Figure 2.5.1-305 Correlation between Morphotectonic Zones and Tectonic Terranes in Hispaniola

Notes:

Morphotectonic zones of Hispaniola

1. Zone 1, Old Bahama Trench (offshore)
2. Zone 2, Cordillera Septentrional-Samaná Peninsula
3. Zone 3, Cibao Valley
4. Zone 4, Massif du Nord-Cordillera Central
5. Zone 5, Northwestern-south-central zone (includes Plateau Central, San Juan Valley, Azua Plain, Sierra de Ocoa, Presqu'île du Nord-Ouest)
6. Zone 6, Cul-de-Sac Plain; Enriquillo Valley
7. Zone 7, Southern or Bahoruco Peninsula; Massif de la Selle; Massif de la Hotte; Sierra de Bahoruco
8. Zone 8, Eastern Peninsula; Cordillera Oriental; Seibo coastal plain
9. Zone 9, San Pedro Basin and north slope of the Muertos Trough
10. Zone 10, Beta Ridge and southern peninsula

Tectonic terranes (zones) of Hispaniola

1. Samaná
2. Puerto Plata-Pedro Garicía-Río San Juan
3. Altamira
4. Oro
5. Seibo
6. Tortue-Amina-Maimon
7. Loma Caribe-Tavera
8. Duarte
9. Tireo
10. (gray area) Trois Rivières-Peralta
11. Presqu'île du North-Ouest-Neiba
12. (ruled area) Selle-Hotte-Bahoruco

Fault abbreviations: RGFZ = Río Grande fault zone, SFZ = Septentrional fault zone, GFZ = Guacara fault zone, HAFZ = Hatillo fault zone, HFZ = Hispaniola fault zone, BFZ = Bonao fault zone, SJRFZ = San José Restauración fault zone, LPSJFZ = Los Pozos-San Juan fault zone, EPGFZ = Enriquillo-Plantain Garden fault zone

Figure 2.5.1-314 Stratigraphic Columns from Five Wells Drilled on the Northern Nicaraguan Rise

Source: Reference 526

Figure 2.5.1-315 Modern Physiography of the Northern Nicaraguan Rise

Note: Detailed bathymetry shows the complexity and segmented character of the northern Nicaraguan Rise seafloor. Present-day carbonate banks (brick pattern) have remained areas of neritic carbonate production since the Late Eocene. Drowned banks and reefs observed in Pedro Channel and Walton Basin formed an east-west barrier along the northern Nicaraguan Rise, where continuous shallow-water environments prevailed from the Late Eocene to Early Miocene. Some of the carbonate banks and barriers (light gray pattern) subsided and drowned as late as the late Middle Miocene. ODP Site 1000 is located in the Pedro Channel.

Figure 2.5.1-319 Northern and Southern Nicaragua Rise in the Caribbean Sea

The northern Nicaragua Rise is bounded on the north by the Cayman Trough and to the south by the Pedro Fracture Zone. The southern Nicaraguan Rise is bounded on the north by the Pedro Fracture Zone and to the south by the Hess Escarpment. Industry wells are indicated by open circles while ODP Site 1000 is identified with a closed circle. Contour interval is 1000 meters with the exception of the 100-meter isobath showing the carbonate banks (shaded) along the northern Nicaragua Rise.
