1.0 PURPOSE

The purpose of this report is to present a description and analysis of the September 1993, Periodic Type A Primary Containment Integrated Leakage Rate Test (ILRT) and a summary of the Periodic Types B and C Local Leakage Rate Tests (LLRT's) conducted at Duane Arnold Energy Center (DAEC). Duane Arnold Energy Center is operated by the Iowa Electric Light and Power Company. Plant specific information and technical data is contained below.

This report has been submitted to the United States Nuclear Regulatory Commission in accordance with the requirements of 10CFR50, Appendix J, Section V, Paragraphs B1 and B3. The form and content of this report is presented in accordance with ANSI/ANS 56-8, "Containment System Leakage Testing Requirements".

1.1 General Data

Operator	Iowa Electric Light and Power
Plant	Duane Arnold Energy Center
Location	Palo, Iowa
Containment Type	Mark I, BWR-4
Docket Number	50-331
Operating License No.	DPR-49
Date Test Completed	September 20, 1993

1.2 Technical Data

Containment Net Free Air Volume	230,000 cubic feet
Design Pressure	56 psig
Calculated Peak Accident Pressure	43 psig
Containment Design Temperature	281 °F

2.0 TYPE A TEST SUMMARY

Attachment 1, Table A - Test Setup Data contains the instrumentation and associated volume fractions list for all of the ILRT instruments. Attachments 2, 3, and 4 provide the raw data input tables for Dry Bulb Temperature, Dew Point Temperature and Pressure readings respectively.

- 2.1 Pressurization** Containment pressurization was begun at approximately 1800 hours on September 19, 1993. Pressurization rate was approximately 6.0 psi/hour. Investigations of all accessible penetrations were performed throughout the pressurization and Type A test. No leaks were identified. Final containment test pressure was achieved at 0250 hours on September 20, 1993.
- 2.2 Stabilization** Containment stabilization was begun at approximately 0300 on Sepember 20, 1993. Pressure, temperature, and dew point data were recorded at 5 minute intervals during stabilization. The temperature and leakage stablilization criteria of ANSI/ANS 56-8 were met and the containment was declared stable at 0730 on September 20, 1993. Attachment 5, Containment Temperature Stability Parameters and Attachment 6, Containment Mass Point Leakage Stability provide the containment stability parameters.
- 2.3 Type A Test** The start of the Type A test was declared at 0745 on September 20, 1993. Pressure, temperature and dew point data were recorded at 15 minute intervals throughout the Type A test. The test proceeded without incident and was successfully completed at 1545 on September 20, 1993 with a Total Time Upper Confidence Limit (UCL-TT) of 0.15356 percent/day and Mass Point Upper Confidence Limit of 0.08282 percent per day. Both Total Time and Mass Point leakage rates were below the 0.75La acceptance criteria. The Type A Test leakage and error parameters are depicted in tabular form in Attachment 7, Type A Test Leakage and Error Parameters.

- 2.4 Verification Test** The superimposed leakage verification test was started at 1630 hours on September 20, 1993. A one-hour stabilization period was implemented in accordance with BN-TOP-1. The test was successfully completed at 2130 hours on September 20, 1993. Attachment 8, Verification Test Parameters provides the upper and lower limits as well as the composite leakage for the verification test period.
- 2.5 Depressurization** After performing a radiological survey, the containment was depressurized over a period of approximately 5 hours.

NOTE

No repairs or adjustments were made to the containment boundary either during the conduct of the Type A test or the Superimposed Leakage Verification test.

3.0 TYPE A TEST RESULTS

3.1 Type A Test Data

3.1.1 **Test Method:** Absolute Method

3.1.2 **Data Analysis Technique:** Total time analysis method in accordance with BN-TOP-1, "Testing Criteria for Integrated Leakage Rate Testing of Primary Containment Structures for Nuclear Power Plants", Revision 1, November, 1972.

3.1.3 **Test Pressure:** Between 44.0 psig and 45.0 psig.

