Document_Title: NUREG-2128, draft

Comments: In general I see no problems with the compiling of the test data from the three individual programs. The test setups themselves and the assumptions made by the researchers were similar enough for the data to be combined. There is a definite need for more testing to be done in order to more confidently justify claims other than the mere possibility of the failure modes considered. To confidently assign probabilities as to the likelihood of any particular failure mode of a circuit in a given configuration would require the analysis of a much larger data set.
