Attached please find the subject requests for additional information (RAI). A draft of the RAI was provided to you on January 6, 2011, and discussed with your staff on January 20 and 24, 2011. No change is made to the draft RAI as a result of those discussions. The schedule we have established for review of your application assumes technically correct and complete responses within 30 days of receipt of RAIs. For any RAIs that cannot be answered within 30 days, it is expected that a date for receipt of this information will be provided to the staff within the 30 day period so that the staff can assess how this information will impact the published schedule.

U.S. EPR Standard Design Certification

AREVA NP Inc.

Docket No. 52-020

SRP Section: 03.06.03 - Leak-Before-Break Evaluation Procedures

**SRP Section: 03.09.02 - Dynamic Testing and Analysis of Systems Structures and
Components**

Application Section: FSAR Chapter 3

**QUESTIONS for Component Integrity, Performance, and Testing Branch 1
(AP1000/EPR Projects) (CIB1)**

**QUESTIONS for Engineering Mechanics Branch 2 (ESBWR/ABWR Projects)
(EMB2)**

Question 03.09.02-160:

The applicant states the following in the FSAR, Appendix 3C.1.3 paragraph:

The initial conditions (pressures, enthalpies, and flow) for the RPV internals are calculated by spreadsheet using data obtained from an analysis of the RPV internal flow paths to assess bypass flows and pressure drops inside the RPV.

The applicant is requested to provide details of the methods used in the spreadsheet to verify the technical soundness of the method used as recommended by the NRC SRP 3.9.2.5.III.

Response to Question 03.09.02-160:

The reactor pressure vessel (RPV) hydraulic model is a more detailed version of the reactor coolant system (RCS) four-loop hydraulic model as explained in U.S. EPR FSAR Tier 2, Section 3C.1.3. The RPV model has been refined to add more control volumes and flow paths to the RPV lower head, core, downcomers, upper head, and upper plenum regions. The initial pressure and enthalpy values for the added control volumes and flow rates for the added flow paths are calculated using pressure loss and conservation of mass and energy equations from the CRAFT2 theoretical manual and the existing values from the RCS hydraulic model as a starting point.

The hydraulic modeling and analyses are performed in accordance with the methodology described in Topical Report BAW-10132P-A (U.S. EPR FSAR Tier 2, Appendix 3C, Reference 4). The spreadsheets provided in U.S. EPR FSAR Tier 2, Section 3C.1.3, are used to perform iterative calculations for the numerous control volumes and flow paths in the model in order to determine the initial control volume pressures and enthalpies. The only calculations performed using the spreadsheets are those used to determine steady-state pressures, temperatures, and flow rates in the RCS. This data is used to initialize the CRAFT RCS thermal-hydraulic model, which is used for all pipe rupture analyses. The calculations performed using spreadsheets do not incorporate a different methodology than the one described in BAW-10132P-A.

FSAR Impact:

The U.S. EPR FSAR will not be changed as a result of this question.