3.1.4 **Maximum Allowable Leakage Rate 0.75La (%/24 hours):** 1.5 %/day

3.1.5 **Calculated Leakage Rate Upper Confidence Limit (UCL):** 0.15356 %/day

3.1.6 **Measured Leakage Rate (Lam):** 0.08080 %/day

3.2 Analysis and Interpretation

3.2.1 **Acceptance Criteria:** Based on Duane Arnold Technical Specification, the primary containment overall integrated leakage rate shall be maintained less than or equal to 0.75 La, where La is 2.0 % by weight of the containment air per 24 hours at Pa, 43.0 psig. 10CFR50 Appendix J, Section III A.5.b, requires that the measured/calculated leakage rate shall be less than .75 La, or 1.5 %/day as determined by the Type A test. This is interpreted to mean that the upper confidence limit (UCL) on the measured leakage rate, including all Type B and C corrections, penalties, and other leakage additions, shall be less than the above acceptance criteria. Further, a verification test using the calibrated superimposed leakage method shall be performed and satisfy the following condition:

$$(Lo + Lam - 0.25 La) \leq Lc \leq (Lo + Lam + 0.25 La)$$

where;

Lo = Superimposed Leakage rate which is between 75% and 125% of La,

Lam = Last valid Type A measured/calculated leakage rate,

Lc = Composite leakage rate as measured by the data acquisition system during the verification test,

La = Maximum allowable leakage rate at pressure Pac.

3.3 Instrumentation System

The test instrumentation system consisted of: (1) a microprocessor controlled data acquisition system (DAS); (2) fifteen drybulb resistance temperature detectors; (3) six dewpoint temperature sensors; and (4) two precision pressure gauges. Prior to containment pressurization, the calculated instrumentation system Instrument Selection Guide (ISG) was 0.034 %/day for an assumed eight hour test duration (refer to Attachment 1, Test Setup Data). This value was well below the required value of 0.5 %/day (0.25La). For testing purposes, the precision pressure gauge connected to the drywell was used.

After pressurizing the containment, and during temperature stabilization, it was determined that the Torus atmosphere was saturated and the dewcells located in the torus were reading higher than the drybulb temperature. It was decided, therefore to use the torus drybulb temperature sensors associated with these dewcells as the measure of dew point temperature. The ISG calculation was not affected.

The instrumentation system configuration at the beginning and end of the test was:

- Drybulb RTD Sensors: 15
- Dewpoint Temperature Sensors 6
- Precision Pressure Manometers 1
- Mass Flow Meters 1

Attachment 9, ILRT Instrumentation List provides a description of instrument identification numbers and locations. Attachments 10 and 11 provide the Temperature and Dewpoint Sensor Zone locations respectively.

3.4 Temperature Stabilization

The temperature stabilizaton period was begun after reaching a containment pressure of 58.98 psia . The containment atmosphere was allowed to stabilize for approximately 4 hours and 30 minutes. The latest rate of drybulb temperature change over the last hour of the stabilization was 0.012 °F. The average rate of change over the last four hours of the stabilization period was 0.106 °F, indicating a very stable containment atmosphere. This difference of 0.094 °F met the ANSI/ANS 56.8 requirement for temperature stabilization. Further, the Containment Air Mass versus Time plot, Attachment 12 and the Mass Point Sliding Leakage Plot, Attachment 13 indicated a linear relationship confirming containment atmosphere stability.

3.5 As Left Containment Type A Test

The Type A Test was begun at 0745 hours on September 20, 1993. Based on the Total Time Analysis Method, the test was declared over at 1545 hours on September 20, 1993. The following summarizes the as left containment test results:

3.5.1	Type B and C Pre Test Penalty Leakage for penetrations not vented/drained	0.04550 %/day
3.5.2	Type B and C Pre Test Penalty Leakage for penetrations isolated during the test	0.00000 %/day
3.5.3	Water Level Corrections	0.05506 %/day
3.5.4	Total Time UCL	0.15356 %/day

$$\text{Total Time Acceptance} = 3.5.1 + 3.5.2 + 3.5.3 + 3.5.4 \leq 0.75La$$

$$= 0.25412 \%/\text{day} \leq 1.50 \%/\text{day}$$

Attachment 14 illustrates the Total Time calculated leakage rate and associated upper confidence limit over the test interval. Based on the above data, it was concluded that the as left containment leakage rate was stable, well below the acceptance criteria, and therefore the containment may be declared operable in accordance with the plant Technical Specifications.

