SUBJECT: HONEYWELL METROPOLIS WORKS NOTIFICATION OF TRANSFER OF DEBRIS UNDER 10 CFR 40.13, "UNIMPORTANT QUANTITIES OF SOURCE MATERIAL"

This letter is to notify the NRC of Honeywell's intention to transfer annually for disposal 90,000 cubic feet (ft³) of debris contaminated with unimportant quantities of source

NM5501

material to the US Ecology Idaho (USEI) RCRA Subtitle C facility located near Grand View, Idaho. This transfer performed in accordance with Title 10, Code of Federal Regulations (10 CFR), Section 40.13, "Unimportant Quantities of Source Material," will establish a separate material stream from that of the previously approved industrial scrap material stream.

The Grand View facility permit issued to US Ecology Idaho, Inc. (USEI) by the Idaho Department of Environmental Quality specifically authorizes receipt and disposal of unimportant quantities of source material pursuant to 10 CFR Part 40.13.

By its letter dated July 16, 2009, Honeywell provided an initial notification to the NRC of intention to transfer 90,000 ft³ of unimportant quantities of scrap material to this US Ecology Idaho facility for disposal. Additionally, Honeywell presented a comprehensive Evaluation in Support of Alternative Waste Disposal Procedures for Unimportant Quantities of Source Materials. On February 4, 2011, Honeywell submitted notification of another 90,000 ft³ scrap material allotment intended to be transferred to the same US Ecology Idaho facility for disposal.

As a result of the Commission staff analyses documented in the Safety Evaluation Reports, the NRC found both transfers of 90,000 ft³ of scrap materials to be acceptable as stated in the NRC approval letters dated February 2, 2010, and April 25, 2011.

The planned debris stream will include paper, plastic, glass, soil or soil-like materials, etc. The material in the proposed debris stream has a nominal density of 0.46 g/cc. This density is less than a third of the 1.5 g/cc density used in conservative estimates for the industrial scrap material transfers and disposals at USEI evaluated in the Safety Evaluation Reports and approved by the NRC on February 2, 2010, and April 25, 2011. Assuming that source material concentration in the newly proposed debris stream is 0.05 percent by weight, a lesser amount of source material is present in 90,000 ft³ of debris due to its significantly reduced density.

All other aspects of the intended debris shipment and disposal will be unchanged and fully consistent with the assumptions previously used in the Commission analyses performed for the Safety Evaluation Reports. It is apparent that the doses to workers and the public from transportation, handling and disposal at the USEI site, long-term impacts to groundwater – as well as possible impacts if a member of the public inadvertently intruded into the site after closure – will be less than those received from the approved transfer and disposal of the industrial scrap material. Consequently, the dose evaluation performed for scrap material and presented in the Safety Evaluation Reports dated February 2, 2010, and April 25, 2011, may also serve as a conservative estimate for the doses received from debris transfer and disposal. The sum of the annual doses received from each material stream (90,000 ft³ of industrial scrap plus 90,000 ft³ of debris per year) will still remain well below all applicable regulatory limits of concern.

Honeywell is planning to begin debris shipments by August 31, 2012. We hope that NRC attention and expedited review of this notification will allow Honeywell to meet its waste disposal goals and shipment schedule.

If you have any questions, require additional information, or wish to discuss this request please contact Bob Stokes, Regulatory Affairs and Radiation Protection Manager, at (618) 524-6341.

Sincerely,

A handwritten signature in black ink, appearing to read "Larry A. Smith". The signature is fluid and cursive, with a large initial "L" and "S".
