

BILLINGS AND ASSOCIATES, INC.

WELL: 29

Well 29 is an alluvial well west of the arroyo channel. The water quality indicates contamination. The source does not appear to be the tailings area as the concentrations of NO₃E are greater than around the tailings Pile and greater than any well in between Well 29 and the Pile. Water Quality has been improving with time which would not be expected if the contamination was coming from the tailings Pile. The TDS/SO₄ ratio should be evaluated. The water quality does not look quite like either mill release or tailings. The pH level is surprisingly high compared to the TDS concentration if one were proposing a dilution of tailings. The improvement in water quality does not coincide with the decrease in water level. Compare to the water quality in Well 28.
