Subject: Inspection Status

As of COB Wednesday we have no issues in the three inspection modules - ENV, RWM and T. Exit is scheduled for 4:00 p.m. on Thursday.

Regarding the two ground water monitoring wells that were "relocated". The old wells were either damaged or it took an extended period of time to collect a water sample. Well 13 they believed calapsed or otherwise became blocked. Attempts to unclog the well were unsuccessful. Well 23 is simply difficult to withdraw or pump a sample of water from. The new well is also slow when obtaining a sample.

The two new wells for each location are located approximately 3'-4' from the old well and were drilled to the same location.

There was an opportunity to observe several waste/product shipments during the week - so that area is getting a good review.
