integrated Leakage Rate Test (Specification 4.7.A.2.f).
- e. Auxiliary Electrical System Operation with inoperable components (Specification 3.8.8.4).
- f. Fire Protection Systems (Specification 3.13.A.3, 3.13.B.3, 3.13.C.3, and 3.13.D.3).

g. Radioactive Liquid or Gaseous Effluent - calculated dose exceeding specified limit (Specifications 3.14.3, 3.15.3 and 3.15.4).

h. Off-Gas System (AOG) inoperable (Specification 3.15.5).

- Measured levels of radioactivity in an environmental sampling medium determined to exceed the reporting level values of Table 3.16-3 when averaged over any calendar quarter sampling period.
- j. Annual dose to a member of the public determined to exceed 40 CFR Part 190 dose limit.

TABLE 6-11-1

REPORTING SUMMARY - ROUTINE REPORTS

| Requirement | Report | Timing of Submittal |
|-------------|---|--|
| | · · · · · · · · · · · · · · · · · · · | |
| TS | Annual Exposure | Within 60 days after January 1. |
| §20.407 | Personnel Exposure and Monitoring | Within first quarter of each calendar year. |
| §20.408 | Personnel Exposure on Termination of Employment or Work | Within 30 days after the exposure of the individual has been determined or 90 days after date of termination of employment or work assignment, whichever is earlier. |
| §40.64(a) | Transfer of Source Material | Promptly upon transfer. |
| §40.64(a) | Receipt of Source Material | Within 10 days after material is received. |
| §40.64(b) | Source Material Inventory | Within 30 days after September 30 of each year. |

TABLE 6-11-1 (cont)

REPORTING SUMMARY - ROUTINE REPORTS

| Requirement | Report | Timing of Submittal |
|------------------------------------|--|--|
| §50.59(b) | Changes, Tests, and Experiments | Within 60 days after January 1. |
| §70.53 | Special Nuclear Material Status | Within 30 days after March 31 and September 30 of each year. |
| §70.54 | Transfer of Special Nuclear Material | Promptly upon transfer |
| §70.54 | Receipt of Special Nuclear Material | Within 10 days after material is received |
| Appendix G to 10 CFR Part 50 | Fracture Toughness | On an individual-case basis at least 3 years prior to the date when the predicted fracture toughness levels will no longer satisfy section V.B. of Appendix G to 10 CFR Part 50. |
| Appendix H to 10 CFR Part 50 | Reactor Vessel Material Surveillance | Completion of tests after each capsule withdrawal. |
| Appendix J to 10 CFR Part 50 | Reactor Containment Building Integrated Leak Rate Test | Approximately 3 months following conduct of test. |

| TS | Reportable Occurrence | | | , | X | |
| §20.405 | Overexposures and Excessive Levels of Radiation and Concentration of Radioactive Material | | | | X | |
| §20.402 | Theft or loss of Material | Immediately | | | X | |
| §20.403(a) | Severe Accident Involving Licensed Material | Immediately | | | | , |
| §20.403(b) | Accident Involving Licensed Material | Within 24 hours | | | | |
| §40.64(c) | Theft or Unlawful Diversion of Source Material | Promptly | | X | | |
| §50.59(d) | Authorization of Changes, Tests, and Experiments | x ² | | | | |
| §70.52 | Accidental Criticality or Loss of Special Nuclear Material | Promptly | | | | |
| §73.42 | Unaccounted for Shipments, Suspected Theft, or Unlawful Diversion of Special Nuclear Material | | X | | | 2 |
| TS | Unique | | | | | х ³ |

NOTES TO TABLE 6.11-2

¹Technical Specifications.

²NRC authorization is requried prior to performing a change, test, or experiment in this category.

³Unique reports covering inspections, tests, and maintenance that are appropriate to assure safe operation of the facility. The frequency and content of these special reports are determined on an individual case basis and designated in the Technical Specifications. Such reports include in-service inspection, tendon surveillance program study, fuel inspection, and containment structural tests.

6.14 OFFSITE DOSE ASSESSMENT MANUAL (ODAM)

6.14.1 Changes to the ODAM may be made by IELP provided:

- Change(s) shall be submitted to the Commission by inclusion in the next Semiannual Radioactive Material Release Report after the change(s) was made effective and shall contain:
 - a. sufficiently detailed information to support the rationale for the change. Information submitted should consist of a package of those pages of the ODAM to be changed with each page numbered and provided with an approval and date, together with appropriate bases or evaluations justifying the change(s);
 - b. a determination that the change(s) will not reduce the reliability of dose calculations or setpoint determinations to facilitate or assess compliance with Specifications; and
 - c. documentation of the fact that the change has been reviewed by the Operations Committee.

6.14-1

- 2. Change(s) to radiological environmental monitoring program required sampling station locations, ODAM Table 5-1, shall be submitted to the Commission by inclusion in the next Annual Radiological Environmental Report.
- 3. Changes shall become effective as reviewed by the Operations Committee and approval by the Plant Superintendent-Nuclear.

6.15 PROCESS CONTROL PROGRAM (PCP)

6.15.1 IELP may change the Process Control Program provided:

- Change(s) shall be submitted to the Commission by inclusion in the next Semiannual Radioactive Material Release Report after the change(s) were made effective and shall contain:
 - a. sufficiently detailed information to support the rationale for the change.
 - b. a determination that the product waste form will conform to the requirements of 10 CFR Part 61.56.
 - c. documentation of the fact that the change has been reviewed by the Operations Committee.
- 2. Change(s) shall be come effective as reviewed by the Operations Committee and approval by the Plant Superintendent-Nuclear.

6.15-1
