Plant Protection System (PPS)

Chapter 12.4
OBJECTIVES

1. State the purpose of the reactor protection system (RPS).

2. State the purpose of the engineered safety features actuation system (ESFAS).

3. Explain the purpose of each reactor trip.
OBJECTIVES

4. Explain how the two (2) out of four (4) RPS trip logic is derived.

5. Explain the reactor trip circuit breaker trip logic.

6. List the operating bypasses incorporated into the Plant Protection System.

7. Explain the effect of placing an RPS trip in trip bypass.
OBJECTIVES

8. Explain the operation of the low pressurizer pressure trip circuitry.

9. Explain the operation of the low Steam generator pressure trip circuitry.

10. Explain the ESFAS logic.

11. Explain the purposes of the ESFAS signals.
The 7 Digital CE plants have a Plant Protection System

- Arkansas Nuclear One 2
- Waterford 3
- San Onofre 2 & 3
- Palo Verde 1, 2, & 3
RPS Purpose

The Reactor Protection System (RPS) monitors various plant parameters and trips the reactor when a limit is approached. A reactor trip under these circumstances is intended to maintain the integrity of the fuel cladding and RCS boundaries during any Anticipated Operational Occurrence (AOO) and limit offsite radiation doses to within the limits of 10CFR100 during any design basis accident.
ESF Purpose

The Engineered Safety Features Actuation System (ESFAS) and associated Engineered Safety Features (ESF) systems are designed to ensure that accident consequences are kept within acceptable limits.
