Subject: Waste Policy

The vital first step in the management of nuclear waste is cessation of production. Even a cursory review of the issue reveals that human errors have caused unmanageable leaks which have polluted the environment and caused human suffering. Too much is enough already.

The great challenge is isolation of nuclear waste which has been produced, including all that is currently in military possession. Just tracking it down and moving it away from any potential human contact will be a great source of employment. These are among the green jobs so highly sought after by politicians.

Secure storage probably means encasement in small glass pellets to reduce radioactive escape. These pellets should be securely stored in retrievable units in a geologically stable area where they can be permanently monitored. Again, lots of jobs making the world a safer place. This plan should be an easy sell.
