Re: EN47197
Supplemental Report IAW 10CFR 20.2203

This correspondence is a supplement to the report submitted on or about September 22, 2011.

In the course of Integrity Testlab's investigation into this event, I questioned the radiographer and assistant radiographer if at any time during the day when they were performing radiography:

- If there were any unusual high readings when performing all the required radiation surveys with the ND-2000; and
- If there had been any alarming events from their assigned RA-500 rate alarm meters; and
- Had either one experienced an off scale condition on their assigned W-138 self-reading pocket dosimeters?

During the course of the day, the radiographer and the assistant radiographer responded they had not observed or experienced any unusual surveys readings or experienced unusual alarms. Furthermore, each had recorded receiving 40mR on their pocket dosimeter at the end of shift.

As previously reported, Integrity Testlab is confident that the dosimeter was accidentally overexposed and that 9.587R received on the dosimeter is not the exposure the assistant radiographer received. Integrity Testlab therefore will be assigning a permanent radiation exposure of 87mR to the assistant radiographer for the month of July, 2011. This amount (87mR) is identical to the radiographer's July recorded exposure.

This exposure of 87mR is in line for the previous four (4) months of recorded doses as indicated in the table below:

Assistant Radiographer DDE Recorded Dose					
JAN-11	FEB-11	MAR-11	APR-11	MAY-11	JUN-11
302mR	242mR	58mR	72mR	28mR	74mR
6 Month Total for 2011					776mR

If there any questions or concerns please feel free to contact me at 302-325-2365.