3.6 As Found Containment Type A Test

As suggested by Reference 9, the Type A Test results should be compensated for the "as found" vs. "as left" leakages for all penetrations if Type B and C repairs and adjustments are made prior to the Type A Test. This correction was equal to 0.2567 %/day. The following summarizes the as found containment results:

3.6.1	As Left Total Time Leakage Rate	0.25412 %/day
3.6.2	As Found vs. as Left Leakage Correction	0.2567 %/day

$$\text{Total Time Acceptance} = 3.6.1 + 3.6.2 \leq 0.75 La$$

$$= 0.51082 \%/\text{day} \leq 1.5 \%/\text{day}$$

Based on the above test results, it was concluded that the as found containment leakage rate was well below the acceptance criteria.

3.7 Verification Test

The superimposed leakage verification test was started at 1630 hours on September 20, 1993. The superimposed leakage rate was 12.2 SCFM. A one-hour stabilization period was implemented in accordance with BN-TOP-1. The test was completed at 2130 hours on September 20, 1993. The following summarizes the verification test results:

3.7.1	Superimposed Leakage Rate (Lo)	1.97640 %/day
3.7.3	Composite Leakage Rate Total Time (Lc)	2.05236 %/day
3.7.5	Type A Test Leakage Rate Total Time (Lam)	0.08080 %/day

The Superimposed Leakage Verification is acceptable provided Lc falls within the following ranges:

$$(Lam + Lo - 0.25La) \leq Lc \leq (Lam + Lo + 0.25La)$$

3.7.6 Total Time Acceptance

$$(0.08080 + 1.97640 - 0.5) \leq 2.05236 \leq (0.08080 + 1.97640 + 0.5)$$

$$(1.55720) \leq 2.05236 \leq (2.55720)$$

Attachment 15 illustrates the verification test Total Time Composite Leakage Rate with respect to the upper and lower limits as a function of time. Based on the above data, it was concluded that the composite leakage rate was stable, well within the limits of the test, and therefore, the Type A Test instrumentation system was considered to be verified functional throughout the Type A Test.

3.8 Reduced Data

Attachment 16, ILRT Containment Air Mass Calculation Parameters, contains the reduced variables and mass calculations for the Type A Test. These values were determined from the raw data inputs.

4.0 LOCAL LEAKAGE RATE TESTS (Types B and C)

The Local Leakage Rate Tests (LLRT) of containment isolation valves and other containment penetrations were conducted as required by the methods described in Duane Arnold Surveillance Test Procedures.

In accordance with 10CFR50 Appendix J, Paragraph V.B., data for the Local Leakage Rate Tests are summarized in Attachments 17 and 18 of this report. The combined as-left leakage for all penetrations and valves subject to Type B and C tests in 1992 and 1993 were below the acceptance criteria of less than 0.60 La.

4.1 Leakage Penalties added to Type A Leakage

In accordance with 10CFR50 Appendix J, Section III A.1.d, certain systems penetrating the containment boundary were not vented and drained. In order to compute the appropriate Type A Test penalty to be applied to the upper confidence limit, an analysis of each affected penetration was performed based on minimum pathway leakage through each penetration. Based on this analysis, a total pretest penalty leakage of 0.04550 %/day was assigned. The following table summarizes this analysis:

Penetration Number	Description	Leakage SCCM
X 9A	Feedwater	29
X 9B	Feedwater	249
X 16A	Core Spray	20
X 16B	Core Spray	7
X 19	Drywell Floor Sump	603
X 23A	Drywell Cooling Inlet	594
X 23B	Drywell Cooling Inlet	1847
X 24A	Drywell Cooling Outlet	3287
X 24B	Drywell Cooling Outlet	901
X 36	CRD Return	54

X 48	Drywell Equipment Sump	162
X 54	RBCCW Outlet	55
X 55	RBCCW Inlet	152
TOTAL		8013 SCCM
(0.04550 %/day)		

4.2 Water Level Corrections

The following water level corrections were assigned for the Type A Test:

Description	ft ³
Reactor Vessel	-18.744
Drywell Equipment Sump	+60.825
Drywell Floor Sump	+0.134
Torus Water Level	0.0
TOTAL	42.215 ft³ (0.05506 %/day)

4.3 Total Corrections 0.10056 %/day
